

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

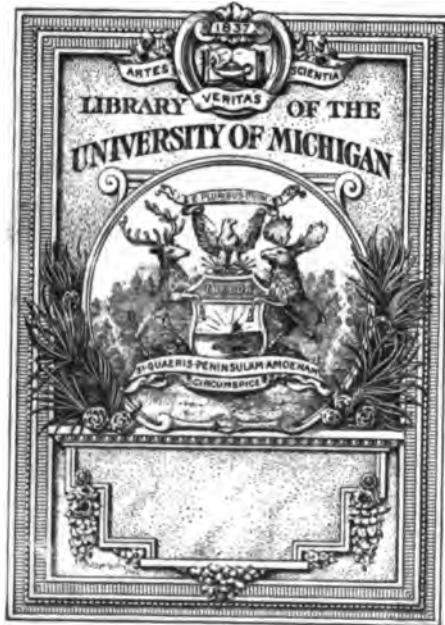

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## PREFACE.

For the first time in three years this, the eighth annual edition of the Copper Handbook is introduced to its readers without an apology. The volume is somewhat late in appearance, but the delay has been unavoidable, and it is believed that the present volume will be found as closely up to date, in its treatment of the various mines, as any of its predecessors, notwithstanding the vast increase in the number of titles and amount of matter contained in the long chapter devoted to detailed mine descriptions. The work of completely revising all old descriptions, and adding the many new titles appearing in this volume for the first time, has been very arduous, requiring fifteen months of steady labor. Owing to the length of time necessarily consumed in this work, it is evident that the earlier mine descriptions would be woefully in arrears, as to date of matter given, except for the plan, followed of necessity, of making three revisions of the matter, by which all descriptions have been brought as closely to the end of 1908 as circumstances rendered possible.

In the first volume of the Copper Handbook, which treated only of Lake Superior mines, there were 256 titles, many of these being for idle mines and defunct companies. In Volume III, the first to treat of the copper mines of the world, there were 2,233 titles of mines and mining companies. In Volume VI, the chapter on mines, which stood unchanged in Volume VII, through loss of half of 1907 by fire, sickness and unavoidable absence of the author, contained 4,626 titles, while in the present volume there are 6,767 titles in the chapter on mines.

The Copper Handbook has grown in size with each successive edition, reaching, in the preceding volume, the practicable limit of bulk, if it were to be bound in a single volume, owing to the weight limit of two kilograms set upon single volumes admitted to transportation in the mails of the countries comprising the International Postal Union. Any work of reference is more convenient if bound in one volume than in two, hence careful thought was given to the matter of bringing the present issue within the permissible weight limit. This desired result has been accomplished by a variety of expedients, and, but for this explanation, it is unlikely that the general reader would note the various changes, each slight in itself, that have kept the book down to its present bulk. The type-forms have been made slightly larger on each page, being both a trifle higher and a trifle wider, though not enlarged sufficiently to prevent ample margins. The leading also has been reduced by ten per cent, though the type-face is briefer, as in all past editions, and, by this combination of economies, an average of about one-third more matter is given per page than previously, without unduly crowding the page with printed matter, or reducing the type in size. Had the long chapter on mines been set in the same manner as in

the preceding issue, the present volume would have consisted of more than 1,900 pages, instead of the 1,500 given. Bulk and weight also have been saved by the substitution of a thinner paper, of better grade than formerly employed.

The hearty thanks of the author are due to a majority of the leading copper mining companies of the world, for returns furnished for this work. With few exceptions the leading mines have proven their friendship for the Copper Handbook by furnishing, in considerable detail, the matter asked, frequently at some little expense of time on the part of busy men of affairs, whose time is valuable.

As in preceding editions, the author wishes expressly to disclaim all pretensions to infallibility, and to request corrections and criticisms from all sources. The invitation has been accepted heretofore, in numerous instances, and the book has benefited greatly from the suggestions, criticisms and corrections furnished by its readers. Investors in copper shares are especially requested to remember that this work is not infallible, and that every intending investor should use reasonable discretion in making his investments.

Owing to the magnificent support that has been given the Copper Handbook in the past, it has, for some years, enjoyed the largest circulation of any mining annual printed in any language, and it is the aim of the author to maintain the standards heretofore set, and better them, as time and experience render it "possible to effect" improvements.

HORACE J. STEVENS.

HOUGHTON, MICHIGAN, U. S. A., DEC. 31, 1908.

## CHAPTER I.

### THE HISTORY OF COPPER.

The mists of antiquity shroud the discovery of copper, but the metal and its alloy, bronze, were known at a period so remote as to antedate the beginnings of history. Possibly gold, which occurs native, was discovered before copper, but the uses of gold in prehistoric times seem to have been purely ornamental, while those of copper, and its alloy, bronze, were utilitarian as well as ornamental, from their discovery.

The Neolithic, or polished stone age, was succeeded by the age of bronze, but the process of substituting weapons and implements of bronze for those of polished stone was not instantaneous, and doubtless was spread over hundreds of years, as polished stone and bronze instruments, obviously of about the same age, have been found in juxtaposition, at many points, and it should be borne in mind that while the comparatively civilized peoples of Asia Minor and the Nile valley were far advanced in the bronze age, the Greeks doubtless were in the Neolithic period, while the barbarians to the north had not advanced beyond the Paleolithic age. Similarly, the natives of the two Americas were in the bronze and stone ages, when discovered by Columbus, in the Fifteenth Century, at a period when the civilized peoples of Europe had left the bronze age two thousand years behind.

Copper is one of the six metals mentioned in the Old Testament, and the bible names Tubal Cain as a cunning artificer in brass and iron. A legendary account of the discovery of iron on Mount Ida has been handed down, but it is certain that copper was known to the ancients for a long time, probably some thousands of years, before the discovery and utilization of iron, and it is known that copper mines were worked on Mount Ida, in Asia Minor, centuries before the alleged discovery of iron.

According to the latest historical investigations, copper was known long before the time of Menes, the founder of the First Dynasty, who was the first king of Upper and Lower Egypt, and who reigned at a period possibly as early as 5500 R. C. Copper was known, at least as a rarity, by one of the aboriginal races of Egypt, probably as early as 7000 B. C. and possibly at a date considerably more remote. At a much later period, yet antecedent to the First Dynasty, the use of copper became more

widely disseminated, and the metal was in quite general use in Egypt before the time of Menes. It is believed that the Egyptians used unalloyed copper for centuries before discovering the use of tin, the alloy of copper and tin producing bronze that is much harder than pure copper, consequently much better suited for weapons and implements of all sorts. The ancient Egyptians are believed to have used arsenic for hardening the copper when used alone.

Bronze was in very early use in Egypt, for the making of weapons and tools, and the use of bronze is mentioned in inscriptions antedating the great pyramids. Rawlinson says "A metallurgy of no small merit must have formed and originated the implements whereby materials, such as those used by the Egyptian sculptors, were worked with ease and freedom." Some of the blue and green pigments used by the earliest Egyptian painters contained copper.

King Sneferu, the first Pharaoh of the Fourth Dynasty, ascended the Egyptian throne at a date variously estimated from 2000 B. C. to 5000 B. C., succeeding the king who carved the great sphinx, and being in turn the immediate predecessor of Cheops, builder of the great pyramid at Gizeh. King Sneferu, according to the inscriptions of his reign, conquered the Sinai Peninsula for its stores of mineral, hence the inference that its copper mines must have been opened at an even earlier date. The copper mines of Mount Sinai, which are the oldest now known to man, are said to have been worked as recently as 1300 B. C. Ancient workings are still visible, with slags from the furnaces and occasional remains of tools. The oldest piece of bronze, of anything like an established date, is a knob from the scepter of Pepi I, a Pharaoh of the Sixth Dynasty, who flourished circa 3000 B. C. This remnant of the regal might of an early day now reposes in the British museum. The Posino collection, in the Louvre, at Paris, shows two small statuary, believed by Perrot to date from the close of the Old Empire, or the beginning of the Middle Empire, circa 2800 B. C. These are light, hollow and cast in single pieces, showing workmanship of a high order. A hollow cast statue of Rameses II, of excellent workmanship, dates from 1300 B. C. As early as the New Empire, more than 2000 B. C., copper seems to have been the monetary basis of Egypt, as accounts were recorded in uten of copper, the uten being a spiral of metal, of about 91 grams weight. In the time of the New Empire, bronze was in use for armor and weapons, artisans' tools, occasional farm implements, household utensils, nails, locks, butts, hardware for chariots and boats, and for jewelry and general decorative purposes. In the old hieroglyphs, several varieties of bronze are referred to, according to their composition. The most common variety of bronze in use in ancient Egypt, as determined by modern assays, contained, respectively, 85 per cent copper and 15 per cent tin, and 88 per cent copper and 12 per cent tin, while bronze used for weapons and cutting tools contained 94 per cent copper, 5.9 per cent tin and 0.1 per cent iron, the iron probably having been included as an impurity, and not through design.

M. de Sarazé judges that copper was produced in Babylonia about 4000 B. C. Gudea, patesi or high priest of Lagash, who became a dependent king under Dungi II of Babylon, who reigned approximately 2000 B. C., at Ur—"Ur of the Chaldees"—collected, as material for temples and statues,

copper from northern Arabia, and the metal and its alloy, bronze, were in quite general use throughout Babylonia at least as early as 2000 B. C.

Apparently copper was known to the Greeks from the earliest historical times. The ancient Greek historians credited the discovery of copper to Cadmus, who also is said to have invented the alphabet, both of which credits are open to serious doubt, as Cadmus really adapted the Phoenician alphabet to Greek use and doubtless brought the first knowledge of copper smelting to the Greeks from the same source. Apparently copper was first found by the Greeks near Chalkos, on the Island of Eubea, hence took the name of chalcos, and was so termed by Homer, Hesiod and other early Greek authors. Pliny states that the method of reducing copper from its ores was discovered on the Island of Cyprus, whence the metal was termed by the Romans, first aes cyprium, and later, cuprum. This discovery unquestionably was merely an adaptation of the methods known to the Egyptians several thousand years earlier. The name of the metal in most of the modern European languages, as the English copper, Swedish koppar, Norwegian kobber, German kupfer, Spanish and Portuguese cobre, and French cuivre, are corruptions of the Latin cuprum. In the ancient mythologies, copper was consecrated to Hathor by the Egyptians, to Aphrodite by the Greeks and to her counterpart, Venus, by the Romans.

It is probable that the first copper mines of Cyprus were opened by the Phoenicians and that knowledge of the metallurgy of the metal was derived from them by the Greeks. The Phoenicians also brought copper from Asia Minor, and later from Iberia, beyond the Pillars of Hercules, and some of the ancient Carthaginian mines, in the Provinces of Huelva in Spain, and Alemtejo in Portugal, were reopened during the latter half of the Nineteenth Century, and remain large producers. It is certain that the Phoenicians brought tin, and possibly copper also, from Cornwall, at a period as remote, in all likelihood, as 500 to 700 B. C., which would indicate that the native Britons were possessed of a rudimentary metallurgy of considerable importance, at a period long antecedent to the conquest of Caesar. The hegemony of the ancient Phoenician world was wrested from the cities of Tyre and Sidon by Carthage, an early Phoenician colony which became far greater than its parent, and Carthage, in turn, lost the supremacy of the Mediterranean to the Romans.

The knowledge of copper possessed by the Romans doubtless was inherited from the Greeks, all of the historical evidences pointing to this conclusion, but it is certain that copper mines in Tuscany were worked by the Etruscans previous to the foundation of Rome. The copper mines of Piedmont, Liguria and Tuscany were worked extensively in Roman times, but the Iberian mines, wrested from the Carthaginians, formed the chief source of the copper supply of the Roman Empire. Spain has been furnishing copper to the world for nearly or quite three thousand years, and remains one of the principal sources of the world's supply. The Rio Tinto mine has been worked, off and on, for about three millenniums, yet remains one of the greatest copper producers of the globe. Prof. Vogt estimates that not less than twenty to thirty millions of metric tons of ore were mined during the eras of Phoenician, Carthaginian and Roman domination, from this mine alone.

During the dark period of the middle ages, mining, while not a lost

art, certainly was not followed as systematically and successfully as during the more prosperous and enlightened era of the Roman Empire. The world's supply of gold and silver decreased from century to century, owing to the losses from attrition and misplacement not being made good by new production. Iron, being subject to rust, was mined and smelted as required, though the production was surprisingly small, and it is probable that the United States Steel Corporation now turns out, in every working day, more iron than was produced in all Europe in a full year, during the period of greatest darkness of the mediæval era. The supply of copper during the middle ages must have been very small, but statistics are so fragmentary that they scarce afford basis for estimates.

The production of copper from Iberian mines was spasmodic, but more or less of the metal was produced in every century, though the industry suffered a severe check when Spain was lost by the Western Roman Empire to the Visigoths, who, in turn, were succeeded by the Moors, that warlike race that held possession of southern Spain and Portugal, until driven out, late in the Fifteenth Century, by Ferdinand and Isabella. The San Domingos mines of Portugal, which were opened, certainly as early as Roman times, and, in all likelihood, by the Carthaginians, or their predecessors, the Phœnicians, were worked spasmodically during the middle ages, and were reopened in 1859, under modern methods.

The mines of Italy and Austria were small producers of copper in mediæval times, the most important Austrian mine being the Gratslitz, in Bohemia, which probably was the largest European producer about the Fourteenth or Fifteenth Century, but which was abandoned in the Eighteenth Century, though reopened, on a small scale, late in the Nineteenth. There are evidences that copper mines were worked in Bulgaria, and probably in Servia also, during the Roman era, and the Servian mines were small producers during the middle ages. There also was a little copper mining in Hungary during mediæval times, and possibly in Roumania also. Copper has been mined and smelted on a small scale in both European and Asiatic Turkey for some centuries.

In Germany, the Rammelsberg mines, in the Ober Harz, were opened circa A. D. 933, and have been producers for nearly a thousand years. The Mansfeld mines of the Ober Harz, opened A. D. 1199, have been fairly steady producers for 700 years, though with occasional hiatuses in output, due mainly to some of the numerous wars that were at once the business and the recreation of the middle ages. These mines made about 1500 long tons of fine copper in the days of Martin Luther, and were producers to about the same extent in 1860, but since have been developed into very large and successful mines, by the use of modern methods and equipment.

Stora Kopparberg, at Falun, Sweden, was opened A. D. 1228, and is claimed to have given to the world, to the end of the Nineteenth Century, not less than 1,200,000 tons of fine copper, remaining a small producer.

One of the earliest English mines was at Newlands, near Keswick, in Cumberland. This property was worked as early as A. D. 1250, and was working as late as A. D. 1470. The Ecton Hill mines, in Staffordshire, were among the earliest English copper mines after Newlands, and the tin mines of Cornwall were small producers of copper also, at least as early as the time of Queen Elizabeth, and probably for a century or

two earlier, though copper production on a large scale began with the Eighteenth Century. The copper mines of Anglesea, in Wales, were producers in Roman times, and were reopened in the Eighteenth Century, but have been idle since about the middle of the Nineteenth Century. In Ireland, mines worked during the Eighteenth Century and up to their closing in 1880, have been reopened, in an exploratory way, during the early years of the Twentieth Century. As early as A. D. 1586, copper ore was shipped to Anglesea for reduction, and in A. D. 1765 there were several smelters treating copper ore near Bristol. The Welsh smelting industry at Swansea seems to date from the Sixteenth Century. The first copper pennies of England were coined A. D. 1717.

At the beginning of the Eighteenth Century Great Britain was making at least three-quarters of the world's copper. The Cornish mines produced 4,923 tons of refined copper in 1799, and the Welsh mines of Anglesea made nearly 2,800 tons in the same year. The great Mansfeld mine, in Germany, made only 372 tons in that year, and only estimates are obtainable for the products of other countries. Spain's output was insignificant, and the United States made but a few tons. Russia and Japan probably ranked next in importance after England as producers, and Austria, Norway, Sweden, Italy and several other nations made small contributions to the world's copper stock. Australia, South Africa and Canada were then unknown as sources of supply. It is a notable fact that one hundred years ago, the mines of the United States, Spain, Chile, Mexico, Canada, South Africa, Australia and Tasmania, which now make about 90 per cent. of the world's copper, were either totally undeveloped, or else producers of but a few tons each, while Great Britain, which made almost 7,000 tons of copper in 1799, produced but 550 tons in 1899.

At the beginning of the Eighteenth Century the English mines, in Cornwall, were making much the largest part of the world's copper output, and even at that date were of such considerable depth, and with such extensive underground openings, that the problem of disposing of the water was of vital importance. Many good mines were allowed to remain idle, solely because the expense of keeping them free of water was greater than the profits of operation. The first steam engine was built for a Cornish mine, the Wheal Por, by a Captain Savery, very early in the Eighteenth Century. It was but a partial success, and the plan was improved on by Newcomen, who erected a pumping engine at the Wheal Fortune mine, Cornwall, in 1720. The Newcomen steam engine was a crude and wasteful device, according to the standards of the present day, but it was much more effective than hand and horse power, or a water wheel, and was used in many of the larger Cornish mines for fifty years or more, until the genius of Watt brought forth the modern steam engine. It should be said, however, for Savery and Newcomen, that crude as were their engines, the pumping plan followed by them was essentially sound, and the Cornish pump, first made by Savery two hundred years ago, and improved a little later by Newcomen, remains the basic model for the Cornish mine pumps, scattered over the habitable world, wherever there are mines.

The first Watt engine, erected at Chacewater, Cornwall, in 1777, proved a great success, and came none too soon, as the larger mines, deepened by reason of the aid given from Newcomen's pumps, were at a depth

where the first crude engines no longer could give satisfactory results.

Although steam power was first applied to copper mining two centuries ago, it was used only for handling water until after the beginning of the Nineteenth Century. The first application of steam power to other mining uses was in the first or second decade of the Nineteenth Century, when a hoisting drum was first actuated by steam.

For the first half of the Nineteenth Century, Great Britain maintained its position at the head of the world's copper producers, but for British copper mines the latter half of the century was a period of ever increasing depression, relieved by only occasional years of prosperity. The invention of the Watt engine and its application to pumping machinery enabled the mine operators of Cornwall and Anglesea to penetrate to depths theretofore undreamed of. In 1790 the Dolcoath mine, in Cornwall, was 600 feet deep; in 1816 it was down 1,368 feet, and in 1830 the Tresavean mine, also of Cornwall, reached the great depth of 1,920 feet. As the mines increased in depth rapidly, various improvements became necessary. The old method of raising ore in baskets, carried up ladders on the backs of men and women, was replaced by whims, operated first by hand, then by horse power, later by water-wheels, and eventually by steam, the ropes that hoisted ore in wicker baskets being coiled around these whims. A little later the hempen ropes were replaced by wire cables, and the baskets gave way to iron skips and cages. In 1842 the first man-engine was built, for taking miners to and from their work in the deep shafts. Mine surveying was introduced, and machinery employed in the mills, where hand-work had been the rule for centuries. The Anglesea mines enjoyed great prosperity for the first quarter of the century, but gave unmistakable signs of exhaustion a few years later, and in the fourth decade ceased to be important factors in the world's copper industry. The smelters of Wales had attained such growth, however, that Swansea still remains the seat of one of the greatest and most diversified smelting industries of the world.

Apparently the first copper mining was done in Japan circa A. D. 700, but the industry did not become important until about A. D. 1600, and in the Seventeenth Century, more or less copper was exported to Europe, through the medium of the trading ships of the Dutch, who enjoyed a monopoly of Japanese trade, until the excesses of the traders and missionaries lead to the closing of the ports in Japan to all foreign trade, after which Japan was a sealed book to the balance of the world, until reopened by Commodore Perry, in 1854. In 1830 the production of Japan was about 4,000 long tons, and in 1874 was only 3,360 long tons, of which four mines furnished about half, and nearly 200 mines the other half, giving an average annual production of about 10 tons only for the smaller mines. Modern Japan may be said to date from 1869, when the Tokugawa government was deposed, and the Shogun was compelled to surrender his usurped power to the Mikado, the rightful ruler. The readjustment of internal political affairs occupied the attention of the Japanese, almost to the exclusion of other matters, for some years, but about 1880 the task of readjusting the ancient economy of the empire to modern environments was begun in earnest, and from that year, in which the first modern mining and smelting machinery was introduced to Japan,

mines, may be said to date the beginning of the present copper industry of Nippon—an industry that has made gigantic strides, and which is well equipped and conducted upon as modern methods as can be found in any country on the globe. Since 1890 the progress has been steady and rapid.

As early as the Sixteenth Century, copper was discovered in Cuba, Mexico, and several of the South American countries, but the Spanish conquistadors were more anxious for the gold of the Peruvian Incas and the silver from Potosí and Guanajuato, than for the baser metals, hence the production of copper in Spanish America remained trivial, being merely sufficient for local needs, until about the middle of the Nineteenth Century. In Chile a little copper mining was done during the Eighteenth Century, but the inception of the great copper mining industry of that country may be said to date from about 1840, when the systematic development of the great copper measures of Chile was undertaken along modern lines.

Argentina first became a producer of copper about 1856, but never has become a large factor in the industry, though possessing copper fields of promise, which doubtless will be heard from in the future.

In Mexico, copper was mined and smelted in a crude way, and to a very limited extent, by the Aztecs. A little metal was produced under Spanish domination, but the Mexican copper mining industry did not become important until about 1880, the profits of silver mining having blinded the miners to the possibilities of great returns existing in the baser metals. Mexico now ranks second only to the United States among the copper producing fields of the world, and its present large production is but an earnest of future possibilities, practically unlimited in extent.

In Cuba, copper mining was begun in the Sierra Madre Mountains, near Santiago, during the Sixteenth Century. These mines were reopened early in the Nineteenth Century, and secured a considerable tonnage between 1817 and 1868, the principal production being after 1834, when the various mines were bought and consolidated by an English company, annual production averaging about \$1,000,000 in value, until the rebellion of 1868, when the plant was burned by insurgents.

In the United States, copper was discovered in Massachusetts as early as 1632, and in 1709 a company was incorporated in Connecticut, for the purpose of working copper ores. The copper deposits of New Jersey were exploited as early as 1719, but the copper mines of Vermont, dating from the Eighteenth Century also, remained the principal source of American production until the opening of the Lake Superior mines in 1844. A promising copper industry was begun, circa 1850, in Tennessee, but was destroyed by the American Civil War, and was not rejuvenated until nearly forty years later.

Really important copper mining in the United States dates from 1844, when the first production, a few tons of black copper ore, probably chalcocite, was taken from a fissure vein near Copper Harbor, Keweenaw County, Michigan. The beginnings of the Lake Superior industry were crude, but the growth was fairly steady from the start, and within two decades the Lake Superior mines became the most important producers of the United States, and second only to the mines of Chile, which were passed in the ninth decennium of the Nineteenth Century. The existence

of the rich stores of native copper in the Lake Superior district was known to the aborigines, and these mines had been worked by some prehistoric people that left considerable traces of their extensive operations. In 1882 Montana, now the largest copper producing district of the world, made its first production of the metal, and the beginnings of the great copper industry of Arizona were a decade earlier.

In British North America, Newfoundland opened its first mines of importance in 1865. A little mining of cupriferous pyrites was done shortly afterward in the Province of Quebec. Copper mining in the Province of Ontario begun with the opening of the Bruce Mines in 1846, but really important copper production dates only from the exploitation of the great nickel-copper deposits of Sudbury about 1886, and the large and promising copper industry of British Columbia had its inception in the last decade of the Nineteenth Century.

In Northern Africa the mining of copper ore, along the shores of the Mediterranean, dates from prehistoric times, but in Southern Africa the industry had its inception in the opening of the O'okiep mine, in Little Namaqualand, Cape Colony, in 1852, though copper had been discovered late in the Seventeenth Century by the Dutch settlers, and some fugitive efforts made in the direction of mining. The exploitation of the copper resources of Central Africa, still at an early stage of development, dates from the closing years of the Nineteenth Century and the same remarks hold true regarding the copper measures and mines of German Southwest Africa. The first recorded production of Australian mines was in 1844, and it is probable that in the future Australia will become a much more important factor in the copper market than has been the case in the past.

In Asia, copper mining and reduction, along very crude lines, have existed for unknown centuries, in China, India and Persia. The copper measures of China are of much promise, and this ancient empire, now awakening to the light of Twentieth Century civilization, doubtless will become a large producer of this necessary metal during the present generation.

The copper industry of the Twentieth Century may be said to date practically only from about the middle of the Nineteenth Century. Of the leading copper producing fields of the world, Lake Superior, Montana, Arizona and Utah, in the United States, were unknown in 1840. Mexico, which now holds second place as a producer, made no copper worth mentioning previous to the last quarter of the Nineteenth Century. The present great copper industry of Canada is so recent that all of its principal developments have occurred since 1880. The copper production of Australasia and South Africa date from about the middle of the Nineteenth Century, and production along modern lines, and on an important scale, in Chile, also began about 1850. Of the really important copper producing fields of the world, only Spain, Germany and Japan have a history that is not covered by the span of life of a man of three score and ten.

The beneficial influence of the copper industry upon the mining and metallurgical methods of the world has been most marked, and the copper industry has been well to the fore in the introduction of improvements. Gunpowder for blasting was first used at Ffleberg, in 1810, and was

introduced at the Wheal Vor mine, in Cornwall about 1670. Steam for pumping and later for general use, was first introduced to mining at the copper properties of Cornwall. Wire rope and iron buckets for hoisting were first used in copper mining, and high explosives and power-drills for breaking rock were first used in the Lake Superior mines. The history of the metallurgy of copper for the past quarter century is almost coincident with the history of metallurgy as a whole for the same period.

Various attempts have been made to corner the production of copper since it became a metal of prime importance. The first attempt along these lines was made by the Associated Smelters of Swansea, which perhaps was the original copper trust. The Associated Smelters, which flourished from 1840 to 1860, was most arbitrary in its operations, buying as cheaply and selling as dearly as possible, and zealously guarding its smelting processes. The short-sighted policy of this association, in screwing prices of ore to the lowest possible figure, while advancing the price of the finished metal, aggravated by its arbitrary charges for draftage and moisture, and by the use of unfair assay methods, led to the establishment of independent smelters at or near the mines, in most of the principal copper producing districts, and effectually shattered the power of Swansea as the arbiter of the copper industry.

The second attempt at a copper corner was made by a group of French financiers, under the leadership of M. Secretan. The basis of this corner was the Société des Metaux, of Paris, formed 1877, which in February, 1887, became one of sixteen underwriters that organized the Secretan Syndicate, with a nominal capitalization of \$13,587,000, eventually reduced to \$10,718,500. Of this capitalization, the Société des Metaux held \$2,910,000, and M. Secretan, personally, \$2,328,000. The Comptoir d'Escompte, which then was second only to the Bank of France, among French financial institutions, became involved, first through guaranteeing purchases from the mines, and later through loaning funds to the Syndicate, originally upon the security of the metal itself, and latterly upon endorsements. The first step of the Secretan Syndicate was to secure control of the production of the Anaconda mine, in December, 1887, the Anaconda being, at that time, the largest copper producer of the world. This was followed shortly by the making of contracts with the Calumet & Hecla, Rio Tinto and other large mines producing at least 75 per cent., and probably as much as 85 per cent., of the copper output of the globe. At the end of August, 1888, the Syndicate had borrowed \$24,825,000, and at the end of December, 1888, the Comptoir d'Escompte had loaned to the Syndicate the enormous sum of \$33,368,000, of which only \$16,878,000 was fully secured. The price of copper was advanced, speedily, by the Syndicate, from 11 cents to 17½ cents per pound, this advance taking place within one month. Consumers, understanding the situation fully, reduced their demands to the lowest possible figure, and an immense amount of old copper was broken up and remelted, the available supply of old copper proving vastly greater than had been anticipated by anyone, and forming perhaps the largest single factor in causing the downfall of the Secretan Syndicate.

Very early in 1889 the credit of the Syndicate was exhausted, and the Comptoir d'Escompte was so seriously involved that the manager

committed suicide, and the bank was saved with great difficulty, while the Secretan Syndicate was demolished utterly. Notice of the failure of the syndicate was followed by an immediate drop, from the market price of £100 per long ton of copper, and, in a single day, in the spring of 1889, copper dropped £70 to £35 per long ton. The bankers, who had loaned immense sums upon copper stored in bonded warehouses, decided to sacrifice their holdings, at any price that would enable them to realize upon their collateral, but, through the action of the Calumet & Hecla, backed by the Anaconda, which threatened to put the price of copper to five cents per pound, unless the bankers would spread the marketing of the surplus over a period of years, utter paralysis of the copper trade was averted. The accumulation of copper made by the Secretan Syndicate, in a period of about eighteen months, has been estimated variously, but may be set down safely at about 175,000 long tons. A period of four years was required to work off this accumulated surplus, which was marketed without serious disturbance to the trade, though entailing six years of low prices for the metal.

The third attempt at a copper corner was made in February, 1899, by the organization of the Amalgamated Copper Company, avowedly formed with the intention of controlling, first the American, and, later the world's copper trade. This corporation was organized with a controlling share interest in the Anaconda, and several other smaller mines of Butte, to which, two years later, was added the Boston & Montana mine. The Amalgamated Copper Co., operating through its sales agency, the United Metals Selling Co., maintained the price of copper at 17 cents per pound until October, 1901, when it was seen that a break in prices was inevitable, and at which time nearly 200,000,000 pounds of copper had been accumulated, this being owned mainly by the Amalgamated Copper Co., and by its subsidiary and affiliated producers. A panic in the copper market was precipitated by the action of the United Metals Selling Co., in making repeated cuts in the price of the metal, at regular intervals. The Amalgamated was credited, popularly, with the intention of cutting the price of the metal squarely in two, to 8½ cents per pound. This price was not reached, however, for the reason that several of the large independent producers, led by Phelps, Dodge & Co., aided by several of the largest American consuming interests, stepped in and bought up all of the surplus copper remaining in the market, at prices around 12 cents to 13 cents per pound.

Early in 1907 an effort was made, by strong interests, to form a combination to include the leading American producers, with a view to maintaining prices through regulation of marketing, and by restricting production if necessary, but this effort was frustrated by the stand taken by several leading independent producers of the United States.

Further and more detailed particulars regarding the history of mining and metallurgical developments will be found in the chapters devoted to metallurgy and to the copper deposits of the world, in addition to which detailed references to the history of individual mines will be found in the descriptions of many of the more important copper properties, contained in the long chapter devoted to copper mines.

## CHAPTER II.

### THE GEOLOGY OF COPPER.

Merely an outline of geological features of interest pertaining to copper is attempted in this chapter. The subject is so great that many books of value have been written upon the matter by different authorities. From its very nature, geology is largely an empirical science, but the Twentieth Century geologist is a vastly better-fitted worker, in his chosen field, than his predecessor of even the preceding generation. The geological work of the Nineteenth Century, until well toward its close, was largely of a synthetical nature, but the new school of geology teaches, and with wisdom, that analysis must precede synthesis. As a consequence of this new spirit, great strides have been made in geological knowledge, and in the special field of copper, much work of a brilliant and highly valuable nature has been done during the few years of the present century. The work of Weed, Winchell, Kemp, Lindgren and other scientists of solid attainments and indefatigable industry has added greatly to our sum of knowledge of the geology of copper. The geologist, who was regarded, fifty years ago, by practical men, as belonging to much the same class of pseudo-scientists as the alchemist, has made for himself, through sound work, a safe place in the ranks of the technical men whose labors are of practical, as well as of theoretical value, to the world.

There is much diversity of opinion, on various important points, among the leading geologists of the present time, but out of this turmoil of argument and confusion, is arising a newer and a sounder knowledge of geology, not only in theory, but in its vital bearings upon the industry and civilization of the world, so fundamentally dependent upon an assured supply, at reasonable cost, of the important metals and minerals.

Rocks may be divided into three classes, these being igneous, sedimentary and metamorphic. The igneous rocks, fused in the bowels of the earth, and ejected by volcanic action, or oozing forth as magma from cracks in the earth's crust, may be divided into granitic, porphyritic, vitreous and tufaceous forms, this latter division including the tufts ejected as scoriaeous material, by volcanic action. The sedimentary rocks were deposited by the action of water, usually on the beds of ancient seas. The detrital material so deposited formed conglomerate, shale, sandstone and limestone strata, and, in the case of the three forms first named, the material for sedimentary beds was obtained necessarily, mainly from the breaking down of the older igneous rocks. Strata of igneous and sedimentary rocks frequently alternate in the older geological groups. The third, or metamorphic class of rock forms, consists of altered rocks of both the igneous and sedimentary forms, in which the phenomena of crystallization and replacement have been brought about since their formation.

by the action of intrusive deposits of molten magma, and by the effects of percolating waters, whether meteoric or volcanic.

The ores of copper are described in detail in the chapter on chemistry and mineralogy, but some brief reference thereto is necessary in an outline of the geology of the metal. The principal copper ores of commercial importance may be divided into seven classes; as follows: Native copper, existing alone, or practically so, in the Lake Superior district, Bolivia and elsewhere, and occurring in the oxidized zone of mines of copper ore in almost every mineral field; oxide ores, including cuprite and melaconite; carbonate ores, including malachite and azurite; sulphide ores, of which chalcocite, bornite and chalcopyrite are the more important; chalcocite, or sulphate of copper, occurring as an alteration product in many rich sulphide mines, and being the source of the copper secured by precipitation from cupiferous mine-waters; enargite, among the arsenides, and atacamite among the chlorides. In importance, the sulphide group is overwhelmingly preponderant, about three-fourths of the world's copper supply coming from ores of this class. Contrary to the opinion formerly held, chalcocite is a far more important source of copper supply than chalcopyrite, and bornite probably is but slightly behind chalcopyrite, as a source of copper supply from the sulphide ores. It is probable that chalcocite, which is the most important ore of copper, produces nearly one-half of the world's supply of the metal.

The copper ores are very showy, giving nearly every color of the spectrum, hence attract attention more readily than most ores of other metals, but nature has so deposited many of our most important stores of copper, as hereinafter described, that the outcrops first visible to the discoverer are merely rusty stains of hematite and limonite, both ores of iron, with colors ranging from yellow through brown to red, these outcrops occasionally carrying small quantities of green and blue copper carbonates.

The industrial metals known to man have varying affinities, this referring not only to their valencies, as determined by their position among the elements, but also referring to their preference for combining with other elements, and furthermore to their choice of neighbors, this latter depending, necessarily, largely upon the material available. It is found, however, in geological and mineralogical research, that certain groups of metals may be looked for in juxtaposition, under given circumstances. Gold, the king of metals, and platinum, scarcely the inferior of gold, hold themselves aloof from the common herd, and occur but rarely as ores. Silver is more democratic, and the common workaday metals are found commingled in a spirit of fellowship, but, as in the social fabric of men, there are certain family relations, and cleavage lines by which classes are formed.

Most copper deposits carry both gold and silver, usually in small quantities, but frequently in sufficient amounts to add materially to the gross values recovered, especially since the very general utilization of the electrolytic process for copper refining has made it possible to recover the precious metal values, practically without cost, while eliminating the impurities remaining in the blister copper turned out by the smelters. Lead and zinc are found very commonly in connection with copper ores,

the three sulphide ores of copper, lead and zinc, being closely affiliated, and iron, while rarely considered a commercial product of copper-ores, is found in the great majority of copper mines, first as the iron hat, marking the outcrop of the vein, and in the lower workings of the mines, chemically united with copper and sulphur, as chalcopyrite, or, as is frequently the case, intimately, but mechanically, associated as chalcocite and pyrite, the sulphide ores respectively of copper and iron. Arsenic and bismuth also are common associates of copper, these being deleterious elements. Zinc also, mechanically mixed with many copper sulphide ores, is a damage, and its presence has prevented the successful development of many otherwise valuable copper mines. Only within the past few years has it become possible to mechanically remove zinc from sulphide copper ores, previous to smelting.

The more common metals, and frequently the rarer ones, are found as component parts of many ordinary igneous rocks, though commonly in such small quantities that these rocks cannot be considered as ores of even the lowest grade. There are notable exceptions to this rule, as in the case of the monzonite ore bodies of Bingham, Morenci and Ely, and it is probable that in the future other sources of copper supply, of the first magnitude, will be found in igneous rocks, in which the original supriferous contents have been enriched, by local action. The enrichment of the monzonite ore bodies referred to, seems to have been due to the shattering of the solidified upper portions of the cooled magma, containing originally a small quantity of magmatic copper concretions, followed by the precipitation of additional copper, in the form of chalcopyrite, from the heavily mineralized magmatic vapors rising into the shattered zone from the still molten mass below. This process may have been aided by later enrichment from percolating waters, which would tend, however, as a rule, to extract the mineral values disseminated throughout the rock-mass, and segregate these values in fissures in the igneous rocks, or along the line of contact with adjacent sedimentary or metamorphic rocks.

In the light of present geological knowledge, it seems probable that the original source of most of the present workable copper deposits was in chalcopyrite disseminated sparingly, in minute particles, through the magma of igneous rocks. From these disseminated particles of chalcopyrite, most of our copper ore bodies have been formed, either by magmatic segregation, in which the greater part of the ore values was deposited, usually at the point of contact with adjacent rock forms, or by leaching therefrom. Nature is much the greatest chemist and metallurgist now doing business, and the work of her laboratories and forges, while exceedingly slow, is upon a vast scale, and never ceases. The sulphide ore values, contained originally in molten magma, have been reconcentrated, and redeposited, repeatedly in many cases, during the millions of years that have elapsed since the work was begun, consequently the miner finds ores existing in a great variety of forms, and giving evidences of complicated chemical reactions, as well as of long continued mechanical concentration.

In a complex magmatic intrusion, the edges, of the intrusive mass naturally cool first, through the radiation of heat to adjoining rocks, and, in addition, the less soluble minerals are the first to crystallize. Copper,

having a greater affinity for sulphur than is possessed by any other metal, is one of the first minerals to crystallize out of the molten magma, as chalcopyrite. These facts afford an explanation of the occurrence of magmatic ore bodies along the point of contact between igneous intrusives and the rocks so intruded. Many of the best workable bodies of copper ore are found at or near the contact between granitic intrusions and sedimentary or metamorphic strata adjoining, occurring either as contact deposits, or, frequently, in fissures traversing either or both the igneous mass and the adjoining strata.

Many important bodies of copper ore occur as contact metamorphic deposits, at or near the contact between intrusive rocks and stratified formations. While the exact genesis of these ore deposits varies according to circumstances, and frequently remains somewhat obscure, the main point of magmatic segregation seems sufficiently plain, and much corroborative evidence has been brought to light by recent investigations. These deposits may be separated roughly into two classes, the first being products of simple metamorphism, with slight changes in ore bodies previously laid down, while the more important, and probably more common class, is attended by contact metasomatism, due to reactions caused by vapors and magma emanating from the intrusive rocks. Where such ore bodies are deposited in limestone, which frequently is the case, further alterations and reactions of prime importance have followed the cooling of the igneous rock, in many instances, the limestone offering an exceptionally suitable reagent, in connection with percolating waters, for further chemical changes in the nature of the ores.

Rain, falling upon the surface of the earth, carries small quantities of oxygen and carbonic acid gas, both weak solvents of many minerals. The weakness of the solvents has been fortified by the immense quantity of rain so falling, and by the lapse of untold millions of years, during which the process of leaching has been continuous. When attacking primary sulphide ores, such as chalcopyrite or pyrite, the water carrying oxygen and carbon dioxide in solution, eventually sets free an atom of sulphur, which, combining with the water, forms a dilute sulphuric acid, very weak to be sure, but a much more powerful solvent than carbonic acid gas or oxygen, and the weak sulphuric acid solution reattacks the sulphide ores, gradually breaking them down, and taking them into solution, and they are redeposited, at suitable points, lower down, as enriched sulphides, carbonates and oxides, and occasionally as native copper. The synthesis of most of the important ores of copper has been fairly established by extended and successful laboratory reactions.

The important part played in ore deposits by water is now acknowledged by all geological authorities. In fact, it is a question if the importance of the work done by water in forming commercial ore bodies is not over-rated by some geologists. While the work of water in laying down ore bodies is generally acknowledged, there are considerable differences of opinion as to whether deposition has come mainly from waters of meteoric or of volcanic origin, and also whether the ore was deposited mainly from descending or ascending waters. There seem excellent grounds for believing that both descending and ascending waters have played very important parts in depositing mineral values. The rains that fall upon

the surface of the earth sink into the rocks to great depth, there being practically no rock formations that are impervious, though the degree of permeability varies greatly. For all practical purposes the rocks composing the earth's crust may be considered permeable by water to the depth where increased temperature vaporizes it. That percolating meteoric waters have been responsible for a considerable proportion of the ore bodies now in existence seems reasonably assured, but that the meteoric waters have been, in many cases, greatly assisted by terrestrial waters, ascending from great depth, strongly charged with metallic solutions, also seems a hypothesis fully warranted by known facts. The terrestrial ascending waters naturally would possess the advantage of heat, to a degree adding greatly to their natural solvent power, and the pressure existing at great depths also would add largely to the solvent power of such waters.

In addition to the primary force of magmatic segregation, and the secondary force of waters carrying minerals in solution, there are other genetic forces of lesser, but by no means negligible importance. That organic matter has played a considerable part in the precipitation of copper minerals is shown plainly in numerous instances. There also is a theory, now in rather general discredit, that metallic values have been precipitated by electro-chemical action, from sea-water. The water of the ocean contains a very small quantity of copper, probably less than one grain in one hundred cubic meters, but, in the aggregate, the seas hold an enormous amount of this metal. Apparently the sea was the source of the metal found in cupriferous shales at many points on the earth's surface, and there is corroborative evidence that the native copper found in the Keweenawan belt of Lake Superior may have been precipitated in metallic form by the action of sodium chloride, the ferrous condition of the small quantities of iron found associated with this native copper seeming to substantiate this view.

Another theory, once widely held, but now in general disfavor, is that the metals were deposited by electrical action. In all likelihood, electricity, which seems but another name for all energy, whether dynamic or static, was not devoid of power in the great work of concentrating mineral values from the original disseminated particles contained in rock magmas, to the point of sufficient richness to be available for the uses of man.

An evidence of the truth of the hypothesis that mineral values have been deposited from heated ascending waters is furnished at a number of points on the earth's surface by hot springs, that are now depositing copper in small quantities. Not the least interesting of these is a hot spring in Java that carries in solution copper iodide, which is concentrated and produced commercially on a small scale.

Clays possess the power, through adsorption, of extracting metals from wonderfully dilute solutions, and it has been ascertained that all clay-shales are more or less cupriferous, though usually valueless as ores. Copper is a peculiarly soluble metal, in most of its compounds, which are largely associated with iron sulphides, hence easily attacked by oxidizing waters. Carbonaceous and organic matters are powerful reagents, and lead to numerous reactions, in connection with the oxygen, carbon dioxide and dilute sulphuric acid found in underground waters.

Copper, nickel and cobalt are found frequently in basic gabbros, in many parts of the world. The Lake Superior traps are of this class, as a rule, and copper, in small amounts, is found as impregnations in dense dioritic rocks, and in unconformable adjacent sandstone of a later geological horizon, near the point of contact, where there are some evidences of metamorphism. The home of the Lake Superior copper, however, is in the metamorphic amygdaloidal traps and conglomerates, and in the sandstones of the upper Keweenawan series. Native copper is found frequently in greenstone, as in the amygdaloids of Lake Superior, in the Nicholai deposits of the Copper River district of Alaska, in the mafophrys of Newfoundland, in Amador and Calaveras counties, California, and at a number of other points.

Various classes of copper ore deposits are found, these including magmatic segregations, metamorphic contact deposits, fissure veins and deposits formed by percolating waters and mineralized vapors, replacements, sedimentary deposits, and impregnations in sandstones, tuffs, conglomerates and breccias. While these various classes of deposits are distinct, in theory, and usually distinguishable in practice, the lines between individual deposits are extremely difficult to draw in some cases. While some ore bodies are entirely covered by flows of later geological age, and while some of the contact deposits in stratified rocks, notably in limestone, show very small outcrops, as a rule there are strong surface indications of cupriferous values at depth. Occasionally the unaltered sulphide ores outcrop at surface, as in the case of deposits of disseminated chalcopyrite in the Algoma district of Ontario and elsewhere, and in the instance of the magnificent surface croppings of massive bornite, chalcocite and chalcopyrite, found in the Copper River district of Alaska, the latter probably being the richest outcrops ever discovered. As a rule, however, a copper-bearing fissure vein or contact deposit shows a gossan, or iron hat, this deriving its color of rusty yellow, brown or red, from iron in the form of hematite or limonite. The gossan may, and frequently does, show copper ore, usually as carbonates, either both malachite and azurite, or more commonly, the green carbonate alone, and occasionally there are other oxidized copper ores shown in the gossans, but, as a rule, these carry but small copper values, and rarely can be considered commercial ores of copper, though in numerous cases the gold contents are sufficient to warrant their working as gold mines. In fact, many mines have been opened for gold that really contained immensely greater values in copper, at depth, and there are frequent instances of gold mines turning into copper mines at depth, the most recent example of importance of this change in metallic values being afforded by the Mount Morgan mine, of Queensland, Australia, for many years one of the largest gold producers of the world, and now a copper mine of great value, at a depth of 1,000 feet or more.

Frequent reference is made to the silver mines of Butte turning into copper mines at depth, but this is somewhat misleading. The first mines at Butte were silver properties, and there seems good reason to believe that some of these may turn into copper mines at great depth, but, as a matter of fact, the silver mines were opened on an entirely different set of veins than those carrying the wonderful copper values for which

Butte is famed, and the discovery of the copper mines was due to cross-cutting, at depth, from the mines on the silver veins, as the copper veins contain practically no values for 500 to 1,000 feet depth from surface. Some of the greatest ore bodies at Butte have no gossans, and surface indications are most meagre, not being sufficient to justify the expense of exploring, in an unproven district.

Examples of silver-lead mines turning into copper properties at depth are fairly numerous in Utah, Mexico and elsewhere, probably the best examples being furnished by the mines of the Bingham district of Utah. At Leadville, Colorado, the zinc ores of the upper workings are being replaced by copper at depth.

In the majority of cases the outcrops of copper ore bodies are leached, and, in such cases, only infrequently give workable values in copper at surface, though, as before stated, there are numerous instances of gossans carrying workable gold values, causing the opening of gold mines that at depth have turned into copper mines.

As chalcopyrite, which may be considered the original form of copper ore, carries one atom of iron, and one of copper, held together by two atoms of sulphur, the breaking up of the granule of chalcopyrite not only releases copper, for redeposition in the form of an enriched sulphide, or as a silicate, carbonate or oxide ore, but also releases the atom of iron, which may be carried upward or downward, or left in place, and which usually appears as hematite, the sesquioxide of iron, or as limonite, the hydrated sesquioxide, disseminated through the outcrop of the vein. This is the gossan or iron hat, a welcome sign of probable copper values below, in nearly every copper mining district of the world. It is not, however, an invariable indication of workable values at depth, and there are numerous instances where fine gossans, of the most promising appearance, have proven deceptive as to values carried in the vein beneath. These gossans also have the bad habit of spreading beyond the limits of the walls of the vein below, through lateral surface filtration, and occasionally a wide gossan covers a narrow vein. At other points the original gossan has been removed by surface erosion, or by glacial action, but, as a rule, a good gossan means at least a fair chance of a good mine beneath.

The depth of gossan cappings varies greatly, according to local circumstances, occasionally being merely superficial, but sometimes extending to the water level. In the case of a typical cupriferous fissure vein with a typical gossan, the iron capping is succeeded by a leached zone, and where the leaching has been long continued and thorough, and erosion light, the mineral values have been removed, almost completely, from the leached zone, to be redeposited at greater depth. In other instances, the leaching has been less thorough, and copper values, usually small, remain in the leached area. The depth of the leached zone varies greatly, according to the circumstances following the first deposition of the ore, and occasionally the leached zone is of great depth, as at Butte; while elsewhere it is comparatively shallow, and sometimes is lacking entirely. The great depth of the leached zone in Butte, and the great depth and richness of the succeeding zone, afford evidence in support of the palpable hypothesis that, under average circumstances, the greater the depth of leaching, the greater the quantity of secondarily enriched ores to be found below.

The typical cupriferous fissure vein may be divided into five zones. The upper is the iron hat or gossan outcrop, succeeded by the leached zone. The third zone is that of oxidized ores, carrying rich oxides and carbonates, and occasional silicates and chlorides, followed immediately by the fourth zone, carrying enriched secondary sulphides, such as chalcocite and bornite, with occasional covellite. The limits between the zone of oxidized ores and that of enriched sulphides are not always clearly defined, and these two zones frequently are considered as one, under the name of the zone of secondary enrichment. It is, however, possible to draw a rough line of demarcation between the oxidized ores above and the enriched secondary sulphides below, in this so-called zone of secondary enrichment, in most cases. The source of the copper in the enriched zone is, of course, the values leached from the vein above, and here redeposited. The depth of the zone of secondary enrichment varies enormously, being dependent upon a considerable variety of factors, including the average percentage of copper in the original vein, the depth to which leaching has been carried, the amount of surface erosion, and the time that has been consumed. In some of the mines of Butte the zone of secondary enrichment is of tremendous depth, a strong vein of massive chalcocite having been found at a depth of 2,400 feet in one of the Anaconda mines.

In the fifth or final zone, the ore is chalcopyrite, sometimes massive, but more commonly disseminated, and usually associated with pyrite, or chalcocite in thin films, as coatings on grains of pyrite. In this zone, values gradually decrease with depth, until the vein pinches out, or, as is more commonly the case, carries lessening values that lead to the abandonment of the property as unpayable.

Bonanza ores in the zone of secondary enrichment sometimes hold to great depth, but, usually are comparatively shallow, the most important exception to this rule being in the case of the deep mines at Butte, previously referred to. The zone of secondary enrichment sometimes carries silicate and chloride ores of copper, as the results of various reactions. Where the unaltered ores in the final zone are argentiferous, copper ores rich in silver occur in the zone of secondary enrichment. Copper ore bodies frequently carry the native metal in the zone of secondary enrichment, where crystals of cuprite shade into crystals of native copper. Masses of native metal of hundreds, and even of thousands of pounds in weight, occur in many of the well-known copper ore mines, but such masses of native metal must be held radically distinct in genesis from the native copper of Lake Superior.

The influence of wall-rocks seems of considerable weight in determining the nature of secondary deposits. Where the wall-rocks are silicious, the products of secondary enrichment, in the sulphide zone, usually are chalcocite and occasionally covellite, while limestone walls are apt to give more or less chrysocolla in the oxidized zone. Chalcocite is especially liable to occur in veins traversing silicious rocks, but frequently is found in considerable quantities in limestone deposits. The copper and tin deposits of Cornwall afford an interesting field for speculation in this connection. According to the best authorities, these metals were given off from granitic magmas, in the form of gases, heavily laden with metallic vapors, which deposited the tin and copper in the same veins, but with a

fairly sharp line of demarcation, the copper occurring mainly in those portions of the fissures that traverse slate, while tin usually occurs in granite.

The most common gangue of copper ore is quartz, which also is true of many other metals. Calcite and spathic iron ore frequently are found also, and occasionally barite. Very commonly the gangue is merely altered country-rock.

All copper ore bodies, including the native copper mines of Lake Superior, notwithstanding a general impression to the contrary, show decreased values at great depth. The exact depth at which the permanent decrease begins depends, necessarily, upon many factors, and no general rule, other than the one herein laid down, can be predicated.

Deposits of copper ore, of size and tenor sufficient to warrant ranking them among commercial ore bodies, may be considered, as to occurrence, by three widely differing methods of grouping. The first of these is geographical, and, while, for commercial reasons, the geographical occurrence of copper is of prime importance, and is treated of fully in later chapters covering the entire world, under the title of Copper Deposits, such a grouping is essentially commercial, and by no means in accordance with geological rules, for the reason that the geographical divisions of the earth have been made by man, hence rarely correspond with the geological divisions made by nature. The two other methods of grouping occurrences of ore may be termed the method of geological horizons, and the lithological plan. It is necessary, in order to afford even an outline of the geology of copper, to give brief consideration to occurrences grouped under both of the latter-named headings. Viewed by geological ages, it is noted that copper deposits occur in rocks of practically all periods except the Quaternary, but the ore bodies are mainly post-Cretaceous deposits of Devonian and Carboniferous ages, laid down in rocks of those or of previous ages. The Permian veins throughout the world are notably cupriferous, and furnish a number of mines, though many of the Permian beds are too low in copper tenor to be considered as available deposits, at the present time, though doubtless these will have their place in the economy of future generations. The rocks of the Permian age, and the Jura-Trias system of the Mesozoic, or age next younger than the Permian, are more uniformly cupriferous than those of any other period, but are apt to carry disseminated ores of very low copper tenor, and these are workable only in occasional spots of exceptional richness, usually due to local enrichments caused by igneous intrusives. While the percentage of copper in the Permian and early Mesozoic beds is small, the aggregate of copper so deposited is past computation, owing to the dissemination of the ores through beds of vast area.

Viewed from a lithological standpoint, workable ore deposits occur mainly in igneous areas, most usually at or near the point of contact between igneous intrusive rocks and stratified beds, limestone being the most common form of the latter, but a number of the largest deposits now worked, including those of Lake Superior, Butte and Mansfeld, are of other classes. Very many of the principal copper deposits now worked are closely connected with intrusive granite rocks, of post-Cretaceous age.

Like most workable deposits of practically all other metals found in place, copper occurs in mountain ranges, perhaps more frequently in the

flanks or the foot-hills than in the higher peaks. In frequent instances, as in the Lake Superior deposits, copper is found in the roots of very ancient mountain ranges that have been quite thoroughly eroded. Many of the largest copper deposits are found at or near the point of contact between igneous intrusives and other rock forms, leading necessarily to the assumption that the metallic values were contained originally in the granitic magma, and either were deposited as magmatic segregations, at or near the point of contact, or, as is more commonly the case, were leached from the magma and redeposited as concentrated ore in fissures and limestone cavities, or as impregnations in permeable rocks. Primary ores usually are associated with basic rocks, or may be contact deposits of igneous acid rocks, but the secondary ores may occur in any adjacent rock strata offering a place for their deposition.

There are occasional occurrences of magmatic copper ores not existing as segregations distinct from the magma, though such deposits offer evidences of strictly local segregation, but most of these cases are of scholastic rather than of commercial importance. Exceptions must be made, however, in the instances of the wonderful monzonite ore bodies of Bingham, Utah, and of Ely, Nevada, and of a portion of the deposits of Clifton and Morenci, in Graham county, Arizona. It is probable that in the future greater attention will be paid to the possibilities of discovering similar porphyritic ore bodies containing magmatic ores, low in copper tenor, to be sure, but immensely valuable because of the almost unlimited quantity of such ore that may be found to occur in a single deposit.

The districts carrying copper in sedimentary formations are low in copper tenor as a rule, but more extensive in area than those fields carrying copper in igneous and metamorphic rocks. The Mansfeld district of Germany covers about two hundred square miles, and the Permian formation of the Ural Mountain range, that separates Russia and Siberia, is very extensive on both flanks, covering several thousand square miles. The Lake Superior copper district is of an exceptional nature, and of unusual extent, having a known length of about 400 miles, from Michipicoten Island, on the east to Pine and Chicago counties, only a short distance north of Minneapolis and St. Paul, on the west, but nearly half of this distance is submerged under Lake Superior, between the western end of Michipicoten Island and the eastern tip of the Keweenaw Peninsula. The present limits of exploitation include a strip of about 100 miles only in length, the Keweenawan series having a width of 2 to 8 miles, and being flanked by beds of sandstone.

Copper is found in practically every class of mineral deposit known to miners, and, in Alaska, and elsewhere, occurs as native stream metal. Copper deposits of more or less value are found in nearly every country on the globe, but many of these are not of sufficient value to justify present working, though what the future may have in store, when the world demands more tons of copper yearly than it now requires tons of pig iron, the best of prophets scarcely could foretell. Copper ores frequently occur in lenticular form, some lenses, as in the case of the Rio Tinto mine, being of immense size, but some of the ore deposits formerly classed as beds are now rated, in view of later and more exact knowledge, as veins.

In the commercial exploitation of copper ore bodies, one of the most

common and most fatal of errors is in attempting to base the future of the mine upon the rich and easily smelted ores of the zone of secondary enrichment. The wise management endeavors to learn the nature and extent of its ore bodies at depth; before building large and costly reduction plants of a permanent nature. When a mine is already opened in rich copper veins, sinking always is a good policy. Only by sinking to depth can the future of the mine be predicated with safety, and only by determining the different kinds and grades of ore, and the proportions in which they exist, can permanently satisfactory reduction plants be planned and installed.

Detailed information regarding the distribution of copper ores throughout the globe, with numerous detailed references to the geology of copper, will be found in the various chapters devoted to the geography of the metal. Geological particulars regarding individual mines also will be found scattered through the long chapter devoted to detailed mine descriptions.

The foregoing matter in this chapter is intended merely as an outline, and is not put forth as infallible in any particular, being merely the best judgment of the author, deduced from such limited studies of ore deposits as he has been able to make personally, amplified by the more detailed and valuable studies of many better authorities. For those who wish to make more careful investigation into the subject of ore deposits, and the geology of copper, I would recommend the perusal of Weed's Copper Mines of the World. While not holding with Mr. Weed on all points, the author of this brief monograph bears witness, cheerfully and gladly, to the vast amount of patient and well-considered investigation of details that has been made by Mr. Weed, and his exposition of the genesis and occurrence of copper ores, while by no means representing the last possible word in so wide a field, where so much remains to be learned, is much the most luminous and satisfactory of anything yet put forth in this particular line. The searcher after truth would do well also to read Kemp's Ore Deposits of the United States and Canada, and in this connection the monographs of Winchell, Lindgren and Sperr are worthy of the most serious consideration.

## CHAPTER III.

### CHEMISTRY AND MINERALOGY OF COPPER.

In this chapter is given a brief outline of pertinent facts regarding the chemistry and mineralogy of copper, ending with an alphabetical list of copper minerals, which will be found to include a considerable number not mentioned in any other work. Despite the appreciable length of this chapter, no attempt has been made to render it exhaustive, as such an ~~volume~~ would, of necessity, include a long treatise on general mineralogy; ~~which~~ even were the ability at command, has been done to such excellent purpose by two generations of scientists of one family that Dana's System of Mineralogy stands, as it long has stood, the world's authority in the ~~specimens~~ field of mineralogy. To the average reader this chapter will give sufficient detail, and may be found of some interest to all who are especially interested in copper, while those desiring to make a serious study of the subject are referred to Dana's monumental work.

The elements with which copper unites most readily are sulphur, oxygen, carbon, silicon, arsenic, antimony, bismuth and chlorine. Among the other metals, iron is the most common associate of copper. Most copper ores are more or less argentiferous, and sulphide copper ores frequently carry gold, though gold is not found in chemical combination ~~with~~ copper.

Following is a list of the 36 elements with which copper has been found chemically united in nature. Following the full name of each element is its chemical symbol and atomic weight, as now figured by the best authorities.

Element	Symbol	Atomic weight.	Element	Symbol	Atomic weight.
Aluminum	Al	27.	Nickel	Ni	58.6
Antimony	Sb	120.	Niobium	Nb	93.7
Arsenic	As	74.9	Nitrogen	N	14.
Barium	Ba	137.	Oxygen	O	16.
Bismuth	Bi	207.5	Phosphorus	P	31.
Calcium	Ca	39.9	Platinum	Pt	194.3
Carbon	C	12.	Potassium	K	39.
Chlorine	Cl	35.4	Selenium	Se	78.9
Chromium	Cr	52.5	Silicon	Si	28.
Cobalt	Co	58.7	Silver	Ag	107.7
Copper	Cu	63.2	Sodium	Na	23.
Hydrogen	H	1.	Sulphur	S	32.
Iodine	I	126.5	Tellurium	Te	125.
Iron	Fe	55.9	Tin	Sn	117.4
Lead	Pb	206.4	Tungsten	W	183.6
Magnesium	Mg	24.	Uranium	U	240.
Manganese	Mn	54.8	Vanadium	V	51.1
Mercury	Hg	199.8	Zinc	Zn	65.1
Molybdenum	Mo	96.			

The ores of copper (alone or with other metals) may be divided into the following groups:

antimonides	iodides	sulphoantimonates
antimonites	manganates	sulphoantimonites
arsenates	molybdates	sulphoarsenates
arsenides	niobates	sulphoarsénites
arsenites	nitrates	sulphates
arsenobismuthomites	oxides	sulphides
arsenobismuthites	oxychlorides	sulphobismuthites
arsenophosphates	phosphates	tellurides
bismuthides	phosphochromates	tungstates
carbonates	selenides	uranates
chloridorides	selenites	vanadates
chlorosulphates	silicates	

While the appended alphabetical list of copper minerals gives several hundred titles, the more important ores are scarcely more than a dozen in number, though many of the minor minerals are of local importance in certain fields.

The sulphide ores are of predominant importance. Of these chalcopyrite, the lowest in copper tenor, is the most common, being found in practically every copper field. The major production from sulphide ores comes, however, from the rich chalcocite or copper glance. Bornite, the first alteration product of chalcopyrite in the ascending scale of enriched sulphide ores, is a valuable ore, and is found in large quantities in many copper fields. Covellite, the next richest sulphide above bornite, is found in connection with bornite and chalcocite in most sulphide districts, but as a rule does not occur in large quantities, though by no means a rare ore, and in a few fields, as in Utah and Wyoming, is found in quantities of considerable commercial importance. There are numerous other copper sulphides and copper-iron sulphides that are found in greater or less profusion, but many of these greatly resemble the more important sulphides previously noted, and rarely are differentiated in practical mining operations. There are a number of copper sulphates, of which chalcantite is the only important ore. While found in natural beds, in Chile, this mineral is, as a rule, essentially a joint product of man and nature, the mine openings in sulphide ores made by man being leached by nature. Being readily soluble, and the copper contents easily precipitated, considerable copper is secured, in many districts, by leaching mine waters charged with bluestone, and in Spain a large part of the extensive copper product is secured in this form.

Next in commercial importance after the sulphide ores comes native copper. This is mined very extensively in the Lake Superior district, and on a considerable scale in Bolivia. Native copper is found in the upper workings of most rich mines of copper ore, and the aggregate production therefrom is quite large.

Third in importance come the carbonates. Of these, azurite and malachite are the only ones usually found in considerable quantities, and malachite is of much the greater importance. This ore is found in profusion in the upper or oxidized workings of many mines, and being rich and easily smelted, is the source of a considerable share of the world's copper supply.

The copper oxides usually are found in connection with the carbonates, and are mined and smelted therewith, being rich and easily reduced. Cuprite is the richest of all copper ores, but melaconite is far more common.

The only important commercial ore among the copper silicates is chrysocolla. This occurs frequently, and in considerable quantities, with the oxidized ores of many mines, and also is found disseminated in low-grade ore bodies at many points. It is probable that a larger proportion of copper will be secured, eventually, from silicate ores, perhaps by leaching processes.

The arsenical ores are common, but as a rule are present in just sufficient quantities to interfere with smelting. In Butte, Montana, enargite is a highly important copper ore, and is handled with signal success. In Chile and Perú arsenical ores are found in large quantities. Tetrahedrite, which shades by almost imperceptible gradations into tennantite, is a fairly common ore, but is not regarded with favor by miners, unless carrying considerable quantities of silver, which frequently is the case, the presence of both arsenic and antimony, frequently with bismuth added, rendering it difficult of smelting. Formerly the metal produced from gray copper ores was so poisoned with arsenic, antimony and bismuth, all deleterious elements, that such copper was suitable for only the roughest and cheapest of uses to which the metal could be put, but the general adoption of the electrolytic refining process has provided a way for eliminating these undesirable elements from the copper produced from gray ores.

In Chile considerable copper is secured from chloride ores, mainly atacamite.

An alphabetical list of copper minerals, including native copper and synonyms, is appended.

**ACICULITE.** Aikinite.

**ADAMITE.** A hydrous basic zinc arsenate, in which copper sometimes replaces zinc to the extent of circa 18%.

**AGUILARITE.** An unnamed alternation product of aguilarite has the formula  $5(\text{Ag}_2\text{Cu})_2\text{S}(\text{Sb},\text{As})_2\text{S}_3$ . The mineral, which is a arsenosulpho-antimonite is isometric.

**AIKINITE.**  $3(\text{Pb},\text{Cu})_2\text{S}\text{Bi}_2\text{S}_3$ . A lead and copper sulphobismuthite, carrying 11% copper. Common names needle ore, acicular bismuth. Crystallization, orthorhombic. Fracture, uneven. Hardness, 2 to 2.5. Gravity, 6.1 to 6.8. Lustre, metallic. Color, blackish lead-gray, tarnishing to pale copper-red. Fuses on charcoal and is soluble in nitric acid. Occurrence, Ural Mountains of Russia and Gold Hill, North Carolina.

**ALASKAITE.** An argentiferous and cupriferous variety of galenobismutite, which is a lead sulphobismuthite, carrying 3.5 to 5.1% copper.

**ADGODONITE.**  $\text{Cu}_2\text{As}$ . A copper arsenide carrying 85.5% copper. Structure, massive and granular. Fracture, subconchoidal. Hardness, 4. Gravity, 7.62. Lustre, metallic on fresh fractures, dulling on exposures. Color, steel-gray to silver-white on freshly polished surface. Is less fusible than domeykite. Occurs in Chile and Lake Superior, in the latter district being found in cross-courses traversing the cupriferous beds of the South Range mines, causing the copper product to be highly arsenical.

**ALISONITE.**  $3\text{Cu}_2\text{S}\text{ PbS}$ . A copper and lead sulphide, carrying 53.5% copper, and 28.5% lead. It related to cuproplumbite. Structure, massive. Color, deep indigo-blue, quickly tarnishing. Occurs at Coquimbo, Chile.

**AMMIOLITE.** Formula undetermined. A mercury and copper antimonite, carrying circa 12.5% copper. Occurs, as an earthy powder, in Chile.

**ANDREWSITE.** Formula undetermined. A hydrous iron and copper phosphate related to chalcosiderite, containing circa 8.6% copper.

**ANNIVITE.** A bismuthiferous variety of tennantite, from Switzerland.

**ANTIMONIAL COPPER.** Common name for chalcostibite.

**ANTLERITE.** Formula probably  $10\text{CuO} \cdot 3\text{SO}_4 \cdot 7\text{H}_2\text{O}$ . A basic copper sulphate, containing circa 54.7% copper. Structure, massive. Gravity, 3.93. Color, light green. From Yucca, Mohave county, Arizona.

**APHANESITE.** Clinoclasite.

**APHTONITE.** An argentiferous and zinciferous variety of tettahedrite.

**ARNIMITE.**  $5\text{CuO} \cdot 2\text{SO}_4 \cdot 6\text{H}_2\text{O}$ . A hydrous basic copper sulphate, containing 47.6% copper. Occurs in acicular crystals.

**ARSENICAL COPPER.** Domeykite,

**ASPEROLITE.**  $\text{CuSiO}_3 \cdot 3\text{H}_2\text{O}$ . A hydrous copper silicate. Apparently a hydrated chrysocolla, from Tagilsk, Perm, Russia.

**ATACAMITE.**  $\text{CuCl}_2 \cdot 3\text{Cu}(\text{OH})_2$ . A hydrous copper oxychloride, containing 60.5% copper. Crystallization, orthorhombic. Fracture, conchoidal. Tenacity, brittle. Hardness, 3 to 3.5. Gravity, 3.75. Lustre, adamantine to vitreous. Color, emerald green to blackish green. Streak, apple-green. Is transparent to translucent. Occurs, as sandy granules, in numerous mines in the province of Atacama, Chile, and elsewhere. Usually occurs disseminated, and low in copper tenor, but is extensively mined in Chile.

**ATELITE.**  $2\text{CuO} \cdot \text{CuCl}_2 \cdot 3\text{H}_2\text{O}$ . A hydrated copper oxychloride. An alteration product from Mt. Vesuvius, closely related to atacamite chemically and mineralogically, but occurring as a pseudomorph after tenorite.

**ATLASITE.** A copper carbonate containing chlorine, from Chañarcillo, Chile. Apparently is merely an intimate mixture of azurite and atacamite.

**AURICHALCITE.**  $2(\text{Zn}, \text{Cu})\text{CO}_3 \cdot (\text{Zn}, \text{Cu})(\text{OH})_2$ . A basic zinc and copper carbonate, containing 16.6% copper. Crystallization, probably monoclinic. Occurs in acicular crystals, forming drusy incrustations; also columnar, laminated and granular. Hardness, 2. Gravity, 3.5 to 3.6. Lustre, pearly. Color, pale green to sky-blue. Streak, light green to light blue. Is translucent. Is soluble in acids. Occurs in small quantities in many zinc and copper fields.

**AZURITE.**  $2\text{CuO} \cdot 2\text{CO}_3 \cdot \text{H}_2\text{O}$ . A basic, copper carbonate, containing 55.3% copper. Common names, blue carbonate of copper, blue malachite, azure copper ore. Crystallization, monoclinic. Fracture, conchoidal. Tenacity, brittle. Hardness, 3.5 to 4. Gravity, 3.77 to 3.83. Lustre, vitreous. Color, azure blue. Streak, lighter blue. Is subtranslucent to transparent. Is soluble in nitric acid. Occurs frequently in the oxidized zone of copper ore bodies, almost invariably with malachite, but is much less common than malachite. Is a valuable commercial ore of copper.

**BARNHARDTITE.** Formula uncertain. A copper and iron sulphide, probably an alteration product from chalcopyrite that has lost part of its iron and copper, containing 46.7 to 50.4% copper. Apparently is nearer to bornite than to chalcopyrite. Structure, massive, compact. Fracture, conchoidal. Hardness, 3.5. Gravity, 4.5. Lustre, metallic. Color, bronze-yellow, tarnishing to pinchbeck-brown. Streak, grayish black, slightly shining. Occurrences, North Carolina and Arizona.

**BARRACANITE.** Cupropyrite.

**BAYLDONITE.**  $4(\text{Pb},\text{Cu})\text{O} \cdot \text{As}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$ . A hydrous basic lead and copper arsenate containing 26.1% copper. Occurs in minute mammillary concretions with drusy surface. Fracture, subconchoidal. Hardness, 4.5. Gravity, 5.35. Lustre, resinous. Color, grass-green to blackish green. Streak, apple-green. Is subtranslucent. Soluble, with difficulty, in nitric acid. Occurs in Cornwall, England.

**BEAUMONTITE.** A very doubtful hydrous copper silicate, from Chassy, France.

**BELL-METAL ORE.** Common name for stannite.

**BERZELIANITE.**  $\text{Cu}_2\text{Se}$ . A copper selenide containing 61.6% copper. Occurs disseminated in incrustations. Is very soft. Gravity, 6.71. Lustre, metallic. Color, silver-white, soon tarnishing. Streak, shining. Usually is argentiferous. Occurs in Småland, Sweden.

**BEUDANTITE.** Apparently this name is applied to two minerals, one an arsenate and the other a sulphate of iron, lead and copper, carrying from a trace to 9.8% copper.

**BINNITE.** Formula probably  $3\text{Cu}_2\text{S} \cdot 2\text{As}_2\text{S}_3$ . A copper sulphaarsenite, containing 37.7% copper. Crystallization, isometric. Fracture, conchoidal. Tenacity, brittle. Hardness, 2.5 to 3. Gravity, 4.47. Lustre, metallic. Color, dark steel-gray to iron-black. Streak, reddish brown. Occurrence, Binnenthal, Switzerland.

**BLACK COPPER.** Common name for melaconite or disseminated chalcocite. In all likelihood much of what has been taken for melaconite in the past was disseminated chalcocite.

**BLUE COPPER.** Common name for azurite.

**BLUE MALACHITE.** Common name for azurite

**BLUESTONE.** Common name for chalcanthite; also for blue vitriol, the manufactured product corresponding in chemical formula with chalcanthite.

**BLUE VITRIOL.** Common name for chalcanthite or bluestone.

**BOGOSLOVSKITE.** Chrysocolla carrying carbon dioxide as an impurity, from the Bogoslovsk mine, Perm, Russia.

**BOLEITE.**  $(\text{Pb},\text{Cu},\text{Ag})\text{Cl}_2\text{OH}_2$ . A hydrated lead, copper and silver oxychloride, containing circa 12% copper. Crystallization, isometric. Hardness, 3 to 3.25. Gravity, 5.08. Color, indigo-blue. Occurrence, at the Boleo mines, Baja California, Mexico.

**BORNITE.**  $\text{Cu}_3\text{FeS}_4$ . A copper and iron sulphide, containing 55.5% copper, 16.4% iron, 28.1% sulphur. Common name, peacock copper ore. Crystallization, isometric, with many hexagonal penetration twins. Struc-

ture, granular or compact. Fracture, small conchoidal to uneven. Tenacity, brittle. Hardness, 3. Gravity, 4.9 to 5.4. Lustre, metallic. Color, copper red to bluish brown, quickly tarnishing to iridescence, often most brilliant. Streak, pale grayish-black. Is soluble in nitric acid, with separation of sulphur. Is the first alteration product from chalcopyrite among the secondary copper sulphides, and often carries nodules and occasionally larger masses of chalcocite. Is one of the most important ores of copper.

**BOTALLACKITE.** Atacamite.

**BOURNONITE.**  $3(\text{Pb},\text{Cu}_2)\text{S}.\text{Sb}_2\text{S}_3$ . A lead and copper sulphoantimonite, containing 13% copper, and 42.5% lead. Crystallization, orthorhombic. Structure, massive, granular and compact. Cleavage, imperfect. Fracture, subconchoidal to uneven. Tenacity, rather brittle. Hardness, 2.5 to 3. Gravity, 5.7 to 5.9. Lustre, brilliant metallic. Color and streak, steel-gray, inclining to blackish-gray or iron-black. Fuses easily on charcoal and is soluble in acids. Occurrence, in many copper fields.

**BRASS ORE.** Common name for aurichalcite.

**BROCHANTITE.**  $4\text{CuO}.\text{SO}_3.3\text{H}_2\text{O}$ . A basic copper sulphate containing 56.2% copper. Crystallization, orthorhombic. Fracture, uneven. Hardness, 3.5 to 4. Gravity, 3.9. Lustre, vitreous. Color, emerald-green to blackish green. Streak, paler green. Is translucent to transparent. Is found in many copper fields, and is an important commercial ore in the Clifton district, Graham county, Arizona.

**BURATITE.** An aurichalcite containing calcium monoxide, probably as a mechanical admixture.

**CACHEUTAITE.** A lead, copper and silver selenide carrying 7 to 36% copper. Is closely related to zorgite.

**CALCIOVOLBORTHITE.**  $4(\text{Cu},\text{Ca})\text{O}.\text{V}_2\text{O}_5.\text{H}_2\text{O}$ . A hydrous basic copper and calcium vanadate, containing 31.7% copper. Hardness, 3.5. Gravity, 3.5 to 3.86. Color, gray to green. Streak, brownish yellow to greenish yellow. Occurrence, Thuringia, Germany.

**CALEDONITE.**  $2(\text{Pb},\text{Cu})\text{O}.\text{SO}_3.\text{H}_2\text{O}$ . A basic lead and copper sulphate, containing 9.4% copper. Crystallization, orthorhombic. Fracture, uneven. Tenacity, rather brittle. Hardness, 2.5 to 3. Gravity, 6.4. Lustre, resinous. Color, verdigris-green to bluish green. Streak, greenish white. Is translucent. Occurrence, Scotland, Hungary, California, etc.

**CANTONITE.** A dimorphous variety of covellite, apparently a pseudomorph after galena, crystallized in cubes with cubical cleavage.

**CAPILLARY RED OXIDE OF COPPER.** Common name for cuprite.

**CARMENTITE.** A variety of digenite.

**CARROLLITE.**  $\text{CuS}.\text{Co}_2\text{S}_3$ . A cobalt and copper sulphide containing 20.5% copper and 38% cobalt. Crystallization, isometric. Fracture, subconchoidal to uneven. Hardness, 5.5. Gravity, 4.85. Lustre, metallic. Color, light steel-gray, with faint reddish hue. Occurrence, Carroll county, Georgia.

**CASTILLITE.**  $(\text{Cu},\text{Ag})_2\text{S}.2(\text{Cu},\text{Pb},\text{Zn},\text{Fe})\text{S}$ . A copper, silver, lead, zinc and iron sulphide carrying circa 41% copper. Apparently an antiprismatic bornite. Structure, massive. Hardness, 3. Gravity, 6.18 to 5.24. Resembles bornite in color, streak and tarnish. Occurrence, Guanacevi, Mexico.

**CHALCANTHITE.**  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ . A hydrous copper sulphate containing 25.4% copper. Common names, blue vitriol, bluestone, copper sulphate. Crystallization, triclinic. Structure, massive, stalactitic and reniform, sometimes fibrous. Fracture, conchoidal. Tenacity, brittle. Hardness, 2.5. Gravity, 2.12 to 2.30. Lustre, vitreous. Color, sky-blue. Streak, uncolored. Is translucent to subtransparent. Is soluble in water. Occurs as deposits from mine water in most sulphide copper mines, and is found in impure state, in beds, in Chile.

**CHALCOCITE.**  $\text{Cu}_2\text{S}$ . A copper sulphide carrying 79.8% copper. Common names, copper glance, cuprous sulphide. Crystallization, orthorhombic; also occurs massive, with structure granular to compact and impalpable. Cleavage, indistinct. Fracture, conchoidal. Tenacity, brittle. Hardness, 2.5 to 3. Gravity, 5.5 to 5.8. Lustre, metallic. Color and streak, blackish lead-gray, tarnishing to dull green or blue. Is soluble in nitric acid. Occurs in all copper districts, frequently in large quantities. Is the richest commercial ore of copper and yields more than one-half of the world's copper supply.

**CHALCOLITE.** Torbernite.

**CHALCOMENITE.**  $\text{CuO} \cdot \text{SeO}_2 \cdot 2\text{H}_2\text{O}$ . A hydrous copper selenite containing 28% copper. Crystallization, monoclinic. Gravity, 3.76. Lustre, vitreous. Color, bright blue. Is transparent. Is soluble in acids. Found at Cacheuta, Mendoza, Argentina.

**CHALCOMICHLITE.** Bornite.

**CHALCOPHACITE.** Liroconite.

**CHALCOPHYLLITE.**  $7\text{CuO} \cdot \text{As}_2\text{O}_3 \cdot 4\text{H}_2\text{O}$ . A hydrous basic copper arsenate containing 42.3% copper. Crystallization, rhombohedral. Hardness, 2. Gravity, 2.43 to 2.66. Lustre, vitreous. Color, grass-green to verdigris-green. Streak, grass-green. Occurs in Hungary, Siberia and Utah.

**CHALCOPYRITE.**  $\text{Cu}_2\text{S} \cdot \text{Fe}_2\text{S}_3$ . A copper and iron sulphide containing 34.5% copper and 30.5% iron. Is the primary ore of copper. Crystallization, tetragonal, sphenoidal, often twinning, also frequently massive and compact. Fracture, uneven. Hardness, 3.5 to 4. Gravity, 4.1 to 4.3. Lustre, metallic. Color, brass-yellow, often tarnishing to iridescence. Streak, greenish black. Is soluble, except sulphur, in nitric acid, and, on being heated, yields a portion of its sulphur. On exposure to moisture and heat becomes hydrated, and copper and iron change readily to sulphates. Alters to azurite, malachite, melaconite, chalcocite, covellite, bornite, brochantite, chrysocolla, tetrahedrite and tennantite. Is found in practically every copper field in the world, and is second only to chalcocite in importance among the commercial ores of copper.

**CHALCOPYRRHOTITE.**  $\text{CuS} \cdot \text{Fe}_2\text{S}_3$ . An iron and copper sulphide containing 13% copper and 48.2% iron. Structure, massive. Hardness, 3.5 to 4. Gravity, 4.28. Color, brassy, with brownish tinge. Occurrence, Nya Kopparberg, Sweden.

**CHALCOSIDERITE.**  $\text{CuO} \cdot 3\text{Fe}_2\text{O}_3 \cdot 2\text{P}_2\text{O}_5 \cdot 8\text{H}_2\text{O}$ . A hydrous iron and copper phosphate containing 6.4% copper. Hardness, 4.5. Gravity, 3.1.

Lustre, vitreous. Color, light siskin-green. Streak, pale green. Occurs in Cornwall, England and Westphalia, Germany.

**CHALCOSINE.** Chalcocite.

**CHALCOSTIBITE.**  $Cu_2S \cdot Sb_2S$ . A copper sulphoantimonite containing 25.6% copper and 48.5% antimony. Crystallization, orthorhombic. Fracture, subconchoidal. Tenacity, brittle. Hardness, 3 to 4. Gravity, 4.75 to 5. Lustre, metallic. Color, between lead-gray and iron-gray. Occurrence, in the Hartz Mountains of Germany and in Guadix, Spain.

**CHALCOTRICHITE.** A form of cuprite with capillary or acicular crystallization. Common name, plush copper ore.

**CHELEUTITE.** A ferruginous, nickeliferous and slightly cupriferous smaltite.

**CHENEVIXITE.**  $2CuO \cdot Fe_2O_3 \cdot As_2O_3 \cdot 3H_2O$ . A hydrous copper and iron arsenate containing 21% copper. Structure, massive. Fracture, subconchoidal. Hardness, 3.5 to 4.5. Gravity, 3.93. Lustre, vitreous. Color, dark olive-green to greenish yellow. Streak, yellowish green. Is soluble in acids. Occurrence, Cornwall, England and Eureka, Juab county, Utah.

**CHESSY COPPER.** Common name for azurite.

**CHILEITE.** Formula uncertain. A hydrous lead and copper vanadate containing 11.7 to 13.6% copper. Is related to psittacinite. Structure, earthy. Occurrence, Chile.

**CHILENITE.**  $(Ag,Cu)_2Bi$ . A silver and copper bismuthide containing 8.5% copper and 75% silver. Structure, amorphous, granular. Is soft. Color, silver-white. Occurrence, Copiapó, Chile.

**CHIVIATITE.** A lead sulphobismuthite carrying circa 2.5% copper.

**CHLORANTHITE.** Empirically nickel diarsenide, but analyses invariably show cobalt and iron, and commonly small quantities also of copper, lead, silver, bismuth and antimony.

**CHLOROTHIONITE.**  $CuCl \cdot K_2SO_4$ . A copper and postassium chlorosulphate. Is an alteration product from Mt. Vesuvius.

**CHLOROTILE.** Formula probably  $3CuO \cdot As_2O_3 \cdot 6H_2O$ . A hydrous copper arsenate containing circa 33% copper. Is related to trichalcite. Crystallization, orthorhombic; also occurs fibrous and massive. Is soft. Color, pale emerald-green. Is transparent.

**CHRYSOCOLLA.**  $CuSiO_3 \cdot 2H_2O$ . A hydrous copper silicate carrying 36% copper. Common names, mountain green and mountain blue. Structure, cryptoerystalline, enamel-like, sometimes botryoidal. Fracture, conchoidal. Is brittle and somewhat sectile. Hardness, 2 to 4. Gravity, 2 to 2.24. Lustre, vitreous to earthy. Color, mountain green, bluish green and sky blue to turquoise-blue, with impure varieties brown to dull black. Streak, white, from pure green and blue varieties. Is opaque to translucent. Is decomposed by acids, without gelatinization. Commonly occurs with carbonate ores in the oxidized zones of copper ore bodies, and is a commercial ore of value in many districts.

**CLAYITE.** A lead sulphoantimonite, carrying copper as a replacement of lead to extent of circa 8%.

**CLINOCLASITE.**  $6CuO \cdot As_2O_3 \cdot 3H_2O$ . A hydrous basic copper ar-

senate carrying 48% copper. Crystallization, monoclinic. Is brittle. Hardness, 2.5 to 3. Gravity, 4.19 to 4.36. Lustre, vitreous to resinous. Color, blackish blue-green externally, dark verdigris-green internally. Streak, bluish green. Is subtransparent to translucent. Is soluble in nitric acid. Occurrence, Cornwall and Utah.

**COPPER.** Cu. Native copper. The chemical symbol Cu is an abbreviation of cuprum, the Latin word for copper. The metal, native or refined, has the following names in modern languages: kupfer in German; koppar in Swedish; kobber in Norwegian; cobre in Spanish and Portuguese; cuivre in French; rame in Italian.

Atomic weight, 63.2. Belongs in the first group and is the leader of the fifth series of Mendeleéf's Periodic System. The group is as follows: 1, hydrogen; 2, lithium; 3, sodium; 4, potassium; 5, copper; 6, rubidium; 7, silver; 8, caesium; 9, unknown (possibly terbium, atomic weight 160); 10, gold; 11, unknown. The fifth series, of which copper is the basic leader, is as follows: 1, copper; 2, zinc; 3, gallium; 4, germanium; 5, arsenic; 6, selenium; 7, bromine. The three metallic elements falling between series four and five in Mendeleéf's table, are iron, cobalt and nickel. The frequency with which these three elements are found associated with copper, and the ease with which all four metals replace one another, are notable. The general resemblance between copper, silver and gold, which form ascending steps in the same group, is readily apparent.

System of crystallization, isometric. Tetrahedronal forms are the most common, with much twinning. Crystals often show cavernous faces and occasionally elevations, are often distorted and pass gradually through distortions into filiform and arborescent forms. Native copper also occurs massive, in granular form, and in laminae. In the Lake Superior mines the metal occurs in all observed forms and sizes, including lamellae from microscopic flakes up to sheets of immense size and weight, crystals of greatly varying form and size, grains from microscopic size to considerable nodules, and druses, often of considerable size, show various filiform and arborescent shapes. The finest particles are grains and exceedingly minute flakes, occurring in an upper sandstone of the Keweenawan series, while the largest masses, weighing upwards of 500 tons, have been found in contact and fissure veins.

Cleavage, none. Fracture, hackly. Tenacity, second only to that of iron. Is perfectly sectile and highly ductile and malleable, ranking in these particulars with the precious metals. Electrical conductivity, .931, as compared with 1,000 for silver, which possesses the most perfect electrical conductivity of any known metal or alloy. Conductivity for heat, 898, as compared with 1,000 for gold, the most perfect conductor of heat.

Hardness, 2.5 to 3. Specific gravity, in vacuo, at 0 degrees Centigrade (equal to 32°, or freezing point, Fahrenheit), when chemically pure and devoid of porosity, is 8.945. Specific gravity of the ordinary copper of commerce, none of which is free from impurities, varies from about 8.75 when cast, to about 8.95 when rolled, hammered or drawn, the exact gravity depending upon how handled, as well as upon the extent and nature of the impurities contained.

Lustre, metallic. Color, copper-red. Streak, copper-red, metallic, shin-

ing. Tarnishes upon exposure to air to brownish red, and is liable to form a coating of verdigris or oxide upon long exposure to air. Atmosphere laden with moisture and carbonic acid is especially favorable to the formation of verdigris.

Fusibility: Copper is fusible at approximately 2,000° Fahrenheit, or a trifle less than 1,100° Centigrade. Color, when fused, sea-green. Copper becomes volatile under the high temperature of the electric arc.

Solubility: Copper is soluble in nitric acid, aqua regia, and strong boiling sulphuric acid, also, slowly, in dilute hydrochloric and sulphuric acids, with admission of air. When in solution in nitric or sulphuric acids will deposit metallic copper on iron immersed therein.

Affinities: Copper has a greater affinity for sulphur than for any other element, possessing also marked affinities for oxygen, carbon dioxide, arsenic, antimony and bismuth, and unites with many other elements.

Alterations: Native copper alters on exposure, especially in damp air, to the simpler oxide and carbonate ores, such as cuprite, malachite and azurite, and occasionally, in time, to the more complex ore forms.

Occurrence: Native copper occurs, usually in small quantities, in most of the principal copper districts of the world. The native metal is mined upon a considerable scale only in Lake Superior, U. S. A., and Bolivia. The Lake Superior native copper carries considerable silver, mechanically admixed, though not alloyed, but carries no gold. In districts outside of Lake Superior and Bolivia the metal occurs most frequently in connection with the oxide and carbonate ores, and occasionally with the secondary sulphide ores.

Impurities: Native copper frequently contains silver, arsenic, bismuth, antimony, zinc and occasionally mercury. Commercial copper, refined from ores, may contain any of the elements already named, and also gold, tin, lead, selenium and tellurium, the latter two elements in very minute quantities.

**COPPER GLANCE.** Common name for chalcocite.

**COPPER MICA.** Common name for chalcopyrite.

**COPPER NICKEL.** Common name for niccolite.

**COPPER PHOSPHATE.** Common name for libethenite.

**COPPER PITCHBLENDÉ.** An impure chrysocolla containing limonite.

**COPPER PYRITES.** Common name for chalcopyrite.

**COPPER SULPHATE.** Common name for chalcantite in nature; bluestone when manufactured.

**COPPER URANITE.** Common name for torbernite.

**COPPER VITRIOL.** Common name for chalcantite when found native, or for bluestone when manufactured.

**COPPITE.** A ferruginous variety of tennantite.

**CONDURRITE.** Apparently a copper arsenide, related to domeykite. Is supposed to be an alteration product of tennantite. Is soft and black. Occurs in the Condurrow mine, and at Cara Brea, Cornwall, England.

**CONICHALCITE.**  $4(\text{Cu},\text{Ca})\text{O} \cdot \text{As}_2\text{O}_5 \cdot 1\frac{1}{2}\text{H}_2\text{O}$ . A hydrous basic copper and calcium arsenate, carrying 24% copper. Structure, reniform and mas-

sive. Fracture, splintery. Tenacity, brittle. Hardness, 4.5. Gravity, 4.12. Color and streak, pistachio-green. Is subtranslucent. Occurs in Andalusia, Spain and at Eureka, Juab county, Utah.

**CONNELLITE.** Formula probably  $\text{Cu}_{15}(\text{Cl},\text{OH})_4\text{SO}_4 \cdot 15\text{H}_2\text{O}$ . A hydrous basic copper chlorosulphate, containing circa 57.6% copper. Crystallization, hexagonal. Hardness, 3. Gravity, 3.36. Lustre, vitreous. Color, fine blue. Is translucent. Is soluble in nitric acid. Occurrence, Cornwall, England.

**CORNWALLITE.**  $5\text{CuO} \cdot \text{As}_2\text{O}_5 \cdot 3\text{H}_2\text{O}$ . A hydrous basic copper arsenate containing 46.5% copper. Structure, massive. Fracture, conchoidal. Hardness, 4.5. Gravity, 4.16. Color, verdigris-green to emerald green. Occurrence, Cornwall, England.

**COSALITE.** Empirically lead sulphobismuthite, but usually cupriferous to the extent of from a trace to 8.75% copper.

**COVELLINE.** Covellite.

**COVELLITE.**  $\text{CuS}$ . A copper sulphide containing 66.4% copper. Chemical name, cupric sulphide. Crystallization, hexagonal; also occurs massive. Is flexible in thin layers, with basal cleavage. Hardness, 1.5 to 2. Gravity, 4.6. Lustre, submetallic on crystals, dull when massive. Color, dark indigo-blue. Streak, lead-gray to black, shining. Occurs in most sulphide copper districts, as a secondary ore and is a valuable commercial ore of copper, when found in sufficient quantities, as in Utah, Wyoming and elsewhere.

**CLARITE.** A dimorphous form of enargite, from Schapbach, Baden, Germany.

**CREDNERITE.**  $3\text{CuO} \cdot 2\text{Mn}_2\text{O}_5$ . A copper manganate containing 34.4% copper. Crystallization, monoclinic. Cleavage, basal, perfect, less distinct in other directions. Hardness, 4.5. Gravity, 4.9 to 5.1. Lustre, metallic. Color, iron-black to steel-gray. Streak, brownish black. Is soluble in hydrochloric acid.

**CROOKESITE.**  $(\text{Cu},\text{Tl},\text{Ag})_2\text{Se}$ . A copper, thallium and silver selenide, containing 44 to 46% copper, 17 to 18.5% thallium and 1.5 to 5% silver. Structure is massive, without crystallization. Is brittle. Hardness, 2.5 to 3. Gravity, 6.9. Lustre, metallic. Color, lead-gray. Occurrence, Smaaland, Sweden.

**CUBANITE.**  $\text{CuS} \cdot \text{Fe}_2\text{S}_3$ . An iron and copper sulphide containing 23.3% copper and 41.3% iron. Crystallization, isometric; also occurs massive. Cleavage, cubic. Hardness, 4. Gravity, 4.026 to 4.169. Color, bronze to brass-yellow. Streak, dark reddish bronze to black. Occurrence, Cuba and Sweden.

**CUMENGITE.**  $\text{PbCl}_2 \cdot \text{CuO} \cdot \text{H}_2\text{O}$ . A hydrous lead and copper oxychloride, related to boléite. Crystallization, tetragonal.

**CUPRIC OXIDE.** Tenorite, when found in nature; copper monoxide in chemistry.

**CUPRITE.**  $\text{Cu}_2\text{O}$ . A copper oxide, containing 88.8% copper, being the richest copper ore. Chemical names, cuprous oxide, copper protoxide. Common names, ruby copper, red glassy copper ore, octahedral copper ore. Crystallization, isometric, commonly in octohedrons; also occurs massive,

granular and sometimes earthy. Fracture, conchoidal. Is brittle. Hardness, 3.5 to 4. Gravity, 5.85 to 6.15. Lustre, adamantine to earthy. Color, light to dark red; when fresh, usually ruby-red, but fades to duller red. Streak, brownish red, shining. Is subtransparent to subtranslucent. Occurs in most copper districts in the upper oxidized zone, frequently shading into crystals of native copper.

**CUPROBISMUTHITE.**  $3\text{Cu}_2\text{S} \cdot 4\text{Bi}_2\text{S}$ . A copper sulphobismuthite containing 15% copper and 65.1% bismuth. Occurs in prismatic crystals. Gravity, 6.31 to 6.68. Lustre, metallic. Color, dark bluish black. Streak, black. The copper frequently is replaced partially by silver.

**CUPROCALCITE.** Formula perhaps  $(\text{Cu}_2\text{O})_2 \cdot \text{CO}_3 + 2\text{CaO} \cdot \text{CO}_2 + \text{H}_2\text{O}$ . Apparently merely an intimate mixture of cuprite and calcium carbonate. Hardness, 3. Gravity, 3.9. Color, vermillion-red. Is soluble in hydrochloric acid.

**CUPROCASSITERITE.** Formula possibly  $4\text{SnO}_2 + \text{Cu}_2\text{Sn}(\text{OH})_6$ . Occurrence, Black Hills of South Dakota.

**CUPRODESCLOIZITE.** A cupriferous variety of descloizite, which is a basic lead and zinc vanadate.

**CUPROFERRITE.** Piaanite.

**CUPROIODARGYRITE.**  $\text{CuI} \cdot \text{AgI}$ . A copper and silver iodide. Apparently a decomposition product of stromeyerite. Occurs, as incrustations, at Huantajaya, Chile.

**CUPROMAGNESITE.**  $(\text{Cu}, \text{Mg}) \text{SO}_4 + 7\text{H}_2\text{O}$ . A copper and magnesium sulphate. Color, bluish green. Is an alteration product, occurring as incrustations, from Mt. Vesuvius.

**CUPROPLUMBITE.**  $5\text{Cu}_2\text{S} \cdot \text{PbS}$ . A copper and lead sulphide, carrying 61.3% copper and 19% lead. Structure, massive. Lustre, feeble or lacking. Color, lead-gray to indigo-blue. Occurrence, Catemou, Aconcagua, Chile, Butte, Montana, and Semipalatinsk, Siberia.

**CUPROPYRITE.**  $\text{CuFe}_2\text{S}_4$ . An iron and copper sulphide, carrying 24% copper. Is closely related to cubanite.

**CUPROSCHHEELITE.**  $(\text{Ca}, \text{Cu})\text{WO}_4$ . A calcium and copper tungstate carrying 3 to 5% copper. Is a variety of cuprotungstate in which copper is mainly replaced by calcium.

**CUPROTUNGSTATE.**  $\text{CuWO}_4$ . A copper tungstate carrying 24% copper. Structure, granular and incrustive. Hardness, 4.5 to 5. Color, pistachio-green to leek-green. Streak, greenish gray to greenish yellow. Is soluble in hydrochloric acid. Occurrence, Llamuco, Santiago de Chile.

**CUPROURANITE.** Torbernite.

**CUPROUS OXIDE.** Cuprite in nature. Chemical term for two atoms of copper united with one atom of oxygen.

**CUPROVANADITE.** Chileite.

**CYANOCHALCITE.** A phosphoriferous variety of chrysocolla, from Nijni Tagilsk, Perm, Russia.

**CYANOCHROITE.**  $\text{CuSO}_4 \cdot \text{K}_2\text{SO}_4 + 6\text{H}_2\text{O}$ . A hydrous copper and potassium sulphate, carrying 14.3% copper. Crystallization, monoclinic. Color, clear blue. Is an alteration product from Mt. Vesuvius.

**CYANOTRICHITE.**  $4\text{CuO} \cdot \text{Al}_2\text{O}_3 \cdot \text{SO}_4 \cdot 8\text{H}_2\text{O}$ . A hydrous basic copper and aluminum sulphate, carrying 39.4% copper. Crystallization, orthorhombic. Lustre, pearly. Color, smalt-blue to sky-blue. Occurrence, Hungary, France, Arizona and Utah.

**DARWINITE.** Whitneyite.

**DELAFOSSITE.** An iron, copper and aluminum oxide containing 37.9% copper, 47.99% iron sesquioxide and 3.52% aluminum sesquioxide. Occurrence, Ekaterinburg, Perm, Russia.

**DEMIDOVITE.** A phosphoriferous variety of chrysocolla from Tagilsk, Perm, Russia.

**DIGENITE.** Apparently a partly altered chalcocite containing a considerable percentage of covellite.

**DIHYDRITE.**  $5\text{CuO} \cdot \text{P}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$ . A hydrous basic copper phosphate containing 55.2% copper. Crystallization, monoclinic; also occurs massive and fibrous. Fracture, conchoidal to uneven. Tenacity, brittle. Hardness, 4.5 to 5. Gravity, 4 to 4.4. Lustre, adamantine. Color, dark emerald-green. Streak, pale emerald-green. Is translucent. Is soluble in nitric acid. Occurrence, Germany and the Ural Mountains of Russia.

**DILLENBURGITE.** An impure chrysocolla containing copper carbonate.

**DIOPTASE.**  $\text{CuO} \cdot \text{SiO}_4 \cdot \text{H}_2\text{O}$ . A hydrous copper silicate carrying 40.3% copper. Common names, emerald copper, emerald malachite. Crystallization, rhombohedral; also occurs massive. Fracture, conchoidal to uneven. Tenacity, brittle. Hardness, 5. Gravity, 3.28 to 3.35. Lustre, vitreous. Color, emerald-green. Streak, green. Is subtranslucent to transparent. Gelatinizes with hydrochloric acid. Is fusible with charcoal and soda. Occurrence, Chile, Hungary, Siberia, French Congo, Arizona, etc.

**DOGNACSKAITE.** Formula perhaps  $3\text{Cu}_2 \cdot 5\text{Bi}_2\text{S}_3$ . A variety of cuprobismutite carrying slightly less copper and sulphur and slightly more bismuth than the normal mineral.

**DOLEROPHANITE.**  $2\text{CuO} \cdot \text{SO}_4$ . A basic copper sulphate carrying 53.1% copper. Crystallization, monoclinic. Color, brown. Is soluble in nitric acid. Is a sublimation product from Mt. Vesuvius.

**DOMEYKITE.** Cu<sub>3</sub>As. A copper arsenide carrying 71.7% copper. Common name, arsenical copper. Structure, reniform and botryoidal, also massive and disseminated. Fracture, uneven. Hardness, 3 to 3.5. Gravity, 7.2 to 7.75. Lustre, metallic, dulling on exposure. Color, tin-white to steel gray, tarnishing to iridescence. Is fusible in open tube, yielding a white sublimate of arsenic trioxide. Is soluble in nitric acid. Occurrence, Chile, Bolivia, Saxony, Mexico and Lake Superior.

**DUCKTOWNITE.** Apparently merely a mechanical mixture of chalcocite and pyrite.

**DÜRFELDTITE.**  $3(\text{Pb}, \text{Ag}, \text{Cu}, \text{Mn}, \text{Fe})\text{S} \cdot \text{Sb}_2\text{S}_3$ . A lead, silver, copper, manganese and iron sulphobismuthite. Occurs in acicular crystals. Hardness, 2.5. Gravity, 5.4. Lustre, metallic. Color light gray. Is related to stylotypite. Found in Peru.

**EHLITE.**  $5\text{CuO} \cdot \text{P}_2\text{O}_5 \cdot 3\text{H}_2\text{O}$ . A hydrous basic copper phosphate con-

taining 52 to 55% copper. Is closely related to dihydrite and pseudomalachite. Gravity, 4.2 to 4.4. Occurrence, Cornwall, England and Nijni Tagil'sk, Perm, Russia.

**EMERALD COPPER.** Common name for dioptase.

**EMERALD MALACHITE.** Common name for dioptase.

**EMPLECTITE.**  $\text{Cu}_2\text{S} \cdot \text{Bi}_2\text{S}_3$ . A copper sulphobismuthite containing 18.9% copper and 62% bismuth. Crystallization, orthorhombic. Tenacity, brittle. Hardness, 2. Gravity, 6.3 to 6.5. Lustre, metallic. Color, tin-white. Occurrence, Chile, Saxony and Norway.

**ENARGITE.**  $3\text{Cu}_2\text{As}_2\text{S}_5$ . A copper sulphaarsenite containing 48.3% copper. Crystallization, orthorhombic; also occurs massive and granular. Fracture, uneven. Tenacity, brittle. Hardness, 3. Gravity, 4.45. Lustre, metallic. Color and streak, grayish black to iron-black. Is soluble in aqua regia and fusible on charcoal. Occurs in many copper fields, notably at Butte, Montana, where it is a common and valuable ore.

**EPIGENITE.** Formula probably  $4\text{Cu}_2\text{S} \cdot 3\text{FeS} \cdot \text{As}_2\text{S}_5$ . A copper and iron sulphaarsenite, carrying circa 41% copper. Crystallization, orthorhombic. Fracture, uneven. Hardness, 3.5. Lustre, metallic. Color, steel-gray. Streak, black. Is soluble in nitric acid. Occurrence, Wittichen, Baden, Germany.

**ERINITE.**  $5\text{CuO} \cdot \text{As}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$ . A hydrous basic copper arsenate, containing 47.8% copper. Occurs in mammilated concentric crystalline groups, also fibrous and rough. Tenacity, brittle. Hardness, 4.5 to 5. Gravity, 4.04. Lustre, slightly resinous. Color, emerald-green. Streak, grass-green. Is opaque to subtranslucent. Is soluble in nitric acid. Occurrence, Cornwall and Utah.

**ERYTHROCALCITE.**  $\text{CuCl} + n\text{H}_2\text{O}$ . A hydrated copper chloride. Is an alteration product from Mt. Vesuvius.

**EUCAIRITE.**  $\text{Cu}_2\text{Se} \cdot \text{Ag}_2\text{Se}$ . A silver and copper selenide carrying 25.3% copper and 43.1% silver. Crystallization, isometric; also occurs massive and granular. Hardness, 2.5. Gravity, 7.5. Lustre, metallic. Color, silver-white to lead-gray. Streak, shining. Occurrence, Småland, Sweden, and Copiapó, Chile.

**EUCHLORINE.** A compound of copper sulphate and cuprous chloride, from Mt. Vesuvius.

**EUCHROITE.**  $4\text{CuO} \cdot \text{As}_2\text{O}_5 \cdot 7\text{H}_2\text{O}$ . A hydrous basic copper arsenate, containing 39.7% copper. Crystallization, orthorhombic. Fracture, subconchoidal. Tenacity, brittle. Hardness, 3.5 to 4. Gravity, 3.39. Lustre, vitreous. Color, emerald-green to leek-green. Is translucent to transparent. Occurrence, Libethen, Hungary.

**FAHLORE.** Common name for tetrahedrite or tennantite.

**FALKENHAYNITE.**  $3\text{Cu}_2\text{S} \cdot \text{Sb}_2\text{S}_3$ . A copper sulphaantimonite carrying 39.5% copper. Apparently is related to stytotypite. Structure, massive. Gravity, 4.83. Color, gray-black. Occurrence, Joachimsthal, Bohemia, Austria.

**FAMATINITITE.**  $3\text{Cu}_2\text{S} \cdot \text{Sb}_2\text{S}_3$ . A copper sulphaantimonite carrying 42.2% copper. Crystallization, orthorhombic; is isomorphous with enargite;

also occurs massive. Fracture, uneven. Tenacity, brittle. Hardness, 3.5. Gravity, 4.57. Color, gray with copper-red tinge. Streak, black. Is fusible on charcoal. Decrepitates in closed tube. Occurrence, Sierra de Famatina, Rioja, Argentina and Cerro de Pasco, Junfn, Perù.

**FIELDITE.** A zinciferous variety of tetrahedrite.

**FOOTEITE.**  $8\text{Cu}(\text{OH})_2 \cdot \text{CuCl}_2 + 4\text{H}_2\text{O}$ . A hydrous basic copper oxychloride containing 55.3% copper. Is closely related to tallingite. Crystallization, monoclinic. Color, deep blue. Occurrence, Bisbee, Arizona.

**FOURNETITE.** Apparently merely a mechanical mixture of tetrahedrite and galena.

**FREDERICITE.** An argentiferous, plumbiferous and stanniferous variety of tennantite, from Sweden.

**FREIBERGITE.** An argentiferous tetrahedrite carrying variable percentages of silver as a replacement of the copper found in the normal tetrahedrite.

**FRIGIDITE.** A ferruginous and nickleiferous variety of tennantite.

**GERHARDITE.**  $4\text{CuO} \cdot \text{N}_2\text{O}_5 \cdot 3\text{H}_2\text{O}$ . A basic copper nitrate containing 52.9% copper. Crystallization, orthorhombic. Cleavage, yields flexible laminae. Tenacity, fragile and sectile. Hardness, 2. Gravity, 3.426. Lustre, vitreous, brilliant. Color, deep emerald-green. Streak, light green. Is transparent. Is soluble in dilute acids. Occurrence, Jerome, Arizona.

**GERSDORFFITE.** Empirically nickel sulphoarsenite, but occasionally slightly cupriferous.

**GLANCE.** Common name for sulphide ores with dark metallic lustre. Copper glance is chalcocite.

**GLASBACHITE.** Zorgite.

**GLAUCOPYRITE.** An iron and cobalt diarsenide, occasionally slightly cupriferous.

**GRAY COPPER.** Common name for tetrahedrite; name also is applied to tennantite, which shades into tetrahedrite.

**GREEN COPPER.** Common name for malachite.

**GRÜNAUITE.** An impure nickel sulphide (polydimite) carrying copper, lead, cobalt, iron and bismuth, copper ranging 1.68 to 11.56% in tenor in published assays.

**GUEJARITE.**  $\text{Cu}_2\text{S} \cdot 2\text{Sb}_2\text{S}_3$ . A copper sulphoantimonite containing 15.2% copper. Crystallization, orthorhombic. Tenacity, brittle. Hardness, 3.5. Gravity, 5.03. Lustre, metallic. Color, steel-gray, with bluish tinge. Streak, black. Occurrence, Andalusia, Spain.

**HARRISITE.** A pseudomorph of chalcocite after galena.

**HENWOODITE.** Chemical formula uncertain. A hydrous aluminum and copper phosphate carrying circa 5.6% copper. Occurs in botryoidal globular masses. Fracture, conchoidal. Hardness, 4.4 to 4.5. Gravity, 2.67. Color, turquoise-blue. Streak, bluish to greenish white. Occurs in Cornwall, England.

**HERMESITE.** An imperfectly established variety of schwartzite.

**HERRENGRUNDITE.**  $\text{CaO} \cdot 4\text{CuO} \cdot 2\text{SO}_3 \cdot 6\text{H}_2\text{O}$ . A hydrous basic cop-

per and calcium sulphate carrying 39.5% copper. Is related to brochantite. Crystallization, monoclinic. Tenacity, rather brittle. Hardness, 2.5. Gravity, 3.18. Lustre, vitreous. Color, emerald-green to bluish-green. Streak, light green. Is transparent. Occurrence, Herrengrund, Hungary.

**HOMICHLINITE.** Chemical formula uncertain. A copper and iron sulphide carrying circa 43.8% copper. Apparently is chalcopyrite partly altered to bornite, and close to barnhardtite. Crystallization, tetragonal; also occurs massive. Hardness, 4 to 5. Gravity, 4.48. Color, brassy bronze. Streak, black. Occurrence, Chile, Germany, Japan, etc.

**HORSEFLESH ORE.** Common name for bornite.

**HORSFORDITE.** Cu<sub>3</sub>Sb. A copper antimonide carrying 76% copper. Structure, massive. Is brittle. Hardness, 4 to 5. Gravity, 8.8. Lustre, metallic. Color, silver-white, tarnishing easily. Is said to occur in large deposits on the Island of Mitylene, Asia Minor.

**HYDROCLIANITE.** CuO·SO<sub>3</sub>. A copper sulphate carrying 39.6% copper. Crystallization, orthorhombic. Is soluble in water. Is an alteration product from Mt. Vesuvius.

**HYDROCUPRITE.** Apparently a hydrated cuprite. Is amorphous, occurring in very thin coatings on magnetite. Color, orange-red to orange-yellow. Found at Schapbach, Baden, Germany, and at Cornwall, Pennsylvania.

**INDIGO COPPER.** Common name for covellite.

**ISOPYRE.** Apparently an impure opal, carrying about 1.6% copper, found at St. Just, Cornwall, England.

**JALPAITE.** 3Ag<sub>2</sub>S·Cu<sub>2</sub>S. A silver and copper sulphide, carrying 13.1% copper and 71.5% silver. Apparently is a cupriferous argentite. Crystallization, isometric. Tenacity, malleable. Gravity, 6.89. Color, blackish lead-gray. Occurrence, Jalpa, Mexico.

**JAMESONITE.** A lead sulphoantimonite, sometimes cupriferous to the extent of about 3.5%.

**JOHANNITE.** Chemical formula uncertain. A hydrous uranum and copper sulphate, containing circa 4.8% copper. Crystallization; monoclinic. Hardness, 2 to 2.5. Gravity, 3.19. Lustre, vitreous. Color, emerald-green to apple-green. Streak, paler green. Is translucent to transparent. Taste, bitter. From Joachimsthal, Bohemia.

**JULIANITE.** A slightly argentiferous and ferruginous variety of tennantite, from Silesia, Germany.

**KAMAREZITE.** (CuOH)<sub>2</sub>SO<sub>4</sub>·Cu(OH)<sub>2</sub>·+6H<sub>2</sub>O. A hydrated copper sulphate. Crystallization, probably orthorhombic. Occurrence, Laurium, Greece.

**KARAMSINITE.** Chemical formula uncertain. As determined is a weird silicate of aluminum, iron, manganese, copper, calcium, magnesium and potassium, containing circa 1.85% copper. Occurrence, Finland.

**KEEWEENAWITE.** (Cu,Ni)<sub>2</sub>As. A copper and nickel arsenide, related to mohawkite, carrying 39 to 54% copper and 9.7% to 20% nickel, with cobalt replacing nickel to extent of about 0.9%. Structure, massive. Cleavage, subconchoidal. Fracture, uneven. Tenacity, slight. Hardness, 4. Gravity, 7.7. Lustre, metallic. Color, pale red, tarnishing to

darker red. Is soluble in nitric acid. Occurrence, Mohawk mine, Keweenaw county, Michigan.

**KLAPROTHOLITE.**  $3\text{Cu}_2\text{S} \cdot 2\text{Bi}_2\text{S}_3$ . A copper sulphobismuthite containing 25.3% copper and 55.4% bismuth. Crystallization, orthorhombic. Fracture, uneven. Tenacity, brittle. Hardness, 2.5. Gravity, 4.6. Lustre, metallic. Color, steel-gray, tarnishing to iridescent brass-yellow. Occurrence, Baden, Germany.

**KOBELLITE.** A lead sulphoantimonite, usually cupriferous to the extent of about 1%.

**KRÖHNKITE.**  $\text{CuSO}_4 \cdot \text{Na}_2\text{SO}_4 + 2\text{H}_2\text{O}$ . A hydrous copper and sodium sulphate carrying 18.8% copper. Crystallization, monoclinic. Fracture, conchoidal. Hardness, 2.5. Gravity, 1.98. Lustre, vitreous. Color, azure-blue. Occurrence, Cobija, Atacama, Chile.

**LAMPADITE.** A cupriferous wad containing 3 to 15% copper.

**LANGITE.**  $4\text{CuO} \cdot \text{SO}_4 \cdot 4\text{H}_2\text{O}$ . A hydrous basic copper sulphate containing 53% copper. Is closely related to brochantite. Crystallization, orthorhombic. Hardness, 2.5 to 3. Gravity, 3.5. Lustre, vitreous on crystals, silky on crusts. Color, greenish blue. Is translucent. Occurrence, Cornwall, England.

**LAUTITE.** An imperfectly determined copper sulphoarsenite, of the enargite family, from Marienberg, Saxony.

**LAVENDULAN.** Chemical formula probably  $3(\text{Cu}, \text{Co}, \text{Ni})\text{O} \cdot \text{As}_2\text{O}_3 + 3\text{H}_2\text{O}$ . A hydrous copper, cobalt and nickel arsenate, containing about 32% copper, 2.5% cobalt monoxide and 1.35% nickel monoxide. Is related to trichalcite. Structure, amorphous. Fracture, conchoidal. Hardness, 2.5 to 3. Gravity, 3.01. Lustre, greasy to vitreous. Color, lavender blue. Streak, pale lavender blue. Diaphaneity, translucent. Is soluble in warm hydrochloric acid. Occurrence, Chile and Saxony.

**LAXMANNITE.** Vauquelinite.

**LEPIDOPHAEITE.** A varietal form of lampadite.

**LETTSONITE.** Cyanotrichite.

**LEUCOCHALCITE.**  $4\text{CuO} \cdot \text{As}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ . A hydrous acidic copper arsenate, carrying about 39.8% copper. Structure, acicular. Lustre, silky. Color, light greenish white.

**LIBETHENITE.**  $4\text{CuO} \cdot \text{P}_2\text{O}_5 \cdot \text{H}_2\text{O}$ . A hydrous copper phosphate carrying 51.1% copper. Common name, copper phosphate. Crystallization, orthorhombic. Fracture, subconchoidal to uneven. Tenacity, brittle. Hardness, 4. Gravity, 3.6 to 3.8. Lustre, resinous. Color and streak, olive-green. Diaphaneity, subtranslucent. Is soluble in nitric acid. Occurrence, Chile, Bolivia, England, Germany and Hungary.

**LILIANITE.** A lead sulphobismuthite, sometimes cupriferous to the extent of about 1.5%.

**LIME-MALACHITE.** Apparently merely a malachite carrying gypsum or calcite, or both, as impurities.

**LINARITE.**  $\text{PbO} \cdot \text{CuO} \cdot \text{SO}_4 \cdot \text{H}_2\text{O}$ . A basic lead and copper sulphate carrying 15.8% copper and 55.7% lead oxide. Crystallization, monoclinic. Fracture, conchoidal. Tenacity, brittle. Hardness, 2.5. Gravity, 5.3 to

**5.45.** Lustre, vitreous to adamantine. Color, deep azure-blue. Streak, pale blue. Diaphaneity, translucent. Occurs in many lead and copper districts.

**LINDACKERITE.** Chemical formula probably  $3\text{NiO} \cdot 6\text{CuO} \cdot \text{SO}_4 \cdot 2\text{As}_2\text{O}_3 \cdot 7\text{H}_2\text{O}$ . A hydrous copper and nickel sulphoarsenate containing 27.8% copper. Crystallization, orthorhombic. Hardness, 2 to 2.5. Gravity, 2 to 2.5. Lustre, vitreous. Color, verdigris-green to apple-green. Streak, pale green to white.

**LINNAEITE.** A cobalt sulphide in which cobalt frequently is replaced partially by nickel, iron or copper, latter to the extent of 1 to 8%.

**LIROCONITE.**  $18\text{CuO} \cdot 4\text{Al}_2\text{O}_3 \cdot 5\text{As}_2\text{O}_3 \cdot 55\text{H}_2\text{O}$ . A hydrous basic copper and aluminum arsenate carrying 28.7% copper. Crystallization, monoclinic; also occurs rarely, granular. Cleavage, subconchoidal. Is imperfectly sectile. Hardness, 2 to 2.5. Gravity, 2.88 to 2.98. Lustre, vitreous. Color and streak, sky-blue to verdigris-green. Is soluble in nitric acid. Occurrence, Hungary and Cornwall, England.

**LITHIDIONITE.** A copper, iron, potassium and sodium silicate carrying circa 5.2% copper. Is an alteration product from Mt. Vesuvius.

**LUNNITE.** A name proposed for dihydrite, pseudomalachite and their varietal forms.

**LUZONITE.** A dimorphous form of enargite, found in the Mancayan-Sayoc district, Lepanto, Luzon, Philippines.

**LYELLITE.** Langite.

**MALACHITE.**  $2\text{CuO} \cdot \text{CO}_2 \cdot \text{H}_2\text{O}$ . A basic copper carbonate carrying 57.5% copper. Common names, green copper carbonate, basic cupric carbonate. Crystallization, monoclinic. Commonly massive, but frequently encrusting and sometimes granular or earthy, and disseminated as stains. Fracture, subconchoidal to uneven. Tenacity, brittle. Hardness, 3.5 to 4. Gravity, 3.9 to 4.03. Lustre, of crystals, adamantine, frequently with concretionary bands of varying shades from pistachio-green to bluish green. Streak, green. Is opaque to translucent. Is soluble in nitric acid. Occurs in most copper districts, in the upper portions of the oxidized zones of ore bodies, and frequently is an important commercial ore. When massive and beautifully marked is a semi-precious stone, used for table tops, etc.

**MALINOWSKITE.** A plumbiferous and usually argentiferous variety of tennantite.

**MARCYLITE.** An imperfectly determined alteration product from copper sulphides, consisting of hydrated copper oxides and sulphides. Occurrence, Peru and Arkansas, U. S. A.

**MARSHITE.**  $\text{Cu}_2\text{I}_4$ . A copper iodide containing 33.4% copper. Crystallization, tetragonal. Fracture, subconchoidal. Tenacity, brittle. Lustre, adamantine. Color, oil-brown. Streak, orange-yellow. Is translucent. Occurrence, Broken Hill mines, New South Wales, Australia.

**MELACONITE.** Tenorite.

**MELANOCHALCITE.**  $\text{Cu}_2(\text{Si}_2\text{C})\text{O}_4 \cdot \text{Cu}(\text{OH})_2$ . A copper silicate containing 61.4% copper. Structure, amorphous or cryptocrystalline, habit of crystals being undetermined. Hardness, 4. Gravity, 4.14. Lustre, vitreous. Color, jet black, powder is coffee-brown. Fine particles are translucent under high power of microscope, light passing through as yellowish brown.

Is decomposed by dilute hydrochloric acid, even a 3% solution changing a fragment into a white silicious mass retaining the original outlines, only cupric chloride being produced. Heated in a closed tube loses water and carbon dioxide, and powder changes in color from coffee-brown to brownish black. Heated with borax gives the sky-blue color of copper. With salt of phosphorous gives a skeleton of silica on the blue glass.  $\text{SiO}_2$  and  $\text{CO}_2$  replace each other within certain limits. From this fact, and the behavior of the mineral under dilute hydrochloric acid, it is deduced by Dr. Geo. A. Koenig, the discoverer, that there exists in it a compound orthoacid,  $\text{H}_4(\text{Si},\text{C})\text{O}_4$ , with the hydrogen replaced by copper. Viewed in this light melanochalcite represents the basic copper salt of the orthoacid. Occurs in the Calumet & Arizona mine, Bisbee, Arizona, the mineral surrounding cuprite as a black band, and being overlaid, in turn, by chrysocolla and malachite.

**MELANOTHALLITE.** Chemical formula probably  $\text{CuCl}_2 \cdot \text{CuO} \cdot 2\text{H}_2\text{O}$ . A copper oxychloride. Is an alteration product of Mt. Vesuvius.

**MIARGYRITE.** A silver sulphoantimonite, frequently cupriferous to the extent of one-half to one per cent.

**MIXITE.** Chemical formula probably  $20\text{CuO} \cdot \text{Bi}_2\text{O}_3 \cdot 5\text{As}_2\text{O}_5 \cdot 22\text{H}_2\text{O}$ . A hydrated basic copper arsenobismuthite, carrying 35.2% copper. Occurs in acicular crystals. Hardness, 3 to 4. Gravity, 3.79. Color, whitish green to emerald-green or bluish green. Streak, lighter green. Is translucent, and, in fine particles, transparent. Occurrence, Baden, Germany, and Utah.

**MOKAWKITE.**  $(\text{Cu}, \text{Ni}, \text{Co})_2\text{As}$ . A copper, nickel and cobalt arsenide, carrying 63 to 69% copper, 3 to 7% nickel and 0.5 to 2% cobalt, usually somewhat argentiferous. Crystallization, hexagonal, by synthesis, no crystals being found in nature. Cleavage, indistinct. Fracture, uneven. Tenacity, slight. Hardness, 4. Gravity, 8.05. Color, light gray on fresh fractures, tarnishing to purple or brassy yellow. Streak, gray. Is soluble in nitric acid. Occurrence, Mohawk mine, Keweenaw county, Michigan.

**MOHAWK-WHITNEYITE.**  $\text{Cu}_4\text{As}$ . A copper arsenide, carrying 83 to 87% copper. Is a mere name of convenience for an intimate blending of mohawkite and whitneyite, or keweenawite and whitneyite, indistinguishable to the eye but determined chemically. Cleavage, none. Fracture, hackly. Tenacity, is malleable, to only a slightly less extent than copper. Hardness, about 5. Gravity, 8.6. Color, gray, with a yellowish tinge, tarnishing to coffee-brown. Streak, gray. Is soluble in nitric acid, with a small residue of gray powder. Occurrence, at Mohawk mine, Keweenaw county, Michigan.

**MOTTRAMITE.** Chemical formula undetermined. A hydrous basic lead and copper vanadate containing about 16.3% copper. Is very closely related to psittacinite.

**MOUNTAIN BLUE.** Common name for azurite.

**MOUNTAIN GREEN.** Common name for malachite. Name sometimes is applied to chrysocolla also.

**MYSORIN.** An impure malachite from Mysore, India.

**NAMAQUALITE.** Chemical formula probably  $2\text{CuO} \cdot \text{Al}_2\text{O}_5 \cdot 4\text{H}_2\text{O}$ . A hydrated copper and aluminum oxide, carrying 35.8% copper. Occurrence, Little Namaqualand, Cape Colony.

**NANTOKITE.** Cu<sub>2</sub>Cl<sub>4</sub>. A copper chloride, carrying 84.1% copper. Crystallization, isometric; also occurs massive and granular. Cleavage, cubic. Fracture, conchoidal. Hardness, 2 to 2.5. Gravity, 3.9. Lustre, adamantine. Color, grayish white to colorless. Is translucent to transparent. Is soluble in nitric or hydrochloric acids, and in ammonia. Yields chlorine when sharply struck. Oxidizes readily on exposure to atmosphere. Occurrence, Carmen Bajo mine, Chile, and Broken Hill mines, New South Wales.

**OCTAHEDRAL COPPER ORE.** Common name for cuprite.

**OLIVE GREEN COPPER ORE.** Common name for olivenite.

**OLIVENITE.** 4CuO·As<sub>2</sub>O<sub>5</sub>·H<sub>2</sub>O. A hydrous basic copper arsenate, carrying 44.8% copper. Common name, olive green copper ore. Crystallization, orthorhombic, with prismatic and acicular crystals; also occurs globular and granular. Fracture, conchoidal to uneven. Tenacity, brittle. Hardness, 3. Gravity, 4.1 to 4.4. Lustre, adamantine to vitreous. Color, olive-green to blackish green. Is opaque to subtransparent. Is soluble in nitric acid. Occurrence, Nijni Tagilsk, Perm, Russia, Cornwall and Devon, England, Chile, Utah, etc.

**ORILEYITE.** (Cu, Fe)<sub>2</sub>(As, Sb)<sub>3</sub>. A copper and iron arsenoantimonite, carrying 12.13% copper. Is related to stibiodomeykite. Structure, massive. Hardness, 5.5. Gravity, 7.4. Lustre, metallic. Color, steel-gray, with purplish tinge on fresh fracture. Streak, dark gray. Occurrence, Burmah.

**PAREMELACONITE.** CuO. A copper oxide carrying 79.3% copper. Is a dimorphous form of melaconite. Crystallization, tetragonal. Hardness, 5. Gravity, 5.83. Lustre, brilliant. Color, purplish black on faces, pitch-black on fractures. Occurrence, with footeite, at Bisbee, Arizona.

**PARTZITE.** Chemical formula undetermined. A hydrous copper antimonite, carrying circa 28.7% copper. Fracture, conchoidal. Hardness, 3 to 4. Gravity, 3.8. Color, yellowish green to blackish green. Occurrence, Mono county, California.

**PEACOCK ORE.** Common name for bornite. Sometimes is applied also to chalcopyrite when showing an iridescent tarnish.

**PEARCEITE.** Chemical formula probably 9(Ag,Cu)S·As<sub>2</sub>S. A silver and copper sulphoantimonite. Crystallization, rhombohedral; also occurs massive. Cleavage, none. Fracture, conchoidal. Tenacity, brittle. Hardness, 3. Gravity, 6.125. Lustre, metallic. Color and streak, black. Occurrence, Aspen, Colorado.

**PELOCONITE.** A varietal form of lampadite.

**PENTLANDITE.** An iron and nickel sulphide carrying up to 1.75% copper.

**PERCYLITE.** Chemical formula probably PbCuO·Cl<sub>2</sub>·H<sub>2</sub>O. A hydrous lead and copper oxychloride carrying circa 17% copper. Crystallization, isometric. Hardness, 2.5. Color and streak, sky-blue. Occurrence, Chile, Bolivia, South Africa and Mexico.

**PHILLIPITE.** CuSO<sub>4</sub>·Fe<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·+nH<sub>2</sub>O. A hydrous copper and iron sulphate, carrying 11.5% copper. Structure, granular and fibrous. Lustre, vitreous. Color, azurine-blue. Diaphaneity, translucent. Taste, astringent. Is soluble in water. Occurrence, Los Condes, Santiago de Chile.

**PHOSPHOROCHALCITE.**  $6\text{CuO} \cdot \text{P}_2\text{O}_5 \cdot 3\text{H}_2\text{O}$ . A hydrous basic copper phosphate, closely related to dihydrite and pseudomalachite.

**PHOSPHOCROMITE.** Vauquelinite.

**PILARITE.** An aluminous variety of chrysocolla, from Chile.

**PISANITE.**  $(\text{Fe},\text{Cu})\text{SO}_4 + ?\text{H}_2\text{O}$ . A hydrous iron and copper sulphate, carrying variable percentages of copper. Practically is a cupriferous melanterite, or copperas. Crystallization, monoclinic. Lustre, vitreous. Color, bright blue. Occurrence, Italy and Turkey.

**PLANERITE.** A hydrous aluminum, copper and iron phosphate, carrying circa 2.8% copper. Occurrence, Gumishevsk, Perm, Russia.

**PLUMBOCUPRITE.** Cuproplumbite.

**PLUSH COPPER ORE.** Common name for cuprite.

**POLYBASITE.**  $9(\text{Ag},\text{Cu})\text{S} \cdot \text{Sb}_2\text{S}_3$ . A silver and copper sulphoantimonite carrying 3 to 10% copper and 62 to 72% silver. Crystallization, orthorhombic. Fracture, uneven. Hardness, 2 to 3. Gravity, 6 to 6.2. Lustre, metallic. Color, iron-black, in thin splinters cherry-red. Streak, black. Is nearly opaque. Occurrence, Guanajuato, Mexico, Colorado, etc.

**PRASINE.** A varietal form of dihydrite, containing alumina, silica and arsenic in small amounts, apparently merely as impurities.

**PSEUDOBROLEITE.** Cumengite.

**PSEUDOLIBETHENITE.** Libethenite.

**PSEUDOMALACHITE.**  $6\text{CuO} \cdot \text{P}_2\text{O}_5 \cdot 3\text{H}_2\text{O}$ . A hydrous basic copper phosphate containing 53.5% copper. Is closely related to dihydrite, but has one extra unit each of cupric oxide and water. Structure, massive, reniform and botryoidal. Hardness, 4.5 to 5. Gravity, 3.4 to 4.4. Lustre, vitreous. Color, emerald-green to blackish green. Streak, paler green.

**PSITTACINITE.** Chemical formula probably  $4(\text{Pb}, \text{Cu}) \cdot \text{V}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$ . A hydrous basic lead and copper vanadate, containing circa 15.4% copper. Structure, pulverulent. Color, olive-green. Occurrence, Argentina and Montana.

**PURPLE COPPER ORE.** Common name for bornite.

**PYRITES OF COPPER.** Common name for chalcopyrite.

**RABDIONITE.** Chemical formula uncertain. A hydrated iron, manganese and copper oxide, containing 11.2% copper. Is very soft. Gravity, 2.8. Lustre, dull. Color, black. Streak, dark brown. Occurrence, Nijni Tagilsk, Perm, Russia.

**RAHTITE.** An impure cupriferous sphalerite.

**RAMIRITE.** Cuprodescloizite.

**RED COPPER ORE.** Common name for cuprite.

**RED GLASSY COPPER ORE.** Common name for cuprite.

**REDRUTHITE.** Chalcocite.

**REGNOLITE.**  $5\text{CuS} \cdot \text{FeS} \cdot \text{ZnS} \cdot \text{As}_2\text{S}_3$ . A copper, iron and zinc sulphoarsenite containing 32.6% copper. Is closely related to sandbergerite. Crystallization, tetragonal. Occurrence, Cajamarca, Perú.

**RESANITE.** Chemical formula uncertain. A hydrous copper and iron silicate, containing circa 18.5% copper. Structure, massive. Color, olive-

green. Is soluble in hydrochloric acid. Occurrence, Luquillo, Porto Rico, associated with chrysocolla and malachite.

**REZBANYITE.** A lead sulphobismuthite, usually cupriferous to the extent of 1.75 to 3.75%.

**RICHMONDITE.** A cupriferous variety of beegerite, which is, normally, a lead sulphobismuthite.

**RICKARDITE.** Cu<sub>2</sub>Te·2CuTe. A copper telluride containing 40.5% copper. Structure, massive. Fracture, irregular. Hardness, 3.5. Gravity, 7.54. Color, brilliant purple, rivaling bornite tarnish, even on a fresh fracture, and showing deep color when pulverized. Is fusible on charcoal and soluble in nitric acid. Occurrence, Good Hope mine, Vulcan, Colorado.

**RIONITE.** A bismuthiferous variety of tennantite.

**RIVOTITE.** Chemical formula uncertain. A copper and antimony carbonate carrying circa 31.6% copper. Structure, amorphous, compact. Fracture, uneven. Tenacity, fragile. Hardness, 3.5 to 4. Gravity, 3.55 to 3.62. Color, yellowish green to grayish green. Streak, grayish green. Occurrence, Lerida, Spain.

**RUBY COPPER.** Common name for cuprite.

**SAFFLORITE.** A cobalt diarsenide, usually cupriferous to the extent of 0.25 to 4.25%.

**SALVADORITE.** FeSO<sub>4</sub>·7H<sub>2</sub>O·2(CuSO<sub>4</sub>)·7H<sub>2</sub>O. A hydrous copper and iron sulphate carrying circa 14.5% copper. Is near pisanite. Crystallization, monoclinic. Lustre, vitreous. Color, bluish green. Occurrence, Calama, Antofagasta, Chile.

**SANDBERGERITE.** A ferruginous, plumbiferous and zinciferous variety of tennantite, from Peru.

**SCHULZENITE.** Chemical formula probably CuO·2CoO·Co<sub>2</sub>O<sub>3</sub>·4H<sub>2</sub>O. A hydrous copper and cobalt oxide. Structure, amorphous. Fracture, conchoidal. Hardness, 3.5. Gravity, 3.39. Color and streak, black. Occurrence, Chile.

**SCHWATZITE.** A mercurial tetrahedrite, in which mercury replaces copper variably, usually to the extent of about 15% of the total. Gravity, 5.10. Lustre, dull. Color, dark gray to iron-black.

**SERPIERITE.** 3(Cu,Zn,Ca)SO<sub>4</sub>·3H<sub>2</sub>O. A hydrous basic copper, zinc and calcium sulphate, containing 28.8% copper. Crystallization, orthorhombic. Color, bluish green. Is transparent. Occurrence, Laurium, Greece.

**SIEGENITE.** A nickeliferous variety of linnæite, frequently carrying small percentages of copper.

**SMALTITE.** Empirically cobalt disulphide, but frequently carrying copper in quantities from a mere trace to 3.25%.

**SOMERVILLITE.** CuSiO<sub>4</sub>·4H<sub>2</sub>O. A hydrous copper silicate, corresponding in formula with chrysocolla and asperolite, except as to excess of water. From Somerville, Somerset county, New Jersey.

**SPANGOLITE.** Chemical formula probably (AlCl)<sub>3</sub>SO<sub>4</sub>·6Cu(OH)<sub>2</sub>·3H<sub>2</sub>O. A basic copper and aluminum chlorosulphate, carrying circa 47.7% copper. Crystallization, rhombohedral. Fracture, conchoidal. Hardness, 2 to 3.

**Gravity**, 3.14. **Lustre**, vitreous. **Color**, dark green. **Occurrence**, Cochise county, Arizona.

**SPANIOLITE**. An imperfectly established variety of schwartsite.

**STANNITE**. Chemical formula probably  $Cu_2S \cdot FeS \cdot SnS_2$ . A copper, iron and tin sulphide, containing 29.5% copper, 13.1% iron and 27.5% tin. Structure, massive, granular and disseminated. Cleavage, cubic, indistinct. Fracture, uneven. Tenacity, brittle. Hardness, 4. Gravity, 4.3 to 4.5. Lustre, metallic. Color, steel-gray when pure, ranging to iron-black when impure, latter with bluish to yellowish tarnish. Streak, blackish. Occurrence, County Wicklow, Ireland, and Cornwall, England.

**STELZUERITE**. Chemical formula uncertain. A basic copper sulphate, closely related to brochahtite. Crystallization, orthorhombic. Hardness, 3.5 to 4. Gravity, circa 3.9. Lustre, vitreous. Color, dark emerald-green to blackish green. Streak, lighter green. Is translucent to transparent. Occurrence, Chile, associated with brechantite and atacamite, and frequently mistaken for both.

**STETEFELDTITE**. A hydrous copper antimonite, carrying circa 12.8% copper. Structure, massive. Hardness, 3.5 to 4.5. Gravity, 4.12 to 4.24. Color, brown to blackish. Streak, shining. Occurrence, Nevada.

**STIBIODOMEYKITE**.  $Cu_2(As,Sb)$ . A copper arsenoantimonite containing circa 65% copper. Apparently is an antimonial domeykite. Crystallization, hexagonal in synthetic crystals, none being found in nature. Cleavage, none. Fracture, uneven. Tenacity, very slight. Hardness, 4. Gravity, 8.1. Lustre, metallic. Color, gray, with yellowish tinge, like domeykite. Streak, gray. Is soluble in nitric acid, with small residue of gray powder. Occurrence, Mohawk mine, Keweenaw county, Michigan.

**STYLOTTYPITE**.  $3(Cu,Ag,Fe)S \cdot Sb_2S_3$ . A copper, silver and iron sulphobismuthite carrying 28.3% copper and 8.1% silver. Apparently is an argentiferous and ferruginous bournonite. Crystallization, orthorhombic. Fracture, imperfectly conchoidal. Tenacity, brittle. Hardness, 3. Gravity, 4.8. Lustre, metallic. Color, iron-black. Streak, black. Occurrence, Copiapó, Chile.

**STROMEYERITE**.  $(Ag,Cu)_2S$ . A silver and copper sulphide, carrying 31.1% copper and 53.1% silver. Crystallization, orthorhombic. Fracture, subconchoidal. Hardness, 2.5 to 3. Gravity, 6.15 to 6.3. Lustre, metallic. Color and streak, dark steel-gray. Occurrence, Chile, Perú, Siberia, Colorado, etc.

**STÜBELITE**. Chemical formula undetermined. A hydrous manganese, copper, iron and aluminum silicate, carrying circa 12% copper. Structure, massive, reniform and botryoidal. Fracture, conchoidal. Tenacity, brittle. Hardness, 4 to 5. Gravity, 2.22 to 2.26. Lustre, vitreous, brilliant. Color, velvet-black to pitch-black. Streak, dark brown.

**STUDERITE**. A varietal form of tennantite containing, as partial replacement of normal copper content, silver, lead, zinc and iron.

**SUB-OXIDE OF COPPER**. Cuprite in mineralogy; cuprous oxide in chemistry.

**SYCHNODYMITE**.  $(Co,Cu,Ni)_2S$ . A cobalt, copper and nickel sulphide, containing circa 14.5% copper. Crystallization, isometric. Gravity,

**4.75.** Lustre, metallic. Color, steel-gray. Is soluble in nitric acid. Occurrence, Eiserfeld, Siegen, Germany.

**TAGILITE.**  $4\text{CuO.P}_2\text{O}_5.3\text{H}_2\text{O}$ . A hydrous basic copper phosphate containing 49.4% copper. Crystallization, monoclinic; also occurs in spheroidal concretions with structure fibrous to earthy. Fracture, uneven. Tenacity, brittle. Hardness, 3 to 4. Gravity, 4.08. Lustre, vitreous. Color, verdigris-green to emerald-green. Diaphaneity, subtranslucent. Is soluble in nitric acid. Occurrence, Coquimbo, Chile and Nijni Tagilsk, Perm, Russia.

**TALLINGITE.** Chemical formula, probably  $\text{Cu}_4(\text{OH})_6\text{Cl}_2 + 4\text{H}_2\text{O}$ . A hydrated copper oxychloride containing circa 64% copper. Structure, sub-crystalline. Hardness, 3. Gravity, circa 3.5. Color, greenish blue. Streak, white. Is subtranslucent. Occurrence, Botallack, mine, Cornwall, England.

**TARGIONITE.** Apparently merely an impure galena carrying circa one per cent each of copper, silver and zinc, from Tuscany, Italy.

**TENNANTITE.**  $4\text{Cu}_3\text{SAs}_2\text{S}_3$ . A copper sulphaarsenite containing 57.5% copper when pure, but shading into a great number of varietal forms. Common name, gray copper ore, in common with tetrahedrite, to which tennantite is closely related and joined by a chain of rather obscure minerals shading gradually from tennantite into tetrahedrite. The many varietal forms of this mineral are brought about by partial replacement of copper by silver, lead, zinc, iron, mercury, cobalt, nickel, tin and platinum, with a marked tendency toward mutual substitution of the antimony of tetrahedrite for the arsenic of tennantite, and vice versa, rendering the tetrahedrite-tennantite group unusually prolific. Crystallization, isometric; also occurs massive and granular, compact. Cleavage, none. Fracture, subconchoidal. Tenacity, brittle. Hardness, 3.5 to 4.5. Gravity, 4.4 to 5.1. Lustre, metallic. Color and streak, flint-gray to iron-black. Diaphaneity, opaque to subtranslucent in small splinters. Is soluble in nitric acid and fusible on charcoal. Occurrence, at numerous points, being found in greater or less profusion in most copper districts. Is not regarded usually as a commercial ore, except where argentiferous, which is quite commonly the case.

**TENORITE.**  $\text{CuO}$ . A copper oxide, containing 79.8% copper. Common names, black copper, black oxide of copper. Chemical names, copper monoxide, copper peroxide, cupric oxide. Crystallization, monoclinic; also occurs massive, pulverulent and earthy. Fracture, conchoidal to uneven. Hardness, 3 to 4. Gravity, 5.8 to 6.25. Lustre, metallic. Color, dull grayish-black when massive, steel-gray in flakes. Is soluble in nitric and hydrochloric acids. Is found in most copper districts, and is a valuable ore of copper when occurring in quantities, but much of what has been considered tenorite in the past really was chalcocite, for which it is easily mistaken when disseminated.

**TETRAHEDRITE.**  $4\text{Cu}_3\text{S}. \text{Sb}_2\text{S}_3$ . A copper sulphaantimonite containing 52.1% copper. Shades into tennantite, which see, for reference to protean forms of these two closely related and frequently indistinguishable minerals. Common name, gray copper ore. Crystallization, isometric; also occurs massive and granular, coarse to fine, compact. Cleavage, none. Fracture, subconchoidal to uneven. Tenacity, brittle. Hardness, 3.5 to 4.5. Gravity, 4.4 to 5.1. Lustre, metallic, brilliant. Color, flint-gray to

iron-black. Streak, grayish-brown to cherry-red. Opaque in quantity, but occasionally subtranslucent in very thin splinters, giving cherry-red transmitted light. Is soluble in nitric acid and fusible on charcoal. Occurrence, in most copper districts, but commonly is not regarded as a commercial ore, except when argentiferous, which frequently is the case.

**THROMBOLITE.** An imperfectly determined hydrous copper antimonate, carrying circa 31.5% copper. Structure, amorphous. Color, emerald-green. Occurrence, Rezbánia, Hungary.

**TIEMANNITE.** An imperfectly determined silver, mercury and copper selenide, carrying circa 8.8% copper. Occurrence, with eucairite and umangite, in the Sierra de Umango, Rioja, Argentina.

**TORBERNITE.**  $\text{CuO} \cdot 2\text{UO}_3 \cdot \text{P}_2\text{O}_5 \cdot \text{H}_2\text{O}$ . A hydrous uranium and copper phosphate, carrying 6.9% copper. Common name, uranium mica. Crystallization, tetragonal. Cleavage, micaceous, with brittle laminae. Hardness, 2 to 2.5. Gravity, 3.4 to 3.6. Lustre, pearly on cleavage planes and subadamantine on other faces. Color, emerald-green to grass-green. Streak, apple-green. Diaphaneity, translucent to transparent. Is soluble in nitric acid. Occurrence, Cornwall, Saxony, etc.

**TRICHALCITE.**  $3\text{CuO} \cdot \text{As}_2\text{O}_4 + 5\text{H}_2\text{O}$ . A hydrous copper arsenate containing 34% copper. Structure, in radiated groups, columnar, also dendritic. Hardness, 2.5. Lustre, silky. Color, verdigris-green. Is soluble in hydrochloric acid. Occurrence, Russia.

**TRIPPKEITE.** ( $n\text{CuO} \cdot \text{As}_2\text{O}_4$ ) A copper arsenite. Crystallization, tetragonal. Color, bluish-green. Is soluble in acids. Occurrence, Copiapó, Chile, in druses.

**TRITOCHORITE.** Cuprodescloizite.

**TURQUOISE.** A gemstone, essentially a hydrous aluminum phosphate, colored by 2 to 6% of copper, which probably is included as a hydrous basic copper phosphate.

**TYROLITE.**  $\text{CuO} \cdot \text{As}_2\text{O}_5 \cdot 9\text{H}_2\text{O}$ . A hydrous basic copper arsenate carrying 40.1% copper. Crystallization, orthorhombic. Cleavage, micaceous. Tenacity, highly sectile and flexible in thin laminae. Hardness, 1 to 1.5. Gravity, 3.02 to 3.1. Lustre, pearly to vitreous. Color, verdigris-green to apple-green. Diaphaneity, subtranslucent to translucent. Occurrence, Liebenthal, Hungary, Utah, etc.

**UMANGITE.**  $\text{Cu}_2\text{Se}_2$ . A copper selenide containing 54.6% copper. Structure, massive. Cleavage, none. Fracture, subchonoidal to uneven. Hardness, 3. Gravity, 5.62. Lustre, metallic. Color, dark cherry-red, with violet tinge on fresh fracture, soon tarnishing to violet-blue. Streak, black. Occurrence, with tiemannite and eucairite, in the Sierra de Umango, Rioja, Argentina.

**URANIUM MICA.** Common name for torbernite.

**URANOCHALCITE.** Chemical formula undetermined. A hydrous basic uranium and copper sulphate carrying circa 5% copper. Occurs in acicular crystals. Hardness, 2 to 2.5. Color, grass-green. Occurrence, Joachimsthal, Bohemia.

**VALLERIITE.** A sulphate of copper, iron, aluminum and magnesium.

Apparently is a mixture of covellite, pyrrhotite and several aluminous and magnesian minerals. Occurrence, Nya Kopparberg, Sweden.

**VARIEGATED COPPER ORE.** Common name for bornite.

**VAUQUELINITE.** Chemical formula probably  $2(Pb,Cu)CrO_4 \cdot (Pb,Cu)_2P_2O_7$ . A lead and copper phosphochromate carrying 3.9 to 10% copper. Crystallization, monoclinic; also occurs amorphous. Fracture, uneven. Tenacity, brittle. Hardness, 2.5 to 3. Gravity, 5.8 to 6.1. Lustre, adamantine to resinous. Color, apple-green to liver-brown. Streak, greenish to brownish. Diaphaneity, opaque to faintly translucent. Occurrence, Berezov, Russia.

**VELVET COPPER ORE.** Common name for cyanotrichite.

**VENERITE.** A hydrous copper, aluminum, iron and magnesium silicate containing circa 14% copper. Occurrence, Springfield, Berkshire county, Pennsylvania.

**VERDIGRIS.** Copper carbonate. Is formed from metallic copper by the action of carbon dioxide and moisture in the atmosphere. The verdigris of the pharmacist is a copper acetate and care should be taken not to confuse these widely varying compounds bearing the same name.

**VESZEYLITE.** Chemical formula probably  $7(Cu,Zn)O \cdot (P,As)_2O_5 \cdot 9H_2O$ . A hydrous copper arsenophosphate carrying circa 30% copper. Crystallization, monoclinic. Hardness, 3.5 to 4. Gravity, 3.53. Color and streak, greenish blue. Occurrence, Moravitz, Hungary.

**VOGLITE.** Chemical formula uncertain. A hydrous uranium, calcium and copper carbonate carrying circa 6.9% copper. Occurs in aggregations of crystalline scales. Lustre, pearly. Color, emerald-green to bright grass-green.

**VOLBORTHITE.** Chemical formula probably  $(Cu,Ca,Ba)_2 \cdot (OH)_2 \cdot VO_4 \cdot 6H_2O$ . A hydrous basic copper, calcium and barium vanadate carrying circa 30.9% copper. Hardness, 3 to 3.5. Gravity, 3.55. Lustre, pearly to vitreous. Color, olive-green to citron-yellow. Streak, greenish yellow. Is translucent in thin splinters. Occurrence, Perm, Russia.

**WARRINGTONITE.** A varietal form of brochantite.

**WHITNEYITE.** Cu,As. A copper arsenide containing 88.4% copper. Structure, massive, crystalline, very finely granular. Tenacity, malleable. Hardness, 3.5. Gravity, 8.4 to 8.6. Lustre, dull and submetallic on fresh fracture, strongly metallic when scratched, soon tarnishing. Color, pale reddish to grayish white, pale reddish white on a rubbed surface, tarnishing to yellowish bronze, brown and brownish black, sometimes with iridescence. Is soluble in nitric acid. Occurrence, Houghton, Michigan, Sonora, Mexico, and Chile.

**WINKLERITE.** Chemical formula uncertain. A hydrous cobalt, nickel and copper arsenate carrying circa 11 to 12% copper. Structure, amorphous, massive. Fracture, conchoidal. Hardness, 3. Gravity, 3.43. Lustre, dull. Color, bluish black to violet black. Streak, dark brown. Occurrence, Almeria, Spain.

**WITTICHENITE.**  $3Cu_2S \cdot Bi_2S_3$ . A copper selenobismuthite carrying 38.4% copper. Crystallization, orthorhombic. Fracture, conchoidal. Hardness, 3.5. Gravity, 4.3 to 5. Color, steel-gray to tin-white, tarnishing to

pale lead-gray. Streak, black. Is soluble in nitric or hydrochloric acids. Decomposes easily on charcoal. Occurrence, Wittichen, Baden, Germany.

**WÖLCHITE.** A varietal form of bournonite.

**WOLFSBERGITE.** Chalcostibite.

**WOOD COPPER.** Common name for olivenite.

**WOODWARDITE.** Chemical formula uncertain. An aluminum and copper sulphate containing circa 38.4% copper. Is closely related to langite.

**YELLOW COPPER ORE.** Common name for chalcopyrite.

**YPOLEÍME.** Chemical formula perhaps  $5\text{CuO} \cdot 2\text{P}_2\text{O}_5 \cdot 5\text{H}_2\text{O}$ . A doubtful hydrous basic copper phosphate of the dihydrite-pseudomalachite group.

**ZEUNERITE.**  $\text{CuO} \cdot 2\text{UO}_3 \cdot \text{As}_2\text{O}_5 \cdot 8\text{H}_2\text{O}$ . A hydrous uranium and copper arsenate containing 6.1% copper. Crystallization, tetragonal. Fracture, uneven. Tenacity, brittle. Hardness, 2 to 2.5. Color, grass-green to emerald-green. Occurrence, Saxony and Cornwall, England.

**ZINKAZURITE.** Apparently merely a hydrous mixture of copper carbonate and zinc sulphate, from the Sierra Almagrera, Spain.

**ZINKENITE.** A lead sulphoantimonite, usually slightly cupriferous.

**ZIPPEITE.** Chemical formula undetermined. A hydrous basic uranium, copper and calicum sulphate. Occurs in acicular crystals and crusts. Hardness, 3. Color, lemon-yellow to orange-yellow. Occurrence, Joachimsthal, Bohemia.

**ZORGITE.** Chemical formula uncertain. A lead and copper selenide, carrying 4 to 15.5% copper and 41 to 64% lead, with traces of silver, mercury and iron. Structure, massive and granular. Tenacity, brittle. Hardness, 2.5. Gravity, 7 to 7.5. Lustre, metallic. Color, lead-gray. Streak, darker lead-gray. Occurrence, Cacheuta, Mendoza, Argentina.

## CHAPTER IV.

### THE MINING OF COPPER.

Large volumes have been written and printed regarding the general subject of ore extraction, and many smaller books have been issued on single branches of mining practice, such as timbering, pumping, use of explosives, etc. Under these circumstances it is obvious that merely an outline can be given, in a single short chapter on the subject of the actual extraction of copper and copper ore. In its main features copper mining is much the same as other branches of metalliferous mining, but there are some special features of interest.

Title to mining lands is secured and held in different ways in different countries. In England and her colonies, mining property usually is held either as freehold, when owned in fee, or as leasehold, when operated by other than the owner of the land. In most of the colonies, especially in the Australian states and in British Columbia, public lands are available for location, on terms favorable to mining operations. In the United States practically all of the land east of the Mississippi River is held by private owners, to whom pertain the mineral rights, as well as the ownership of the surface of the land. In the states and territories from the Rocky Mountains westward to the Pacific coast there are immense areas of mountainous mineral lands, owned by the government, and available for the location of mining claims. The full mining claim allowed by the United States laws is a parallelogram of 600 by 1,500 feet, with its longest dimension practically coincident with the axis of strike of some mineral body. Claims may be fractional, where the full size permitted cannot be secured because of surrounding claims previously located. The locator of a claim must make affidavit that he has found mineral in place, but this requirement is more honored in the breach than in the observance. There is no limit to the number of claims that may be located by a single person, firm or corporation. Neither is there anything to prevent other locators staking out claims impinging upon or covering claims previously located. In many mineral districts there is much litigation, owing to infringing claims. United States mineral claims are of two varieties, one known as a quartz or lode claim, previously referred to, and a second variety, of greater area, known as a placer claim, located for placer gold. The locator of a mineral claim on United States government land is required to do annual work, usually called assessment work, to the value of \$100 on each claim, until the end of five years, when, upon satisfactory proof to the land office that \$500 worth of work has been done, a government patent will issue for such lands. In the case of a group of contiguous claims, assessment work may be done, by shaft or tunnel, on a single claim of the group, instead of being divided among the individual claims. In actual practice a 10-foot tunnel or a 10-foot pit is considered equivalent to \$100 worth of work, though ranging in cost from \$35 to \$50, as a rule. In Mexico and several others among the Latin-American coun-

tries, surface title does not carry the ownership of mineral values, which pertain to the state. No permanent titles to mineral properties are given in Mexico, but these are held subject to the payment of regular taxes of 10 pesos per pertenencia of one hectare arca, and upon non-payment of taxes title to the lands is forfeited automatically.

The law of the apex in the United States is that the owner of a vein that outcrops at surface may follow such vein to any depth, at any dip, regardless of side boundary lines at surface. This law is the cause of endless confusion, and in some of the best mining camps, notably at Bisbee and Leadville, side-line agreements are made between the owners of different claims, by which they agree mutually that the law of the apex shall be waived. The law of the apex holds only in the mining states west of the Mississippi river, and is unknown in the Lake Superior district and other eastern mining fields.

Ore may outcrop at the surface, or may be overlaid by alluvium consisting of sand, gravel and boulders to depths ranging from a few feet to hundreds of feet. Ore bodies also may be overlaid by eruptions of rhyolite or similar flows laid down after the deposition of mineral values. Every property must be a prospect before it can be a mine, and prospects divide naturally into two classes, one showing outcrops and the other having its ore bodies covered by dirt or rock. Ore bodies not outcropping at surface may be proven by the use of the churn drill or diamond drill. The diamond drill has a hollow cylindrical bit, set on its inner and outer edges with black diamonds. This bit is rotated by means of pipes connecting with the machine above, and bores a hole of hundreds, or if necessary, of thousands of feet, in depth, cutting a core that gives a complete record of the formation penetrated. In soft ground no solid cores can be secured, and in such cases it is necessary to collect rock cuttings from the sludge that falls from the mouth of the hole, water being forced into the bottom of the hole under pressure to remove the chips and rock dust. The churn drill cuts no core, but is valuable for exploratory purposes, in most cases being cheaper than the diamond drill for shallow borings.

Unknown ground may be proven also by test-pits or trenches. Test-pits, usually shallow, sometimes are sunk for several hundred feet in depth, and may be made into permanent shafts. In the Lake Superior district, where nearly all of the shafts are sunk on inclines, at the angles of dip of the cupriferous beds, it is customary, in opening mines on beds covered with heavy drift, to sink temporary vertical shafts through the alluvium and from twenty to fifty feet into the solid rock. From the bottom of such a temporary shaft a crosscut is run to the desired bed, and the permanent shaft frequently is opened to surface by means of an upraise, after which the permanent shaft is deepened on the bed. A sand shaft is a shaft sunk through sand to the rock ledge, and frequently is very difficult in sinking. A drop shaft is one that is sunk through sand or alluvium by weights piled on the top of the timbering. The bottom is shod with steel, to facilitate its descent through the soft material, and new timbers are framed in at the top, until the solid rock is reached.

Copper mines may be divided into two classes, according to their system of opening. The first of these is the quarry or open-east mine, while the other is a mine proper, with subterranean openings. In working

mines open-cast it frequently is necessary to remove the overburden of alluvium, sometimes of considerable depth, preparatory to quarrying the ore. Some of the open-cast mines are worked exclusively as quarries, and others in combination with underground openings, where ore broken down in large open pits is milled through winzes to tunnels beneath, for removal in tram-cars. The mine of the Utah Copper Company, in Bingham, Utah, is worked in benches, by steam shovels, this plan being rendered possible by the enormous size of the ore body, which is a mountain of cupriferous monzonite.

By far the greater number of copper mines, as well as mines of nearly all other minerals, are developed by strictly underground openings. The underground mines fall into two classes, the first being those opened by adits or tunnels, and the second those that depend upon shafts for ore extraction. Tunnel mining, so called, is where the principal avenue of ore extraction is through a practically horizontal opening, commonly called a tunnel, though more properly termed an adit, as, strictly speaking, a tunnel opens to the surface at both ends. The tunnels are given a slight rise from the portal, to provide drainage, and also to obtain the aid of gravity in removing loaded cars. The principal advantage of tunnel mining is that it permits cheap development and extraction, by reason of requiring no pumps or costly machinery for hoisting. In mountainous districts tunnels frequently give good backs—that is large ore bodies above the tunnel level. A disadvantage of development by tunnel is that it sometimes operates to restrain development at a greater depth, because of the hesitation of the mine management in making the heavy outlay required for hoisting machinery and pumps. Many copper mines are combinations of tunnel and shaft mines, having been opened by tunnel originally, and deepened later by shaft.

All underground openings in a mine may be divided into three classes, of which the first includes the openings made upon a practically horizontal plane, while the second includes the openings that range from a very flat dip to vertical. The third class includes stopes and chambers of varying size and trend.

The horizontal openings include not only the adits and tunnels previously referred to, but also plats, drifts and crosscuts. A plat is the beginning of a drift, cut out beside a shaft. A drift is like a tunnel, except that it starts from some underground opening and usually is smaller in size than a tunnel. A crosscut is an opening on a horizontal plane, like a drift, except that it runs across an ore body instead of with it. The word level is more comprehensive than the word drift and includes all horizontal openings on that particular plane, such as adits, tunnels, plats, drifts, crosscuts, stopes and chambers.

The second class of openings, includes shafts and winzes, the winze being a connection, or the beginning of a connection, between levels. In the old system of mining levels usually were 10 fathoms or 60 feet apart, and sometimes even closer. Modern mining practice usually provides levels at 100 foot intervals, and occasionally levels are placed 150 feet apart, in which case sub-levels are driven when necessary.

Of the third class of mine openings, a stope is any ore body developed by horizontal openings that is available for ore extraction, and the term

is applied also to the chamber left by extraction of the ore. Stoping is the actual mining of ore, as distinguished from opening work, which merely provides the preliminary underground passages necessary to actual ore extraction on a considerable scale.

The reopening of an old mine is a task that is both nasty and dangerous, owing to rotten timbers and mine openings filled with water, usually with considerable rubbish at the bottom of the shafts. Frequently such reopening work must be done by the aid of defective mine maps, or without any maps whatever. Old shafts frequently are cut down to larger size, the cutting down being a process of enlargement and retimbering.

Shafts frequently are vertical, and may be sunk at any angle corresponding with the dip of the ore body that is being developed, though in actual practice shafts rarely are sunk flatter than an angle of 25° with the horizon. Shafts usually are divided into compartments by timber cribbing. Sometimes the cribbing is open, and again very close. The various compartments are utilized for hoisting, for ladders providing ingress and egress, and for air-pipes, water-pipes and wires. The ladderway usually is timbered off solidly from the other compartments, and usually has sollars, or landings, at stated intervals, for both convenience and safety. At all levels there usually are platforms with openings just large enough for the cages, or skips, to pass through. An air-shaft is one that is used for purposes of ventilation only, being either a shaft sunk for that sole purpose, or an old shaft otherwise useless. A blind shaft is one that does not come to the surface, usually connecting with a tunnel. An upraise is a winze or shaft, or the beginning of either, made by working upward. The upper workings of a mine frequently are in soft rock, or ore softened by oxidation, and such openings require heavy timbering for safety. In the case of mines opened on soft veins having strong walls there is considerable advantage in sinking the incline shaft in the footwall, at a depth of 25 to 75 feet under the ore, the shaft following the same dip as the vein and running parallel therewith. In the case of a vertical shaft there is a similar advantage in sinking in the footwall and crosscutting for the ore body, unless the depth and dip are such that this plan necessitates crosscuts of prohibitory lengths.

Vertical shafts have guides in each compartment, along which the cage travels. The cage is merely a rough elevator, and hoisting commonly is done in counterbalance. This may be accomplished by the use of a single drum with a fleet-gear, or by hoisting with a split drum. In the case of a very deep vertical shaft with hoisting done by cages in counterbalance, tail-ropes running from the bottom of each cage around a sheave-wheel in the bottom of the shaft prevent excessive vibration. Hoisting in vertical shafts usually is done in cages, which raise the loaded tram-cars and lower the empty cars from surface, but a comparatively recent development is the Kimberly skip, which is swung under the cage. The Kimberly system calls for one, two or even three skips, swung under the cage. The skips discharge automatically into bins, on reaching the surface. The utilization of the Kimberly system of hoisting in deep vertical shafts increases their capacity by 25 to 50 per cent., according to circumstances.

As a rule incline shafts should be sunk at a constant angle, while

drifts should follow the ore, as far as practicable. Hoisting from incline shafts is done in skips, which are iron boxes with square bottoms and tops built at such an angle that the mouth of the skip is approximately level while on the skip-track. The skip-track is of steel rails, usually laid on wooden cross-ties, the weight of the rails depending on the size and capacity of the skip.

At the surface of a shaft the first equipment may be an "armstrong" windlass—that is, one worked by hand power. The next stage is a horse-whim or whip, followed by a pony hoist, operated by steam or gasoline, and the last stage calls for permanent hoists, these ranging up to thousands of horse-power in capacity in some large and deep mines. For an open pit a derrick with mast and boom may be used for hoisting ore in a bucket. The simplest headgear over a shaft is a tripod of three sticks of timber. The next stage is a gallows-frame, which may be small or large, and of wood or steel, the tendency at the larger mines being strongly toward building all important surface structures with steel frames. Shaft-houses, which are enclosed structures, may be of wood or steel, with a decided preference for steel. In the Lake Superior district the shaft-houses usually have in connection rock-houses, where the preliminary crushing is done. In hoisting with a bucket this swings free in a vertical shaft, while in an incline shaft the bucket rides skids, or, preferably, a trolley cable. The present maximum capacity of skips and cages is about twelve tons of cargo. In deep shafts the weight of a skip or cage and the cable attached thereto is fully equal to the weight of the load hoisted, but by working in counterbalance the disadvantage of these excessive weights is reduced greatly. Hoisting is done mainly by steel cables, composed of strands, each built up of numerous steel wires, slightly twisted. In some districts flat steel cables are used. Cables should be inspected at regular and frequent intervals, and all defective ropes removed, as the constant strain of torsion ruins the strength of the best of cables in time. Care should be exercised in preventing short turns, as these are very damaging to the life of the wire. Large sheaves and drums of large diameter, with minimum changes of direction, add greatly to the life and safety of steel cables. The engine-houses containing the hoists almost invariably are set on the footwalls of the mines, partly for safety and partly to obviate short bends in the hoisting cables.

In shallow mines the workmen go up and down on the ladderways, while in deep mines the men ride in the cages of the vertical shaft, or in the case of incline shafts, ride to and from their work in skips, or, in some mines, on man-cars especially built for carrying mine-workers. The old style of man-engine, which was highly efficient in its day, has gone out of use.

A competent engineer is as necessary to a mine as to a railroad, and good maps are equally important. While a competent civil engineer can do fair work in mine surveying, and some excellent mining men have had merely the training of civil engineers, a special course in mining engineering is much to be preferred. The work of a competent chemist also is of great importance in most copper mines, and in small mines the engineer usually serves as chemist also. Any mine that can employ a dozen men can afford the services of an engineer and chemist combined—in fact cannot afford to do without. In many small mines the superintendent is

chemist and engineer, and possibly also bookkeeper and supply clerk, and there are cases on record where to these accomplishments the mine manager added the blacksmith's trade as well, but that is almost too much talent for one man to possess. The records of old mines usually are deficient in reliable maps, but modern practice is very thorough as to engineering and mapping, and blueprints are extended monthly, from accurate data obtained underground.

While the general public uses the term miners for all underground workmen, this term is reserved in actual practice for the skilled workmen who do the drilling and blasting. Mine timbering is skilled work that is done sometimes by the miners, and sometimes by special timber gangs. The muckers, or trammers, are the men who do the shovelling and rough labor of the mine. Some large properties have special shot-firers for blasting. Miners may work by the day or on contract, contracts being divided into two general classes, the first being opening' work, which consists mainly of shaft-sinking and running drifts. The second class of contract work is stoping, the latter being the actual breaking down and extraction of ore in considerable quantities. Contract work is preferable in nearly every case where possible, and gives more satisfactory results to both miners and mine-owners, as it secures more work to the owners for the money paid, and also gives larger earnings to the good workmen. In the case of contract miners the supplies furnished by the mine, such as candles, detonators, fuse, dynamite, etc., usually are charged at much more than cost, such prices sometimes running two or three times the actual cost to the mine. On the face of it this practice is a great injustice to the miners, but in actual work is defensible on the ground of results. It has been shown by actual trial that the average contract miner is careful or careless of supplies in proportion to their cost, and as the excessive use of supplies is a dead loss that eventually must be shared between the miners and the owners, anything that operates to bring about economy is an advantage to both parties.

Most copper mines work two or three shifts. The double shift mines usually work shifts of ten hours each, but in mines giving the eight-hour day it is customary to work three shifts, thus utilizing the entire twenty-four hours. There is economy in keeping underground work going at top speed, with double or triple shifts, the fixed charges and many of the heavy expenses on surface being the same in either case.

Mining, at best, is a dangerous calling, and when not surrounded by proper safeguards is extra hazardous. The copper mines make a good showing among the metalliferous mines of the world, in their proportion of fatalities, and in the leading districts the precautions taken result in keeping down the percentage of mortality to a fairly low basis. The principal cause of accidents, responsible for more than half of all the deaths, is the carelessness of the miners themselves. Human nature is so constituted that the average man becomes habituated to danger that is met with in the course of his daily work, and miners fall into shafts and winzes, or step from stagings through sheer carelessness. Of the semi-avoidable sources of accidents, falling ground is responsible for more than half the deaths. This source of trouble is called semi-avoidable for the reason that, with care, accidents from this cause can be greatly reduced, though not

entirely eliminated by even the utmost vigilance on the part of both men and management. Missed holes or premature explosions are responsible for many horrible accidents and deaths. Poor fuse is more dangerous to miners than dynamite, and wise managers scrutinize the quality of their fuse as closely as they investigate the safety of their hoisting cables. Accidents through riding in skips are unpleasantly common. In many mines there is a rule that miners shall not ride to or from their work in skips, but this rule seems made to be broken, and serves merely as an excuse to the management when accidents occur. It is much better to shoulder the responsibility, as many managements have done, and permit the men to ride in the skips with such safeguards as can be furnished.

Ankylostomiasis, or the hook-worm disease, is found in but few copper mines, but seems to be spreading, and should be guarded against. The spread of this disease is greatly facilitated by dampness.

The methods by which ore is extracted vary greatly, the principal factors determining the method to be used being the nature and size of the ore deposits, and the character of the walls. Most mines are irregular as to both the size and value of their ore bodies, which vary from point to point, in dip, strike and tenor, and the walls of ore bodies frequently are poorly defined. Sometimes there is a selvage of fluccan, very soft clayey material, along either or both walls. Faults are noted frequently, and the ore body may be thrown in any direction by a fault, or series of faults, or may be cut out temporarily by a dyke, or may be divided by a horse, or may come to a final end against a different formation. In other cases the ore body may continue as a vein, while losing its mineral values when passing into a different country rock. Veins also fork and come together. Superincumbent strata are apt to creep, especially in a limestone formation, on a mountain side where the strata are deeply tilted, such mines requiring heavy timbering and constant care. Heavy pillars of vein rock usually are left standing beside the shafts, and sometimes elsewhere in the mine, as supports for the rock above. When a mine is considered worked out it is customary to rob the ore from the pillars and permit the mine to cave in, but sometimes nature caves in the mine before the owners get around to the job.

By the caving system of mining superincumbent rock and drift are permitted to fall into the mine, a little at a time, the process being practically continuous. The shafts are protected by heavy pillars, or, preferably, are sunk in the solid footwall and the ore body reached by crossouts. Mining is begun on the top level, which is timbered lightly, being secured just enough to permit the safe extraction of ore values. While stoping is in progress on the upper level, drifts are being run on the level below, and a plat cut from the shaft for a third level. The various levels are stoped in order, from the top down, no reserves being left in the levels that are stoped, as these begin caving almost as soon as the work of stoping is finished, and sometimes before. In a mine worked on the caving system the stoped out levels above are constantly coming in, and the miners at all times are working under caving ground. Notwithstanding the apparent danger of this plan, the mines worked on the caving system average fully as safe as those worked by the older methods, and the plan has decided advantages for many mines. It is not, however, adapted to all mines, and

a modified system, in use at a few properties, bids fair to increase, especially in the Lake Superior district, where some of the older and deeper mines are experiencing much trouble from air-blasts and similar troublesome phenomena coincident with very deep mining. This modified plan of the caving system calls for the sinking of shafts, preferably in the solid footwall, and drifting on each level to the extreme length of the territory to be exploited. A seven-by-seven drift, well timbered, is too small an opening to seriously endanger caving. Stoping is begun on the top level, at the extreme end of the drift, and stopes are timbered but lightly, stoping working backward toward the shaft, and the ground is permitted to cave behind the miners. By this plan of mining stoping must begin on the upper levels, and continue in steady order toward the bottom of the mine. This plan is thoroughly sound in theory, and, while not in general use, seems certain to grow in popularity, and to give satisfactory results in mines that would be dangerous to work on the old plan.

Ore is blocked out when it has been opened on three sides, and ore in sight, strictly speaking, is ore that has been blocked out, but this term is sadly misused, in many cases, and incidences are not lacking where small mining companies, with stock for sale, have claimed millions of tons of ore in sight, on the strength of a fair outcrop on the surface and a hundred feet or so of shaft or tunnel.

Timbering may be of wood, rock or concrete, but as a rule is of wood. The increasing scarcity of good timber, with consequent rise in price, in most parts of the world where copper mining is followed extensively, is causing vigilant mine managers to utilize other material to an increasing extent. The use of concrete and cement has reached the highest point in Germany, but is gaining ground in the mining fields of many other countries. Timbering may be heavy or light, according to circumstances. Some copper mines, like the Calumet & Hecla and Copper Queen, are forests of timbers, while others, like the Osceola, have but very little timber outside of that required for skip-roads and ladderways in the shafts. Heavy timbering is required from surface to the solid rock ledge, when passing through alluvium. There are many different methods of timbering with wood, but the one in most general use and favor is known as the square set system. A square set of timber has a bed-piece, two legs and cap of the same length, usually eight feet, mortised and tennoned. A similar set at eight feet distance is connected with bed-pieces and caps, and these cubicles may be extended indefinitely in any direction. Lagging usually is placed above the cap-pieces of a square set to prevent the falling in of rock from the roof, and in soft ground bulkheading is required, this necessitating the driving of heavy sticks of 8-foot timber into the ground on either side, to form a solid bulkhead. False sets are used at times, and sprags are utilized frequently. The use of dry-walling is increasing. Dry-walls are built of waste mine-rock, laid without mortar, and when carefully built are very effective in holding the ground above, and have the advantage of disposing of waste rock that otherwise must be hoisted. Ore is anything that will pay to extract for its metallic values, and varies greatly in different fields, and under different circumstances. In some of the Lake Superior mines rock carrying an average of one per cent. copper pays millions in dividends, and rock carrying even one-half of one per cent.

metallic copper is treated at some properties, though the average of the mine necessarily is higher. In other fields ores that carry ten per cent. copper are unprofitable, because of narrow veins, lack of transportation or other serious drawbacks. In Australia the soft mullock broken in the mines is used for filling in cribs, by what is known as the pigsty system. Concrete seems especially useful for finishing the collars of shafts, and has been tried for the sleepers of skip-tracks, but seems somewhat rigid for the latter use. Courses of brick have been used for finishing the collars of shafts in the Lake Superior district. Steel, mainly in the form of worn-out rails, cut down to short lengths, is used to a considerable extent for timbering in some mines. There is no question that concrete must be used to an increasing extent in mine timbering.

The matter of disposing of water is a problem of importance with most mines. Tunnel drainage is possible with properties opened exclusively above the adit level, and, with mines partly opened by shafts and partly by adits, the water is discharged through the lowest tunnel level. Occasionally large vugs are encountered underground, and small mines have been flooded from the waters contained in such cavities. Limestone, so often met with in copper mines, is readily permeable by water, and one mine may drain an entire basin of considerable area. Good mines are lost sometimes because of the excessive cost of keeping them free of water.

Where a mine must be kept unwatered otherwise than by natural drainage through adits or tunnels, the water may be removed by pumping or bailing. Mine pumps may be divided into two classes, these being movable and stationary. Station pumps usually are of large capacity, and are set permanently in underground stations prepared for them, while sinking pumps are placed on skids and lowered in the shafts by chains or steel cables as required. The great majority of both station pumps and sinking pumps are actuated by steam or compressed air, usually the latter, though steam may be used in shallow mines before the installation of air compression plants, or in a great emergency, but the carrying of steam to a considerable depth is impracticable, owing to excessive condensation. Electric pumps are increasing in numbers and efficiency, and with further improvements should prove the ideal variety of pump for most underground uses. Air-lifts and pulsometers are used to some extent, mainly for sinking purposes. Water also may be removed from mines that have filled through idleness or that have been flooded accidentally, by bailing. The bailers, which replace buckets, cages or skips, usually are large cylindrical tanks, frequently old steam boilers, with a valve bottom, and, at a pinch, ordinary skips may be used. The method of unwatering mines by bailing is used only in emergencies, though some attempts have been made at utilizing bailing for regular mine drainage.

All mines show an increase of temperature with depth, after the first few hundred feet of the earth's crust is penetrated, but the rock temperature varies greatly in different fields. The Lake Superior copper mines, which are the deepest of any mines in the world, are not so hot at similar depths as the mines of most other fields. At the vertical depth of 4,920 feet the rock temperature in the Red Jacket shaft of the Calumet & Hecla was 87.6° Fahrenheit, but this has been reduced, by connection of the

lower levels with other shafts, and by the utilization of compressed air exhaust from the rock-drills. Many sulphide ore mines are extremely hot, owing to the gradual oxidation of sulphur.

Copper mines contain neither choke-damp nor fire-damp, those deadly gases found in coal mines, but nitrous oxide fumes from dynamite are poisonous, and are difficult to dissipate in workings having only one open end. Powerful fans at surface sometimes aid in ventilating the dead workings of deep single shafts. The general use of power-drills, actuated by compressed air, assists materially, not only in furnishing fresh air in dead workings, but also in reducing the temperature in deep mines, as air yields up considerable latent heat when compressed, and robs all surrounding objects of heat when released from compression. In mines of more than a few hundred feet in depth nature provides a system of ventilation as soon as two shafts are connected underground, the shallower shaft becoming a downcast, through which the air is sucked down, with great force, while the deeper shaft—that is the one having its collar on the highest ground at surface—becomes an upcast. The deeper the shaft the stronger the draft, for the same reason that a high chimney gives a stronger draft than a low one. In deep shafts the air currents so called into being are so strong that it is necessary to provide air-doors in the connecting levels.

Fire is a danger to which practically all mines are subject. Even a fire on surface may endanger underground workmen, through the destruction of the hoisting plant, or headgear, and fire from a structure over the shaft may enter the mine by working down the timbering. Underground fires may be divided into two classes, the first occurring in sulphide mines where the ore itself furnishes the fuel, while the other class occurs in mines with heavy timbering that is liable to burn. Heavy damage to a mine, accompanied by serious loss of life, may occur through either form of fire. Timber fires are caused mainly by the carelessness of miners in disposing of candle-ends, lamp-wicks, matches and partially burned tobacco from pipes.

In the Calumet & Hecla mine, which has suffered losses aggregating millions of dollars through five serious mine fires in the past quarter century, great precautions are taken, not only to prevent the occurrence of fires, but to put out mine fires immediately after their inception, and to prevent the spreading of fire throughout the mines. Masonry bulkheads, fitted with fire-doors, permit the cutting off of different portions of the mine. Electric signals and telephones furnish the means for turning in prompt alarms, and water-pipes and fire-hose are kept at underground stations for the fighting of fires that have gained a foothold.

All mines containing large bodies of ore rich in sulphur are liable to spontaneous combustion, but this danger can be minimized by various precautions, though not obviated entirely. The danger of spontaneous combustion is enhanced by the fissuring caused by improper support of ground opened or stope, as such fissuring produces considerable quantities of pulverized sulphides that are subject to unusually rapid oxidation, and are liable to spontaneous combustion. The St. Lawrence mine, at Butte, Montana, has been on fire for nearly a score of years. There also have been serious fires in the United Verde, Iron Mountain, Wallaroo & Moonta and

other sulphide copper mines. A sulphide mine fire, while dangerous and costly, has the advantage of not destroying values to a large extent, as the copper contained in the ore is leached readily by the natural drainage of the mine, after the burning of part of the sulphur from the ore, and the values can be gained as cement copper on surface, by precipitation from the heavily charged mine waters. A mine fire may be drowned by water, or extinguished by shutting off the supply of oxygen. Carbon dioxide, which is heavier than air, also has been pumped into mines to extinguish flames. This can be generated in large quantities in old boilers, by treating crushed limestone with dilute sulphuric acid, but the process is slow. Perhaps the most successful method yet used in fighting a sulphide mine fire was devised in 1906, at the Iron Mountain mine, in California, where an exhaust ventilating fan was reversed, and used as a blower. The air-current from the blower drove the sulphurous acid gas, given off from the burning stopes, back into the broken ore, thus enabling the miners to remove the face of the ore on fire, ore being mined at temperatures of  $160^{\circ}$  to  $450^{\circ}$  Fahrenheit. This plan called for a very careful balance of air pressure, in order to clear the mine workings of foul gases to such an extent as to permit work to be carried on, while insufficient to fan the flames in the fissured ground unmined.

Air-blasts, noted in some of the older Lake Superior mines, are artificial earthquakes, caused in the older and deeper mines by the slipping of superincumbent strata insufficiently supported by mine pillars. One of these air-blasts, in 1906, was of sufficient severity to cause an earthquake that was felt over an area of some thousands of square miles. The liability of mines to this trouble increases with their age and depth. The first symptom of air-blasts usually is given by the violent decrepitation of small particles of rock from pillars that are subjected to excessive strains. Small masses of rock are thrown off violently, with detonations like pistol shots. Such troubles, when once begun, are liable to prove continuous and cumulative.

The lighting of copper mines is mainly by candles or lamps, the fuel in either case being stearic acid as a rule. Electric lights have been tried, but were not liked, the illumination being too powerful, and rendering the miners nervous by giving the roofs the appearance of danger, where careful inspection by the light of lamps or candles showed the ground to be perfectly safe.

The old system of mine signalling was limited to a single heavy wire, running down the shaft and connecting with a bell in the engine-room, which was rung by pulling levers attached to the wire, at the different levels of the mine. Electric signals are now in quite general use, in most mines of importance and telephone systems have been installed in many mines, while a beginning has been made in the use of electric signalling systems displaying semaphore arms and colored lights.

In the actual breaking and removal of rock or ore, the first step is that of drilling holes for explosives. In mines carrying ore in a decomposed talcose gangue it is possible to drill holes by hand, with a breast auger, but in ordinary rock and ore, holes must be bored with steel drills. Such drills are of varying lengths, and are changed from time to time, as the hole is deepened. There is a considerable variety of cutting faces for

drills; but that in most common use has two cutting faces crossed at right angles. Drills are dulled rapidly, and require frequent sharpening, for which purpose they must be taken to the smithy, on surface. Hand drilling has given way in most properties to power drilling, the machines being actuated by compressed air or electricity, the former agent being in very general use in most important mines. The water-drill is a form of drill, actuated by compressed air, in which a jet of water is fed through a hole in the centre of the steel bit, to lay the dust produced by the drill. The power drill is fixed on a tripod or pillar, to afford solidity, and power drills are worked frequently on timber stagings and rock ledges that would seem inaccessible to anyone but an experienced miner. Electric drills have given unsatisfactory results in many mines where tried, though working excellently in a few properties. The trouble with electric drills is due, probably, to inefficient designing in some makes, and to even a larger extent to inefficient handling, rather than to any inherent defect in the theory of the machine. A set of holes for one blast is known as a round. Much skill is shown by old miners in drilling such holes, which must be driven at such angles, to such depth, and in such number as to break the proper amount of rock with a minimum expenditure of labor in drilling, and with a minimum charge of dynamite for blasting. A skilled miner, who takes full advantage of cleavage, jointing and bedding planes, of varying strengths of different rock forms, and of fundamental principles of physics, will accomplish better results, with half the drilling and half the powder, than can be secured by a beginner or an ignoramus.

Ordinary gunpowder, commonly known to miners as black powder, is useful for blockholing, which is breaking up large masses of rock previously broken, and occasionally for other uses, but dynamite is the principal underground explosive. This consists of nitro-glycerine, taken up by some absorbent, usually wood-pulp, sawdust or diatomaceous-earth. The strength of dynamite varies greatly, and should be gauged according to the nature of the rock. Some of the newer high explosives are used also, to a limited extent, in copper mines. In blasting, the dynamite cartridges, which slip easily into the holes bored for them, are placed at the bottom of the holes, in such quantities as required, and in the pasty top of the final cartridge is inserted a copper cap or detonator, holding a single drop of fulminate of mercury, with the end of a fuse firmly fixed within the end of the cap. The fuse is fired by a match or candle, it being timed by the length to which it is cut, and when the fire in the core of the fuse reaches the fulminate of mercury there is a sharp explosion, which in turn explodes the dynamite. Occasionally charges of dynamite fail to explode, and as a round of holes consist of five to a dozen borings, the dynamite in one or two holes may fail to explode. Such missed holes are highly dangerous, and frequently cause explosions later, when the dynamite is reached by the drill in boring other holes. When a mine is worked with a ten-hour shift, blasting is done twice per shift, as a rule, the blasting being timed at about a quarter-hour before the close of the half shift and full shift, this providing an hour and a quarter for the dynamite fumes to dissipate from the workings. Dynamite, fuse and detonators usually are kept underground in boxes, sometimes in large quantities, and carelessness in handling is responsible for very serious accidents at times.

When broken, the ore, or rock, or both must be disposed of, usually by hoisting both ore and worthless rock to surface, except where underground selection is possible, in case waste-rock is used for dry-walling or fills. In the old system of mining the long-handled shovels in the hands of muckers were the main reliance, ore and rock being loaded into tram-cars of wood or steel, which were pushed from the face of the workings to the shaft on light T-rails or strap-rails. In modern practice rock frequently is sent down, through chutes, to bins on the level below the one where broken. The chutes may be of wood or iron, and chutes built of rock are used in some mines. Broken ore or rock usually will clear itself in a chute of  $30^{\circ}$  to  $35^{\circ}$  dip, and even with less dip in the case of an iron chute.

Underground haulage plants are used in a number of the larger and more progressive mines, though this system is suitable only to properties that have long hauls, and large ore bodies on the levels where such haulage plants are installed. Underground trammimg by power is done by locomotives, actuated by compressed air or electricity, steam locomotives not being suitable, owing to the confined scope of operations, where smoke and gases from the boiler would poison the underground atmosphere. Underground loading-bins are coming into use, and these, which are installed at the shaft, on the various operating levels, permit the trammers to discharge their cars into the bins, and skips can be filled from the chutes of the bins as required. This system obviates delays both in trammimg and hoisting, and has much to commend it. A hoisting system installed recently at the Wolverine mine provides for special workmen known as car-dumpers. The trammers leave loaded cars at the shafts, and the dumpers discharge these into the skips, beginning at the top hoisting level, and working down, level by level, to the bottom, then riding up in the skips and beginning anew. In sinking deep winzes the shovel is the main reliance in disposing of ore or rock, which must be shoveled up from stage to stage, in the most laborious manner, unless a donkey-hoist is installed to care for the dirt. For this reason upraises are preferable to sinking, in the opening of winzes, as a rule.

In early days the heavy mass copper of Lake Superior mines, ranging in weight from a ton to 500 tons per mass, was cut up into chunks not too heavy for hoisting, by the use of long-handled chisels, this process being laborious, slow and costly. The work of cutting up masses underground is now done with pneumatic chisels, at about a tithe of the former cost.

The span of life of any mine is a matter of vital importance to its owners, but no general rule can be given for gauging the life of copper mines, as each property is a problem with varying factors that must be worked out individually. The Rio Tinto is the oldest active mine of the world, and until the discovery of the monzonite-porphyry ore bodies at Bingham, had the largest proven ore reserves of any mine of any metal, notwithstanding its having been worked for some three thousand years. The Lake Superior copper mines, operating on stratified beds, will hold indefinitely in depth, but the depth to which successful mining may be done cannot be predicted with any degree of certainty.

## CHAPTER V.

### THE MILLING AND CONCENTRATION OF COPPER.

As native copper and copper ores usually occur disseminated in gangue rock, the first process of reduction after the ore is brought from the mine is one of concentration. Milling really should begin in the mine, and a little care on the part of the mine superintendent often eases the burden of the mill superintendent and brings about cheaper and closer extraction. The use of excessive charges of dynamite in blasting not only is a waste of explosives, but results also in the making of an unnecessary quantity of fines, causing an excess of slimes in the mill, with consequent labor and expense in extraction, and unnecessarily heavy losses. The mine superintendent also can aid the millman greatly by sending with his ore the minimum quantity of wood, drill-steel, hammer-heads and other material that is rather unpleasantly common in the average ore that reaches the average mill.

The general principles of milling are the same in the concentration of all ores, but local practice varies greatly, according to the nature of the ores of various districts. The practice in general use in the native copper mines of Lake Superior is given at the end of this chapter.

Mills usually are built as near the mines as possible, to save long hauls on ore, and frequently are located immediately at the mines, though at times it is necessary to build the mills at some distance from the workings in order to secure adequate water supply. As a rule mills are located in mountainous districts, where full advantage can be taken of the steep slopes, and modern mills are so planned and constructed that the raw ore is dumped into bins at the top of the structures, and passed gradually through the various processes, the final concentrates being discharged on the lowest terrace, thus taking full advantage of gravity. The elevation of material, once common in all mills, is reduced to a minimum in modern plants, which are nearly automatic, and require much smaller forces of workmen, who, as a rule, are skilled men that understand why as well as how. In most cases a ready-made mill is a serious mistake—the same sort of a mistake that would be made by the laying out of shafts and drifts for a mine by engineers who never had seen the property. Every mine has individual problems that can be solved satisfactorily only by the man on the ground, if he be a competent miner, and the same observation holds as true of the milling as of the mining, at most properties. Much of the trouble in mill practice arises from faulty designing, often where good mill men, either technical or practical, or both, plan mills to treat ores from an unfamiliar district. Local peculiarities require local adjustment in milling practice, and it frequently is the case that what is the best practice for the milling of ore from one mine is not exactly suitable for the milling of ore from even an adjacent property. This matter of local variations is one that cannot be treated except in the broadest outline, or in the fullest detail. The best modern mills are now designed, with great care, to treat the specific ore of an individual property, and careful de-

singers frequently make extended mill-tests, and other experiments, before designing either the structure or equipment of a mill. As a result of this care, losses have been greatly reduced at the best mills, and tailings now run nearly as clean as the slags from a well managed smelter.

There is a general haziness regarding the matter of rating milling capacity. It would be well if this could be removed, and that it should come to be clearly understood that a 100-ton mill was designed and equipped to treat advantageously 100 tons of material daily, and that any considerable excess over this quantity of ore, while it might be run through, could not be handled so as to secure thoroughly satisfactory extraction. The average designer is apt to underrate the capacity of his mill, probably under the mistaken impression that a mill rated at 100 tons that proves capable of treating 125 tons satisfactorily is a credit to his professional reputation. The best results never are secured from any machinery that is run to the fullest limit of its capacity. In many cases a hundred-ton mill may be made to put through 150 tons of material, but the work will be slighted at nearly every stage, and the losses will be correspondingly heavy.

Too much stress cannot be laid upon the practical coördination of every process in the mill. Each particular department should have sufficient capacity to handle, to advantage, its due proportion of material, this capacity necessarily decreasing toward the end, as the ore becomes concentrated, and an increasingly large amount of gangue has been eliminated.

Occasionally there arise difficult problems in handling materials of widely varying specific gravity. As a case there may be cited the Shannon mill, in Arizona, which treats ores have the following specific gravities: chrysocolla, 2; azurite, 3.5 to 3.8; malachite, 3.7 to 4; chalcopyrite, 4.1 to 4.3; chalcocite, 5.3, and cuprite, 5.8 to 6.1, while the specific gravity of the quartz gangue is 2.64. While this is an extreme case, it is by no means uncommon for a mill to treat ores of two or three widely varying gravities. It is now possible to handle successfully mixed ores that were worthless even as recently as the close of the Nineteenth Century, because of the impossibility of satisfactory separation. Zinc, especially, is removed from copper ores much more readily than formerly.

In the concentration of ores, hand work is used exclusively at some of the smaller mines that are distant from smelters, where the ores must be brought to a high copper tenor by hand selection. Even in the case of mines having good mills, a limited amount of hand selection may be used to advantage, and hand-cobbling, by which worthless gangue rock is separated from valuable ore, may relieve the mill of considerable work. Many mills have picking-tables or picking-belts. The best form of picking belt is one that carries the material past the workmen, who remove the valuable ore for further treatment, while the worthless material remains on the belt and is dumped automatically at the end, or vice versa. Magnetic separation is used, with success, in a number of copper mills, where the material to be removed is magnetic, or can be made magnetic by roasting.

For almost every milling operation there is a choice of machinery, or process, or both, and advocates of these different processes or devices usually are loud in the praises of their pets. While some machines are better adapted than others to certain uses, more depends upon the entire milling system being planned with a view to treatment of the particular ore

handled, and the intelligent carrying out of the theory into practice, than upon the make of the machine that is employed, though this is by no means unimportant. A good millman will secure fair results from indifferent machinery, while an inefficient millman will obtain poor results from good machinery, either through poor grouping or inefficient handling. Only the man on the ground, and he only after repeated experiments, can intelligently adjust even a good mill to fully satisfactory work.

Owing to scarcity of water in many copper mining districts, where it must be used and husbanded with great care, settling ponds are provided, and some great economies are effected, not only in repeated usings of the water, after clarification, but also in minimizing the gross amount of water required for milling ore. The Detroit mill, at Clifton, Arizona, makes extensive use of settlers, and requires only about 300 gallons of fresh water per ton of ore treated.

Large storage-bins for ore are of much advantage to a mill, and the disadvantage of small storage-bins becomes apparent, shortly, to the superintendent of every mill that is so unfortunate as to have them. Large storage capacity for raw ore affords a balance wheel, and takes up slack that otherwise results in occasional mill stoppages, due to temporary mine stoppages, or even to a decrease in the day's output of the mine. Large storage capacity for concentrates is desirable also, in some cases, though not so important as storage capacity for raw ore.

Modern milling practice pays greater attention than formerly to both extremes, beginning with the coarse concentrates and ending with the slimes, and the classification of ore is carried out far more thoroughly than formerly. The advantage of removing concentrates as coarse as possible is that by so doing extensive sliming is obviated. At every operation by which ore is reduced in size, slimes are produced. Some ores slime much more readily than others, according to their structures, but all ores are more or less susceptible to sliming, and sliming easily can be carried to excess by poorly devised milling processes.

Crushing may be done either wet or dry. Where dry crushing is in use a great deal of fine dust gets into the air, and this should be removed by an exhaust fan. On very heavy material it is advisable to divide the crushing into two, and possibly three, operations, as no jaw-crusher can break masses of rock or ore to minimum size advantageously. Crushers are of many makes, but are essentially of two classes, one being the jaw-crusher and the other the gyratory crusher. There is a difference of opinion as to which causes the most sliming, but it is probable that a smaller percentage of slimes is caused by gyratory crushing, in most cases. The jaw-crusher is in more general use, however, than the gyratory. Rolls are used to a considerable extent in milling copper ores, but are not employed so generally as in the reduction of lead and zinc ores.

It is advisable to use a grizzly or trommel between each process of reduction, and the use of a grizzly before the first crushing will remove a considerable percentage of fines from average ore. The intelligent use of grizzlies or trommels not only obviates excessive sliming, but also saves the labor and power that otherwise would be used in unnecessary crushing of fine material. Revolving screens or trommels are of different styles and makes. These usually are of the same diameter throughout, but occasion-

ally are built tapering, though the uniform size seems more satisfactory, as a rule. The material delivered to such screens is carried to the lower end of the trommel by gravity, aided by the rotary motion of the screen. The openings in the screen, through which ore falls, may be of uniform size, from end to end, or may be divided into two or even three sizes of openings, giving the same number of sizes of concentrates. More inclination is required on coarse material than on fine, and more in dry screening than wet. Revolving trommels will handle ore satisfactorily down to particles of two to three millimeters in size, and impact screens will do good work on lumps of ore as small as one millimeter in size. Perforated metal is preferable to woven wire for screens, as the perforations are very slow in wearing, while the woven wire is quite certain to give openings of irregular dimensions after the screen has been used for a short time.

After crushing the ore is passed over jigs, of which there are a great many different designs, though the essential principle is the same in all, the gangue, which is lighter than the ore, being driven off by rapid oscillatory or vibratory movements of the bed of the jig, aided by the force of running water, the vibration and water jets being so carefully regulated as to permit the ore to remain on the bed of the jig while the worthless gangue rock is washed away. No matter how carefully this work may be done a little ore is lost in the tailings and a little rock remains with the concentrates. The Hancock jig has the greatest capacity of any make, and its use is increasing outside of Australia, where it was invented. While not suited to all grades of ore, there are many copper ores on which it can be used to advantage. The jigs usually are worked in series, and are divided for the handling of two or three different sizes of material, these being known as roughing jigs, middling jigs and finishing jigs, or having other names, according to different local usages, for the coarse ore, middlings or raggings, and fines. There is much more regrinding of both middlings and tailings than formerly, and there is much better machinery available for this purpose than even a few years ago.

The treatment of slimes varies greatly, in different mills, but, as a rule, the slimes are put over patented concentrators or tables, of which the Wilfley seems the most effective and in most general use. The Wilfley grades the fine ores and separates them from the finely crushed gangue rock by means of an inclined table having riffles covering about one-half of the surface, these being arranged along a diagonal line from corner to corner, the table having a slight oscillatory movement. Circular tables also are used to some extent. Screen sizing usually is stopped at about three millimeters, and hydraulic sizing begun. This is very effective, in most cases, but is not suitable for fine slimes that already contain an excess of ore, these requiring settling tanks. There is one make of hydraulic classifier, of considerable promise, that utilizes air-jets in connection with water. Hydraulic classifiers are of considerable variety in form, but usually have "V" or "W" shaped bottoms, whence the settled fines are drawn off, through plugs, for further treatment. Slime tanks also are in use in many mills for the final collection of fines. Filter presses are used but slightly for copper milling, though in common use in many gold mills. One of the greatest advances made in milling practice, since the beginning of the century, lies in the far greater saving of slimes, as compared with the older practice.

In the matter of sampling, the old and highly inefficient rule-of-thumb

plan has been discarded, in all modern mills. There are several excellent makers of automatic samplers, that do very accurate work, but, of course, these samples must be assayed both honestly and carefully in order to take advantage of the information that they offer regarding losses in tailings. It is probable that the losses in tailings in old mills were considerably greater than ever were shown by the grab-samples taken under the old methods.

The fines and slimes from the mill are finely comminuted, hence usually require briquetting before smelting, as otherwise a large proportion would be blown out of the furnace as flue-dust. A small quantity of lime, or some other suitable material, may be used for a binder, in briquetting, but this is not necessary in all cases, and in some instances fines and slimes from the mill are briquetted in connection with flue-dust from the smelter, preliminary to furnace treatment.

Oil concentration has been experimented with extensively, but is not yet fully accepted in milling practice, though some excellent results have been secured. In nearly every instance where oil concentration has been carefully tested, the technical results have been very satisfactory, but in many cases the process has not proven commercially available. Given a fairly steady and copious supply of material suitable for oil concentration, there seems no sound reason why the process should not prove a commercial success. There are several processes of oil concentration, but the original and most important is the Elmore system. By this process the ore is first pulped, then passed through a horizontal rotary drum, provided with cross-blades that lift and drop the pulp while propelling it along the drum. With the pulp is admitted a small quantity of viscous oil, left as a residue from the refining of petroleum. This oil, which is the best for the purpose, and also possesses the advantage of cheapness, selects the ore while rejecting the gangue rock. The oiled pulp is discharged, automatically, into spitzkasten, in which the tailings of gangue rock settle down and flow off, while the oil containing the fine ore floats and is drawn off from the top of the spitzkasten, into a centrifugal extractor that removes the oil, which is again used, the loss of oil in the process being quite small.

Various forms of pneumatic concentrators have been devised, from time to time, but none seem to have scored a marked success, though the theory seems good, and pneumatic concentration may become a success, eventually.

Electric concentration has been attempted, at various times and in various ways. The most promising of the electric processes, to date, provides for the utilization of static electricity. Finely crushed ore and gangue come into contact with a metallic surface, charged statically, which repels the particles of high conductivity, while those of low conductivity are retained for a sufficient length of time to be drawn aside and discharged into a separate receptacle. This process, while it does not appear to have come into use, would seem to possess intrinsic merit, for the separation of mixed ores of chalcopyrite, sphalerite and galena, which are of such common occurrence, intimately intermixed, in many fields.

In the Lake Superior district, where copper is found native, the milling process differs somewhat from any in use elsewhere, the principal feature of difference being in the crushing of ore by steam stamps. The native

metal occurs mainly disseminated in small particles through amygdaloidal or conglomerate rock, in quantities averaging only 15 to 30 pounds of copper to the short ton of rock in the amygdaloid mines, and averaging only 45 pounds of copper in the richest conglomerate mine. The metal sometimes occurs in masses that weigh from a few pounds up to hundreds of tons each. The larger masses are cut underground into pieces sizeable for hoisting, and when arrived at surface, are hand-cobbed, to eliminate as much as possible of the adhering gangue, and then put directly into the reverberatory furnaces for smelting.

The preliminary work of a stamp-mill, in the Lake Superior district, is done in the rock-house at the mine. This usually is built in connection with the shafthouse, though one rock-house may care for the production of two shafts. The ore is dumped from the skips, or cages, onto the upper floor of the rock-house, where the small masses are cobbed under steam-hammers, and the balance of the ore, containing fine copper disseminated through gangue rock, is passed over a grizzly, the larger masses going through a powerful jaw-crusher, the product of which descends to the next floor and there is put through smaller crushers, going thence to bins, from whence it is drawn into railroad cars and taken to the stamp-mills.

The modern stamp-mills are of fireproof construction, having steel frames, with cement floors, and are liberally supplied with windows for lighting. The buildings are terraced, so as to take full advantage of gravity in handling the material treated. The storage bins at the tops of the mills, are connected with trestles, which permit the access of loaded trains, and the bins are of great capacity, holding thousands of tons of rock in the larger mills. Picking-belts are used to some extent in some of the mills.

The first stamps in the mills of the Lake Superior district were of the old Cornish style, crushing by gravity alone. The Ball head is a single stamp, operated by steam, and the entire stamp, including mortar-box, is one machine, set upon a very heavy foundation. Formerly heavy timbers were placed between the foundation and the mortar-box to furnish vibration, but these were found undesirable, and the practice has been discontinued. The ordinary steam-stamp has a piston of 18 to 20 inches diameter, with stroke of about 24 inches, the piston developing a velocity of about 25 feet per second and striking blows of three to four tons, at the rate of 90 to 110 strokes per minute, under a steam pressure of 95 to 120 pounds per inch, in the case of the simple heads, which are driven by engines of 150 to 250 horse-power each. The weight of the reciprocating parts of a steam stamp averages about 5,500 pounds. The economy in steam consumption possible through compounding the simple stamps being readily apparent, cross-compounding was tested thoroughly at the Champion mill for about a year. The results proved a large economy in steam consumption, but the very considerable disadvantages inherent in working four 500-ton stamps as a unit proved too great, and the system was abandoned. The cross-compound stamp was followed by the Nordberg steeple-compound stamp. This has high and low pressure cylinders, mounted tandem one above the other, and in actual practice the steeple-compound stamp has given an increased capacity averaging about 25 per cent., with a saving of about 25 per cent. in fuel. At the beginning of the last decade of the

Nineteenth Century the average crushing capacity of the simple steam-stamp in the Lake Superior district was 350 tons per 24 hours. This has been increased by heavier parts, greater power and the discarding of timber foundations, to 500 and even 600 tons per diem. The steeple-compound stamp is of much greater capacity, one stamp in the Osceola mill having crushed 779 tons of amygdaloid rock in 24 hours, in 1906, with an average for two weeks of 600 tons per day, including all stops. The capacity of the stamps varies considerably, at the different mills, according to the nature of the rock crushed. The conglomerate rock of the Calumet & Hecla is much more refractory than the amygdaloidal rocks of the other mines, and a stamp can treat only 60 to 65 per cent. as much conglomerate as amygdaloidal rock. The conglomerate also is much harder upon stamp-shoes than the amygdaloid. These shoes are of chilled iron, cast by local foundries, which are able to give an 11-inch chill, a statement that may be doubted, but is susceptible of full verification. The shoes weigh about 800 pounds each when cast, but lose half of their weight and become badly worn in four to fourteen days, according to the nature of the rock crushed, and are then discarded. Rock is fed under the stamps in pieces ranging up to a foot or fifteen inches in extreme dimension, with a smallest dimension of about four to six inches.

The system of coarse stamping now in general use was begun at the end of the Nineteenth Century. This process utilizes mortar-grates for discharge having perforations of about ten-sixteenths inch in size, as against the old standard of about three-sixteenths inch only, while revolving screens, with apertures of about four-sixteenths inch, let out the fines and return the oversize to auxiliary machinery for recrushing. The coarse stamping system has resulted in giving about 50 per cent. of the mill product from the stamps, before jigging, as against 10 per cent. extracted at the heads under the old method, thus affecting important economies in the amount of material handled in stamps and jigs, and reducing the quantity of slimes.

From the stamps the crushed rock is fed to jigs, which are in series, taking coarse and fine sands from the stamps. A portion of the coarse sands, discharged as tailings, is recrushed and rejigged. Various types of regrinding mills are in use, including Chilean mills and other forms. The cost of regrinding Calumet & Hecla conglomerate, which is extremely refractory, has ranged as high as 30 cents per ton in Chilean mills, but in Huntington mills the cost has been cut to 10 cents per ton. The fines and slimes are passed over slime-tables of various patterns, these including the old-style Evans round-table, frequently with two or three superimposed decks, to save floor space, and the Wilfley and Overstrom patent tables, which have given very satisfactory results. The waste sands are washed through launders to some distance from the mill, while the concentrated metal, with its adhering gangue-rock, known locally as mineral, is shipped to the smelters for reduction. Formerly the mill practice of the Lake Superior district called for dressing mineral to a high percentage of metallic contents, but modern practice yields mineral much lower in copper tenor, and the losses in tailings now average only about one-half as much as at the beginning of the last decade of the Nineteenth Century. The mineral produced by the Lake Superior mills varies greatly, ranging

from 50 to 80 per cent. in copper tenor. Most of the mills make several different grades of mineral, these varying in size of material, and also in richness, the coarser grades carrying the larger percentage of copper. In some of the mills the coarser mineral is hand-picked for particles of silver.

Water consumption has been reduced about one-third through coarse stamping and other economies. Owing to unlimited water supply, and the enormous capacity of their pumps, the Lake Superior mills have been very prodigal of water in their washrooms. In the last decade of the Nineteenth Century as much as 10,000 gallons of water was used for washing a ton of ore, but this consumption has been reduced to an average of about 7,000 gallons per ton, and it is evident that considerable further economies are possible.

Owing to the compounding of stamps, resulting in greatly increased crushing capacity, some of the older mills have been unduly crowded in their washrooms, with consequent losses in tailings. The newer mills provide a much larger area of washroom for each stamp, thus allowing for the greatly increased stamping capacity of each head.

The tailings of the Lake Superior mines range from 0.15 to 0.75 per cent. in copper tenor. These figures are low, but are not as low as might be wished, in view of the low average tenor of the original ore. Great improvements have been effected, however, and the losses in tailings now average no more than half those of twenty years ago. Many attempts have been made in the district, and are being continued at the Calumet & Hecla, at reworking the tailings, but so far none have proven commercially feasible. The stamp-sand from the mills is utilized locally for mortar, in building construction, and is excellently adapted to that work. The stamp-sand also is used in making sand-lime brick, and for the manufacture of paving blocks.

## CHAPTER VI.

### THE HYDROMETALLURGY OF COPPER.

Readers desiring a detailed exposition of this subject are referred to Eissler's excellent volume entitled "Hydrometallurgy of Copper." This chapter will be found to give a fairly complete outline of the subject, but without any attempt at great detail.

The extraction of copper values from ores by simple leaching processes has been known for many centuries, and probably was discovered by some of the earliest followers of mining and metallurgy. Leaching processes vary, according to nature of the ores, and in minor details. The simplest process is that by which the water from sulphide copper mines is compelled to precipitate its copper values on scrap-iron, after reaching surface. Plants for leaching cupriferous mine waters are simple, usually, and the process is essentially the same, wherever used. At Butte the water from the mines carries .0015 to .0065 per cent. copper, and the seepage water from the tailings piles is very much richer. The oxidation of chalcopyrite in tailings is very slow, but chalcocite and oxidized ores leach much more rapidly. The tailings piles at Butte are leached by water, conveyed in ditches over the surface of the piles, and such leach-water, after leaving the tailings, goes from pond to pond, and then is pumped to precipitating tanks, in series of two or three with grades of 1 to 240 at the beginning, and 1 to 50 at the end, the copper being precipitated on scrap-iron, tin cans and other iron waste, the product being cement copper running from 30 to 90 per cent. in copper tenor. The product resulting from the precipitation of copper from cuprous sulphate solutions upon scrap iron is a very impure mixture of metallic copper with iron, antimony, arsenic, silica, etc., and is washed, sometimes repeatedly, before reduction to blister copper in blast-furnaces.

Lixivation is especially adapted to sulphide ores of low grade, but not all low grade ores can be handled advantageously by leaching, as it is not adapted to ores containing considerable quantities of ferrous oxide, manganese or lime, while the leaner oxides, carbonates and disseminated sulphides having quartz gangues are especially suited to lixiviation. The initial outlay for a leaching plant is comparatively small, but the process is slow, and, to be even fairly complete, requires much time, for long continued leaching, in the case of average ores. Where applied on a very extensive scale, as in Spain, the principal disadvantage is the locking up of enormous quantities of ore, entailing a heavy investment, but this disadvantage, when once overcome, affords compensation by reason of the immense amount of material in process of leaching acting as a sort of balance wheel, rendering it possible to forecast production to a far greater extent than in the case of mines using ordinary concentration and smelting processes of reduction.

The mines of the Sierra Morena, in Spain and Portugal, have been worked intermittently for about three thousand years, and immense piles of low-grade sulphide ores and refuse have accumulated. As these weath-

ered, the sulphides became oxidized gradually, and natural lixiviation was brought about by the rains. The bulk of the copper so leached out was lost, but it was learned, at some remote time in the past, that the copper values could be saved by depositing scrap iron in the path of the leach-water. This process of securing copper from sulphate solutions is now in use at many old and idle copper mines as well as at active properties, in various parts of the world.

The process of natural cementation is well exemplified at the San Domingos mine, in Portugal, where the low grade sulphide ore is cobbled to three or four inch size, and piled in immense heaps, 15 to 40 feet in height, which are provided with valleys for drainage, with brick chimneys at intervals. Pipes are laid over the surface of the heap, and water is applied copiously, at intervals. The water draining from the heaps is collected in sluices, and the metal, carried in solution as copper sulphate, is precipitated on scrap-iron. Some of the heaps at the San Domingos contain as much as a million tons of partially leached low-grade ore, and require eight to ten years for the complete extraction of values to the point of impoverishment where further work, by even this phenomenally cheap plan, is unprofitable.

A modified method, which might be termed artificial cementation, was employed for a long time at the Rio Tinto mine, in Spain, but has been succeeded by a process that will be described later. By this old method broken ore was piled in roast-heaps, called teleras, in quantities of 1,000 to 1,500 tons per heap, the ore ranging from 1.5 to 2 per cent. in copper tenor. The heaps were fired, burning slowly for three to six months, after which the ore, then uniformly and thoroughly roasted, was placed in cement tanks, each about 5 feet deep, 35 feet wide and 100 feet long, provided with false bottoms of square timber. The leach-water from these tanks ran into settling tanks, where the copper was deposited on pig-iron. After five or six successive leachings the ore was removed and piled in heaps, called terreros, and weathered again for further leaching. At one time the Rio Tinto had about seven million tons of low grade ore in ter-  
reros, for further leaching.

The present leaching process in use at the Rio Tinto differs somewhat from the method previously described. The bulk of the copper values of the Rio Tinto is contained in chalocite, distributed in pyrite, and not in chalcopyrite distributed through iron pyrite, as formerly held. The first process in the leaching of low grade ores is exposure to air and moisture, which form some ferrous sulphate, that oxidizes to ferric sulphate, which reacts, with considerable rapidity, on the iron copper sulphides, producing copper sulphate and iron sulphate. About half of the copper values contained originally are changed into the form of sulphate within six months, the final reaction producing copper sulphate and sulphuric acid. About two years are required to extract 80 per cent. of the half of the copper remaining in the leach-heaps after the first six months of leaching.

At the Rio Tinto a site is chosen for a leach-heap where the ground is concave and sloping, to permit the leach-liquor to run out from the base of the heap. The first step is the building of a network of air-flues, with an internal diameter of about one foot, connecting every 50 feet with vertical chimneys built of rough stones. The ore, crushed to not larger than 3-inch size, is spread alternately, in lumps and fines, to a height of about 30 feet,

and the surface is leveled, each completed heap containing approximately 100,000 tons of ore. The surface of each heap, after levelling, is formed into squares, by means of ridges of mineral, these serving to distribute the water locally. A system of gutters is arranged for running water over all parts of the mass, and water is run on as the heap is built up. The ore oxidizes rapidly, the temperature of the air in the chimneys rising to 170° to 180° Fahrenheit, and at the latter point the chimneys are closed, to check too rapid local oxidation, and to promote the slow and thorough oxidation of the entire heap. The pile of ore changes to a brownish color, due to the hydration of the yellowish, basic ferric salt. Great care is required to prevent firing the heap, as fire once started is very difficult to extinguish. When oxidation has proceeded as far as safe, water is supplied, at the rate of 50 cubic meters per hour, until the soluble copper is leached out, after which the heap is allowed to oxidize naturally, and the process of leaching is repeated. After about one year the squares on the surface of the heap are rearranged, and gutters are shifted. At the edges of the heap the mineral has become cemented, holding a considerable quantity of copper salts, and the edges are dug down into terraces, and the copper extracted therefrom by washing. When the copper contents have been reduced to about 0.3 per cent., the heap is considered thoroughly leached, and the residue, containing an average of 49.5 per cent. sulphur, is exported as washed sulphur ore.

The copper liquor, as it runs from the heap, has considerable ferric iron in solution, and, to remove this, the liquor is run over a smaller heap of ore, known as a filter bed, laid in a reservoir formed by a masonry dam thrown across a small ravine. The filter bed greatly reduces the quantity of ferric iron carried in solution, and the leached liquor is then run to the cementation tanks, reaching the tanks containing, per cubic meter, about 4,000 grams of copper, 1,000 grams of ferric iron, 20,000 grams of ferrous iron, 10,000 grams of free sulphuric acid and about 300 grams of arsenic, a total of about 3.5 per cent. carried in 96.5 per cent. water. The liquor is run from the reservoirs, at about 300 cubic meters per hour, through the precipitation tanks over pig iron, producing cement copper, the process of cementation being facilitated by warm weather. The precipitation tanks are arranged in series, on the slope of a hill, the leach-liquor passing forward and back, and being discharged from the lowest tank practically free from copper, but containing considerable ferrous iron and free sulphuric acid. This waste liquor coming from the cementation tanks, called *salida*, is pumped back and mixed with fresh water, for further use on the leach-heaps. Each series contains three parallel tanks, which are about 2½ feet deep, 5½ feet wide and 320 feet long, the slope at the bottom varying from one in five hundred, in the first series, to one in ninety in the last series, added velocity being provided in the final series to overcome the tendency of the free sulphuric acid to attack the pig iron more rapidly as copper is deposited from the solution. The tanks are built of lumber and the spaces between them filled in with stone and cement. No metal is used in the construction of the tanks, wooden plugs being used for joining the timbers. Cracks between the boards are filled with oakum and pitch, to render the tanks water-tight, and at each end of each tank there is a drop-door. The tanks contain about one ton of pig iron for each foot of length.

The precipitate is taken daily from the tanks, the cement copper being removed from one tank at a time. The rough precipitate is taken to the

cleaning and concentration plant, where the precipitate is cobbed from the pig-iron, which is replaced for further use. The crude precipitate so secured, containing an average of about 70 per cent. copper, is fed onto a perforated copper plate, through which it is washed by a strong jet of water from a small nozzle, into a long launder, material not passing the perforations being removed and hand-sorted. The precipitate passing into the launder is washed and concentrated, by the velocity of the water, into different grades. The first few yards of the launder produce a red precipitate, known as No. 1, that assays about 94 per cent. copper and under 0.24 per cent. arsenic. This is followed by No. 2 precipitate, assaying about 92 per cent. copper and between 0.3 and 0.75 per cent. arsenic, while No. 3 precipitate, at the far end of the launder, consisting of very fine grains, averages only about 50 per cent. copper, and up to about 5 per cent. arsenic, including also graphite from the pig-iron, and some antimony and bismuth. Nos. 1 and 2 precipitate are bagged for shipment to the refinery, and No. 3 is moistened with acid liquors, made into balls by hand, dried in the sun and then smelted and bessemerized in the ordinary manner.

A system of combined roasting and leaching, in use in the Sierra Morena district of Spain, consists of roasting copper sulphides with ferrous iron sulphate, which reduces the copper to the form of sulphate, after which it is leached. Iron sulphate is produced extensively in the ordinary cementation process.

Copper sulphides may be converted into chlorides in various ways. By one process the sulphide copper ores are treated with ferric chloride, or with ferrous chloride and hydrochloric acid, decomposition being hastened by saturating the ores under treatment with calcium chloride or sodium chloride, both cheap and common chemicals. Another process, which is quicker, and gives closer extraction, though costlier, consists of roasting the raw sulphide ores with the addition of about 1.75 per cent. salt. The ore so treated is roasted in teleras, after which the chlorurized ore is leached in vats, and the residuum placed in terreros, for further weathering and leaching. A modification of this process is in use near Pittsburg and at several other American points.

The Doetsch leaching process is not in present use, though once employed extensively at the Rio Tinto. By this process raw sulphide ores were mixed dry with about one-half per cent. of ferrous sulphate and salt, the ore being broken to half-inch size and built up into large heaps having channels and chimneys for ventilation. The weathering process required about two years, and about 80 per cent. of the copper contained was secured by leaching and cementation.

The Hunt & Douglas process is a modification of the Doetsch process, but none of the chloride processes are in very general use.

The earlier wet process of Langmade, improved by Henderson in 1860, and since modified slightly, is in quite extensive use in Great Britain. This system is designed for the extraction of small copper values from the cinders remaining from cupriferous pyrites after burning for sulphur used for the making of sulphuric acid.

Metallic copper is slightly soluble in cyanide solution, the solubility being in direct ratio to the fineness of comminution. Copper carbonates and oxides, in small quantities, have a deleterious effect on the cyanide treatment of gold ores, decomposing the solution rapidly. Copper taken into the

solution to a point where affecting its strength for gold solution can be precipitated electrolytically.

A patented hydro-electrolytic process is planned to leach copper direct from the ore and deposit pure metal electrolytically from the solution. By this process ore first must be crushed to size passing a 40 to 80-mesh screen, then calcined and leached in tanks in a solution containing 6 to 10 per cent. of sulphuric acid. It is claimed that one ampere of electrical energy will precipitate one ounce of copper in 24 hours, but this process does not seem to have passed the empirical stage.

New processes of lixiviation for copper ore are numerous, and many new systems have been patented, in different countries. Some of these new processes call for involved and intricate reactions, possible in laboratory experiments, but difficult of carrying out in the actual extraction of copper on a large scale commercially. A fault common to many new leaching processes is that materials too costly in price are required, and such processes, while technically correct, are unavailable commercially by reason of high cost. In practically all developed copper fields only the low grade ores are adapted to leaching, all ores of medium and high grades being treated by smelting, with or without preliminary concentration. Only the cheapest materials are available for leaching processes that will prove commercially successful, and the only two chemicals that seem to have met the tests as to strength and cheapness are salt and sulphuric acid, with salt losing ground in this field, in which it once disputed supremacy with the acid.

## CHAPTER VII.

### THE PYROMETALLURGY OF COPPER.

Smelting, or the reduction by fire, of metal from ore, has been known to mankind from prehistoric times. The reduction of copper to metallic form is effected by three methods, or combination of methods, these being hydrometallurgy, where leaching processes are employed, pyrometallurgy, where fire is the reducing agent, and electrometallurgy, with electric energy as the agent of reduction. The greater part of the world's copper production is secured with the aid of fire by smelting, but the rough copper so obtained is refined, as a rule, by electrolysis. This chapter is devoted to smelting in its various branches.

The antiquity of copper smelting is evidenced by the finding of copper and bronze in tombs and disinterred cities of very great age, and it is obvious that the copper must have been smelted, because the ancients are not known to have possessed mines of the native metal. The secret of smelting never was lost, but was handed down from generation to generation, and spread from country to country. In Europe there were copper smelters, at very early periods, in Germany, Austria and Sweden, it being obvious that the metallurgical practice of these works was derived from the Romans.

In Great Britain there are fugitive historical references to copper smelters early in Plantagenet times, and it is altogether probable that smelting was done, in a primitive manner, on tin ores, many centuries before the Christian era, and that the improved metallurgical practice introduced to the island by the Romans was never lost entirely, through the troubulous centuries preceding the welding together of numerous petty principalities into one nation, under Alfred the Great, in the year 900. In the Swansea district the earliest recorded smelter is that of the Mines Royal works, dating from A. D. 1584, though it is known that these works were preceded by still earlier smelters. The Taidach works date from 1727, and in Cornwall, copper smelters at Hayle date from early in the Eighteenth Century. The Welsh and English were the first to engage in copper smelting as an independent industry, the practice, from time immemorial, having been to smelt the ore at or near the mines, in primitive works under the same ownership. As a result of the establishment of independent works that bought ore from many mines, the Welsh smelters progressed more rapidly in metallurgical knowledge than their competitors and gained great skill in treating refractory ores. As a consequence of this progress Swansea became the seat of the greatest diversified smelting industry on the globe, the location of the city being favorable for the receipt of ore and matte from foreign countries. The smelting industry of Swansea, though still large and highly diversified, is of much less importance than formerly, the decadence of Welsh smelting having been aided, beyond doubt, by the arbitrary restrictions imposed upon the producers of the ore, for at the height of their prosperity the Swansea smelters drove very hard bargains

with the miners. For a long ton, twenty-one hundredweights of one hundred and twelve pounds each were demanded and received, in addition to which an allowance of three and one-half pounds on three hundredweights was exacted for "draftage," and allowances also were claimed for moisture. No new smelters have been built at Swansea since 1867, though perhaps nearly three-fourths of the world's copper output was smelted at that point about the middle of the Nineteenth Century.

The smelting of copper dates from time immemorial in China, Persia and India, and Japanese smelting was begun about the Seventh Century of the Christian era. In Japan the large and highly important modern copper smelting industry now in existence may be said to date from about 1890, when the first modern machinery and equipment were installed at a Japanese plant.

The change of base of the copper smelting industry of the world dates from about the middle of the Nineteenth Century, when the development of highly important copper industries in Lake Superior, Chile, Australia and South Africa led to the building of smelters near the mines. The smelting industry, so far as copper is concerned, has reverted to the ancient practice of thousands of years, interrupted for a couple of centuries by the rise of the Welsh smelting industry, and the reduction of copper ores is carried on now, as a rule, at or near the mines, though, in the case of electrolytic refining, the greater portion of the rough copper is refined at long distances from the smelters.

In Chile the first reverberatory furnaces were built in 1842, at Coquimbo, by Charles Lambert, and Lambert, who was an extensive operator of Chilean mines, opened the Port Tennant works at Swansea, in 1852, to escape the intolerable exactions of the Associated Smelters. From this declaration of independence may be said to date the decline of the Welsh smelting industry. Charles Lambert built the first Chilean blast-furnaces, at Coquimbo, in 1857, but these were not entirely successful. Chile now has a number of modern smelters, though none of the first magnitude, and a considerable amount of ore continues going to Swansea for reduction.

In Australia the first smelter was built at Port Adelaide, South Australia, in 1851, and the second was erected at Wallaroo, in the same state, in 1861. The first smelter in New South Wales was built in 1874, at Lithgow, and the first in Queensland was built, in 1888, at Aldershot, a suburb of Maryborough, while the first smelter in Western Australia was not constructed until after the opening of the Twentieth Century. In Tasmania the first copper smelting was done at a plant on the east bank of the Derwent, at Smelting Works Bay, shortly previous to 1860, but these works do not seem to have proven a success. The modern works of the Mount Lyell, which are exceeded in size by many plants, but in efficiency by none, date from 1896.

In the United States the smelting industry was slow in gaining a foothold, partially because of the policy of England in forbidding the smelting of copper ore in the colonies. There was a limited production of ore from mines in New Jersey, Vermont and elsewhere, during the Eighteenth Century and in the early decades of the Nineteenth Century, but the first American smelter of which authentic records have been found was the Revere works, at Port Shirley, Boston, Massachusetts, having cupola furnaces, which were built in 1835. The company owning the works was reorganized in 1851, and continued business as a copper smelter until 1868, and remains

in business with a copper rolling mill, though no longer a smelter. It is asserted by Nicol Brown, an eminent English authority, that a copper smelter was built by Crocker Bros. at Taineston, Maine, in 1836, but there is no town by this name in the state of Maine, and verification of the statement has not been obtained. The first thoroughly successful American smelter was built, in 1845, at Baltimore, by the Baltimore & Cuba Smelting & Refining Co., to treat Cuban ores. This plant had reverberatory furnaces, operated by Welsh smelters, and treated ores from Cuban mines, and later from South American mines, that previously had been shipped to Swansea for reduction. This plant, now under the ownership of the Baltimore Refining & Smelting Co., remains in existence, and has been in continuous and successful operation for upwards of sixty years.

The New Haven Copper Co. built a small smelter at New Haven, Connecticut, in 1846, and from the opening of this primitive plant dates the great copper and brass manufacturing industry of the Naugatuck Valley, now the first in this line. In New Jersey a small but good copper smelter was built in 1846, at Bergen Point, and this small beginning has resulted in the building up of the enormous copper smelting and refining industry now found on the New Jersey coast along New York Bay. The Orford works, at Constable Hook, New Jersey, were built in 1881, this being the first strictly modern plant in New Jersey.

The beginning of the Lake Superior industry may be said to date from the construction of a small smelter at Pittsburg, Pennsylvania, in 1848, by Hussey & Howe. This proved fairly successful, and the affiliated firm of Hussey & Co. built a copper smelter for Lake Superior ores at Cleveland, Ohio, in 1850. In the same year the Detroit & Lake Superior Copper Co. built a smelter at Detroit, Michigan, and shortly after the same company built the first Lake Superior smelter at Hancock, Michigan, this being located in the heart of the Lake Superior copper district.

The southern copper smelting industry dates from 1854, when two small blast furnaces were built at Ducktown, Tennessee, a reverberatory furnace being built at the same point in the following year. The copper industry of Tennessee was extinguished, temporarily, in 1863, by the American Civil War, and modern copper smelting in that state may be said to date from 1890, with the advent of the Ducktown Sulphur & Copper Co., which has been a leader in the development of successful raw sulphide ore smelting. In North Carolina a small blast-furnace was built at the Ore Knob mine in 1876.

The earliest western copper smelting was done in California, circa 1865, but the bulk of the Californian copper ore production of that day went to Swansea for smelting, and the Californian copper industry suffered almost complete extinction shortly previous to 1870. Modern copper smelting in California dates from 1896, when the Mountain Copper Co. erected a fine modern plant at Keswick, in Shasta county. In Arizona some crude smelting was done at an early date, but modern smelting was begun in the Clifton district of Graham county, circa 1878. Copper smelting in Utah is a comparatively recent affair, though this state now has some of the best works to be found anywhere.

In Montana the first smelter was built at Butte, in 1880, by the Boston & Colorado company, and reverberatories for matting were built in the

same year by the Parrot mine, and the Meaderville smelter of the Montana company was constructed shortly afterward.

The smelting of copper has made greater progress since the middle of the Nineteenth Century than in all the centuries intervening since the discovery by primitive man that metal could be obtained from copper ore through heat, and this progress is shown in no more striking manner than by the increase in furnace capacity. About the middle of the Nineteenth Century the capacity of an average reverberatory furnace was circa seven tons per diem, while in 1902, the capacity had reached three hundred tons. The blast-furnace had increased, by the year 1900, to a daily capacity of three hundred tons, while in 1907 the capacity of the largest blast-furnace, at the Washoe works, was two thousand seven hundred tons.

In smelting gold and silver ores it usually is necessary to provide a metallic carrier for the precious metal values, the proportion, by weight, of the gold and silver being so small that it is necessary to collect these metals in some other metal of less value, but found in the ore in larger quantities. The preference, until recently, has been for lead, as a collector, but there is a marked tendency, noted since the beginning of the present century, to substitute copper for lead.

Copper melts at about 2,000° Fahrenheit—2,043° according to Plattner—or approximately 1,100° Centigrade. When heated within 200° of the melting point the metal becomes brittle and friable. Copper, when fluid, at white heat, is of a beautiful sea-green color, and volatilizes slowly, combining with oxygen to give a green flame.

The old method of smelting called for reduction of the ore to metal by six stages. In the first stage the ore was roasted in a reverberatory furnace, with the addition of about 15 per cent. of fuel. In the second stage the roasted ore was smelted, with flux and fuel, to a matte of about 35 per cent. copper tenor. In the third stage the low-grade matte was roasted in reverberatory furnaces, with the addition of about 40 per cent. fuel. The fourth stage called for the smelting of the roasted matte, with the addition of about 50 per cent. fuel, to white metal of about 75 per cent. copper tenor. In the fifth process the white metal was remelted, in reverberatory furnaces, with about 60 per cent. of fuel, to blister copper. The sixth and final process called for the refining of the blister copper by a succession of partial oxidations. The process of bessemer smelting usually is applied to the conversion of high grade matte, as hereinafter explained, but consists essentially of any reduction of ores by means of an oxidizing atmosphere, and both pyritic smelting and semi-pyritic smelting may be considered forms of the bessemer method of smelting.

New smelting processes are of great variety, and are constantly cropping up in considerable number. Most of the new processes are patented, and in theory many are of a revolutionary nature. Unfortunately such processes have a bad habit of working out wrong in actual practice, though frequently successful in theory. The working out of a new theory of smelting, by laboratory experiments, is a vastly different thing from applying such new processes successfully in works handling immense quantities of material. A small mine or a new mine cannot afford to experiment with new and untried processes of reduction. That work should be left to the big smelters, which, with very few exceptions, are managed by experienced

and progressive men, who are ready, at all times, to try out new smelting processes that give promise of resulting successfully. The progress of metallurgy is accomplished, as a rule, by small and frequent advances, rather than by great leaps or by revolutionary inventions.

In treating sulphide copper ores, which predominate in most districts, it is necessary to expel the sulphur, and iron also, where that is connected with the copper, as in most cases. The iron can be slagged by the addition of appropriate fluxes, and, where the ores are deficient in iron, that element must be provided by ferruginous flux, iron being necessary in the formation of free slag in copper smelting. As most of the sulphide ores possess an excess of sulphur, it was customary, until quite recently, to drive off the excess of sulphur by roasting before smelting. This work is done still, at many smelters, while at other works roasting has given way to pyritic smelting, or semi-pyritic smelting, as hereinafter described. Excess of sulphur may be removed from ore by heap-roasting in open air, by roasting in shaft furnaces or kiln furnaces, or by calcining in reverberatory furnaces, usually of a special pattern, with rabbles.

The process of heap-roasting is inherently defective, and seems doomed to gradual extinction, semi-pyritic smelting, commonly known as raw sulphide smelting, being preferable, in most cases. While the theory of heap-roasting is the same in all cases, there are many minor modifications. At the Rio Tinto mine, where heap-roasting has been discarded, the heaps were of enormous size, and were burned with a marvelously small amount of carbonaceous fuel. Under the former practice at this mine, hand-selected rich ores, averaging 8 to 10 per cent. in copper tenor, were piled into heaps of about 400 tons each, and fired with a single cord of wood, burning six to nine months each. At the Tyee mine, in British Columbia, the process of heap-roasting has been carried pretty closely to perfection. Ores are dumped from the railroad hopper-cars into sixteen 100-ton receiving bins, with hopper-bottoms and screen-tops, latter set at angle of 40°, all fines under three-eighths inch mesh falling into separate compartments built in the center of each bin. The level of the roast-yard is about eight feet below the tram-tracks that run under the receiving bins. The yard has six permanent trestles, sixty feet apart from center to center, and at right angles to the permanent trestles are six trenches, each four feet deep and forty feet from center to center. Between the permanent trestles are movable bridges, traveling on wheels, these being trussed so as to clear the roast-heaps below. Both permanent trestles and movable bridges have tram-tracks, with turntables, over which travel side-dumping ore-cars, which thus obtain easy access to every square foot of the roast-yard. Roast-heaps are built up automatically, by dumping the tram-cars, each heap averaging twenty-four by fifty feet in size on the bottom, by seven feet in height, and containing an average of 300 tons. Each roast-heap requires an average of eight cords of wood, and burns about three weeks, reducing the sulphur contents to about 5 per cent. The system works perfectly, cintering being reduced to a minimum. When roasted, ore is shoveled into 4,500-pound ore-cars, traveling on tram-lines laid in the bottom of the trenches before mentioned, the tops of the cars being on a level with the bottoms of the roast-heaps. Roasted ore is trammed to the burnt-ore bins, 1,500 feet distant and just behind the blast-furnace build-

ing, there being eighteen fifty-ton bins, with central bottom-discharge gates, emptying into tram-cars running over scales to the charging-floor of the furnace.

In the case of ordinary heap-roasting, where it is not practicable to go to the expense of providing a system so well devised as at the Tyee, ground should be selected with sufficient slope to provide good drainage, and ditches should be dug to carry off rainwater, and also to divert the drainage of adjacent ground, as a large proportion of the metallic values contained originally may be leached out by water in a short time. Usually the ground is surfaced by broken rock or slag, and given a final top-dressing of clay, well rolled or pounded. Above this should be placed a layer of fines, three to six inches deep, to prevent baking the clay, followed by its inclusion with the roasted ore when the latter is removed. On this surface of fines the roast-heap proper is built. There is a first layer of wood, much or little according to the nature of the ores, and usually more than really is needed. The worst wood available will do very well, if care is taken to furnish a little good wood for kindling the fire. Channels are provided, so that after the wood has burned out there is draught through the heap. Chimneys of boards are built at various points, the number of channels and chimneys depending on the size of the heap. In American practice a cord of wood is used for an average of 30 to 50 tons of ore, the percentage of fuel growing less as the size of the heap is increased. The first layer of ore is in coarse lumps, two to six inches in size, or even larger, surmounted by a layer of ragging, or medium-sized lumps, and topped with a layer of fines. The greater the percentage of sulphur, the lower the height of the pile. The shape of the heap on the ground may be square or oblong, usually the latter, to facilitate upbuilding and removal. In a roast-yard it is necessary to have a considerable number of heaps, so that the process may be continuous. The heap is fired, after building, and the wood gradually ignites the sulphur in the ore, which continues to burn for many weeks. The success or failure of the process depends mainly upon careful handling, the heap requiring a small but steady supply of air, for even roasting, while too much air allowed to enter the heap will result in matting part of the ore. Heap-roasting requires much hand-labor, and has various objectional features tending to restrict its use.

Matte is sometimes heap-roasted, requiring several successive burnings, but the practice is of very doubtful utility.

The fuels used in smelting copper are of a great variety, choice depending largely upon availability and prices, as well as upon individual requirements. Bituminous coal is used extensively, and anthracite coal sparingly. Anthracite is a very good fuel, but unobtainable at reasonable prices in most copper fields, while bituminous coal is the most objectionable fuel, and, next to charcoal, the least used, though there is a great difference in the varieties of bituminous coal, some of which work well in partial or complete fuel charges, while others give most unsatisfactory results. Coke, which is the most common fuel, was utilized first at Freiberg, in 1818, and proved an immediate success. For satisfactory work, in either reverberatory or blast furnaces, coke should develop not less than 10,000 British thermal units. Wood is used extensively in Chile, and in

some other districts. Charcoal sometimes is employed in blast furnaces, but for this use should not be burned dead in the kilns or pits, as in such case combustion is too rapid in the furnace, leaving a frozen charge. Where wood or charcoal must be burned for fuel, on account of local conditions, wood-burning reverberatories are preferable, as a rule. Petroleum sprayed into the firebox has been utilized in reverberatory furnaces, and in Transcaucasia is the principal fuel, giving thoroughly satisfactory results. Apparently petroleum is not well adapted to blast-furnaces, as experiments along that line have not proven successful. Gas is used to a limited extent in reverberatory furnaces, giving satisfactory results.

The nature of the charge placed in a furnace depends, necessarily, first upon the ores available, and secondly upon the nature of the principal ore or ores to be smelted. Some ores are so constituted as to be self-fluxing, containing in themselves the necessary iron, silica and limestone. In most cases it is desirable to blend the various copper ores, where the required grades can be secured, rather than to add barren fluxes, but this process depends largely upon the availability of the ores desired. One of the principal reasons for the success of big custom smelters lies in their ability to mix varying ores, from different districts, so as to lessen or entirely obviate the use of barren limestone, silica or iron ore, for fluxing. The use of "sweeteners" is to be commended, where such ores are obtainable at reasonable prices. Ores that are excessively silicious require fluxing with ferruginous copper ores, or with iron ores that are barren of copper, and vice versa. Local conditions regulate practice, and the soundest theories must step aside, at times, in the presence of prohibitory freight rates, which, unfortunately, seem entirely too common, in many of the important copper districts of the world.

In the use of silicious fluxes it should be borne in mind that all silicates are not  $\text{SiO}_2$ , which is pure silica. Quartzite or some other form of  $\text{SiO}_2$  is much preferable to bisilicates or trisilicates, and, of course, the best silicious flux of all is a low grade ore, with gangue composed mainly of  $\text{SiO}_2$ , carrying appreciable values in gold, silver or copper, or some combination of these three metals. Barium sulphate is difficult of reduction, and ores having a heavy barite gangue are refractory in smelting. Excellent results have been secured at the Ladysmith smelter on burnt ore averaging 38.87 per cent. barium sulphate, a general average analysis of slags from this heavy barite ore giving only 0.37 per cent. copper.

In the case of native copper from the Lake Superior mines, which reaches the smelter with only 20 to 50 per cent. gangue rock adhering, the process of reduction is simple. Oxide and carbonate ores are smelted readily, but with sulphide ores it is necessary to utilize different methods as hereinafter explained. Pyritic and semi-pyritic smelting are employed successfully in some works treating sulphide ores, but the usual process of reduction calls for preliminary roasting, in yards, or, more frequently, calcination in reverberatory furnaces, before charging for smelting. The full treatment of sulphide ores is given later, in this chapter.

Fines, coming either as fine concentrates, slimes or flue-dust, best can be smelted in reverberatories, on account of the heavy draft of the blast-furnace blowing out large quantities of the fines as flue-dust, but fines can be smelted with fair success in blast-furnaces by briquetting before charg-

ing. The briquettes made from slimes frequently include flue-dust, and are charged while moist, or the briquettes may have lime or other material for a binder, if necessary. Fines charged directly into blast-furnaces cause the growth of crusts on the sides of the furnace, together with the formation of excessive quantities of flue-dust, thus reducing the output both through losses in fumes and reduced capacity of smelting. Cement copper is a reddish precipitate, composed of metallic copper and sundry impurities, requiring smelting and refining before use. Copper bottoms are alloys of metallic copper and metals existing in the matte as impurities, formed in matting.

Ore bedding is a system by which ores of various grades are stocked near the furnace, and used as required, for mixed charges. In using this system concrete or stone-lined pits, shallow and narrow, but long, are built beside railroad tracks, and ore is dumped into them from railroad cars coming from the mine. Different grades and varieties of ore are kept in different pits, and these, as needed, are scooped up by a steam-shovel and loaded into cars for carrying to the furnaces. The system is suitable only for large works that can afford a steam-shovel, and the value of the method is dependent largely upon the thoroughness with which the plan is carried out.

Mechanical charging is preferable to hand charging in all but small works, and is in very general use. For blast-furnaces, charging is best done by means of side-dumping cars. For reverberatory furnaces the best method of charging is through hoppers in the roof, near the firebox end, and, in the case of the larger reverberatory furnaces, the process is semi-continuous. In Lake Superior smelting with reverberatories the mineral is loaded into one or two-ton side-dumping tram-cars having V-shape bottoms. These are loaded transversely on railroad flat-cars, and are unloaded onto trestles leading into the smelters, the dump-cars being discharged either into bins, for storage, or direct into the hoppers above the reverberatories.

Furnaces for copper smelting are of two classes, the first being the blast-furnace, which has a powerfully reducing atmosphere, and the second being the reverberatory furnace, where the reflected flame gives a neutral atmosphere. The comparative availability of these two classes of furnaces depends largely upon local conditions, and in many plants both forms are found. The choice of kinds of furnace should be based upon a careful consideration of all the circumstances of each individual case. There is no large difference in cost of equipment between blast and reverberatory furnaces, though as a rule the latter are somewhat more costly. Blast-furnaces and their adjuncts occupy only about half the space required for reverberatories. Blast-furnace slags usually run a little higher in copper than reverberatory slags, under similar conditions, but there is a considerable variance according to the circumstances of each case. Reverberatories make very much less flue-dust, as they lack the blast that is such a powerful agent in carrying off fine particles of solid matter in the gases from blast-furnaces. Reverberatories require only about 50 per cent. of the power of blast furnaces, and a slightly smaller force of workmen for an equal capacity.

The blast-furnace was the earliest smelter of any sort, and its age is

greater than that of history itself. Crude forms of the blast-furnace are found in use still, in remote portions of Mexico, South America, the Philippines, China and elsewhere. In the original form the blast was supplied through hollow tubes from human lungs. In fact, iron is made, to this day, in remote oases of the Sahara desert, with the aid of human blast. The next step was the invention of a crude bellows, and to supply continuous blast, two bellowses were used, worked alternately, the blacksmith's forge of today being merely a slightly improved form of the blast-furnace of prehistoric times. In its crudest form the blast-furnace is an open pit, or shallow depression in the ground. The next step is a small oven of stone, into which ore and fuel are charged. The development of the blast-furnace, to its present size and efficiency, has been accomplished by a steady succession of little improvements, covering many centuries, rather than by single strides, yet it may be said, with safety, that blast-furnace smelting has been improved more in the three past decades than in the five preceding centuries. Increase in the number of tuyeres was begun at Freiberg in 1845. The movable forehearth, now in general use, is an American invention, of comparatively recent date. The growth of the blast-furnace in capacity has been marvelous during the past few years. In 1900, the closing year of the Nineteenth Century, the largest blast-furnace in existence had a daily capacity of about 300 tons only, yet in 1907 the largest blast-furnace in use, at the Washoe works, Montana, had a length of 86 feet and a daily capacity of 2,700 tons. This single furnace, running on 6 per cent. ore, which probably was about the average of copper ore smelted at the beginning of the Nineteenth Century, could have turned out, in less than 60 days, all of the copper produced in the world in one year, one hundred years ago. The big blast-furnace at the Washoe works, made by cutting out the end-plates and joining a number of contiguous cupolas into a single furnace, has resulted in a very considerable decrease in fuel consumption per ton of ore treated.

The date of invention of the water-jacket blast-furnace remains a subject of dispute. A ten-ton blast furnace of two feet diameter, built by Wendt, in 1876, was given a water-jacket. Two years previously, in 1874, a water-jacket was installed at the Longfellow mine, in Arizona, which was 800 miles from a railroad, at that time, with fire-brick costing one dollar each and of short life, the ore being highly basic. J. B. Cooper states that the first water-jacket blast-furnace was used at the Detroit smelting works previous to 1864. While blast-furnaces are used occasionally with fire-brick linings, water-jacketed cupolas are employed almost universally. Despite the considerable loss of heat resulting from the circulation of water between the inner and outer shells, the water-jacket has proven itself both efficient and economical. Furnaces usually are rectangular, though occasionally circular or oval, with jackets of soft steel, wrought-iron or even cast-iron, and occasionally of copper.

The smelting of copper ore in a blast-furnace is a process of reducing the metal from its ores by the use of carbonaceous fuel, usually coke, in a cupola having a blast of air, which may be drawn direct from the atmosphere, or heated before passing into the furnace through the tuyeres. Blast-furnace smelting is adapted to the reduction of almost all of the commercial ores of copper, though for certain specific uses reverberatory

furnaces are to be preferred. Fuel and flux, in the quantities demanded for reduction and slagging, are added to the ore, the flux being barren, or containing metallic values, as circumstances may dictate.

Preheated air for the blast was used first by J. B. Neilson, in 1828, at an iron furnace, and was used first on copper at Freiberg, in 1837, but did not prove fully successful there, though utilized permanently at Kongsvinger, where it was installed shortly afterward. The rotary Roots blower was the first in American use, and remains the principal producer of slightly compressed air for blast-furnaces. The pressure under which blast is furnished depends mainly upon the depth of the bath, it being evident that increased pressure is required to force air through an increased depth of molten matter, the average pressure being 14 to 16 ounces per square inch. Blast is heated to greatly varying temperatures, ranging up to 800° Fahrenheit at some works, and the heating may be done in several ways, the most economical method being the heating of the blast by waste gases from the furnace itself.

The date of invention of reverberatory furnaces seems uncertain. The earliest British record of furnaces of reverberatory type is dated 1765. Furnaces of this class can be made, at a pinch, of adobes or sun-dried brick, and these, while crude, and not recommended for use where better material can be had, give fairly satisfactory results in the hands of a first-class smelterman. In the reverberatory furnace the flames from a lower grate, on which the fuel is burned, are reflected back upon the ore, lying on a bed above, thus giving a neutral atmosphere. The forehearth is brick-lined, and movable, and the air entering the furnace may be preheated, though this is not customary. In the best average practice five to seven tons of ore are smelted per ton of fuel burned, the larger furnaces giving the lower ratios of fuel consumption. In the case of sulphide ores the reverberatory furnace produces a richer matte than from the same ores reduced in a blast-furnace.

During the past thirty years the reverberatory furnace has gained tremendously in size. In 1878 the capacity of the average American reverberatory was 12 tons only, but had increased to 24 tons in 1887, and, in the case of the larger furnaces, had increased to 50 tons in 1894, 150 tons in 1899, and 300 tons in 1902. The largest reverberatory furnace in existence is at the Washoe works of the Anaconda mines, in Montana, this being 19 feet wide and 116 feet long, with a daily average capacity of about 300 tons.

In the Lake Superior district the smelting of copper mineral is done in reverberatories. The charge is first melted down, with fuel and flux, anthracite coal and coke constituting the fuel and limestone the flux. The products of the first fusion are slags rich in copper, which are remelted, and impure copper, which is tapped to a refining furnace, where rabbled by blowing air through a gas-pipe, this process having an oxidizing effect on the charge. The copper is then poled with staddles of green wood, to bring it to the proper pitch, when it is dipped and moulded by hand, or tapped into mechanical casting machines. It is possible to perform the entire operation of fusion and refining in the refining furnace alone, but in practice it is found profitable to separate the work into the two operations previously noted. The standard Lake Superior reverberatory furnace is 13x17 feet and the largest in the district, previous to the building of the Michigan smelter,

was 17x28 feet. At the Michigan works a furnace 20x50 feet was built, but, after repeated trials, this was found too large to hold the heavy charges of mineral, and was cut down to 16x35 feet in size, and furnished with a 24-inch ventilated bottom.

The bulk of the world's copper supply comes from sulphide ores, and, while leaching processes are used to a considerable extent, the far greater part of the sulphide ores is reduced by heat alone. Unless pyritic or semi-pyritic smelting be employed it is desirable that as much as possible of the sulphur be eliminated before the ore goes to the smelter. Preliminary roasting or calcining may be done in the open air, by heap-roasting, as previously described, or by roasting in stall, shaft, or kiln furnaces. The roasting of sulphide ores may be reducing or merely oxidizing in nature. The calcination of copper ores is a simple process, in theory, but in practice requires nice discrimination and care, to secure the best results, owing to the varying proportions of copper, iron, sulphur and other elements found in the raw ores. The skill with which the calcining is done greatly affects the success and cost of the future processes of reduction. As the combinations of ore vary greatly in different districts, the practice also varies to a considerable extent, and the best practice for the calcination of a given ore is determined, first by theory, and secondly by actual work.

Calcining may be done in hand-furnaces, but automatic devices are more economical, and are in general use in all but the smallest and least modern works. Hand reverberatory furnaces, with the hearth heated by a fireplace separated from the furnace by a bridge-wall with side openings, give as good satisfaction as can be secured with hand furnaces. Muffle furnaces are used occasionally, though not extensively, giving a very equable heat, but proving expensive in operation. Hand power cylinders are used at times, but are not so economical as mechanically operated calciners. The Brückner automatic intermittent discharge cylinder, invented 1864, has a greater diameter and shorter length than other varieties of cylindrical calciners, hence it takes less floor space, and is automatic and efficient in operation, being in quite general use. The Douglas muffle cylinder calciner, with continuous discharge, has a central flue of tile, which takes combustion products direct to the chimney. This calciner, while suitable for general work, is especially adapted to the economical and cleanly saving of sulphur fumes for the making of acid.

The principal form of calciner is the automatic reverberatory, of which there are a number of varieties, mainly patented, all of more or less value. These consist essentially of stationary reverberatory furnaces, through which plows are dragged, to rabble the ore under calcination and to remove the calcined ore. One of the most efficient forms is the turret furnace in which horizontal revolving plows are actuated from a central shaft, the ore charge being fed automatically from hoppers above. The turret furnace is economical of floor space and attendance, and may be built with a number of decks. The four-hearth Welsh calciner has hearths of 16x16 feet. The O'Hara calciner, with straight hearth, was the first to use mechanical rabbling, with plows set on horizontal arms attached to an endless chain. The turret calciner of Pearce, with superimposed hearths, came out in 1892. The McDougall mechanical calciner, invented 1891, is the type found in most general use. This has numerous superimposed hearths, some furnaces having

as many as six, each rabbled by rotating arms carrying plows. The Argall furnace has a hearth with reciprocating movement, rabbles being lifted automatically when the hearth makes the return movement.

Ores are roasted also in kilns, stalls and shaft furnaces. A stall furnace is merely a perfected form of heap-roasting, wherein brick, stone or slag-block walls are built about the roast-heaps, giving perfect regulation of air currents. Where necessary a roof is built, to prevent the access of rainwater, which would leach out a considerable part of the copper values. In the most modern forms of stall furnaces, paved or grated floors are added, and stalls grade into furnaces by the addition of flues and chimneys for the carrying off of roast-gases. The Gerstenhöfer shaft furnace, utilizing the sulphurous fumes for making sulphuric acid, consists of a vertical shaft with a mechanical device for feeding the charge from above, and the fresh pulverized ore is intercepted in its downward progress by projecting ledges, permitting its partial oxidation. Kiln roasting also is employed where sulphurous fumes are saved for making acid, the kilns being of shaft-like form. The advantage of kilns and shafts is found mainly in the saving of the sulphurous fumes, but the process of desulphurization is more complete than is possible in heap-roasting or stall roasting.

Matting is the process of making a semi-metallic compound from sulphide ore, materially richer in copper than the ore treated. In the process of matting a considerable proportion of the sulphur in the ore is thrown off in fumes, and a large part of the original gangue is eliminated as slag. A definition of matte, or regulus, as it sometimes is called, is exceedingly difficult to give, for the reason that matte may contain greatly varying proportions of any of its elements, and a considerable variety of elements, of which sulphur always is necessary, copper being necessary, of course, in a copper matte, and lead in a lead matte, while iron, arsenic and a number of other impurities, some valuable and others damaging, are found in greater or less number and proportions in different mattes. Copper matte may contain as little as 15 per cent, or as much as 75 per cent. of the metal, though usually ranging from 25 or 30 per cent., in the lower grades, up to 50 or 55 per cent. in the higher grades. Copper matte is an intermediate product between raw or calcined ore, usually the latter, and the finished copper product. Matte is variously considered as an alloy, a mechanical compound or a mechanical mixture. It obviously is a semi-metallic product, possessing certain metallic characteristics, such as malleability, which is quite marked in the case of some high grade mattes. The mattes of high grade have specific names, according to their copper tenor. Blue metal is a matte containing 60 to 65 per cent. copper; white metal runs 70 to 75 per cent. copper; pimple metal carries 80 to 85 per cent. copper. Black copper is impure metallic copper carrying 1 to 5 per cent. sulphur, also sundry metals and metalloids, the name coming from the oxidation of the surface to a dull black. Blister copper is the highest grade of unrefined metal, carrying 96 to 99.5 per cent. copper, with one per cent. or less of sulphur, and small, variable quantities of other impurities. Its name comes from the blebs or vesicles, in which the bubbles of gas, from sulphur and other volatile elements, are retained as the copper hardens. Blister copper looks well, and is suitable for many uses, but, with the exception of the unusually pure metal from Lake Superior mines, blister copper is red-short, as a rule, though

not cold-short in most cases. The quality of blister copper varies greatly, the purer brands being of good commercial grade, while the baser qualities are suitable for rough copper uses only.

The tendency of present practice is away from the old plan of blowing up a matte to blister copper by easy stages, and in the most modern plants only two fusions are required between calcining and bessemerizing. The separation of matte from the slag depends mainly upon specific gravity, hence the separation is imperfect when heavy basic ferruginous slags are produced, while light siliceous slags usually are quite free from matte. Copper bottoms are alloys of metallic copper and other metals existing in the matte as impurities. The formation of the bottoms purifies the matte, and such bottoms are resmelted. In matting it is found that small furnaces are exceptionally liable to freeze. The product of the first fusion in the reverberatory matting process is of low grade, ranging from 15 to 50 per cent., usually 25 to 40 per cent., in copper tenor. If the charge is blown up to more than 50 per cent. copper at the first fusion, the slags are almost certain to carry considerable copper, entailing direct losses, or necessitating remelting.

Blast-furnace slags, as a rule, run a little higher in copper than reverberatory slags produced from the same ore. The chemical composition and physical properties of slag vary according to the nature of the ore and fluxes, but usually slags are rich in both iron and silica. In Lake Superior smelting practice the reverberatory slags run 10 to 25 per cent. in copper tenor, and are resmelted in blast-furnaces, which, in turn, give slags carrying only 0.75 to 1 per cent. copper. An average of 10 per cent. copper in reverberatory slags is considered good practice in the Lake Superior district, the nature of the material treated differing greatly from the ores of other districts. The rich slag, containing much cuprous oxide, is skimmed off at the end of poling.

The scoria, or slag from a smelter, accumulates in large quantities, and its disposal sometimes becomes a matter of difficulty. Various systems are in use for disposing of slag, the simplest being to let it run outside and care for itself, but this is possible only where there is a sharp incline and plenty of room, conditions frequently lacking about a modern smelter. Where it is impossible to permit the slag to care for itself, the cheapest method of disposal usually is by granulation, which is accomplished by running the molten slag into a trough conveying a small stream of rapidly running water. The slag granulates instantly, and is washed away by the water and deposited by gravity at any point desired, granulated slag being sluiced in water almost as easily as coarse sand. Slag may be disposed of also by removal from the furnace in slag-pots, transported by hand, horse or mechanical power, or may be run out in gutters, while liquid, though somewhat difficult of handling by this method because of its viscosity. At a number of smelters slag-bricks are made, and while these are not suitable for general building purposes, they are available, to a considerable extent, about a modern reduction plant, and make satisfactory brick for almost any rough use.

In calcining or smelting copper ores, varying proportions of the metal are volatilized and carried off with the roast-gases, while fine particles of unsmelted ore may be carried out of the smelting zone by the powerful draft of a blast-furnace. Formerly the copper blown out in fine particles, and

volatilized by intense heat, was lost, but in all modern plants the greater part of such furnace loss is regained by deposition in dust chambers. It has been found advantageous to make the dust chambers of great length, which permits the settling of the small solid particles from the fumes, and the sublimation of the volatilized copper along the course of the flue. Dust chambers are found in all modern plants, and as a rule are merely enlargements of the flue, having transverse partitions permitting the gradual settling of the dust from the furnace fumes. In the larger plants the flue-dust is removed from the dust chambers through hoppers underneath, which load into tram-cars. As flue-dust usually is high in arsenic and antimony, volatile elements that are highly deleterious to finished copper, flue-dust commonly is smelted by itself, though sometimes mixed with matte or briquetted with fines previous to resmelting.

Fumes from sulphide ores are injurious to vegetation, and lead to much litigation. There is no question that much damage is caused to agricultural interests by smelter fumes, and equally there is no question that an industry of mulcting smelters has grown up among agriculturists in various smelting districts. The courts usually hold with the farmers, and increasing trouble is caused the smelters, with prospects of still more serious trouble in the future. It has been suggested that smelter fumes be concentrated and turned into the streams, but this suggestion is not practicable, as the damage would be far greater than now caused by dissipating the fumes in the air. The sulphur fumes from roast-heaps are especially objectionable, as they lie low on the ground, doing far more damage than the fumes thrown off from high stacks. Owing to the increasing difficulties of smelters with surrounding agricultural interests, because of noxious fumes, it is certain that the sulphur contents must be used, to an increasing extent, in the manufacture of acid.

One ton of sulphur combined with oxygen and water makes three tons of sulphuric acid, which is the basis of all other inorganic acids, and may be called the foundation of commercial chemistry, as there is scarcely a single branch of chemical manufacture that does not depend, directly or indirectly, upon sulphuric acid. Previous to 1838 the volcanos of Sicily were practically the sole producers of sulphur for the making of acid, but owing to a short-sighted attempt at unduly raising prices, the cost of sulphur was made almost prohibitive, leading to the utilization of the sulphur contained in iron pyrites, more especially the cupriferous pyrites of Cornwall, Wales, Ireland, Portugal and Spain, incidentally having a strong influence in reopening the principal copper mines of the Iberian Peninsula, which are notably rich in sulphur. Sulphuric acid can be manufactured easily by passing sulphureous acid fumes, given off from sulphide ores roasted in shaft-furnaces or kiln-furnaces, through lead-lined acid chambers, where the fumes are taken into solution by water. The contact acid process, a comparatively new invention, is available for making sulphuric acid from fumes containing only a small percentage of sulphur dioxide. The United States lags behind Great Britain and Germany in this detail of the copper industry, and, as has been pointed out by Prof. Douglas, the United States, while leading the world in some branches of metallurgical practice, is by no means well to the front in the fullest possible utilization of by-products.

The process of conversion, or bessemerizing, now in very general use in

copper smelters treating sulphide ores, which reduces high grade matte to blister copper, dates, in its inception, from 1855, when the first patent for making steel from iron by his new process was taken out in England by Sir Henry Bessemer. The first attempt at utilizing the Bessemer process for the conversion of copper was made at the Bogoslovsk mine, in the Ural Mountains of Russia, by Seminikov, who did not succeed, however, in producing metallic copper. In 1880 Pierre Manhes began experiments at Verdennes, near Avignon, France, and the process of bessemerizing, as applied to copper, was brought to a commercial basis by Manhes, though somewhat improved by Paul David in 1881. The first successful converters made by Manhes, at Lyons, France, took 3-ton charges. The process was brought into the United States in 1883, by Franklin Farrell, who installed a Manhes plant for conversion at the Parrot mine, in Butte, Montana, considerable improvements in the practice being made at the Parrot plant. Since then the process has enjoyed great growth, having come into practically universal use for the final smelting of sulphide ores.

The first converters utilizing the Bessemer process were very small in size, treating only 2,000 to 3,500 pounds of matte at a charge, and were rotated by hand, the operation requiring two stages. Converters now in use run 12 to 15 tons in size, as a rule, though the Washoe plant of the Anaconda has trough converters 96 x 150 inches in size, and the largest converter ever built is at Butte, Montana, being of the tremendous and somewhat unwieldy size of 8x20 feet. The weight of charge in a converter varies greatly, the first charge in a newly lined shell being much smaller than the last, owing to gradual destruction of the lining.

Bessemer converter plants vary greatly in size, at different works, but the essential plan is the same in all cases. A single unit consists of a stand, one or more movable shells, and an air-compressor to furnish blast. As a rule there are about two shells for each stand, as shells must be newly lined from time to time. The stands, built of steel, hold the shells containing the charge, which are mounted on trunnions, and the stand is provided with devices for tilting the shell. Hand power for tilting is used at some of the smaller installations, but in all larger plants mechanical power is employed, rotation usually being accomplished by electric or hydraulic power. A blast of varying strength, averaging about 15 pounds per square inch, is furnished by an air-compressor connecting with the shells through ball valves, which have replaced the old style plugs. The number and size of the tuyeres through which the blast enters the retort vary according to the style and size of the converter.

The retorts, or shells, are made of boiler-plate steel, in three parts, with flanges which are strongly bolted together. Shells are of widely varying sizes and types, the principal styles being the barrel type and the upright round type. The barrel type being easier to handle, both on and off the stands, is in most general use. The shells are lined, sometimes with fire-brick, though this is going out of style, the usual lining being silicious material thoroughly tamped in and dried. The most common converter lining is made of quartz and clay, the latter serving merely as a binder. In some cases it is advisable to use silicious low grade ores for linings, to save the mineral values, but such linings rarely give us good results as those made of pure silica. Magnesite linings have been used with success, at Butte, and are said to have given unusually long service. The lining of longest aver-

age life seems to be that made from quartzite containing about 85 per cent. silica and 10 to 12 per cent. alumina, bonded with clay. The life of linings varies greatly according to different factors, high grade matte containing little iron being least destructible to linings. The usual lining consist of practically pure quartz, or gannister, containing 98 to 99 per cent. silica, bonded with a little clay. The quartz or other silicious material usually is crushed in rolls to pass a  $\frac{5}{8}$ -inch trommel, or may be crushed in a Chilean mill or grinding pan. Quartz and clay are dumped into large bins, in the lining department of a smelter, and are withdrawn and mixed as necessary in a mixing pan, or trough. The lining is done in sections, the lower section being tamped with a mixture of about one part clay to five or six parts of quartz, mixed rather dry, while the upper portion is lined with a softer mixture. The lining is tamped in, sometimes by hand, but mainly mechanically, with heated bars, and the linings, when completed, vary in thickness from about 30 inches, at the tuyeres, to extinction at the mouth of the shell.

In the actual process of conversion at the best arranged plants the high grade matte is run direct from the cupola well of the furnace into the converter shells. Blast is turned on automatically, by rotating the filled shell to its normal upright position, and the powerful blast, working its way upwards through the molten matte, causes the sulphur to unite with the oxygen in the air and pass off as sulphur dioxide. The converter blows off, with a tremendous roar, into a hood that connects with a flue running to the dust chamber. More or less copper is volatilized by the powerful blast, but nearly all of the metal so driven off is saved in the dust chambers, and remelted at flue-dust. The blowing of a converter charge is a delicate process, and considerable experience and care are required to secure the best results. If the charge is overblown the slag becomes high in copper oxide, while if underblown the process of conversion is not carried out fully, and the resulting blister copper will contain an undue percentage of impurities. Owing to the greater specific gravity of gold and silver, the precious metals tend toward the bottom of the converter, and can be saved therefrom to a considerable extent, if desired, but as practically all bessemerized copper now is refined electrolytically, and gold and silver values are recovered much more perfectly by electrolysis than by any possible method of metallic segregation, the separation of gold and silver in the process of conversion is now attempted at but few smelters.

The ferric oxide formed during the combustion of the matte robs the converter linings of silica to form slag, and the life of the lining is long or short in proportion to the slow or rapid destruction of its silicious material through uniting with little or much iron in the matte to form slag. In average practice linings last for six to eight blows, though in some instances the life is much longer, and occasionally considerably shorter. The iron in the matte is eliminated before the sulphur, the oxidation of the sulphur contained in the charge being the final process. Zinc is oxidized from the matte to a considerable extent, while arsenic is eliminated but slowly in the earlier stages, and antimony remains practically intact in the matte until the final process, when it is largely eliminated in the last few minutes of blowing. The copper oxide in the matte is reduced by the copper sulphide, the sulphur becoming oxidized and passing off in fumes, while the metallic copper, as formed, sinks to the bottom of the shell. The flames

from the mouth of the shell change in color, at different stages, and are watched closely by an experienced man in charge of the process. At the start lambent greenish flames, mingled with yellow, are noted playing over the surface of the charge. At the period of skimming the slag, which is when the matte has reached the white metal stage, with a tenor of about 75 per cent. copper, blue flames are noted. When blue flames become prominent the blast must be shut off, or foaming and explosion are almost certain to be caused by violent chemical reactions that produce large volumes of sulphurous anhydride. In the best practice ten to fifteen ton converters handle full average charges, and turn out finished blister copper of better than 99 per cent. tenor, in 45 to 75 minutes. The blister copper produced must be refined electrolytically, in nearly all cases, to eliminate a considerable variety of impurities, present in the metal to only a limited extent, but highly deleterious to finished copper.

In order to prolong the life of the linings, pulverized silicious material sometimes is blown into the charge through the mouth, or placed in the bottom of the shell before charging with matte, such material furnishing a portion of the silica required for slagging the iron, and thus prolonging the life of the lining. Such pulverized material should be thoroughly dried before charging, as it may cause serious explosions if even slightly wet, when coming into contact with the molten matte.

At the British Columbia smelter, in 1906, it became necessary, while rebuilding the plant, to convert cold matte in the shells. This was accomplished by lighting a wood fire, which, when thoroughly ablaze, was covered by a charge of 1,500 pounds of coke, and a light blast turned on. When the coke reached red heat, three tons of cold broken matte were added, and full air pressure turned on. The matte melted quickly, and further broken matte was added. The slag was partially skimmed, and further matte added from time to time, until the shell was fully charged. The entire process required 3½ hours only, and 15 tons of 40 to 50 per cent. matte were converted, in one stand, in a single shift. Matte up to 55 per cent. in copper tenor was converted, but was found more liable to freezing than matte of lower tenor. The process was not economical, though necessary under peculiar circumstances, but demonstrated latent possibilities.

The casting of copper, after the final process of smelting or conversion, may be done by hand or machine. In hand work the copper must be dipped in ladles and cast into moulds by hand labor. The machines are mainly of two types, one having an endless chain, with automatic tripping of ingots into water for cooling, the second type being the Walker casting machine, in which moulds are carried on a circular platform, copper being cast through a tapping-ladle direct into moulds. Some cuprous oxide is sure to be formed in casting. Copper shrinks in casting 0.1875 inch per foot, or 1.56 per cent, as compared with 1.32 per cent. for brass, 2.6 per cent. for zinc and lead, 1.69 per cent. for aluminum and 1.04 per cent. for iron. Eutectic copper is a mutual mixture which freezes out last in casting, after ingredients in excess have been removed by gradual cooling. Eutectic copper is a mixture of metal with about 3.4 per cent. of cuprous oxide, containing about 0.38 per cent. oxygen. Under the microscope eutectic copper can be seen as a thin groundmass surrounding grains of pure copper. Eutectic copper is transparent, with blue color by reflected light and is red in transmitted light. Eutectic copper may be a

source of weakness in castings requiring tensile strength, especially in copper tubes that carry hot and reducing gases, which may react on the eutectic copper in the tubes, with the result of forming fine cracks.

The principal features of general copper refining, including impurities, are treated in the following chapter on the electrometallurgy of copper, as it seems desirable to cover the subject in one chapter, rather than in two, and the bulk of the world's copper production now is refined electrolytically.

In the middle of the Nineteenth Century refining furnaces for the refining and casting of blister copper were about 5x10 feet in size, taking average charges of seven to ten tons. The average size now is about 18x30 feet, with average charges of seventy-five tons. The oxidation of impurities contained in the copper can be accelerated by means of an air blast playing upon the surface of the molten metal. The "direct method" of copper refining consists essentially of the fusion of a mixture of raw and calcined matte, of about white metal grade, the resultant product being blister copper.

Pyritic smelting practically was invented by John Hollway, in 1878, though he did not succeed in bringing the process to do satisfactory work. The experiments of Hollway were made in an endeavor to smelt Rio Tinto copper sulphides by heat generated through the oxidation of their sulphur. The first attempts along this line in the United States were made, circa 1887, at Toston, Montana, where a partial success was scored. The first absolutely successful pyritic smelting was done by Robert Sticht, at Mount Lyell, Tasmania, in the early years of the present century.

While pyritic smelting is rather closely allied to raw sulphide, or semi-pyritic, smelting, it differs considerably in theory from that process. Full pyritic smelting practically is a bessemerizing process from the start, carried out in blast furnaces, rather than in converters, in its earlier stages. The process consists of the reduction of sulphide ores without the use of other fuel than the sulphur contained in the ore itself, whereas semi-pyritic smelting is the reduction of sulphide ores to matte with extensive use of the fuel values of sulphur contained in the ore, and with a minimum charge of carbonaceous fuel. In theory pyritic smelting is applicable to any raw sulphide ore not carrying lead. The roasting or calcining of sulphide ores drives off, by oxidation, large quantities of sulphur, which undoubtedly is a valuable fuel, providing it can be so burned as to give an oxidizing or reducing atmosphere in a furnace. Sulphide ores occasionally require a small addition of oxidized ores to serve as fluxes.

In theory one pound of pyrite, burned in a furnace, is equal to 2,026 British thermal units, this being about 35 per cent. of the calorific value of a pound of average carbonaceous fuel, but in practice the percentage of value in pyrite probably is considerably smaller. Making all reasonable deductions, one pound of pyrite probably carries fuel values equivalent to 15 to 20 per cent. of the fuel values contained in a pound of coke. The fuel value of a unit of pyrite burned to FeO and 2SO<sub>2</sub> is calculated by Lewis T. Wright as 1.926, while given by other authorities as only 1.29, this comparing with 8.08 calories secured from the combustion of one unit weight of carbon burning to CO<sub>2</sub>. It is probable that Mr. Wright's figures are a very close approximation to the actual calorific value of pyrite.

One of the principal disadvantages, and probably the greatest disadvantage, encountered in full pyritic smelting, is that sulphur will burn only in the presence of an excess of free oxygen, which greatly lowers the temperature of the smelting zone. Sulphur, when pyrite is the fuel, burns in three stages. In the first stage of combustion, pyrite, which consists of one atom of iron and two of sulphur, chemically united, loses one-third of its sulphur and forms  $Fe_2S$ . In the second stage there is a loss of one-sixth of the original sulphur contents, leaving a residue of  $FeS$ . In the third and final stage of combustion the single atom of sulphur is dissociated from the single atom of iron in the  $FeS$ , completing the work of reduction. This process of three stage combustion is long drawn out, lowering the temperature of the smelting zone, and causing scaffolding, and the building up of concretions of semi-fused charges on the sides, through which the blast cannot penetrate. In theory the ore should furnish its own fuel in the sulphur contained, but in actual practice it is, of course, necessary to use a little coke, to start the process of combustion, just as it is necessary to use kindling to start a fire of anthracite coal, but in full pyritic smelting no carbonaceous fuel is required, after the initial warming up of the furnace and charge.

The most successful application of the theory of pyritic smelting has been made at the Mount Lyell mine, Tasmania, by Robert Sticht. The Mount Lyell pyrite averages about 46 per cent. sulphur, 40 per cent. iron, 4.5 per cent. silica, 1.5 per cent. barium sulphate, 2 per cent. aluminum sesquioxide and 2.35 per cent. copper. To this ore is added silicious bornite, purchased from other mines, with quartz for flux. The ore is smelted without previous roasting, and without carbonaceous fuel, other than is required for preliminary warming of the furnace and charge, to a matte of 15 per cent. copper tenor. Formerly 3 per cent. of coke was used, and a hot blast of about 525° Fahrenheit was employed, but the use of coke has been abandoned and the blast is only warmed. The first fusion product, 15 per cent. matte, represents the putting of 7 tons of raw ore into one ton of low grade matte, and the process, in addition to affording a remarkable technical success, is highly successful from a commercial point of view, by reason of its cheapness. The 15 per cent. matte is recharged and brought, in the second fusion, to a copper tenor of 45 to 50 per cent., a small percentage of limestone and coke being used for the second fusion, with a cold blast. In both fusions the charge is subjected constantly to an oxidizing rather than to a reducing process. The total consumption of carbonaceous fuel averages 3.25 per cent. only, for the double smelting, all of the coke, except the preliminary warming charge, being used in the second process.

Much valuable work in pyritic smelting has been done by Lewis T. Wright, at the Iron Mountain mine, California. He found that with a cold blast the sulphur gave rather less than one-third of the total calorific power of the sulphur volatilized, while the warm blast diminished the percentage of coke in accordance with the heat generated by the increasing quantity of sulphur burned. Mr. Wright's experiments showed 39 per cent. of the total heat generated to be carried off by gases, 25 per cent. to go in slags, and the balance of 36 per cent. to pass off in radiation from the furnace and in the molten matte produced. Air to the extent of about 350 cubic feet was required for each pound of charge. The difficulties in the way of

pyritic smelting apparently are few and simple, in theory, but in actual practice results have been distinctly disappointing in the great majority of cases, hence the great measure of success scored by Mr. Wright and the complete success scored by Mr. Sticht are most notable, as well as most encouraging. That there are serious practical difficulties in the way of successful pyritic smelting cannot be gainsaid, but as these have been overcome fully in one plant, and very largely in another, while marked progress has been made elsewhere, it would seem that the process, which offers benefits that are readily apparent, should come, eventually, into quite general use, though it is improbable that it will be found suited to all sulphide ores.

Semi-pyritic smelting, or raw sulphide smelting, is a system by which partial advantage is taken of the sulphur contents of the ore for fuel purposes, but differs from full pyritic smelting in that carbonaceous fuel, to a varying extent, is necessary under all circumstances. This process is in quite general and growing use, and has given highly pleasing results where carried out intelligently, but experience and ability are required to secure fully satisfactory practice. The process of semi-pyritic smelting may be said to date from A. D. 1555, when the essential theory was evolved by Barthold Hohler, who first utilized iron pyrites as a carrier for the precious metals. The Kongsberg process of semi-pyritic smelting adds raw pyritic ores to the charge, simply to produce a carrier or matte for the precious metals, and differs widely in theory from the principle of pyritic smelting.

Raw sulphide smelting is done in a blast-furnace, ore being put into the furnace by layer charging or by column charging. In layer charging the raw crushed ore is blended intimately with a small proportion of coke, and the mixture is fed into the top of the furnace, there being gradual heating, followed by the ignition of the entire mass. In column charging the raw crushed ore is fed into the smelting zone of the furnace, and a strong hot-blast aids in the process of reduction, exercising a bessemerizing effect. When carefully handled, a furnace fed by column charging gives matte of good grade, with exceptionally clean slags, and turns out a large tonnage of matte with minimum coke consumption. It has been found that in raw sulphide smelting furnaces of more than four feet in width are apt to run cold, and form crusts. Considerable trouble was experienced at first through the formation of crusts on the sides and corners, necessitating frequent barring, but this trouble can be overcome almost entirely by careful charging.

The proportion of sulphur varies greatly in ores smelted by the semi-pyritic process, ranging from nearly 50 per cent., as in the case of low grade cupriferous pyrites, containing chalcocite or chalcopyrite disseminated in pyrite, to as low as 5 per cent. sulphur in the total charge, in the case of some other sulphide copper ores. Zinc up to about 5 per cent. of the charge is mainly volatilized. Alumina proves injurious, tending to form infusible silicious compounds that bring about the formation of crusts in the furnace, and also gives great trouble in the settlers.

Raw sulphide smelting has been brought to a high degree of success by the Ducktown and Tennessee companies, close neighbors in the southeastern corner of the state of Tennessee. At the Tennessee smelter the first fusion gives a low grade matte of 10 to 15 per cent. copper. This matte is charged,

broken, with silicious flux, the use of limestone having been abandoned, into a second furnace, the product of the second fusion being a matte of 45 to 50 per cent. copper tenor, though, if necessary, a matte carrying up to 60 per cent. copper can be turned out. The second fusion gives an iron slag running up to about one per cent. copper, which requires resmelting. Pyrometric tests, at the works of the Tennessee Copper Co., show that a furnace run on green ore, with a charge of only 2.5 per cent. coke, is hotter in the smelting zone than similar furnaces charged with roasted ore and 12 per cent. of coke, the excess heat produced by raw sulphide smelting ranging up to 100° Centigrade.

The Tennessee company, by changing to raw sulphide smelting, cut fuel charges of coke from 12 per cent. on roasted ore to an average of 3.5 per cent. on raw ore. The Ducktown smelter uses 4.4 per cent. coke charges only, to produce a 50 per cent. matte. This plant was the pioneer in raw sulphide smelting, and the work done there is entitled to great credit. Raw sulphide smelting reduces the output of a furnace by 20 to 30 per cent., but this reduction in output is more than counterbalanced by the elimination of the preliminary roasting processes. Raw sulphide smelting also does away with the extremely noxious sulphur fumes arising from heap-roasting. The fumes and gases from a smelter can be discharged from a high stack, causing minimum damage, while fumes from roast-heaps lie lower on the ground, and cause great injury to all surrounding vegetation. It also is possible to utilize the sulphur dioxide produced in raw sulphide smelting for the manufacture of sulphuric acid by the contact process, and this plan is to be used at the Tennessee smelter.

The raw sulphide smelting process requires 40 to 50 per cent. larger furnace capacity than the old system providing preliminary roasting or calcining, but effects enormous savings in other directions. Raw sulphide smelting requires extra labor, by reason of the double handling of matte, but this is more than balanced by the saving of one extra handling of the ore required by the old process. At the Tennessee works the saving in labor is estimated at 40 cents per ton of ore, or more than one cent per pound on finished copper, and there is an immense saving in fuel, estimated at nearly two cents per pound on finished copper.

Apparently the very considerable utilization of the sulphur contents for fuel use renders the hot-blast unnecessary in reducing strongly pyritic ores. The hot-blast has been dropped at the Mount Lyell, Ducktown and Copper Queen smelters, and never was installed at the Tennessee works, these being four of the most progressive smelting plants in existence.

The reactor process, invented circa 1901, does not seem to have proven the success that was anticipated, and is not found in general use.

Nickel-copper ores are matted quite readily, but the product is difficult of reduction, and requires special processes. The Orford works, which treat a large proportion of the entire output of nickel copper matte, utilize sodium sulphate, which dissolves copper and iron sulphides freely, forming a solution of lower specific gravity than that of the nickel sulphide. The nickel-copper matte is charged with coke and sodium sulphate into a cupola furnace. When fused the sodium sulphate is reduced by the coke to sodium sulphide, and forming a solution with part of the copper and iron sulphides, flows with the undissolved nickel sulphide through the tap-hole into moulds,

where the constituents separate according to their specific gravities, the dissolved copper and iron sulphides floating to the surface. When the mould has solidified the parts are separated by fracture, and the tops, containing copper and iron sulphides, are recharged into a smelting furnace, where the sodium sulphide is fluxed for an iron slag. The bottoms of the moulds, containing nickel sulphide, but with more or less copper and iron sulphides admixed, are remelted by the same process as before. Formerly four or five successive smeltings were necessary to bring the nickel sulphide to sufficient purity for the refining process, but by a recent improvement a longer smelting period is given, causing more complete dissolution of the copper and iron sulphides, and two treatments are sufficient, in an open-hearth reverberatory furnace, to effect fairly complete separation of the nickel and copper, 50-ton charges requiring four to five hours heating, after complete fusion.

The Mond process of reducing nickel-copper matte takes a bessemerized matte that is dead-roasted, which is treated with a little sulphuric acid, permitting the extraction of about two-thirds of the copper contents. The full process of securing the nickel is described in the article on the Mond Nickel Co., Ltd.

## CHAPTER VIII.

### THE ELECTROMETALLURGY OF COPPER.

For many years the possibility of electric smelting has excited the interest and efforts of scientists and practical metallurgists. Much experimental work has been done, and substantial progress has been gained, though no process of electrical smelting has been demonstrated fully successful. The first serious work in this line was done by Héroult, whose initial experiments on 7% sulphide ores gave mattes up to 45 per cent. in copper tenor, with slags carrying only 0.1 to 0.2 per cent. copper. Electrodes of carbon are used in smelting, and one of the principal difficulties encountered in actual work results from arcing, trouble from short-circuiting having given the most serious difficulties encountered in efforts at electrical smelting. Basing the figures upon the experiments of Héroult, about 3,000 horsepower are required for the operation of a hundred-ton furnace, and the consumption of carbon electrodes is 6 to 7 kilograms per ton of ore treated. Many electrical furnaces have been patented, but none are in commercial use as yet, on copper ores, though substantial progress has been made in the electrical reduction of iron ore. As yet there remain serious practical difficulties in the way of successful copper smelting by electrical energy, though these are being overcome, gradually, but the process, even if perfected, remains too costly for general use. It seems probable, however, that some form of electric smelting will become sufficiently perfected, within a comparatively short time, to permit its use in districts where large water powers can be harnessed at cheap cost, and where carbonaceous fuel is unusually costly.

There have been numerous attempts at the direct reduction of copper ores by electrolysis, and some of the experiments have given encouraging results. The Borchers process provides for the direct electrolytic reduction of 80 per cent. copper matte, but it does not seem that matte would furnish very satisfactory anodes. The most promising of the electrolytic direct reduction processes is that of Dr. Laszcynski, which was being utilized, in 1907, in Poland and near Semipalatinsk, Siberia. By this process ores are first crushed, then, if sulphides, are briquetted and roasted, to produce a mixture of copper oxide and sulphide. The roasted ore is then leached with dilute sulphuric acid, the product being a solution of copper sulphate, which is subjected to electrolysis, with the use of insoluble anodes. By means of an electric current the copper sulphate is separated into copper and SO<sub>2</sub>, one atom of oxygen from the SO<sub>2</sub> escaping, leaving sulphur trioxide, which combines with water to form sulphuric acid. The ferrous sulphate in the anode, or rather in the electrolyte, is converted into ferric sulphate, which exercises upon the cathode a dissolving force equal to that of dilute nitric acid, reducing precipitation by fully one-half and giving a low grade and brittle metal in the cathode. The iron salts exist, necessarily, in the bluestone in large quantities, and are decidedly pernicious, but the process provides for the continuous making of sulphuric acid in the electrolyte. The anodes are of sheet lead, covered with thick cotton cloth.

Previous to a description of the actual process of electrolysis, it seems desirable to give consideration to the impurities existing to greater or less extent in all unrefined copper. The two most desirable features of copper are tensile strength and electrical conductivity, even the brass founders depending largely upon the conductivity test in purchasing copper. Tests for conductivity must be made with great care, as a variation of 1° Fahrenheit from the standard causes a variation of 0.2 per cent. in conductivity. Annealed wire gives the highest percentage of conductivity, hard drawn wire of the same metal testing 2.5 to 3 per cent. lower.

No absolutely pure copper is supplied commercially, but the best electrolytic brands are of unusual purity, some ranging above 99.95 per cent. copper, but containing gold, silver, iron, bismuth and arsenic in very minute quantities. The best grades of Lake Superior copper also are very pure, but contain small quantities of silver, iron and arsenic. Occasionally aluminum, silicon and phosphorus are added in small quantities, on account of their ability to deoxidize copper injured in heating. Molten copper has the property of absorbing such gases as hydrogen, carbon monoxide, carbon dioxide and sulphurous anhydride, which are set free on solidifying, causing difficulty in making solid castings and necessitating great care to prevent porosity. There are many mixtures of copper with zinc, tin, aluminum and other elements, forming useful alloys, which are treated elsewhere in the chapter devoted to alloys of copper.

The impurities found to greater or less extent in manufactured copper are upwards of twenty in number, including aluminum, antimony, arsenic, bismuth, cadmium, carbon, cobalt, gold, hydrogen, iron, lead, manganese, nickel, oxygen, phosphorus, selenium, silicon, sulphur, silver, tellurium, tin and zinc.

Aluminum, as shown by the experiments of Addicks, when added to copper to the extent of only 0.006 per cent., brought the conductivity of the copper down to 98.6 per cent., and the addition of 0.739 per cent. aluminum reduced the conductivity of the copper so alloyed to 43.5 per cent. The factor of ratio of aluminum in reducing the electrical conductivity of copper is 500, aluminum ranking between antimony and arsenic as a deleterious element in reducing electrical conductivity.

Antimony, like iron and arsenic, exists in most commercial copper, though usually found in small quantities. In small quantities, antimony renders copper both red-short and cold-short, but under 0.5 per cent. does not seem to greatly affect the ductility of copper, though 0.2 per cent. causes copper sheets to crack at the edges when rolled. The bad effects of antimony are partially neutralized by arsenic, but are intensified by tin, aluminum or manganese, when found in copper. Antimony to the extent of 0.0071 per cent. lowers the conductivity of copper by 1 per cent.; the factor of ratio in reducing electrical conductivity being 190.

Arsenic, found in small quantities in all commercial copper, does not seem to affect the ductility of copper when existing in quantities of less than 0.1 per cent., and copper containing 0.2 per cent. arsenic can be rolled hot and is highly malleable. Arsenic in small quantities renders copper both red-short and cold-short. Arsenic is extremely bad for wire-bars, reducing ductility and conductivity, but for many uses is advantageous because giving a harder copper than the pure article. Arsenic gives no particular

trouble in smelting, but when found in copper in any considerable quantity requires elimination by electrolysis, unless arsenical copper is required for special use. Arsenical copper should contain at least three times as much arsenic as lead and bismuth combined, but should not exceed 0.6 per cent. arsenic. Arsenical copper is harder and tougher than ordinary refined copper, and has greater tensile strength. Arsenic to the extent of 0.0013 per cent. lowers the conductivity of copper by 1 per cent., the factor of ratio for lessening the conductivity of copper being 720, arsenic ranking second only to phosphorus in this respect.

Bismuth, all things considered, is the worst enemy of copper, and highly bismuthiferous ores of copper are smelted rarely, except when carrying large quantities of silver, but bismuth in small quantities is found in most sulphide ores. Bismuth is not so objectionable in smelting as in the finished metal, but can be eliminated easily, to all but a trifling extent, by electrolytic refining. In small quantities bismuth renders copper both red-short and cold-short, and the addition of only 0.002 per cent. bismuth renders copper so brittle that it cannot be rolled. The bad effects of bismuth are partially neutralized by arsenic, but are intensified by tin, aluminum and manganese, when found in copper. The factor of ratio of bismuth for reducing the electrical conductivity of copper is only 4, the effect of bismuth on conductivity being so slight as to be negligible.

Cadmium, sometimes found in very small quantities in finished copper, has a factor of ratio of 9 in reducing electrical conductivity.

Carbon, in the form of carbon monoxide or carbon dioxide, may be absorbed by copper at a critical pitch of the metal, producing porosity in castings, though apparently having no other effect.

Cobalt, sometimes found in refined copper to a small extent, has about the same effects as iron or nickel, and usually is found associated with nickel, when occurring as an impurity in copper.

Gold exists only as a mere trace in electrolytic copper. The factor of ratio in reducing electrical conductivity of copper is 10.

Iron is found in practically all commercial copper, in quantities ranging from a mere trace up to appreciable percentages. In large quantities, iron is a deleterious impurity, but in small quantities seems to form an alloy with the copper, and does no appreciable damage, other than to slightly reduce electrical conductivity.

Lead, next to bismuth and arsenic, is the most damaging impurity found in ordinary commercial copper. Lead to the extent of 0.02 per cent. renders copper so brittle that it cannot be rolled, and 0.5 per cent. renders copper cold-short, while lead in copper to the extent of 1 per cent. ruins the copper for all purposes except casting, for which use the lead is a positive advantage, as it largely prevents the porosity so frequently found in cast copper. The bad effects of lead are partially neutralized by arsenic, but are intensified by tin, aluminum or manganese, when occurring as an impurity in copper. The factor of ratio of lead for reducing the conductivity of copper is only 3, this being the least harmful to conductivity of any element, and being only one-half as harmful as silver, as regards electrical conductivity, notwithstanding that silver is the most perfect conductor of electricity that is known.

Manganese sometimes occurs as an impurity in copper, to a small extent. Manganiferous copper containing 2 to 3 per cent. manganese is harder

and has greater tensile strength than pure copper, but should not contain more than traces of lead or antimony.

Nickel, in very small quantities, is a common impurity of copper, and has about the same effect as iron, reducing electrical conductivity slightly, but having no other apparent bad effect. Copper containing 2 to 3 per cent. nickel is harder and of higher tensile strength than pure copper, but should not contain more than traces of lead or antimony.

Oxygen unites with copper readily, in the form of cuprous oxide, and practically all refined copper contains a small fraction of one per cent. cuprous oxide. Up to one per cent. cuprous oxide does not affect malleability, if no other impurity is present in considerable quantities. Cuprous oxide will melt at red heat, without decomposition, and frequently becomes a component part of the refined copper. Cupric oxide in small quantities has no apparent effect on the metal, but in quantities of one-half per cent. or more lowers ductility, though not injuring the metal in other respects, even in quantities up to 10 per cent. The factor of ratio in reducing the conductivity of copper is 25, oxygen usually being found in the metal in the form of cuprous oxide.

Phosphorus, to the extent of 0.2 per cent., gives copper that can be rolled hot, and is highly malleable, but in small quantities renders copper cold-short, and, if present to the extent of 0.5 per cent., causes red-shortness. Phosphorus copper, which is harder than pure metal, should contain 99.7 per cent. to 99.8 per cent. copper, 0.05 to 0.1 per cent. phosphorus and not more than 0.04 per cent. oxygen. Phosphorus is the most deleterious element known, so far as affecting the electrical conductivity of copper, and if present in copper to the extent of 0.08 per cent. lowers conductivity to 52.3 per cent., the factor of ratio for reduction of electrical conductivity of copper being 3,000, the highest known.

Selenium occurs occasionally in crude copper, but can be eliminated quite thoroughly by electrolysis. It would seem that the peculiar physical properties of selenium should give it a greatly increased market, and in such case the metal can be secured in considerable quantities, as a by-product from electrolytic refineries.

Silicon, in even small quantities, renders copper red-short, but up to 2 per cent. does not affect ductility. Three per cent. causes brittleness, and copper containing above 5 per cent. silicon is too brittle for any ordinary use. Silicon to the extent of 0.007 to 0.042 per cent. reduces the electrical conductivity of copper less than 1 per cent., the factor of ratio for lessening the electrical conductivity of copper being 70.

Silver, which is quite thoroughly eliminated by the electrolytic process, sometimes is found in electrolytic copper to the extent of an ounce or so per short ton, and in commercial blister copper frequently is present to a much greater extent, especially in Lake copper. Silver in small quantities has no appreciable bad effect on finished copper, except for a very slight reduction of electrical conductivity, the factor of ratio for lessening the electrical conductivity of copper being only 6.

Sulphur usually is found in blister copper in the form of barium sulphate. When present to the extent of 0.25 to 0.5 per cent. sulphur causes cold-shortness, but the injurious effect may be offset by the addition of manganese or aluminum. The factor of ratio of sulphur for reducing the electrical conductivity of copper is only 8.

Tellurium, to the extent of even 0.001 per cent., renders copper appreciably red-short, and slightly larger quantities render the copper both red-short and cold-short. Tellurium has much the same effect as arsenic on copper, but to an intensified degree, and when present to a very small extent renders copper of wonderful hardness. Its use is recommended to those who are endeavoring to temper copper. Tellurium does not greatly affect the ductility of copper, and Sperry states that tellurium in high brass does not affect rolling, unless present in quantities of more than 0.1 per cent., when the brass cracks in rolling. The factor of ratio for lessening the electrical conductivity of copper is only 4.

Tin, in small quantities, renders copper red-short and brittle, but ductility can be restored, at least partially, by heating to cherry red and cooling suddenly. Copper containing 0.2 per cent. tin can be rolled hot, and is highly malleable. When present to the extent of 1 per cent. or upwards, tin materially lessens the ductility of copper. The factor of ratio of tin in reducing the electrical conductivity of copper is 67.

Zinc, as an impurity in copper, causes trouble in smelting, though not a highly deleterious impurity in the final product. When present in copper, to the extent of 0.2 per cent., zinc causes the sheets to crack at the edges when rolled, and in considerable quantities lessens ductility. The factor of ratio of zinc in reducing the electrical conductivity of copper is 30.

The great bulk of the world's copper production, with the exception of the Lake Superior output, is refined electrolytically. The principal advantages of electrolytic refining are that gold and silver values contained in the blister copper are saved, practically intact, while the product of the electrolytic refineries is a copper of unusual purity. The principle of electrolysis, or the parting of metals and the redeposition of one selected metal by the aid of a continuous electric current, was discovered in 1835, by Michael Faraday. As early as 1836 Becquerel planned works for the electrolytic recovery of copper and silver, but, owing to the prohibitive cost, the effort was abandoned. The first patents relating to electrolytic refining were taken out by Elkinton, of Birmingham, in 1865 and 1869, and in 1870, a plant was built at Swansea to utilize this process. A little later several small electrolytic refineries were built in Germany and France, and in 1879 the first American refinery to use electrolysis was erected in Phoenixville, New Jersey, this being followed, in 1881, by the construction of the Balbach works, at Newark, New Jersey, the latter named plant being the first to do electrolytic refining of copper on a considerable commercial scale. Shortly after the construction of the Balbach works, new plants of considerable importance were built in both France and Germany, followed, at a slightly later date, by the construction of new electrolytic plants in England and Wales. Previous to the opening of the great Boston & Montana electrolytic plant, at Great Falls, Montana, in 1893, electrolytic copper was produced mainly in Europe, but America now furnishes more than half of the electrolytic copper production of the world, doing electrolytic refining of blister copper from South America and Australia, as well as from the United States, Canada and Mexico.

Considerable secrecy regarding processes is maintained at many electrolytic refineries, but while the practice varies at different plants, the fundamental principles are the same in all works, and are understood by all competent operators. There are two principal systems of electrolytic refin-

ing, with numerous minor modifications. The series system uses rolled sheets, requiring a special rolling mill, and has electrodes in series and tanks in series, or, more frequently, in multiple series. The multiple system uses cast anode plates of 1 to 2.5 inches thickness, requires a much smaller electromotive force than the series system, and is in much more general use.

The tanks in which the process of electrolytic segregation and redeposition is carried on may be of wood, lead or slate, usually the former, though lead seems preferable. The wooden tanks usually are lined with lead, tarred felt or asphalt. The tanks may be set upon the floor, usually of cement, or may be sunk, leaving the tops about flush with the floor, to permit easier handling of the material. Tanks are terraced, in series, providing for a natural circulation of the electrolyte, which is pumped into the upper tanks and flows thence, by gravity, from tank to tank, until the bottom terrace is reached, when again pumped to the upper tanks. The Baltimore refinery uses tanks 9x2x2.5 feet in size, containing 130 electrodes of two plates each, giving a total weight of 5,700 pounds of charge, the process being carried on at a temperature of 20° Centigrade, with a power cost of about twenty dollars per horsepower year.

Connections between dynamos and tanks are made of high conductivity copper, necessarily of large size, to carry the heavy current used, and are of varying forms in cross-section, overlapping slabs of high conductivity copper being used at some plants.

The crude copper, mainly blister copper produced by bessemer conversion, may reach the works already cast in anodes, but usually arrives in pigs, and the anode bars usually are cast from blister copper melted in a cupola furnace, kept running for the purpose, and are cast in a variety of forms, usually in thin plates with projecting lugs that rest on the sides of the tanks, one lug resting on the electrical conductor, while the other is insulated. Lugs of anodes and cathodes vary in width, permitting each to make direct contact with the poles. The average American anodes average 98 to 99.5 per cent. in copper tenor, and the auriferous and argentiferous varieties carry up to 40 ounces gold and 300 ounces silver per short ton, with from a trace to 2 per cent. arsenic, and with variable quantities, usually small, of iron, nickel, antimony, bismuth, sulphur, silicon, selenium and tellurium, and with occasional minor impurities. After the process of electrolysis has been carried on until the anodes, usually rectangular in form, are worn down to about 15 per cent. of their original weight, the remaining portions are removed, melted down and recast.

The composition of the electrolyte, which is the fluid in which the process of electrolysis is carried on, varies at different works, carrying 5 to 10 per cent. sulphuric acid and 15 to 20 per cent. bluestone, added to 70 to 80 parts of water. The average composition is 6 to 9 parts of acid and 16 to 18 part of bluestone. It is desirable that the electrolyte have a sufficiently high percentage of sulphuric acid to render its specific resistance very low. The electrolyte frequently carries a very small percentage, as low as one part in two hundred millions, of some soluble chloride, usually sodium chloride, for the purpose of precipitating silver in chloride form, sodium chloride also tending to slime antimony in the form of an oxychloride. When the electrolyte becomes too foul for satisfactory use it is purified,

brought up to the proper standard and pumped back into use. Purification usually is accomplished by working up, at regular intervals, a certain quantity of electrolyte into bluestone, and adding fresh acid. The solution deteriorates more rapidly at the higher temperatures and the low current densities, apparently in direct ratio to anode loss and cathode gain. Nickel sulphides go into the electrolyte to some extent from nickeliferous copper anodes, and arsenic also passes into the electrolyte to a considerable degree, causing trouble in elimination. The easiest method of eliminating arsenic is to reduce the electrolyte to bluestone before purification.

In the process of electrolysis metals are dissolved at the negative pole of a battery, taken into solution in the electrolyte and redeposited from the electrolyte at the positive pole, where free circulation is permitted in a favorable solution, with a proper electric current. Varying currents give varying effects, and some metals pass over more freely than others, copper being one of the first to pass over. Apparently the impure metallic copper of the anode is first broken into cuprous sulphate, from which are derived the molecules of practically pure metal that are deposited on the cathodes. In actual work there is a slight redissolution of the metal from the cathode, but this is not of sufficient extent to prove seriously detrimental. Good adherent copper can be obtained on the cathodes at almost any current density, providing there is a sufficient rate of circulation of the electrolyte. Current density is employed up to 3.5 amperes per square decimeter, but the usual ratio is a current density of 14 amperes per square foot, at a temperature of 50° Centigrade. As the unrefined copper in the anodes contains a variety of metals and metalloids, it is important that the electrical current be so regulated that the minimum of other elements pass over to the cathodes at the same time as the copper. The adjustment of the varying factors of composition and circulation of the electrolyte, current density and temperature, call for nice discrimination, to be secured only by experience and care. The matter of temperature is one of prime importance, as the cost of power decreases with rising temperature, within certain limits, and the heating of the electrolyte not only facilitates the process of decomposition, circulation and redeposition, but produces also a smoother deposit of copper on the cathodes. Covered tanks are used extensively, to increase the temperature at which the work is done, and the best results seem to be secured at a temperature of about 70° Centigrade, equal to 158° Fahrenheit.

The cathode plates are made of strips of rolled copper, of one-eighth to one-fourth inch thickness, cut into varying sizes and forms, though usually rectangular. The cathode plates are oiled and coated with fine graphite, to promote deposition, and sometimes have lead lugs soldered onto them for handling.

While the copper and minute quantities of other impurities pass over to the cathodes, the great bulk of the impurities contained originally in the anodes is first taken into circulation in the electrolyte, and then precipitated to the bottom of the tank, as sludge or slimes. If more than traces of impurities are carried over to the cathodes it is because the electrolyte has become foul, or the current is wrong. Constant watchfulness is necessary, as apparently slight causes may bring about serious disarrangements of the process, at any point. The sludge precipitated to the

bottom of the tank may form a conductor, causing short-circuiting, and should be removed frequently, as large accumulations are reasonably certain to cause trouble.

An average anode slime runs about 40 per cent. silver, 25 per cent. copper and 2 per cent. gold, with about 10 per cent. arsenic, antimony and bismuth, the combined balance consisting of lead, silicon, sulphuric acid and minor impurities. The slimes contain greatly varying percentages of gold and silver, according to the nature of the copper treated. Slimes are removed from the bottoms of the tanks by bailing, or siphoning, and are taken to the slime-tank, where the copper scraps are picked out by hand. At some plants the slimes are put through a filter press and dried, though this is not customary. Slimes are treated generally with sulphuric acid and sodium nitrate, air and steam being admitted for agitation and heating. The copper is dissolved very readily as cuprous sulphate, by treating with ferric sulphate, and is recovered as bluestone. The arsenic also is removed by treatment with sulphuric acid and sodium nitrate, and after the removal of the copper and arsenic the remaining material is dried and smelted with soda, to slag the antimony, the impurities being oxidized by the nitrate. The doré bullion produced by this process usually is parted with sulphuric acid, but sometimes is parted mechanically, with a silver nitrate bath. Tellurium requires prolonged furnace treatment for burning off, though not especially difficult of elimination, if sufficient time is taken. Both selenium and tellurium, especially the latter, could easily be recovered from the slimes, if there were sufficient market to take the considerable quantities of these rare elements that could be furnished by the electrolytic refineries.

The process of electrolytic refining necessarily is continuous, two to four weeks being the average time required for the making of a cathode. Including time required for remelting and for other purposes, five to six weeks usually are required for the making of finished cathodes from rough copper, though much better time has been made under exceptionally favorable circumstances. The rate of progress depends quite largely upon the nature of the anodes, the process of electrolysis being greatly facilitated and cheapened by comparatively pure anodes. Mechanical devices have reduced greatly the number of workmen required about a well-quipped electrolytic plant, and have obviated most of the heavy manual labor required formerly. Traveling cranes and overhead trolleys provide expeditious means of handling both anodes and cathodes, and the electrolyte is handled by pumping, while as a rule the slimes are taken from the tanks by siphons, rather than by the old process of hand-bailing.

The cathodes produced by electrolytic refining average 99.93 to 99.9 per cent. in copper tenor, hydrogen being the chief impurity. The objectionable impurities are those that decrease electrical conductivity or render the metal brittle, the principal impurities to be guarded against being arsenic and antimony, which decrease conductivity, and lead and tellurium, which cause brittleness. Antimony and bismuth are seldom present in sufficient quantities to cause injury. The impurities in electrolytic copper usually include silver, to the extent of one-tenth to one ounce per ton, and a trace of gold, but these impurities are in nowise deleterious, though representing a loss to the refiner. Most copper ores contain silver, and the majority contain gold, in varying quantities, the copper mines of Utah being

richer in gold than those of any other American state, followed in turn by Arizona and California. In silver, the copper mines of Montana lead, followed closely by Utah, and, at a little distance, by California and Arizona. The immense importance of the precious metals obtained as by-products from the electrolytic refining of copper is shown by the figures of such production from American copper mines in 1904, amounting to 237,116 ounces of gold and 15,769,327 ounces of silver.

Electrolytic copper is in very minute crystals, while Lake copper is in crystals of considerable size, this difference in the size of the crystals being readily apparent to the naked eye on fractured faces. The larger crystals apparently are responsible for the superior tensile and torsional strength and ductility of Lake copper, but the toughness of Lake copper disappears under electrolytic refining, the product varying in no essential particular from all other electrolytic coppers, which come out of the bath as like as peas from a pod.

The cost of electrolytic refining varies from \$8 to \$20 per ton, according to circumstances. Unlike smelting, which usually best can be done near the mines, to save excessive freight charges on worthless material, electrolytic refining is performed, in most cases, nearer to consumer than to producer. The extra freight paid on one to four per cent. of impurities contained in blister copper is so very small a fraction of the total transportation charges that this loss is more than offset by the advantages of cheaper labor, cheaper fuel and better transportation facilities found along the Atlantic seaboard in the United States, where a considerable amount of foreign copper is refined, as well as the bulk of the domestic production.

## CHAPTER IX.

### THE ALLOYS OF COPPER.

The work of alloying the metals is a special branch of the metallurgical art, requiring much technical skill and experience, owing to the different melting points of the component metals, and their different capacities of oxidation and volatilization. Insufficient heat causes segregation of the different constituents, in the case of many alloys.

Zinc is the metal most commonly alloyed with copper, the product being brass. The proportions of the two metals vary greatly, ranging up to equal quantities, in the case of very high brass. Ordinary high brass is composed of two parts copper and one part zinc, and is of a light yellow color. Low brass ranges from 75 to 88 per cent. copper and 12 to 25 per cent. zinc, and is considerably redder in color than high brass. The addition of lead, to a small extent, usually not exceeding 5 per cent., gives an improved color to brass, and renders the metal more suitable to machining, as well as slightly reducing the cost. Ordinary commercial brass frequently contains 2 to 5 per cent. tin, which gives added strength and density. There also are special brass alloys containing lead, aluminum and manganese, in addition to copper and zinc. Brass is a much poorer conductor of heat and electricity than copper, and is more easily fusible.

Tin is mixed with copper in a variety of proportions, giving a considerable range of bronzes, with rather remarkable variations in their physical characteristics. Bronze probably is the most ancient alloy known to man. An alloy of 97 per cent. copper with 3 per cent. tin, practically a bronze, makes good sheathing metal. A small quantity of tin added to copper causes it to become brittle, but the ductility can be restored, at least partially, by heating to a cherry red, and cooling suddenly. Ancient bronze for tools and weapons ranges from 85 to 92 per cent. copper and 8 to 15 per cent. tin. Ancient bronze medals carry 8 to 12 per cent. tin. Ancient bronze mirrors contain 20 to 30 per cent. tin. Flexible bronze contains about 95 per cent. copper and 5 per cent. tin. Gun metal ranges 90 to 91 per cent. copper and 9 to 10 per cent. tin, and if the percentage of copper is increased the gun metal becomes liable to liquation. Bell-metal contains 80 to 84 per cent. copper and 16 to 20 per cent. tin. This is highly sonorous, when cast in bells, and makes good castings, but is decidedly hard, brittle, and difficult to work. Sudden cooling reduces the brittleness and restores the hardness. Bell metal is malleable at a low heat and can be forged, if handled very carefully. Speculum metal contains about 75 per cent. copper and 25 per cent. tin, and is harder and whiter than bell metal, and even more brittle and difficult to work.

Brass-bronzes are used for a variety of purposes, and for certain specific uses alloys composed of copper, tin and zinc are preferable to either brass or bronze. Bearing brass is much harder than common brass, and contains 80 to 82 per cent. copper, 10 to 14 per cent. tin and 2 to 4 per cent. zinc, being a brass-bronze rather than a brass. A cheaper and less efficient

bearing brass contains a smaller percentage of copper and a greater proportion of zinc. Muntz's metal is brass containing 60 to 62 per cent. copper and 38 to 40 per cent. zinc, and commonly carries about 0.2 per cent. in iron, nickel, tin, arsenic, or manganese, usually as a combination of several of these elements. There are a number of proprietary anti-friction metals having copper as a base, with varying proportions of tin and zinc, these being as a rule more closely allied to bronze than to brass, though a cross between the two metals.

Aluminum is the base of a number of important copper alloys, and the tensile strength and ductility of aluminum wire are much improved by the addition of as little as 1.5 per cent. copper. Aluminum bronze is a bronze containing about 3 per cent. aluminum, used largely for water-tube boilers. Several varieties of aluminum bronzes show high tensile strength, and an alloy of 96 per cent. copper and 2 per cent. aluminum gives a strong and fairly rigid metal. Albradum is an alloy having aluminum for its base, with the addition of copper, nickel, zinc and phosphorus. This alloy takes a very high polish and has good tensile strength. Aluminum alloyed with small quantities of nickel and copper has shown a tensile strength of 40,000 pounds per square inch.

Nickel copper, containing 2 to 3 per cent. nickel, is harder and of higher tensile strength than pure copper, but should not contain more than traces of lead or antimony. Monell metal is a natural alloy of copper and nickel, made from the nickel-copper ores of the Sudbury district. German silver is an alloy of 5 parts copper, two parts zinc and one part nickel.

Steel has been alloyed with nickel and copper, the latter to the extent of about 0.5 per cent., for the facing of compound armor plate, and this metal is said to resist corrosion as well as wrought iron.

Manganese, to the extent of 2 to 3 per cent., alloyed with copper, gives a product that is harder and of higher tensile strength than pure copper, if containing no more than traces of lead and antimony.

Arsenic alloys readily with copper, such alloys offering phenomena that are not fully explained by the chemical and metallurgical knowledge of the present day. Alloys of copper and arsenic are known usually as blanched copper, or speiss. Arsenical copper should contain at least three times as much arsenic as lead and bismuth combined, but should not exceed 0.6 per cent. arsenic, unless it be considered an alloy. Experiments on binary alloys of copper and arsenic show that arsenic lowers the melting point, down to about 20 per cent. arsenic, reaching the lowest point of fusion at 685° Centigrade, with an alloy of 19.2 per cent. arsenic, corresponding to the formula Cu<sub>4</sub>As. With increase of arsenic the fusion point is raised to 747°. Centigrade with 28.34 per cent. arsenic, which corresponds to the empirical formula Cu<sub>2</sub>As, and to 810° Centigrade with 32.2 per cent. arsenic, corresponding to the formula Cu<sub>5</sub>As, an alloy with 37.4 per cent. arsenic giving the formula Cu<sub>6</sub>As. The practical limit of the direct binary compound of copper and arsenic was reached with 41 per cent. arsenic, corresponding to the formula Cu<sub>8</sub>As. The alloy of 19.2 per cent. arsenic gave a surface of pale blue color, the alloy of 28.34 per cent. gave a deep blue, 30 per cent. gave light purple, and 32.2 per cent. gave a reddish purple color to the surface of the alloy.

Mercury alloys with copper in the proportion of three parts of copper

to seven parts of mercury, making a copper amalgam known as Viennese metal cement.

Phosphorus, in small quantities, renders copper considerably harder than when pure. Phosphorus copper should contain 99.7 per cent. to 99.8 per cent. copper, 0.05 to 0.1 per cent. phosphorus, and not more than 0.04 per cent. oxygen.

Strontium and tungsten, in small quantities, alloyed with brass, give a golden metal of great tensile strength, strongly resistant to atmospheric influences. The alloy contains 60.8 per cent. copper, 37.6 per cent. zinc, 0.4 per cent. tin, 0.3 per cent. strontium, 0.3 per cent. tungsten, 0.3 per cent. aluminum, 0.2 per cent. manganese and 0.1 per cent. iron.

Tellurium, in small quantities, renders copper of wonderful hardness, though also causing it to become red-short, having much the same influence on the metal as arsenic, but to an intensified degree.

Gold and silver are alloyed with copper for coinage purposes, and for trial plates and medals.

Imitation gold, bearing a striking resemblance to the real article, is made by an alloy of copper, tin, nickel, silver and aluminum.

## CHAPTER X.

### THE BRANDS AND GRADES OF COPPER.

Copper is placed on the market in a variety of grades and shapes, descriptions of which are appended.

Lake copper is the product of the native copper mines of Lake Superior. Lake copper varies greatly in characteristics, and materially in price, the Calumet & Hecla brand being nearly as free from impurities as the best electrolytic copper, while the Copper Range metal is highly arsenical, and between these grades there is a great variety of brands made by different mines. The lake copper is the toughest that is made, hence is especially suitable for wire-drawing or cold-stamping. The best brands of lake copper command a premium over electrolytic, this varying from time to time, but averaging about one-eighth cent per pound. The standard of conductivity of lake copper is 99.5, but there is a considerable range of conductivity among the various brands, this running as low as 91 per cent. in Wolverine copper and as high as 101 per cent. in the metal from the Quincy and Michigan mines. Lake copper possesses greater tensile and torsional strength than is found in other brands. In addition to the domestic market, lake copper finds a limited but steady demand in Europe, for all uses where copper of special toughness is required, as in the making of cartridge cases, metallic buttons, etc.

Electrolytic copper is copper from any source that has been refined electrolytically, and the cathodes average about 99.93 per cent. fine. Copper made by this process is the purest chemically that is on the market, and is the best conductor of electricity, having conductivity up to 103, but lacks the toughness of lake copper, hence is not so suitable for wire-drawing or cold-stamping, but for some other uses is preferable, and for most purposes there is little choice between lake and electrolytic.

Approved brands of copper are those that have been approved by the London metal market, and include practically everything that would pass as standard copper.

Best selected copper averages about 99.75 per cent. fine, and is used largely by brass foundries for making brass castings, rolling brass sheets and drawing brass tubes.

Tough cake is practically the same as best selected copper in the English market, price being the same, and is used mainly for rolling and for tube and cylinder making. The average tenor is about 99 per cent. copper, and this grade usually contains a little lead, which is no particular detriment for the uses noted.

Tough copper is practically the same as tough cake, and is used for wires and sheets.

Ingot copper is rated in the English market with tough cake, and is practically selected copper.

G. M. B. copper is the usual abbreviation for good merchantable brands.

Good merchantable brands of copper, a term formerly used extensively in the English market, is now generally known as standard copper. The

old title was so misused that it deteriorated sadly, and became very indefinite, in time including almost anything that could be called copper.

Chili bars are bars of blister copper from Chile ranging 95 to 99 per cent. in copper tenor. The term is in much less general use than formerly, and most of the Chili bars are sold as standard copper.

Standard copper covers almost anything carrying 96 per cent. copper, and includes considerable metal that is decidedly inferior, much of it containing very undesirable impurities. The price ranges two to three pounds sterling per ton under the market price of tough copper. The average tenor of standard copper probably is about 97 per cent. Standard copper is more a standard for speculation, in the metal market, than a grade for actual consumption, as most of the low-grade copper included under this name is used either as casting copper, or is brought up to high grade by electrolytic refining.

Rough copper is practically the same as standard copper.

Casting copper is rough metal, not suitable for the manufacture of wires or sheets, containing considerable impurities of a serious nature, being suitable only for casting purposes.

Tile copper is brittle, and is suitable for casting only, hence usually is graded as casting copper, in the English market.

Scrap copper is the remnants from the manufacture of sheets, wire, etc., and is of good average grade, though in undesirable form, but can be melted down into cakes or ingots.

Copper is placed on the market in a variety of forms, which are listed as follows:

Ingots are cast in two sizes, the standard weight being about 60 pounds avoirdupois. Copper is put up in this form mainly for casting purposes, the two deep depressions in the top of the ingot being provided to facilitate the cutting of the ingot into three parts.

Wire bars are cast 3 to 4 inches square and 3 to 7 feet in length, averaging in weight 300 to 400 pounds, and, as the name implies, are used for wire-drawing.

Cakes are cast square, in weights of 100 pounds or upwards, some special cakes for the Russian market weighing as high as 4,000 pounds each. Copper in this form is used almost exclusively for rolling into sheets.

Moulds are somewhat similar to cakes, and are used mainly for rolling into sheets.

Anodes are cast in plates about 2 by 3 feet in size, and have an average thickness of about 1½ inches, with an average weight of about 250 pounds. Crude copper from the furnaces is cast into anodes for electrolytic refining.

Cathodes are of approximately the same size as anodes, except that they are much thicker at the top than at the bottom, and while the copper contained is exceptionally pure, it is in crystalline form, and the cathodes are melted down and run into other shapes, cathodes rarely appearing on the finished copper market.

Flat bottoms are circular copper sheets, used for making copper boilers, pans, etc.; and in the English market command a slight premium by reason of being partially manufactured shapes.

Sheet copper is cold-rolled metal, and commands a premium by reason of being partially manufactured.

Sheathing copper is hot-rolled metal, and, like sheets and bottoms, commands a premium over ordinary brands by reason of being partially manufactured.

The various alloys of copper, some of which are of considerable commercial importance, are treated in the preceding chapter, devoted to alloys.

Tempered copper is a will-o-the-wisp that is referred to frequently. Many inventors, usually poorly equipped with technical skill, have wasted much time in efforts to rediscover the "lost art" of tempering copper, and, on an average of once yearly, the American press contains long articles giving hazy details of a rediscovery of the process of tempering copper to the hardness of steel, such wonderful discoveries usually being made by blacksmiths in Maine, cobblers in Pennsylvania, farm-hands in Illinois or cow-punchers in Texas. A typical example of one of these processes is furnished by a lady in the state of Washington, who puts a razor edge on copper tools by adding an ounce of bluestone to a hundred pounds of copper, while molten, and, if an especially fine edge is desired, an ounce of bichromate of potash is added to the charge. The lady inventor evidently is a homeopathic metallurgist. It is doubtful if the mound-builders of America possessed any special art of tempering copper, as it has not been proven that the copper tools of the ancients were harder than those made from modern copper. If tempered copper were greatly to be desired, it is probable that it might be furnished with the aid of tellurium, a small quantity of which renders copper exceedingly hard, but as tempered copper merely would replace steel, in most instances, and as steel is very much the cheaper of the two metals, a perfect process for tempering copper seems unnecessary.

## CHAPTER XI.

### THE USES OF COPPER.

Iron, copper and zinc are the three indispensable metals of the present age. The loss of tin, or lead or even of nickel or aluminum would be a severe blow, working great hardship, and, even were we to be deprived of such apparently insignificant metals as antimony, cobalt, manganese and platinum, the industrial world would suffer a loss entailing disastrous consequences. The taking away of gold and silver, and that useful thief-taker, mercury, which catches most of the world's gold supply, would reduce the finances of the globe to chaos. Iron and copper, however, are the main pillars of the metallic structure, while zinc, in addition to many other virtues, possesses the unique quality of being the only electrically negative metal, and, without it, copper, for electrical uses, would be much like a "pair" of scissors with but a single blade.

Many great industries are dependent upon the metal copper, which, directly and indirectly, affords employment of some hundreds of thousands of persons, mainly skilled workmen, and adds nearly or quite five hundreds of millions of dollars yearly to the wealth of the world. Copper is nearly as indestructible as the precious metals, and its life is infinitely longer than that of iron or steel, as has been brought to attention by more than one archaeological discovery, in which bronze weapons or implements were practically intact, while those of iron or steel were represented merely by streaks of rust.

The engineering trades take nearly half of the total copper production of the world, and, until about 1890, used nearly or quite four-fifths of the entire output of this metal. Since that time has been witnessed the wonderful development of the various branches of the electric industry, and, at the present time, electricity, in some of its various forms of energy, is the largest single user of the metal, with every indication that the electrical requirements of the future will continue to expand, almost indefinitely.

Electrical machinery, as dynamos or motors, is a heavy consumer of copper and brass, but the principal consumption of copper for electrical uses is in the form of wire, for the transmission of energy to be used for power, traction and lighting, and for the electrical impulses providing the conveyance of messages. Copper is an integral factor of prime importance in all electric installations, and for the transmission of power, light and telegraphic or telephonic impulses, is a necessity. It is true that iron wires were used by the pioneers in the telegraphic and telephonic fields, but these are giving way rapidly to strands of copper. Iron is of low electrical conductivity, rendering it an inefficient and costly medium for transmission, and its lack of ductility, and the ease with which it is rusted, render it far less desirable than copper, though it is used at times because of its greater cheapness.

The life of copper wire is as yet undetermined. When laid under-

ground it is affected by electrolysis, but to nothing like the same extent as iron, and copper wire, in the atmosphere, while undergoing some surface oxidation from carbon dioxide and sulphur vapors, is but slightly affected thereby.

The trolley line of the present day, threading its way through the mazes of every city and town of any importance, and weaving a spider's web over most of the thickly populated sections of the United States, is a strictly modern affair, and may be said to date from about 1890, the earlier lines having been few in number, short in length, and of an experimental and usually unsatisfactory nature. At the end of 1906 there were upwards of 40,000 miles of trolley lines in the United States, requiring upwards of 40,000 tons of copper for power transmission alone. The average weight, in that year, of trolley wire in the United States, was 1,688 pounds per mile for short lines and 2,687 pounds per mile for long-distance power lines on interurban and well-equipped city roads. The trolley line is as yet in its infancy, and the time will come, unless some superior means of traction shall be invented later, when the United States alone will have more than a million miles of electric roads, wild as this prediction may sound at the beginning of the Twentieth Century. Furthermore, the trolley line must grow more popular in all other countries. The United States has led in the electrification of transportation lines, but the cities of Europe are now possessed, in most cases, of modern electric street railways, and it is but a question of time when interurban lines will supplement urban transportation facilities in Europe, as they now do in the United States.

In addition to the large quantities of copper required for power transmission lines, the metal is used very extensively in the motors of the cars themselves. The weight of copper in a street railway car ranges from a minimum of about 250 pounds to a maximum of nearly one ton, a forty horse-power trolley-car motor containing an average of about 800 pounds of the metal.

The electrification of steam railroads has been discussed academically since the trolley-car first became a factor of importance in the field of transportation. The work of electrifying the steam lines has proceeded but slowly, much to the disappointment of many urgent advocates of such a change, but the reasons for this slowness are not difficult to find. Thousands of millions of dollars have been invested in steam railroads, in the United States alone, and it would be folly, or worse, for those in charge of these lines to discard an old and proven motive force for a newer power, until the latter had demonstrated fully its ability to do the work more cheaply and advantageously.

In the war now on between the steam roads and trolley lines, for urban and suburban passenger business, the trolleys have had very much the better of the battle, and are now forcing the fight into the country of the enemy, by means of linking together various interurban lines, through which plan long stretches of road have been brought into single systems. On some of these lines dining and sleeping cars have been introduced, but the latter seem to be more in the nature of an advertisement, or a boast, than for practical use. The steam locomotive and the electric trolley-car have been running side by side for a sufficient length of time,

in a sufficient number of fields, to afford fair basis for comparison, and a dispassionate survey of both fields leads to the conclusion that neither is supreme, and that, for at least many years to come, the steam locomotive will hold its own, on many lines. Each method of traction has its advantages and disadvantages. It is possible to build an electric motor that will compete with any steam locomotive, as to speed and tractive power, but this would require feeding from a much heavier wire than now in use on any trolley line. For long hauls and great speed between distant points, the trolley cannot yet be held a serious competitor of the steam locomotive, while for short distances, immediate access to centers of population, and frequency of trips, the electric line has proven its great superiority to the steam road.

Electrification of tunnels and terminals has been undertaken by a number of railroads, and electric traction offers so many points of superiority for these special uses that it is certain to dispossess the steam locomotive, in the majority of cases.

It is now possible to distribute electric energy for great distances, without serious impairment or waste, and it would be folly to attempt to set a limit to the future possibilities in this field. Eventually it may be found practicable to transmit electric energy from great central stations, located at available water-powers, or in coal-fields, along many hundreds and even thousands of miles of railway line, and when that time arrives, the steam locomotive will have met its Waterloo. That steam ultimately will be displaced by electric power, in many, and probably in the majority of cases, may be accepted as a reasonable probability, but this process will be gradual, and due allowance must be made for the influence of future inventions, which may give an entirely new phase to the situation. It should be borne in mind, in this connection, that the past decade has witnessed some marvelous developments in the production of power, entirely outside of the electrical field, these including the perfection of the turbine steam-engine, great improvements in turbine water-wheels, the vast increase in scope and power of internal combustion engines, and the utilization of producer-gas. The prophet who attempts to peer too far into the future may strain his reputation, as well as his eyesight.

Hydro-electric power installations are becoming very common, throughout the world, and from these plants electric energy is distributed for distances of fifty to one hundred miles, and even for one hundred and fifty miles in the case of some of the later installations. In transmitting power for long distances, a high voltage is used, almost invariably, the current being stepped down at the point of utilization. Water power, which was the principal mechanical force of the world, one hundred years ago, but which fell into very general disuse about the middle of the Nineteenth Century, is coming into its own again, and where a stream was made to furnish a few hundred horse-power, by means of a wasteful overshot water-wheel, fifty or seventy-five years ago, the same stream now gives thousands of horse-power by means of the economical water turbine. The utilization of water power is revolutionizing the location of industries, which, for the past three generations, have been located near fuel supplies, or along the lines of least resistance in the distribution of fuel.

Electric lighting has ceased to be a novelty or a luxury, and is now

a necessity in every progressive community. There can be no question that eventually electric energy for both lighting and power purposes will be transmitted throughout the country, to such an extent that rural, as well as suburban populations, will benefit fully from its use. In 1902 the American Census Bureau reported 125,143 miles of main and feeder wires connected with electric lighting and power plants, and this network of wires must have reached nearly or quite 200,000 miles in 1907.

The telephone, invented in the last quarter of the Nineteenth Century, and not in general use until after 1880, is now found scattered throughout the length and breadth of every civilized land, and in many countries that only by a stretch of imagination could be termed more than semi-civilized. Greater New York alone possesses nearly a quarter of a million telephones. At the end of 1906 the various affiliated companies of the American Bell telephone system had in use about 375,000,000 pounds of copper wire, of which more than 50,000,000 pounds were added in 1906, the increase for that year having averaged almost exactly 1,000,000 pounds per week. In addition the thousands of smaller independent telephone systems throughout the country use tens of millions of pounds of copper wire yearly. At the beginning of 1907 the Bell system of the United States had in use sufficient wire to girdle the earth thirty-eight times, at the equator, if the wire were standardized to the size used for long-distance transmission. In addition to the requirements of the telephone companies for wire, the instruments themselves contain considerable brass, and modern desk-phones are made of brass, nickel-plated. Furthermore, an immense amount of copper is required for the big switchboards of the telephone companies, and the mammoth switchboards of the electric light, power and traction lines also are consumers of enormous quantities of the metal.

In the beginnings of telegraphy, iron wire, because of its lower cost, was used very generally, but the lower conductivity of iron, and its lack of ductility and proneness to break under stress of wind or sleet, renders iron wire, while cheaper in the first cost, much dearer in upkeep than copper, and the present tendency of the telegraph companies is to replace iron with copper wire, wherever possible, the greater initial cost being more than offset by the far greater life and assurance of good service given by copper. The various ocean telegraph cables, of which there are approximately 200,000 miles in use, require many thousands of tons of copper. The government cable, between the United States and the Philippine Islands, is 8,200 nautical miles in length and in making required 19,000,000 pounds of iron and steel wire, and 3,600,000 pounds of copper wire. In addition to the wires, all telegraph instruments are made of heavy brass, and copper sulphate is used in enormous quantities for batteries, furnishing power for the transmission of the electric impulses.

In addition to the power, light and traction lines, and the telegraphs and telephones, copper wire is used to the extent of millions of pounds for minor electrical systems, these including messenger call systems, fire-alarm systems and burglar-alarm systems for banks and private residences. These systems not only require much wire, but also are considerable consumers of brass for their annunciators and other instruments.

Electric heating and cooking are as yet in the experimental stage, to the extent that while their feasibility has been demonstrated, their

cost remains prohibitive, in most cases. It is probable, however, that further inventions will reduce the cost to a point where the electric current will come into quite general use, for these purposes. The immediate availability of the electric current, which may be turned on or off by the mere touch of a switch, has brought about the very general use of electric lighting, and will bring about as wide a use for cooking and heating purposes, as soon as the march of invention will permit the furnishing of the current at lesser cost, for such uses.

In addition to its use for the transmission of electrical impulses or energy, copper wire is utilized for other purposes, in a great number of industries, though the electric trades consume more than ninety-five per cent. of the copper wire that is drawn.

Brass, an alloy of copper and zinc, is one of the most useful metals known to man, being the most valuable of all alloys, and probably is consumed to a larger extent than all other alloys that are made. The engineering trades are the heaviest consumers of brass, and, notwithstanding the immense consumption of copper for electrical purposes, it is probable that the engineering trades remain the heaviest single consuming interest in the copper trade. Every modern steam engine has brass oil-cups, and many have brass, gun-metal, bronze or composition copper bearings. Copper and brass boiler-tubes are used in locomotives and other high-pressure boilers, and every locomotive requires a large amount of brass in its trimmings. Copper tubes are used almost exclusively in marine condensers.

The ship-building trade is one of the very best customers of the copper mines. Until the era of iron vessels, prudent ship-owners sheathed the hulls of their vessels with copper, which kept the bottoms clean, and within the past few years this practice has been renewed, with modern steel steamers, on which it is necessary to plank over the hull, below the water line, in order to give a backing for the riveting-on of the copper sheets. The loss in speed, and consequent loss in time and fuel, brought about by barnacles gathering on iron and steel bottoms, is very great, and this can be obviated only by dry-docking and scraping, at considerable expense and loss of time, or by copper-sheathing below the water-line, and the latter plan is considered the cheaper. In all likelihood some method will be devised, eventually, for the plating of copper directly on the steel bottoms of boats. Every modern passenger vessel and warship of great size is a consumer of hundreds of tons of copper, in the form of brass for engines, copper and bronze for fittings, copper and brass for dynamos and motors, and in wires for telephone, telegraph and electric light systems.

In the line of land transportation, the use of copper for roofing and sheathing passenger coaches of railroads is spreading. The underground railway cars in New York are sheathed throughout with copper, which proves more durable than wood, and this utilization of the metal is likely to increase steadily, as old-style cars of wooden frame give way to steel cars. The ideal passenger car of the future will have a steel frame, copper roofing and sheathing, wooden interior finish with brass fittings, and paper wheels.

Wherever there are waterworks, brass faucets and valves are found. The

consumption of brass for valves is enormous, and for very many uses these valves, while very costly in the larger sizes, prove economical in the end.

In the arts and manufactures, copper plays a highly important part. The great vacuum-pans of the sugar factories and refineries are made of copper, and there are copper vats in pulp and paper mills. The wormes and stills of distilleries are of copper, and the copper brewing kettles in which beer is made are of immense size, and are numbered by thousands. There is scarcely a branch of manufacture that does not make use of copper or brass, usually to a considerable extent, in one or many of the various processes employed. In the textile trades, copper rolls for stamping patterns on print-cloths are consumers of hundreds of tons of the metal.

Perforated metal screens of brass and copper are in use in many industries, and these, while considerably higher in first cost than similar screens of iron, are more economical for many uses. Similarly, woven wire screens of brass are replacing steel wire-cloth for many uses, the first cost being higher, but the life much longer.

The automobile may be termed a strictly Twentieth Century invention, as the modern machines date from but a few years back, even though their forbears were seen, as a rarity, in the closing years of the previous cycle. An average automobile requires about 100 pounds of copper, mainly in the form of brass, for lamps, horns and other parts and accessories. The world's consumption of copper for automobiles probably reached nearly or quite ten million pounds in 1907.

The motor-boat is another Twentieth Century invention, even more recent than the automobile, and is gaining rapidly in popularity. These boats require from fifty to two hundred and fifty pounds of copper each, according to size.

In building construction, the uses of copper are extensive and increasing. Copper roofs for buildings, with the metal in either sheet or tile form, are quite common, and the use of copper for cornices is general, these having much longer life than cornices of galvanized iron. Copper is more costly, but its freedom from corrosion and its rich appearance render it desirable for ornamental trimmings and cornices on the better class of buildings. Bronze gates and doors for churches and public buildings are highly ornamental, and of practically perpetual life. Bronze grille work is in high favor, both for its rich appearance and its durability. In some recent buildings, copper sheets have been used almost exclusively for outside walls and facings, in place of brick or cut stone. The use of this metal for sheathing interior woodwork, where exposed, as in baseboards, window-sashes, doors, etc., is increasing. In the destruction of San Francisco, in April, 1906, through an earthquake shock, followed by fire, the Kohl building, an eleven-story office structure, suffered comparatively little damage, being the only tall building in the city that was not badly injured. In this building all interior woodwork was protected by sheet copper, and it was this protection that allowed the building to escape with the minimum of damage. This use of copper is certain to increase, as the severe trial imposed in San Francisco proved the value of metallic sheathing for interior wood finish, and architects and builders have been greatly impressed by the advantages of this feature of construction. The San

Francisco earthquake and fire also proved the great danger to pedestrians resulting from the use of concrete and terra cotta cornices. There is a growing use of copper for windows and sashes made from sheet metal, and one firm in Maine turns out over one million copper-wire window-screens yearly, these costing about three times the first price of steel woven wire, but proving cheaper to the user in the long run.

In builder's hardware, brass, bronze and copper locks, knobs, butts, bolts, catches and drawer-pulls are in steadily increasing favor and use, and because of the superior durability and appearance of copper and its alloys, will continue to displace iron to a greater extent, as wealth increases and the standard of living is raised. In modern office and apartment buildings and in hotels, the mailing chute, made of brass and glass, is becoming a necessity, rather than a luxury. There is a large consumption of high-grade brass pipes and castings for gasoliers and electroliers, which are rapidly displacing the crude and often semi-barbarous iron devices of the preceding generation. Brass pipes and faucets, usually nickelized, are used in the best plumbing, for bathrooms and lavatories, on both land and sea.

The domestic uses of copper and brass are numerous and varied. Brass beds and furniture attract by their cleanliness, beauty and durability. Brass rods are used in millions of homes for stair-carpets, and for the suspension of portieres and curtains. Brass or copper lamps for burning kerosene oil are more durable than those of glass and pottery, and far safer. In the kitchen, the brazen kettles of earlier days are losing ground; there is no better material in use for cooking, when carefully cleaned, and none that may cause so much trouble if neglected.

The use of copper, in the form of bronze, for statuary, dates from prehistoric times. The ancient Greeks used mainly Pentelican marble for statues, and terra cotta for statuettes, but the modern world makes its statues and bas-reliefs almost exclusively of bronze. Iron turns to rust, wood decays, and marble is mutilated and discolored, but bronze retains the beauty and finish imposed upon it by the sculptor, being subject to slight corrosion only, in the course of ages, when buried in the earth. For general decorative purposes bronze is much used for vases, urns and similar ornamental receptacles.

The best bells are of bronze, in which copper is the principal component. In addition to perhaps a million church bells, there is a considerably larger number of smaller bells, mainly made of brass, in use in practically every power plant, and in fire, burglar and messenger alarms.

Copper is used extensively for munitions of war, the largest single requirement being for cartridge cases, with small but appreciable quantities used for buttons, and for a variety of other uses. The brass-cannon, so popular fifty years ago, are in the present age used mainly for firing salutes, ornamenting public squares and trading to the heathen. Notwithstanding this disuse of the metal for ordnance, except in small salute-guns for yachts, more copper is used now, for munitions of war, than ever was consumed in the casting of cannon. Brass and copper cartridge-cases, cold-stamped from tough sheets, are consumed annually, by the world's armies, to the extent of hundreds of millions, for machine guns and small arms, and to a scarcely smaller extent by hunters. Hundreds of tons of

the best tough metal are used annually, merely to make the brass buttons for decorating the uniforms of the world's armies and navies. Brass fittings and buckles for men and horses, brass canteens, drinking cups and cooking utensils, also require much copper for the followers of Mars, though aluminum, by reason of its superior lightness, is displacing copper for the smaller metallic articles required by troops. The copper exploders, used in every metal mine where modern methods are employed, afford another use, apparently trivial, yet which is one of the scores of minor demands that in the aggregate consume thousands of tons of copper yearly. The amount of the metal consumed by the world, for munitions of war, cannot be much short of ten thousand tons yearly, in times of peace, and several times as much in season of great wars.

Copper and its alloys have been employed for coinage from time immemorial. Originally copper was a purely money metal, like silver and gold, and each copper coin, unless debased by the short-sighted cunning of the petty tyrant, oligarchy or democracy of the day, represented upon its face merely the intrinsic value of the metal it contained. Eventually the inherent impossibility of keeping three separate metals upon any fixed basis of parity led to the relegation of copper to the status of token money, for the same reason that silver coins have been made merely token money, by the leading nations of the globe, during the past hundred years. The Chinese continued to give honest values in their brass money until 1904, when the possibility of debasing the coinage, to the great profit of the provincial officials, suggested itself so forcibly to the astute minds of some of the governors that several of the Chinese mints were worked with feverish activity, in turning out new copper cash, but, as invariably is the case in any debasement of coinage, the work was overdone, and much confusion and loss has been caused by the excessive issue of copper coins, in several of the provinces. In 1904 the four mints of Tientsin, Wuchang, Canton and Foochow emitted 8,997,710 twenty-cash pieces, and 371,916,380 ten-cash pieces, consuming therefor 13,718 long tons of copper. The total amount of copper consumed for Chinese coinage, in the three years 1903 to 1905, inclusive, probably was between thirty thousand and forty thousand long tons, though possibly greater, and the coinage requirements of 1905 alone have been estimated as high as 59,000 long tons, but this, without question, is excessive. For the fiscal year 1906 the United States government consumed about 825,000 pounds of fine copper for coinage, this including the metal for bronze cents and the copper used for alloying gold and silver coins. The monetary systems of practically all civilized countries include the use of copper for the smaller coins. It is estimated that nearly £1,000,000 in copper coins is locked up, constantly, in the penny slot-machines extensively used in Great Britain for gas-meters, and for the automatic vending of many other articles. In the United States, France, Germany and many other countries, automatic vending machines are very common, and have necessitated, in all such countries, a considerable increase in the coinage of copper money, to maintain the supply of minor coins, so heavily drawn upon by the automatic machines.

Practically the entire works of a modern clock are made of brass, and in the case of the Yankee dollar clocks, now to be found in the most no-

mote corners of the earth; practically everything but the glass front and the hands are made of brass, though the case is nickelized. The gear-wheels and pinions of watches, whether of the dollar variety or of the highest grade, are made from brass, and the dials of watches also are made of brass enameled. A single firm, in the Naugatuck valley of Connecticut, stamps out one hundred thousand watch dials daily, and buys Cahumet & Hecla copper in lots of five to fifteen tons therefor.

Instruments of precision used in the scientific world are composed mainly of brass. Microscopes and telescopes, surveyor's transit and draughtsman's protractors, and hundreds of other strange instruments, of marvelous variety and complexity, that do human work without the element of human fallibility, are composed almost exclusively of brass.

In ceramics, copper and cobalt, often found associated in nature, are the principal metals used for coloring, and an infinite variety of colors and shadings of the utmost delicacy are secured, in glassware and the higher grades of pottery, from the ores and compounds of these metals.

In the business world, the uses of copper are numerous. Signs of copper, brass and bronze stare at us from every corner of crowded city streets. Copper leaf is used by sign-writers, and in various other ways, and tinned-copper is used in bronzing. Brass rods are utilized for window displays and in various mechanisms used for exhibiting goods in retail business houses.

In offices and for clerical work, copper is consumed to an extent far beyond the wildest guess of anyone who has not given thought to the subject. Brass platens are used on typewriters, for heavy manifolding, and the best numbering and dating machines have their figures cut upon brass wheels, and brass is used in other parts of such devices. Brass wire for stapling papers is consumed extensively, as are brass paper fasteners, and the little brass clips, so easily attached to or detached from masses of papers, are used by the hundreds of millions yearly; a single set of files, of the dozen or more required by the Copper Handbook, consuming about fifteen thousand such clips in every year. Hundreds of tons of copper are consumed in the manufacture of metal tips for lead pencils, these being almost invariably of brass, with a thin plating of nickel; and for metallic tips for penholders, metallic pencilholders and miscellaneous office devices and fittings.

Practically all of the high grade American toilet preparations now are put out in glass bottles, or nickelized cans. These cans, formerly of tin, now are almost invariably of brass and copper, lightly plated with nickel. A single manufacturer of talcum powder alone used more than six million small cans for his product, in 1906.

Several thousand tons of copper are consumed yearly, in the United States alone, for the manufacture of so small but necessary an article as the pin.

A single Connecticut firm uses an average of about twelve thousand pounds of copper daily for making eyelets, bals and vamps for shoes.

Brass mountings are used extensively in the manufacture of harnesses for horses, either appearing in the natural color, or plated with nickel, silver or gold. Copper is used frequently for card cases, cigarette cases and for mounting ladies' fine pocketbooks, wrist bags, and chatelaines,

either appearing as the natural metal, or plated. Copper is used also, to a large extent, for the heads of umbrellas and canes, and is used frequently for backing combs, brushes and mirrors.

The use of copper for ornaments is very general among all savage tribes where the metal is available, either through aboriginal production or by reason of purchase from traders. Copper wires, made from ore smelted in crude furnaces, and drawn through stone mandrels, are found in Central Africa, in the vicinity of Lake Tanganyika, and are used extensively for arm and leg bracelets, ear-rings, nose-pieces and other embellishments for the person of the untutored savage. The dark-skinned Hindoo, and the darker-skinned native of Central and Southern Africa, evince one failing in common, this being a great fondness for jewelry and ornaments made from telephone and telegraph wires; but when these are succeeded, as is commonly the case, by high voltage power transmission lines, such depredations cease, after about the third consecutive funeral. Some of the telegraph and telephone companies, operating in districts where natives are unduly fond of copper wire, have found it necessary to protect their wires by currents of sufficient voltage to give severe shocks, without causing death to wire thieves.

The uses of copper enumerated in the preceding paragraphs of this chapter are for the metal and its alloys, brass and bronze. There are other alloys, not previously mentioned, such as nickel-copper, arsenic-copper, aluminum-copper and others, that are used for a variety of special purposes.

Malachite, the green carbonate ore of copper, when found massive, is a semi-precious stone of great beauty, and is much in demand for table tops and interior architecture, and also is an exceedingly beautiful stone for brooches, pins and buttons. Chrysocolla, a silicate of copper, vies with malachite in beauty and utility, and turquoise owes its beautiful blue color to the small amount of copper contained therein. Other ores of copper are ground up for pigments, many beautiful shades, especially blue and green, being secured from mixtures having copper ores as bases.

The most important copper mineral, for other uses than the production of metal therefrom, is copper sulphate, the common bluestone or blue vitrol of commerce. This is found in nature as chalcanthite, but, as a rule, is a product of manufacture. This compound is one of the most important chemical agents known to science and the arts, and is a necessity in the electrolytic refining of crude copper. It is a component part of all wet batteries, and, as such, rings our door-bells, carries our telegrams, and is the energizing agent that permits the transmission of the human voice over the wires of the telephone. In electroplating, electrotyping and kindred industries, it is the prime factor. As an insecticide it stands without an equal, dilute solutions of sulphate of copper having stayed the ravages of the phylloxera, when the vineyards of France seemed doomed. It is probable that not less than one hundred thousand tons of copper sulphate, containing a quarter of its weight in metallic copper, are consumed yearly in spraying the vines and fruit trees of Europe and America, and thus it may be said that it is to copper that we owe the sparkling wines of France, the peerless American apple and the blushing peach that reaches perfection on every continent.

The consumption of sulphate of copper is not confined to horticulture and the electrical industries, as it is used, to the extent of thousands of tons monthly, in the textile factories, in the chemical industries and in manufactures of greatly varied lines. Bluestone, for the past few years, has found a new and valuable use, as a destructive agent in eliminating the algae from domestic water supplies, and it is asserted; apparently with reason, that the typhoid fever germ is destroyed by adding bluestone to water in the proportion of one to ten millions. A bluestone solution of one to five hundred thousand is effective in killing the larvae of mosquitos, when young.

During the Nineteenth Ceentury the production and consumption of copper increased by more than forty-fold, and the end of the century found the metal used for nearly forty times as many purposes as were known one hundred years before. What another century may bring forth, no man can tell, but that the metal will be in strong demand, in ever-increasing quantities, for an ever-widening variety of uses, seems open to no doubt.

## CHAPTER XII.

### SUBSTITUTES FOR COPPER.

For many uses copper is unrivaled, while for other uses there are substitutes of greater or less utility that may become available under certain circumstances. The displacement of copper by other materials increases, in many lines, almost in direct ratio to the increase in price of copper, but while higher prices for the metal cause considerable substitution, lower prices invariably drive the substitutes, partly or entirely, out of the field.

In building construction, for making cornices and similar uses, galvanized iron is a cheap but not altogether satisfactory substitute for sheet copper. Iron remains a competitor of copper also in the wire trade, for telegraph and telephone lines, but owing to its low conductivity is not available for power transmission.

Copper wire laid underground, and not protected by tubing, is affected by electrolysis, but to nothing like the same extent as iron, and copper wire in the atmosphere undergoes some surface oxidation from carbon dioxide and sulphur vapors, but such oxidation is merely superficial. Apparently the life of a good copper wire, in ordinary use, is of indefinite and practically everlasting duration. Iron is low in electrical conductivity, rendering iron wires an inefficient and costly medium for the transmission of electrical impulses, and out of the question for the transmission of electrical energy. Iron also is subject to rust, and its lack of the ductility that is such a strong characteristic of copper, causes iron wires to break from winds and sleets that would not injure lines of copper wire. Telegraph and telephone wires of iron remain in use to a much larger extent than generally supposed, owing to the cheap initial cost of installation, but the cost of maintenance and repairs renders it certain that iron must give way to copper, sooner or later, at practically all points in this field. Many local telephone systems are installed with iron wires, but so certainly as such installations become successful, the replacement of iron by copper wires is certain to begin. Iron wires for telegraphic trunk lines are in quite general use on branches, but the principal telegraphic trunk lines are of copper.

Metallic sodium has been tested for overheard transmission. Owing to the great affinity of sodium for oxygen, it is necessary that it be protected from the air by being run into wrought iron pipes, which in turn are protected by weather-proof paint. It is claimed that, for the same conductivity, the cost of building a sodium conductor is only about 40 to 60 per cent. that of a copper conductor, but these figures are viewed with suspicion, and while sodium may become a serious competitor of copper for power transmission, in time, the prospects of strong competition from this source do not seem alarming.

Copper has but one really formidable competitor, this being aluminum, and in view of the very considerable substitution of aluminum for

copper, in certain fields, and the threat of even more strenuous competition, serious inquiry into the subject seems warranted in a work devoted to copper.

The electrical conductivity of aluminum is 63, compared with 101 to 103 in the best grades of copper. As compared with copper, aluminum has fair electrical conductivity, but lacks tensile strength. The latter defect, however, is overcome to a large extent by the greater lightness of aluminum, its atomic weight being 27, as compared with 63.2 for copper. Aluminum does not oxidize readily in the atmosphere, but when brought into contact with iron an electrolytic action is brought about that causes rapid deterioration. The use of aluminum transmission wires, where exposed to the action of salt water, is impracticable, owing to rapid corrosion, and for the same reason this metal cannot be used for sheathing vessels. Aluminum wires are claimed to be superior to copper for damp places, or for withstanding acid fumes and moisture in the air or soil, these having but slight effect on aluminum.

One of the principal defects encountered in the use of aluminum for transmission wires is found in the great difficulty experienced in making good joints, although it has been stated, repeatedly, that this trouble has been overcome. Owing to the difficulty with which joints are soldered or brazed, the connections are mainly in the form of a three-way sleeve, giving a straight joint equivalent to a straight splice. In the case of large wires, dove-tailing is adopted, and, in smaller wires, a flattened tube is used occasionally. The conductivity of aluminum transmission lines is impaired somewhat by slight oxidation at the joints.

Aluminum being much lighter than copper, the number of poles required for a transmission line can be reduced, but owing to the large coefficient of expansion, aluminum wires sag heavily in warm weather.

The principal electrical use of aluminum is found in power transmission lines. This metal having lower conductivity and considerably less tensile strength than copper, its use necessitates bars or wires of considerably larger section, which disadvantage is balanced by the much lighter weight, but wires of aluminum are much more apt than those of copper to suffer from the stresses of snow, ice and wind, because of lesser tensile strength. Aluminum cables are in use in a California transmission line that carries power for a distance of 154 miles, to San Francisco. The longest transmission line is from Niagara Falls to Syracuse, a distance of 162 miles. This latter installation includes nine aluminum cables, each containing nineteen wires, giving a total length of about 28,000 miles of wire, the cables carrying a voltage of 60,000. The general consensus of opinion among those who have used both aluminum and copper wires, for power transmission, is that aluminum is materially cheaper in first cost, but not so satisfactory in operation, being more subject to accidents, and requiring greater outlay for upkeep.

The use of aluminum in electric railway systems is limited practically to high-tension lines for feeder cables, as it cannot be used for trolley lines because aluminum will not solder or braze satisfactorily, and trolley wires require carefully soldered or brazed joints made smooth. If a satisfactory method of brazing or soldering aluminum can be invented, and this would seem probable to come in time, aluminum will become a competitor

of copper in the trolley field, on practically the same terms, as the metals now compete in the field of long distance power transmission. For high-tension feeder wires on trolley lines aluminum possesses one marked advantage over copper, in that it does not melt when short-circuited, as copper does.

Although extensive tests have been made with aluminum wires for telegraph and telephone lines, these have not proven satisfactory, and the metal is but slightly used for these purposes, aluminum wires being found lacking in tensile strength. The telephone and telegraph companies prefer steel wire to aluminum, and copper wire to either.

The weight of aluminum rolled is 162 pounds to the cubic foot, and for copper, 555 pounds per cubic foot. In electrical capacity for power transmission, one pound of aluminum is nearly but not quite equivalent to two pounds of copper, hence in figuring a parity between the metals, for power transmission purposes, the base can be secured by doubling the market price of copper and comparing same with the market price for aluminum, but for the purpose of final comparison, allowances must be made for the cost of drawing the wires and further allowance made for the added expense and difficulty of securing satisfactory joints in the aluminum transmission lines.

Aluminum was given an excellent opportunity of demonstrating its capacity to replace copper, during the era of high prices of the latter metal that culminated in the market break of July, 1907, but it cannot be learned that there was any very general substitution of aluminum for copper, on account of the high price of the later metal, although advocates of the substitution of aluminum for copper claimed that with copper at 26 cents and aluminum at 39 cents there was an economy of 50 per cent. in price, and of 55 per cent. in weight, in favor of aluminum.

Aluminum is becoming a serious competitor of brass in the manufacture of light castings, but for heavier work does not seem to have made much headway as yet. The aluminum castings have superior lightness, but lack the tensile strength of brass. The principal use of aluminum castings has been made by the automobile trade, but such castings do not seem to have been entirely satisfactory to some manufacturers, although well liked by other makers. Aluminum seems to be a very satisfactory substitute for copper and brass in the making of pans, kettles and boilers for various industrial uses, such as sugar manufacturing, wax refining, fruit canning, etc., and for kitchen utensils is much preferable to copper or brass. For certain uses, such as buckles, buttons, canteens, cups and other equipments for troops, the extreme lightness of aluminum renders it preferable to brass or any other metal.

For some uses various alloys of aluminum possesses considerable advantages over the pure metal, but some of the much-touted alloys of aluminum have given results falling far short of the promises made for them. There are, however, several aluminum alloys of marked value. Alloyed with about 1.5 per cent. copper, aluminum wire gains materially in tensile strength and loses nothing in ductility, wire so alloyed permitting spans of 150 feet in length, for long distance transmission lines carrying high-voltage currents.

The present production of aluminum is only a trifle more than one

per cent. that of copper, and is about the same in tonnage as the copper production of a century ago. It is probable, however, that the production of aluminum will show a larger proportionate increase than that of copper, for the next decade.

As matters now stand, with aluminum around its present range of prices and production, it scarcely can be considered a serious competitor of copper in any single field, with the exception of long-distance power installations, but given a material decrease in the cost of production of aluminum, through improved processes which are possible, though not yet in sight, a largely increased production would be assured, as the supply of raw material is absolutely inexhaustible, and were the metal to be sold at a price corresponding to a considerably reduced cost of production, which might not be the case immediately, if the new processes were controlled by a monopoly, but would be certain to come in time, aluminum would become a competitor to be reckoned with seriously by all the other commercial metals, but the brunt of the fight would be borne by tin and copper, and probably tin would be the greater sufferer of the two, in the long run. Apparently the supremacy of copper in its leading fields is not severely threatened by aluminum, which metal will make a place for itself in the industrial world, having certain advantages that must greatly extend its present use, and certain limitations as well, which, in all probability, will operate to prevent its becoming a dangerous competitor of copper.

## CHAPTER XIII.

## GLOSSARY OF MINING TERMS.

The following glossary of mining, milling and trade terms first appeared in Vol. II of the Copper Handbook, and has been amplified in 1903 and 1907. It will be found fairly complete.

**ACICULAR.** Needle-shaped.

**ACID.** An acid rock is one in which bases are combined with acids, forming salts. The antithesis of basic.

**ADIT.** A mine opening, driven from the surface into a hill or mountain, on practically a horizontal plane, only enough rise being allowed to provide for natural drainage and to allow the easy removal of cars bringing rock from the breast of the working. An adit can be driven only where the surface is mountainous or quite hilly.

**ADOBE.** Sun-dried brick.

**AIR-BLAST.** A violent explosion, caused by the escape of air compressed by the settling of the upper workings of a deep mine.

**AIR-COMPRESSOR.** A machine for condensing air to a pressure sufficient to actuate machinery, when delivered underground, or elsewhere, at a considerable distance.

**AIR-DOORS.** Owing to strong currents of air frequently found in the depths of mines, it is sometimes necessary to build a little chamber in a drift connecting two shafts, with a door at either end, to prevent extinguishment of the lamps and candles of the miners by strong air currents.

**AIR-DRILL.** A power drill operated by compressed air.

**AIR-SHAFT.** A shaft sunk solely to provide ventilation for deep workings, or an old shaft kept open solely to furnish air to the mine. Nature provides a means of ventilating even very deep mines. Two shafts, one of which is sunk on slightly higher ground than the other, will provide natural ventilation underground, when connected by a drift, the longer shaft becoming a chimney, and the shorter an inverted siphon, down which the air is sucked with great force.

**ALKALI.** An alkali is a lye—the opposite of an acid.

**ALLEY.** Two or more metals united mechanically, but not chemically, by fusion.

**ALLUVIUM.** Soil or broken rock deposited by the action of water.

**ALTERED.** An altered rock is one that has undergone changes in its chemical and mineralogical structure since its original deposition.

**ALUMINOUS.** A rock having aluminum as a base or prominent constituent element.

**AMALGAM.** A union of mercury with other metals, such as gold, silver or copper. Mercury will not amalgamate with iron.

**AMALGAMATION.** The process of uniting gold, silver or copper with mercury. The quicksilver is expelled later, by heat, and recovered for further use.

**AMORPHOUS.** Without structural form.

**AMYGDALOID.** A trap rock, of igneous origin and frequently of highly complex structure, the name coming from the little pits or amygdaloids of softer rock-material found therein. In the Lake Superior copper district the copper-bearing amygdaloids frequently show the native copper in the amygdaloids left by the leaching out of the softer rock originally contained therein.

**AMYGDALOIDAL.** Of the nature of or akin to amygdaloid.

**ANALYSIS.** A complete chemical test of any given substance.

**ANHYDROUS.** Devoid of water.

**ANTICLINE.** A fold of rock-strata bulging upwards, in saddle-shape. The reverse geologically of syncline.

**ANTICLINAL.** An anticline. Of the nature of an anticline.

**ANTIGUA.** In Mexico, is a mine worked by Spaniards or Mexicans at a time so remote—from 50 to 300 years—that particulars have been forgotten. Sometimes valuable.

**APARTADO.** Apartado de correos is Spanish for postoffice box. Usually written apartado only or abbreviated to Ap.

**ANTIMONIDE.** An ore of any metal chemically united with antimony.

**APEX.** That part of an ore vein at or nearest surface. In the United States usually requires opposing experts and several lawsuits to determine. In case of litigation, rightful title to the apex usually rests in the litigant having the most money.

**APICE.** Apex.

**ARENACEOUS.** Of a sandy nature.

**ARGENTIFEROUS.** Silver-bearing.

**ARGILLACEOUS.** Of a clayey nature.

**ARASTRA.** A Chilean mill. A circular trough, in which broken ore is pulverized by a revolving wheel or mill stone.

**ARROYA.** A gulch.

**ARROBA.** A weight of varying heft. Spanish, 25.36 pounds avoirdupois; Portuguese, 32.38 pounds.

**ARSENIDE.** An ore of any metal, of which arsenic is the other constituent.

**ARSENOPYRITE.** An ore of any metal with which arsenic and sulphur are chemically united.

**ASSAY.** A chemical test of ore or metal to determine its exact content and value in any given metal or metals.

**ASSESSMENT WORK.** The amount of work required annually by the United States government, from the holders of an unpatented mining claim.

**ATTLE.** Cornish term for waste rock.

**AURIFEROUS.** Gold-bearing.

**AUXILIARY.** An auxiliary engine or machine is one kept in reserve for use when the principal machine is out of commission.

**AVERAGE PRODUCE.** Cornish term for percentage of copper in ore.

**BACK.** The roof of rock above any mine opening driven on a horizontal plane.

**BAD AIR.** Air in which miners cannot work, owing to powder fumes, noxious gases or insufficient ventilation.

**BAL.** Cornish for mine.

**BALANCE BOB.** A counterweight for pump rods.

**BALL HEAD.** A steam stamp, named after its inventor.

**BALL STAMP.** A Ball head.

**BARRANCA.** A deep gulch or cañon, with precipitous sides.

**BARILLA DE COBRE.** Spanish term for native copper, dressed but unsmelted. Equivalent to the "mineral" of Lake Superior mines. Used mainly in Bolivia.

**BARREL WORK.** Copper in small masses, detached from its rock-matrices at the rock-house, and shipped in barrels direct to the smelter.

**BARROW.** A wheelbarrow; also same as burrow.

**BARTLETT.** A Bartlett concentrating table.

**BASALT.** A trappian rock.

**BASE.** An alkaline element.

**BASE BULLION.** Copper or lead carrying much gold or silver.

**BASE METAL.** Any of the more common metals except gold, silver and platinum.

**BASIC.** Of an alkaline nature.

**BASIN.** A syncline; a trough in the earth's surface.

**BATTERY.** A set of gravity stamps, usually five in number.

**BEARING.** The bearing of a mineral outcrop is its strike.

**BEATING AWAY.** To cut down or stope a mineral body.

**BED.** A stratified rock formation. Used in some mineral districts for veins or lodes lying horizontally, or approximately so.

**BEDDED VEIN.** A vein parallel with the stratification of country rock.

**BED ROCK.** The solid rock, as differentiated from loose or surface rock. The ledge.

**BELLS.** Signals for lowering and hoisting the bucket, skip or cage in a shaft usually are given by bells, the number of strokes indicating the nature of the load, the place for stopping, etc.

**BIT.** A steel drill; a short hollow cylinder of soft steel, used in diamond drilling. The diamonds are set around the inner and outer edges of the bottom of the bit, boring the most refractory rocks when the bit is rotated.

**BLACK COPPER.** Copper partly smelted, but containing impurities requiring refining.

**BLACK JACK.** Sphalerite, zinc blende of dark color.

**BLANCHED COPPER.** Copper containing a large amount of arsenic, practically forming an alloy.

**BLAST.** (N.) Air forced through tuyeres into a blast furnace or bessemer converter. (V.) To explode gunpowder or dynamite.

**BLASTED.** A blasted miner is one who has been injured by the explosion of a charge of dynamite or gunpowder.

**BLAST FURNACE.** An oven in which ore is smelted, with the aid of air pumped in under pressure.

**BLASTING.** The breaking of rock by means of high explosives, inserted in holes bored in the rock for the purpose.

**BLENDE.** Zinc blende; sphalerite.

**BLIND DRIFT.** A drift connected with other workings of the mine at one end only. A cul de sac.

**BLIND LODE.** A lode not outcropping at surface.

**BLISTER COPPER.** Copper of 96 to 99 per cent. tenor.

**BLOCKING OUT.** Opening the ore in a mine so that it can be won merely by stoping. Properly speaking, ore is not blocked out for stoping until opened on three sides.

**BLOSSOM.** The outcrop of an ore body altered by weathering.

**BLOW.** A blossom.

**BLOWER.** A fan used to force air into a mine; a blowing engine.

**BLOWING ENGINE.** A rotary engine for forcing air into blast furnaces under an average pressure of about one pound avoirdupois per square inch.

**BLOWING IN.** A smelting furnace is blown in when charged and the process of reduction by fire is begun.

**BLOWING OUT.** A smelting furnace is blown out when the metal and slag are tapped out, and the fires are allowed to die out.

**BLOWOUT.** An outcrop larger than the ore-body beneath.

**BLUESTONE.** Copper sulphate.

**BOILING SHAFT.** A sand-shaft in which quicksand and water boil up from the bottom.

**BONANZA.** A body of exceptionally rich ore. Commonly applied to silver mines.

**BONNET.** The cover or roof of a cage; also a steel casting connecting the piston-rod with the upper end of a stamp-shaft.

**BORE HOLE.** A drill hole bored for test purposes.

**BORT.** A form of crystallized carbon between the diamond and the black diamond.

**BORTZ.** Bort.

**BOTRYOIDAL.** Shaped like a bunch of grapes.

**BOTTOM.** A mass of impure copper formed below the matte, in matting copper ores.

**BOULDERS.** Detached masses of rock, rounded by attrition, usually found at or near surface, in alluvial deposits lying above rocks in place.

**BOX CAÑON.** A cañon closed at one end.

**BRANCH.** A vein branching off from the main ore body.

**BRATTICE.** A screen for the regulation of air currents in a mine.

**BREAST.** The face or working end of a drift, stope or adit.

**BRECCIA.** A conglomerate rock, in which angular fragments of rock are cemented together.

**BRECCIATED.** A rock stratum made up of sharply broken fragments, partially or wholly cemented together.

**BROKEN.** A vein is broken when lacking clearly defined walls or characteristics of regularity.

**BROKEN GROUND.** Rock strata where the walls are poorly defined and the general formation unsettled.

**BROOD.** Cornish for waste ore, such as mundic or zinc blende, when found in connection with copper ores.

**BUCKET.** A kibble. An iron or steel bucket used for hoisting in a mine. In a vertical shaft a bucket swings free in ascending and descending, but in an incline shaft the bucket runs on a skidway of plank timbers, or ride a trolley cable.

**BUDGLE.** A conical table on which ore is dressed. Machine and name both growing obsolete.

**BULKHEAD.** A wooden or masonry partition walling off a mine opening, or protecting mine sets against soft or creeping ground.

**BULLION.** Refined gold or silver. Sometimes erroneously applied to copper.

**BULLION BARS.** Unrefined gold and silver secured by melting the precious metals precipitated to the bottom of the tank in the electrolytic refining of argentiferous and auriferous copper anodes.

**BUNCH.** A pocket of exceptionally rich ore.

**BUNCHY.** An ore body given to considerable variations in width or values, or both.

**BURDEN.** Overburden.

**BURROW.** A rock burrow.

**CABLE.** The steel wire rope used in shafts for hoisting buckets, skips or cages.

**CAGE.** The elevator used in vertical shafts for hoisting mineral and for lowering men, timber, etc.

**CAKES.** Copper cast in the form of cakes.

**CALCAREOUS.** Of a limey nature.

**CALCINE.** To drive off sulphur or other volatile constituents of an ore by heating.

**CALCINER.** A calcining furnace.

**CALCINING FURNACE.** A furnace for roasting ore to drive off sulphur, previous to smelting.

**CALCITE.** Crystals of calcium carbonate.

**CAM.** A curved tooth, fixed on a shaft, for lifting the pistons of gravity stamps.

**CAMP.** A mining town.

**CÁNON.** (pronounced canyon). A deep gorge with precipitous walls.

**CANYON.** A cañon.

**CAP.** The top piece of a framed set of mine timbers; copper caps containing fulminate of mercury, used to explode dynamite in blasting rock.

**CAPPING.** The rock or other ground overlying the mineral body of a mine.

**CAP-ROCK.** Capping.

**CAPTAIN.** In most mining fields where Cornishmen are found, the man in charge of mining work is termed a captain. The mining captain is the executive officer underground.

**CARBONACEOUS.** Of the nature of coal; containing carbon.

**CARBONATE.** An ore of any metal or metals with which carbon and oxygen are chemically united.

**CARBONATES.** A term commonly applied, in the western part of the United States, to ores containing a considerable proportion of lead carbonates, usually argentiferous.

**CARBONIFEROUS.** Rocks of the geological ages usually associated with coal measures.

**CARGA.** A Mexican weight equalling 300 pounds avoirdupois.

**CARTRIDGE.** Dynamite put up in cylindrical cases of oiled paper to fit the holes bored by drills.

**CASING.** The wooden lining of a shaft; an iron pipe put down outside of a diamond drill hole when passing through soft or broken ground, to prevent the hole becoming clogged by matter intruding from outside.

**CASTING COPPER.** Impure copper better suited for casting into various forms than for drawing into wires or rolling into sheets.

**CAVE.** A natural opening or "vug" in a rock formation; the partial or complete falling in of a mine.

**CAVING SYSTEM.** A plan of mining, by which the worked out upper levels and surface are allowed to subside gradually, as the mine workings are deepened.

**CEMENT COPPER.** Regulus. The impure metal obtained from ores by leaching processes.

**CERRO.** Spanish for a hill showing rock outcrops.

**CHAMBER.** A large stope.

**CHAPEAU DE FER.** French for gossan or iron hat.

**CHARGE.** The amount of ore, flux and fuel required for one filling of a furnace.

**CHIMNEY.** An ore body of pipe shape in an approximately vertical position.

**CHERT.** A coarse flint containing calcium.

**CHILEAN MILL.** An arastræ.

**CHILE BARS.** Bars of Chilean blister copper, weighing about 200 pounds each.

**CHLORIDE.** The ore of any metal united chemically with chlorine.

**CHLORIDES.** Commonly applied, in the western part of the United States, to chloride ores of silver.

**CHURN DRILL.** A drill having a churning motion, used for boring test-holes, or wells.

**CHUTE.** A section of a lode or vein differing by being much richer or leaner than the average; also a trough for dropping ore or waste to lower openings in a mine.

**CIRCA.** Approximately.

**CLACK.** A pump valve.

**CLAIM.** Public land staked off and claimed by a prospector or miner. Size of claims varies in different countries.

**CLAY COURSE.** A seam of clay between vein and wall.

**CLAY PARTING.** A clay course.

**CLAY SLATE.** An argillaceous slate.

**CLEAN-UP.** The cleaning up of accumulated ore or metal in a mill or smelter.

**CLEAVAGE.** The parting of rock along more or less regular lines of least resistance.

**CLEAVAGE PLANES.** The lines along which rock cleavage occurs.

**COARSE JIGS.** The jigs used to handle the heavier grades of ore or metal.

**COARSE METAL.** Matte resulting from the first smelting.

**COBBING.** Breaking masses of ore into lumps by hand hammers.

**COLLAR.** The top of a shaft; the surface timbering of a shaft.

**COMPANY ACCOUNT.** Miners and other underground employees working on fixed wages per shift or month usually are called "company 'count men'" to distinguish them from miners working on contract.

**COMPARTMENT.** Mining shafts usually are divided into two or more compartments, separated by framed timbers and planking.

**CONCENTRATES.** The concentrated ore or metal, after partial or complete elimination of gangue rock.

**CONCENTRATION.** The process of separating native metal or ore from its gangue of worthless rock.

**CONCENTRATING TABLE.** A concentrator.

**CONCENTRATOR.** A plant where ores are concentrated; a jig, or machine for separating ore or metal from gangue-rock, the process usually employing a rocking or oscillating motion, aided by jets of water, whereby

the worthless gangue is driven off and the heavier mineral retained by specific gravity.

**CONCHOIDAL.** A fracture resembling in form the shell of a bivalve mollusk.

**CONCRETIONS.** Nodules formed by aggregation of mineral matter.

**CONDUCTIVITY.** Electrical conductivity is measured by the resistance offered to the passage of an electrical current.

**CONGLOMERATE.** A rock stratum formed of pebbles and rounded boulders cemented together. Sedimentary conglomerates are ancient sea-beds; volcanic conglomerates are called tuffs, and consist of scoriaceous matter ejected from volcanic vents and cemented to rock, under pressure.

**CONSTRUCTION ACCOUNT.** Many of the Lake Superior copper mines summarize their finances so that the cost of operation is divided into two classes, one being for general working expenses and the other for construction account. The latter includes new buildings and machinery on surface, and frequently new mine openings. In effect the construction account of a mine is like the stock account of a merchandise firm, and sometimes, like charity, "covers a multitude of sins."

**CONTACT.** The junction of two dissimilar bodies of rock.

**CONTACT VEIN.** A mineral body found between two unlike rock strata.

**CONTORTION.** The distortion of a rock body.

**CONTOUR.** The outline or configuration of any given tract.

**CONTRACT.** Many miners work on contract, agreeing to sink, drift or stope at a fixed price per running foot, or per fathom. These are known as contract miners, and are usually the more skilled workmen.

**COPPER ORE.** See detailed descriptions of copper ores and copper-bearing minerals in chapter on chemistry and mineralogy.

**CORE.** A drill core.

**CORNISH PUMP.** A form of mine pump actuated by long rods reaching from surface down the shafts.

**CORNISH STAMP.** A gravity stamp, in which the heads are raised by cams and dropped by gravity.

**COST-BOOK SYSTEM.** A plan of mine operation, used in Cornwall only, by which shares are subject to unlimited assessment. A sort of unlimited partnership.

**COSTEANING.** Proving an ore body by trenching across its outcrop at approximately right angles.

**COUNTERBALANCE.** Hoisting plants usually are worked in counterbalance for deep shafts. The weight of the descending cage or skip is used to partially offset the weight of the ascending cage or skip.

**COUNTER VEIN.** A cross vein, running at approximately right angles to the main ore body.

**COUNTRY ROCK.** The predominant rock form of a given district.

**COURSE.** The direction or strike of a mineral body; a stretch of mineralized matter in an ore vein.

**CRAB.** A hand winch.

**CREEPING.** The movement caused in mines by the pressure of superincumbent and adjacent rock masses.

**CRETACEOUS.** Of a chalky nature; limestone of a certain geographical horizon.

**CRIBBING.** The lining of a shaft; frameworks of timber to support an underground roof.

**CROPPINGS.** Outcrops.

**CROSS COURSE.** An intersecting vein.

**CROSSCUT.** An opening similar to a drift, except that the crosscut is sent at approximately right angles to the formation, while a drift follows the trend of the lode or vein.

**CROSSCUT TUNNEL.** A tunnel driven at approximately right angles to the ore body.

**CROSS VEIN.** An intersecting vein.

**CRUCIBLE.** A vessel of refractory material, used to contain ores and metals for assaying or smelting.

**CRUSHER.** A rock crusher.

**CRYSTALLINE.** Showing crystals.

**CRYSTALLIZED.** Having plainly defined crystals.

**CRYSTALS.** Geometrical forms, with plane faces, of infinite variety, assumed by the majority of minerals.

**CUPOLA.** A furnace in a smelter.

**CUPRIFEROUS.** Copper-bearing.

**CUT.** To intersect an ore body; the portion of a working face of mineral removed at one operation.

**CUTTING DOWN.** To enlarge a shaft.

**CWT.** A hundredweight, or 112 pounds avoirdupois.

**DAM.** A masonry barrier, built underground, to hold back water.

**DATUM LEVEL.** The level (usually sea-level or mean level of nearest considerable body of water) from which altitudes are measured in surveys.

**DEAD ROASTING.** Sulphide ores are dead roasted when all the sulphur possible to drive off by roasting has been eliminated.

**DEAD WORK.** The opening of new shafts, drifts and winzes, preliminary to the stoping of the mineral bodies.

**DEBRIS.** Broken down rock material.

**DECOMPOSED.** Rock or ore broken down by elemental action.

**DECREPITATE.** To break into fragments with violence, under the blowpipe or great heat.

**DENDRITE.** A mineral crystallized in form similar to the branch of a tree.

**DENOUNCEMENT.** In Mexico, the formal filing of a claim to mineral land.

**DENUDATION.** The uncovering of rock strata by the weathering of wind or water, or both.

**DEPOSIT.** A term, loosely used, meaning a mineral body.

**DERRICK.** A mast, freely rotatable, carrying a boom or yard-arm, at the end of which is a sheave-wheel. In mining is used mainly for open pit work.

**DESSICATION.** The drying out of water from any given substance.

**DETITUS.** Debris. Broken down rock.

**DEVELOPMENT WORK.** Dead work.

**DIAMOND DRILL.** A machine for boring holes in rocks, taking its name from the black diamonds or bort used to form cutting surfaces on the inner and outer edges of the hollow cylindrical bit.

**DIE.** The iron block in the mortar, onto which the ore is fed for crushing under the stamp.

**DIORITE.** Greenstone; a crystalline spathic hornblende.

**DIP.** The angle at which a lode or vein descends from the earth's surface.

**DIP COMPASS.** A compass having the needle fixed to swing in a vertical plane.

**DIRT.** Frequently used to designate ore broken underground.

**DISINTEGRATION.** The breaking down of rock forms, usually through weathering.

**DISSEMINATED ORE.** Ore found scattered through a gangue of valueless rock.

**DISTURBED.** An ore body is disturbed when lacking defined walls and settled character.

**DOLLY.** A crude prospecting stamp set on a spring pole.

**DOLOMITE.** Magnesian limestone; carbonate of calcium and magnesium.

**DONKEY HOIST.** A small auxiliary hoisting engine, usually operated underground and actuated by compressed air, or used for preliminary work at new shafts or exploring pits.

**DOWNCAST.** A shaft having a downward air current.

**DRAFTAGE.** An arbitrary allowance claimed by some British smelters, to cover loss of weight in transport.

**DRESS.** To separate ore from gangue rock by hand or machinery.

**DRESSING FLOOR.** A floor or dirt surface where ore is dressed by cobbing and other hand-work.

**DRIFT.** A horizontal opening in a mine, following the direction of the lode or vein; loose alluvial matter, such as sand, pebbles and boulders.

**DRIFT COPPER.** Native copper found in alluvium, far from its original rock matrix, whence carried by glaciers.

**DRIFTING.** Opening drifts. Driving.

**DRILL.** A steel bar for boring in rock, having a single sharp cutting face, or two cutting faces crossed at right angles.

**DRILL-CORE.** Solid, cylindrical cores of rock, are cut by the operation of the diamond drill. These are raised to surface and form a valuable permanent record of the strata through which the drill has passed.

**DRILL HOLE.** A hole bored by a drill.

**DRIVE.** A drift.

**DRIVING.** Drifting.

**DROP SHAFT.** A shaft, usually of heavy framing sunk by weight, through sand or similar material.

**DRUM.** The cylinder of a hoisting engine, around which the cable winds.

**DRUSE.** A vug.

**DRY ORE.** Argentiferous lead ores containing insufficient lead for fluxing in a smelter.

**DUCTILE.** That which is capable of being extended in length by tension.

**DUCTILITY.** The capacity of a metal to elongate, when under pull from the ends, without cracking or breaking.

**DUMP.** A place for depositing rock taken from a mine. An ore-dump contains good mineral, and a waste-dump the worthless rock hoisted from underground.

**DYKE.** A fissure in the rock formation, usually transverse, filled with igneous matter. When mineralized, dykes are called cross or counter veins.

**DYNAMITE.** Nitro-glycerine absorbed by wood pulp, infusorial earth, or some similar article, to render it safer in use. Power varies greatly according to percentage of nitro-glycerine contained.

**EISENER HUT.** German for iron hat, or goðan.

**ELECTRIC DRILL.** A power drill operated by an electric current.

**ELECTROLYTE.** The solution in which electrolytic separation of metals is carried on.

**ELECTROLYSIS.** The separation and redeposition of metals by electrolytic action.

**ELECTROLYTIC.** Term applied to copper means copper gained from impure metal by electrical decomposition and redeposition, whereby the copper is taken from an impure bar and redeposited in a pure form at the opposite pole of the battery, while other metals are precipitated to the bottom of the solution in the tank in which the work is done.

**ELVAN.** Cornish name for the dyke rocks of Cornwall, usually green-stone or porphyrite.

**EROSION.** The wearing away of surface masses of rock and soil by the elements, or by glacial action.

**ERUPTIVE.** Rock matter deposited in molten form by volcanic action.

**ESCARPMENT.** A rock wall; nearly or quite vertical.

**EXFOLIATION.** The separation of thin leaf-like layers from the main body.

**EXPLORERS.** Fulminating caps, for setting off high explosives.

**EXPLOITATION.** Development work and production.

**EXPLORATION.** Prospecting work.

**FACE.** The breast of a drift. A face of ore is the ore shown at the working end of a drift or stope.

**FAHLBAND.** A banded crystalline rock, carrying finely disseminated ores.

**FALL OF GROUND.** Rock falling from the roof into a mine opening.

**FALSE SET.** A temporary set of timber.

**FAN.** A machine for forcing air into a mine.

**FATHOM.** Six feet. In stoping, a fathom is a cube of six feet.

**FAULT.** Dislocation of a rock stratum by which continuity is lost.

**Fee.** The ownership of land in fee-simple.

**Fee-owner.** The owner of land in fee-simple.

**FEEDER.** A branch ore vein.

**FERRUGINOUS.** Carrying iron.

**FILLING.** Occupying old stopes or chambers with waste rock; allowing a mine to fill with water.

**FINES.** The finer ore or metals saved in concentrating processes.

**FINISHER JIGS.** The jigs used to save the fine ores or metals in a concentrator or stampmill.

**FIRE.** The miner's warning cry when a blast is to be set off, is "fire."

**FISSILE.** That which easily may be split.

**FISSURE.** Rock matter deposited at a later period, in a crack in the original rock.

**FISSURE VEIN.** A fissure, containing ore, usually disseminated in a worthless gangue.

**FLAKE COPPER.** Very fine scales of native copper.

**FLEET-GEAR.** A compensating device for taking up slack and paying out rope where a hoisting system is worked in counterbalance. Several turns of the cable are taken around each drum of the hoist, and the bight of the cable is carried to the rear and around a large sheave-wheel lying horizontally and traveling on trunnions, allowing the taking up or paying out of the cable.

**FLOAT.** A particle or boulder of ore or rock, dissociated from its matrix.

**FLOAT COPPER.** Drift copper.

**FLOAT ORE.** A detached ore mass found at a distance from its matrix.

**FLOOR.** The floor of a drift or other horizontal mine opening; the underlying rock stratum.

**FLOUR COPPER.** Very fine native copper that floats on water and is very difficult to save in milling.

**FLUCCAN.** A seam of clay, found in ore bodies, or more frequently, between the ore and walls of country rock.

**FLUKAN.** Fluccan.

**FLUME.** A launder or pipe line for carrying water.

**FLUX.** Any mineral used in the furnace to aid in fusing the gangue rock and worthless elements, which combine with the flux to form slag.

**FLUXING ORE.** An ore containing appreciable metallic values, but smelted mainly because containing fluxing agents required in the reduction of richer ores.

**FOLIATED.** Having a laminated structure.

**FOOT.** The foot-wall.

**FOOT-WALL.** The stratum of rock underlying an inclined mineral lode or vein.

**FORK.** To pump water from a mine; the branching of a vein.

**FORMATION.** A term used to imply the general geological conditions of a given district.

**FOSSICKING.** Extracting ore from old mines or waste-burrows.

**FOUNDERS-SHARES.** The few shares necessarily issued to individuals organizing a stock company. In case of companies owned outright by other companies, founders shares are issued to as many individuals as are required to incorporate and hold the offices required for corporate management, as the laws do not permit a corporation, which is an artificial person, to form another corporation, or to serve as a director of another corporation.

**FRACTURE.** A break.

**FREE.** A metal is free when virgin or native, and not combined chemically with any other element.

**FREE MILLING.** A metal or ore that is separated readily from its accompanying rock by mechanical means.

**FREEZE.** A furnace freezes when the heat falls sufficiently to permit the molten charges to solidify.

**FRIABLE.** That which may be pulverized easily.

**FROZEN.** A furnace is frozen when its molten charge solidifies.

**FURNACE.** An oven for the smelting of ore.

**PUSE.** A cotton cord with a gunpowder core, so made as to carry fire to an explosive placed for use.

**FUSIBLE.** That which may be melted.

**FUSION.** Melting. Alloying metals while liquid, through heat.

**GRABBRO.** A rock composed mainly of plagioclase feldspar.

**GAD.** A small wedge or chisel.

**GALENA.** Lead sulphide, frequently found associated with sulphide copper ores.

**GALLERY.** A drift.

**GALLOWS FRAME.** A framework over the mouth of a shaft, carrying a sheave-wheel, over which the hoisting rope passes to the engine.

**GANGUE.** The foreign rock matter in which ore or metal is disseminated, the gangue rock being mechanically and not chemically united with the ore or metal.

**GASH VEIN.** A shallow fissure vein, rapidly narrowing to extinction.

**GEODE.** A hollow nodule of rock.

**GEOLOGICAL HORIZON.** Geological age.

**GEOLOGY.** The science of the formation of the earth.

**GIANT POWDER.** Dynamite.

**GLACIATION.** The erosive effect produced by glaciers.

**GLANCE.** Any metallic sulphide showing a bright, shining surface. Copper glance is chalocite.

**GLORY HOLE.** A large open pit from which pay ore is at first extracted.

**G. M. B.** "Good Merchantable Brands"—an English grade of refined copper. Term becoming obsolete.

**GNEISS.** A banded, slaty granite.

**GOB.** Mud above a mine; refuse in worked-out openings.

**GOPHERING.** Prospecting work confined to digging shallow pits or starting adits. Term used from similarity of this work to the crooked little holes dug in the soil by gophers.

**GOSSAN.** Iron hat. A rock capping, usually quartzose, showing yellow to reddish brown iron stains, from disseminated limonite or hematite. Frequently is found overlying veins of copper ores.

**GRADE.** The percentage, or value, of ore bodies and partly refined metals; the percentage of rise in roads or mine openings driven on an approximately horizontal plane.

**GRANITE.** A dense, granular rock, composed of varying proportions of quartz, feldspar and mica.

**GRANULATED.** In the form of grains.

**GRASS ROOTS.** At surface.

**GRAVITY STAMP.** A stamp, usually set in batteries of five, in which the piston is raised by a cam, the stamp crushing the charge in the mortar by its weight, when allowed to fall.

**GREENSTONE.** Diorite, or gabbro.

**GRIZZLY.** A grating of heavy iron or steel bars, through which fall the smaller pieces of rock or ore.

**GROSS TON.** A long ton of 2,240 pounds avoirdupois.

**GROUND SILL.** The bed-piece of a set of mine timbers.

**GUIDES;** Perpendicular wooden stringers for guiding cages in vertical shafts.

**GUT.** To rob.

**HACIENDA DE BENEFICIO.** Spanish for milling plant.

**HACIENDA DE FUNDICION.** Spanish for smelter.

**HADE.** (American). Dip of a vein from the zenith. (English). Dip of a vein from the horizon.

**HALVAN.** Cornish for refuse copper ore.

**HANGING.** The hanging-wall; the stratum of rock overlying an inclined mineral lode or vein.

**HARDHEAD.** A lump of partly smelted ore, carrying high percentages of refractory elements, such as iron, antimony and arsenic.

**HAT.** The capping of a mineral body.

**HAULAGE PLANT.** A mechanical installation for the underground trammimg of rock, operated by ropes, compressed air or electricity.

**HEAD.** Water pressure.

**HEADGEAR.** A building, or framework, fitted with sheaves, over the mouth of a shaft.

**HEAP-ROASTING.** Burning the sulphur out of ores piled in heaps, with a small amount of wood or other fuel.

**HEAVER.** A fault. The rolling out of line of dip by a lode in making depth.

**HEAVING.** Rolling.

**HECTARE.** A metric measure of area equalling 2.471 acres.

**HECTAREA.** Spanish for hectare.

**HOIST.** An engine for raising ore from a mine, and for lowering men and material therewith.

**HOISTER.** A hoist.

**HOLE.** Any opening in the ground; a hole drilled for explosives.

**HOLING THROUGH.** A drift or other mine opening is holed through when a connection is made between two separate sections working toward each other.

**HORIZON.** The sky-line, commonly used in the sense of absolutely flat, as shown by a spirit level. Geologically, all rock strata of the same geological period.

**HORSE.** An intrusion of country rock into a mineral body; sometimes used as synonymous with dyke.

**HORSEPOWER.** One horsepower is rated as equivalent to raising 33,000 pounds avoirdupois, to a height of one foot in one minute.

**HORSE-WHIM.** A windlass operated by horse-power.

**HOT BLAST.** Heated air supplied to a blast furnace.

**HUEL.** Wheel.

**HUNGRY.** Nearly or quite barren of mineral value.

**HUNTINGTON MILL.** An improved Chilian mill.

**HYDRATED.** Containing water of crystallization.

**HYDRO-METALLURGY.** The reduction of ores by wet processes.

**HYDROUS.** Containing water of crystallization.

**IGNEOUS.** Of volcanic origin.

**IMPREGNATED.** Containing ore. Properly used in referring to country rock carrying mineral similar to that in the vein.

**INCH.** One-twelfth of a foot. See Miner's inch.

**INCLINATION.** The dip of a vein from the horizon, measured in degrees.

**INCLINE SHAFT.** A shaft sunk at any except a vertical angle with the horizon.

**INCRUSTATION.** A solidified coating, usually crystallized.

**INFILTRATION.** The deposition of a mineral matter from percolating waters.

**INGOT.** A mass of metal cast in a peculiarly formed mold; applied only to gold, silver or copper. Iron and lead are cast in pigs.

**IN PLACE.** Rock matter in the position where deposited by nature.

**IN SITU.** In place.

**INTAKE.** The opening for water to enter a pipe or flume.

**INTRUSIVE.** Igneous rock masses pushed up through other and older rock formations.

**IRIDESCENT.** Showing the colors of the rainbow.

**IRON HAT,** Gossan.

**JACK.** A miner's name for sphalerite. Is called black jack, ruby jack or rosin jack, according to color.

**JIG.** A machine for concentrating ore or mineral by means of oscillatory or vibratory motion, aided by jets of water, separation of the ore from its gangue being effected by utilizing the greater specific gravity of the former.

**JIGGER.** A crude jig.

**JIGGING.** Concentrating ore by the use of a jig.

**JUMP.** To take possession of mineral lands held or claimed by another party.

**JUMPER.** A churn drill; one who jumps a mineral claim.

**JUNCTION.** The uniting point; the point of contact between dissimilar rock forms.

**KEWEENAWAN.** Pertaining to or of the Keweenaw formation, in which the Lake Superior copper mines are opened.

**KIBBLE.** A bucket used for hoisting material in a shaft.

**KILLAS.** Clay, slate or shale.

**KILO.** A kilogram.

**KILOGRAM.** A metric weight of 2.2046 pounds.

**KILOMETER.** A measure of distance equalling 0.621376 miles. For rough computations may be figured as five-eighths of a mile.

**KIN.** A Japanese weight of 1.31 pounds avoirdupois.

**KINDLY.** The appearance of rock carrying or promising to carry good mineral values.

**LADDER ROAD.** A ladderway.

**LÄDDERWAY.** The series of ladders giving ingress and egress to a mine shaft; the compartment in which the ladders are.

**LAGGING.** Timber, usually of small diameter, placed over the cap-timbers of incline shafts and drifts, to prevent damage from falling rock.

**LAMINA.** A thin plate. Plural is laminae.

**LAMELLAR.** In thin sheets of laminae.

**LAMINATED.** Lamellar.

**LANDER.** The man at the mouth of the shaft, who receives signals from below, and attends to the unloading of rock sent up in buckets, skips or cages.

**LAUNDER.** A wooden flume or sluice, used to convey water, or tailings held in solution in water.

**LAVA.** Rock formed of flows from volcanoes.

**LEACH.** To dissolve minerals from ore by water, or acid, or both.

**LEACHING.** Lixiviation.

**LEAD.** A mineral body; the metal.

**LEADER.** A small vein running to a larger one.

**LEDGE.** The solid rock where encountered at or nearest surface.

**LEG.** An upright timber supporting the cap of a set of timber.

**LEG-PIECE.** A leg.

**LENSE.** An ore body of lenticular form.

**LENTICULAR.** Having the shape of a double convex lens.

**LEVEL.** A horizontal opening in a mine. Levels commonly are opened at stated intervals as depth is gained—usually at 100 feet in modern mining practice. The word "level" frequently is used interchangeably with the word drift, but is more comprehensive. Both drifts and crosscuts may be opened on a level, but a crosscut is not a level.

**LIGNEOUS.** Of a woody nature.

**LIMESTONE.** Calcium carbonate.

**LIXIVIATION.** The process of leaching out mineral values from ores.

**LOCATE.** To make formal claim to public mineral lands.

**LOCATION WORK.** Labor required by law to be done on mining claims when located.

**LODE.** Variously used in different mining fields. In Lake Superior refers to the mineralized stratified beds. Is used locally, in many fields, as synonymous with vein. Sometimes is used as meaning an aggregation of mineralized veins.

**LONG TON.** A gross ton of 2,240 pounds avoirdupois.

**LOW GRADE.** Carrying mineral values but sparingly.

**MAGMA.** An originally molten mass of rock coming to the earth's crust from depth.

**MAGMATIC.** Of the nature of or pertaining to magma.

**MAGMATIC SEGREGATION.** The process by which the different constituents of molten rock masses crystallize at varying temperatures,

with a tendency to separate themselves, so far as circumstances allow, from the other compounds.

**MALACATE.** A whim with vertical drum used for hoisting in Mexico. Sometimes is called a Zacatecas malacate.

**MALLEABLE.** That which may be made to change form, without fracture, under a hammer.

**MAN-CAR.** A skip-truck having tiers of circus seats, used for carrying miners to and from work in mines operating deep inclined shafts.

**MAN-ENGINE.** An appliance for raising and lowering miners in deep incline shafts. Consists essentially of two long beams, worked in counter-balance and having platforms at stated intervals.

**MASS.** A solid chunk of native metal.

**MASSIVE.** Rock without defined lines of cleavage; ore occurring without appreciable gangue, as contradistinguished from ore disseminated throughout a gangue.

**MATRICE.** The rock surrounding an imbedded object, such as a particle or mass of ore or native metal.

**MATRIX.** Matrice.

**MATTE.** Regulus: A product between sulphide copper ore and blister copper, varying greatly in the percentage of metal contained. Is obtained by eliminating more or less sulphur and other elements from sulphide copper ores.

**MATTING.** The process of converting sulphide ores into matte.

**MATTOCK.** A miner's pickaxe.

**MESÁ.** Spanish for a tableland or plateau.

**MESH.** The size of openings in a screen.

**METALLIFEROUS.** Carrying metal.

**METALLURGY.** The science and practice of reducing metals from ores and minerals.

**METAMORPHIC.** Rock that has been metamorphosed.

**METAMORPHOSIS.** The process by which changes in structure are effected in a rock form by heat or percolating water.

**METER.** A metre.

**METRE.** A linear measure of 39.37 inches.

**METRIC TON.** A weight of 2,000.6 pounds avoirdupois.

**MILLING.** Dressing ore in a mill; also running ore in a mine through a winze for loading into tram-cars or wheelbarrows on a lower level than the one where broken.

**MILL RUN.** A mill test.

**MILL TEST.** The determination of the metallic contents and recoverable values in any given ore by the milling of a sufficient quantity to afford average milling conditions.

**MINE.** An open pit, or underground opening or openings, from which mineral values are extracted.

**MINER.** In strict construction, the man that does the drilling and blasting in a mine. In a broader sense, all men working underground.

**MINERAL.** Ore or rock containing metal. In the Lake Superior district the term mineral has a special use, being employed to designate the native copper, with its adhering gangue of amygdaloid or conglomerate rock, as it comes from the mill, before going to the smelter.

**MINERAL BELT.** The mineralized territory in a given formation, or district.

**MINERAL DE COPRE.** Spanish for copper-matte.

**MINERALIZED.** Carrying metalliferous values.

**MINERALOGY.** The science of minerals.

**MINERAL RIGHT.** The ownership of the right to mine under the surface of land owned by another holder. Mineral rights sometimes are reserved in selling the surface of land in some districts.

**MINERS INCH.** The amount of water that will flow through an opening one inch square under a six-inch head, which is 2,274 cubic feet in 24 hours, or 94½ cubic feet per hour, equal to 656 wine gallons or 593 imperial gallons hourly.

**MINING ENGINEER.** Any man having sufficient ability to pass intelligently upon mineral values, and to open and operate a mine, whether such ability was gained in a school or by practical experience. Graduates of technical mining schools usually are given the degree of engineer of mines and sign the letters E. M. after their names. The letters M. E. stand for mechanical engineer, when given by a school, but are often used by men engaged in mining, who lack scholastic degrees, as an abbreviation for mining expert.

**MISSED HOLE.** A drill hole, charged with explosives which fails to be set off by the fulminating cap.

**MOIL.** A steel bar, like a drill, except that it is sharpened to a point instead of having a cutting face.

**MOLDS.** Copper cast in molds.

**MOMME.** A Japanese weight equal to 8.75 grams or 2.4113 pennyweights.

**MONOCLINE.** A specific portion of the earth's crust in which the strata have a practically uniform dip.

**MORAINES.** A mass of boulders and detrital material marking the limits of a former glacier.

**MORTAR.** An assayer's mortar in which ore or rock is crushed with a pestle; a mortar-box.

**MORTAR-BOX.** The iron box under the stamps, into which ore or rock is fed for crushing.

**MOUTH.** The opening, at surface, of an adit, tunnel, or shaft.

**MUCKER.** A grammer.

**MULLOCK.** Australian for waste-rock broken underground.

**MUNDIC.** Pyrite.

**NATIVE.** A virgin metal—not an ore.

**NICKELIFEROUS.** Carrying nickel.

**MODULE.** A small mineral mass of approximately spherical form.

**NON-CONFORMABLE.** Rock strata not associated originally in the position now occupied.

**NUGGET.** A lump of native metal. Term usually applied to gold.

**OPEN-CAST.** A mine worked as a quarry, without underground openings.

**OPEN CUT.** Open cast.

**ORE.** A chemical union of one or more metallic elements with other elements, usually non-metallic, of which oxygen, carbon and sulphur are the most frequent. For the various ores of copper, see chapter on chemistry and mineralogy.

**ORE CAR.** A mine car for carrying ore or waste rock.

**ORE CHUTE.** A specific portion of an ore vein carrying increased values. Usually has a vertical or diagonal dip on the plane of the dip of the ore body.

**ORE DUMP.** A dump for ore.

**ORE SHOOT.** An ore chute.

**ORTHOCLOSE.** Silicate of potassium and aluminum. An acid feldspar.

**OUTCROP.** The ledge of a lode or vein that is exposed on the surface of the earth.

**OUTLIER.** An isolated rock or group of rocks lying at a distance from the main body, and separated therefrom, on the surface of the earth, by a different rock formation.

**OUTPUT.** Production.

**OVERBURDEN.** Superincumbent material, usually drift or alluvium.

**OVERHAND STOPPING.** Removing ore in ascending steps.

**OXIDATION.** Process of conversion of other minerals into oxides by weathering, or by the chemical effects of underground waters.

**OXIDE.** An ore of any metal or metals chemically united with oxygen.

**OXIDIZE.** To unite with oxygen. Many minerals and most metals oxidize with greater or less rapidity when exposed to air or water.

**PARE.** Cornish for a gang or shift of miners.

**PARTING.** The separation of two or more metals mechanically admixed by electrolysis, cupellation, use of acids or other chemical or metallurgical processes; a fluecan.

**PASS.** A winze.

**PATENT.** Direct title, from the government, to mineral lands.

**PATIO.** A walled yard with paved floor where finely crushed argentiferous ore is amalgamated.

**PAYSTREAK.** A portion of a vein or mineralized bed carrying workable values, occurring on either wall, or, occasionally, in the center of the mineral body.

**PENTHOUSE.** A shed-roof erected in the bottom of a shaft, when sinking, to protect miners from accidental fall of rock, timber or tools from above.

**PENTICE.** An erroneous spelling of penthouse.

**PEROXIDE.** The oxide of any metal containing the greatest proportion of oxygen.

**PERPENDICULAR SHAFT.** A shaft sunk vertically.

**PERTENENCIA.** One mineral claim in Mexico; area, one hectare, or 2.471 acres.

**PETKING.** Pinching.

**PETER OUT.** To pinch out.

**PETROLOGY.** The science of rocks.

**PHOSPHATE.** An ore of any metal or metals with which phosphorous and oxygen are chemically united.

**PICK.** A pick axe.

**PICUL.** A Chinese weight of 133 1-3 pounds.

**PILLAR.** A section of rock or ore left in place to support shafts or roofs.

**PINCHING.** The narrowing of a vein.

**PINCHING OUT.** The narrowing of a vein to extinction.

**PIPE VEIN.** An ore body of chimney form, deposited in the vent of an extinct volcano.

**PIT.** An opening in the earth's surface, usually shallow.

**PITCH.** Synonymous with "dip," but occasionally used to designate the angle of decline from the horizon, measured along the strike of the ore or vein.

**PLAIN.** A flat, champaign country.

**PLANE.** A level surface bounded by straight lines.

**PLANT.** The machinery equipment of a mine or reduction works. In general use the term includes buildings housing machinery.

**PLAT.** The enlargement of a shaft at a level, to give extra space for loading and unloading the cage, skip or bucket.

**PLATEAU.** An elevated plain.

**PLUMBEIFEROUS.** Carrying lead.

**PLUTONIAN.** Plutonic.

**PLUTONIC.** Rock strata of volcanic origin.

**POCKET.** Underground, an ore deposit, usually of small extent. On surface, a bin at shaft-house or mill, in which ore, flux or fuel is stored.

**POCKETY.** Carrying only occasional bunches of good ore.

**POLING.** The process of adding carbon to a charge of molten copper in a reverberatory furnace by stirring with long poles.

**POLL-PICK.** A tool having a pick on one end, and a poll, or hammer head, on the other.

**POOD.** A Russian weight of 36.112 pounds avoirdupois.

**POPPET-HEAD.** Framework over a shaft for a sheave-wheel.

**PORPHYRITIC.** Of the nature of porphyry.

**PORPHYRY.** Like charity, covers a multitude of sins, and quite commonly is used to describe any crystalline rock. Properly, is any crystalline rock shewing larger crystals upon a ground-mass of smaller crystals. Porphyry may be granite, quartz or one of several other rocks.

**POUND.** The troy pound is used for gold, silver and platinum only, the avoirdupois pound being used in weighing the other metals and other commodities in English-speaking countries.

**POWER-DRILL.** A machine for drilling holes in rock, actuated by compressed air, steam or electricity.

**PRILL.** Cornish for selected ore secured by culling.

**PRIMARY.** The first; the oldest rock formations.

**PROP.** A heavy timber placed with its foot against the floor of a mine opening, and its top against the roof, to support the rock above.

**PROSPECT.** To seek for mineral; a new mining property that has not yet earned the right to be called a mine.

**PROSPECTOR.** A searcher for mineral.

**PROTOXIDE.** The oxide of any metal containing the least proportion of oxygen.

**PUDDINGSTONE.** A coarse conglomerate, showing rounded pebbles.

**PULLEY-STAND.** A temporary tripod or other light frame construction, holding a pulley, over which passes the rope used in hoisting.

**PULP.** Pulverized ore or concentrates.

**PULVERIZE.** To crush to powder.

**PULVERULENT.** That which easily may be reduced to powder.

**PYRRHOTITE.** Magnetic iron sulphide.

**PYRITE.** Iron disulphide.

**PYRITES.** Sulphide ores; more properly iron disulphide.

**PYROGNOSTICS.** Characteristics of a mineral under the blowpipe.

**QUARRY.** An open pit, of varying size, sometimes several acres, from which stone or ore is mined.

**QUARTER-SECTION.** In the United States a quarter of a square mile, 160 acres, laid out in a parallelogram, each side of which is one-half mile in length.

**QUARTZ.** Silica, Dioxide of silicon, frequently containing traces of iron and other minerals, and often the gangue of gold and other metals.

**QUARTZ CLAIM.** In the United States mining claims are divided into two classes, the first being placer claims, carrying mineral, usually gold, in alluvium, and quartz claims, this name being applied to any prospect carrying metalliferous bodies in place.

**QUARTZITE.** An oxide of silicon, with other minerals in varying quantities, partly granular and partly crystalline in structure.

**QUARTZOSE.** Rock having much quartz in its composition.

**QUICKSAND.** Fine sand, which flows easily when wet.

**RAGGING.** Cornish for rough cobbing; broken lumps of ore of medium size.

**RAISE.** A shaft or winze that is being opened from below. Sometimes called upraise or uprise.

**RAKE VEIN.** A vein cutting through stratified rocks.

**RANGE.** A mineral belt, also in many American states a surveyor's term for describing and locating lands. The state is surveyed in sections (with their subdivisions), towns and ranges. A town (or township) comprises 36 sections and is a square of six miles. Each township receives a double number, one for the town and one for the range. The towns are numbered consecutively from south to north, and the ranges are similarly numbered from east to west.

**RAW ORE.** Ore before treatment.

**REAMER.** A tool like a bit, used to enlarge a hole previously drilled.

**REDUCTION.** The separation of metals from their ores.

**REEF.** A stratified mineral-bearing rock formation.

**REFINING.** The elimination of impurities from crude metals, or separation of metallic alloys obtained in the reduction of ores.

**REFRACTORY.** A refractory ore is one that cannot be smelted by ordinary metallurgical processes. A refractory stamp-rock is one that is pulverized with unusual difficulty.

**REGULUS.** Copper matte.

**RENIFORM.** Kidney-shaped.

**RESERVES.** Bodies of mineral-bearing ground opened in a mine ahead of immediate requirements.

**REVERBERATORY FURNACE.** A smelting furnace in which the flame from the grate below is reflected back by the roof, on the charge of ore above.

**RISE.** A raise.

**ROASTING.** Driving off sulphur and other volatile elements from ore, by heat. When done in a furnace, under great heat, the process is called calcining.

**ROASTING FURNACE.** An oven for the expulsion from ore of sulphur, arsenic and other volatile elements.

**ROCK.** To remove pillars and other supports from a mine for their mineral values, regardless of the future of the property.

**ROCK.** Stone.

**ROCK BREAKER.** A rock crusher.

**ROCK BURROW.** A pile of refuse rock from a mine.

**ROCK CAR.** An ore cart.

**ROCK CRUSHER.** A machine for reducing rock or ore to smaller sizes. Crushers are of two types, the jaw-crusher and the centrifugal. The jaw crusher works as a man cracks nuts with his teeth; the centrifugal operates on the plan of a coffee-grinder.

**ROCK DRILL.** A power drill.

**ROCK DUMP.** A rock burrow.

**ROCK FILLING.** Waste rock, placed in worked-out stopes to support the roof.

**ROCK-HOUSE.** A building where copper-bearing rock is received and put through crushers before shipment to the mill. Is really a preliminary mill, and usually is built in connection with the shafthouse.

**ROLL.** To make depth at irregular angles.

**ROLLS.** Heavy steel rollers, worked in pairs, like a clothes wringer, for crushing rock and ore.

**ROOF.** The rock above a mine opening.

**ROOM.** Similar to a stope; term usually applied to mines working mineral bodies lying nearly horizontally.

**ROYALTY.** A percentage paid to the fee-owner from mineral values obtained by the lessee of a mine.

**RULE-OF-THUMB.** The guesswork and rough measurement plan of mining, in contradistinction to systematic development from data obtained by careful surveys.

**RUN.** A bar or course of ground better or worse than the average value of the mine.

**RUNNING GROUND.** Superincumbent material that falls into the mine openings.

**SADDLE.** An anticline.

**SAFETY CAGE.** A cage furnished with automatic appliances to stop its descent in case the cable breaks.

**SALT.** A chemical union of an acid with a base.

**SALTING.** Placing foreign ore in a mine to deceive intending purchasers or other interested parties.

**SAMPLE.** A specimen of ore from a mineral deposit. A selected sample usually is misleading because containing far above average values, and fine samples frequently come from the poorest mines. An average sample is what its name purports—if it be an average sample.

**SAMPLING.** Securing sufficient ore from mine openings to allow a test to determine average values. Honest sampling requires great skill and prolonged practical experience.

**SAND PUMP.** A pump, usually centrifugal, designed to lift water carrying large quantities of coarse tailings or sand in solution.

**SANDS.** Tailings from the stampmills of Lake Superior copper mines.

**SAND SHAFT.** A shaft sunk through quicksand.

**SAND WHEEL.** A large wheel, having buckets on its inner perimeter, for elevating water carrying stamp-sand.

**SCALE COPPER.** Copper in very thin flakes.

**SCHIST.** A metamorphic laminated rock of foliated structure, made up of superimposed flattened particles.

**SCHISTOSE.** Of the nature of schist.

**SCORIA.** Slags from copper smelters; volcanic ash.

**SCORIACEOUS.** Of the nature of scoria.

**SCRAM.** A mine that is being gone through carefully, when apparently worked out, for mineral previously overlooked.

**SCRAMMING.** Searching a mine for mineral previously overlooked.

**SCREEN.** A grating of perforated metal or woven wire.

**SEAM.** A thin layer of rock or ore.

**SECONDARY ENRICHMENT.** Nature's process of evolving high-grade from low-grade ores. See chapter on geology.

**SECTILE.** That which may be cut easily.

**SECTION.** A field or district; also, in the United States of America, a square mile of land.

**SECTION POST.** A boundary mark set at section corners, by surveyors.

**SEDIMENTARY.** Rocks formed by deposition from water, as distinguished from rocks formed by igneous action.

**SELVEGE.** Fluecan.

**SET.** A framed form of timber, used for supporting ground in a mine.

**SHAFT.** A downward mine opening having its upper end at surface.

**SHAFT-HOUSE.** A building at the mouth of a shaft, where ore or rock is received from the mine.

**SHALE.** An argillaceous slate, of fissile structure.

**SHEAVE.** A grooved wheel, notched to carry rope; an open pulley.

**SHIFT.** A miner's turn, of eight to ten hours' work; a force of men employed on one turn.

**SHIFT-BOSS.** A mine boss, or under-captain, in charge of one gang or party of miners.

**SHOE.** A stamp shoe.

**SHOOT.** A chute.

**SHORT TON.** A weight of 2,000 pounds avoirdupois.

**SHOT.** A blast of some explosive.

**SHOT-COPPER.** Small rounded nodules of native copper, somewhat resembling small shot in size and shape.

**SHUTTE.** A chute.

**SILICA.** Dioxide of silicon.

**SILICATE.** An ore of any metal or metals chemically united with silica.

**SILICIOUS.** Containing much silica or quartz.

**SILL.** The floor-piece of a set of mine timbers.

**SINKING.** The process of deepening a shaft or winze.

**SINKING-PUMP.** A movable pump, usually vertical, secured to a platform, and lowered as required, as the shafts are deepened.

**SKIP.** An iron box, open at the top, running on four wheels, and hauled

by a cable, used in incline shafts for hoisting ore and rock, and for lowering timber.

**SKIP-ROAD.** A track of T-rails, -spiked to wooden sleepers, on which a skip runs.

**SKIP-WAY.** A skip-road.

**SLAG.** The vitreous refuse matter from a smelting furnace.

**SLICE.** To remove mine pillars.

**SLICKENSHIDE.** A polished rock surface, showing striations produced by movement of adjoining rocks under great pressure.

**SLIDE.** A dissociation of strata caused by the subsidence of the overlying rock formation.

**SLIME.** Exceedingly small particles of rock and mineral held in solution in water.

**SLIME TABLE.** A circular revolving table, whereon slimes are worked, and the minute particles of mineral saved.

**SLIP.** A fault where a superincumbent stratum has slid downward.

**SLUDGE.** Mixed rock and water, brought to surface where a diamond drill cuts through very soft rock: tailings from a concentrator or mill.

**SLUICE.** A wooden flume or launder.

**SMELTER.** Works where ores or crude metals are freed from gangue or chemically united elements by heat.

**SMELTING.** The reduction of ores and crude metals, in furnaces, by heat, fuel and fluxing material being added to the matter to be melted.

**SMELTS.** A smelter.

**SOAPSTONE.** Steatite.

**SOFT GROUND.** Underground openings that do not stand well and require heavy timbering.

**SOLLAR.** A platform in a shaft.

**SPATHIC.** Having a form approximating that of feldspar.

**SPECIMEN.** A sample of mineral selected because typical, unusual or exceptionally rich.

**SPEISS.** Impure metallic arsenides produced in copper smelting; ore particles finely disseminated throughout a rock, usually occurring as impregnations.

**SPHALERITE.** Zinc blende; zinc sulphide, often found associated with galena and chalcopyrite.

**SPILL.** Lagging driven ahead of the regular timbering in treacherous ground.

**SPITZKASTEN.** Pyramidal boxes wherein ores are concentrated and sized by a jet of water fed from below.

**SPoon.** A long-handled spoon, used to scrape out drill holes.

**SQUARE SETS.** A form of mine timbering having forms with mortised and tenoned sill, top piece and uprights of equal length, joined at right angles.

**SQUIB.** A fuse.

**SPRAG.** A cross-timber set to secure the hanging wall in a stope.

**SPUR.** A short branch from a principal ore vein.

**STACK.** The chimney of a furnace; usually employed to designate a number of furnaces, when used in the plural.

**STAMP-MILL.** A mill for crushing and concentrating minerals.

**STAMP-ROCK.** Rock containing fine copper that can be secured by crushing and jiggling.

**STAMPS.** Machines to crush rock or ore by heavy blows.

**STAMP-SHOE.** The heavy chilled iron casting attached to the lower end of a stamp piston, that does the actual crushing of rock in a stamp-mill.

**STANNIFEROUS.** Tin-bearing.

**STATION.** A chamber in a shaft, cut out for pumps, etc.

**STATION-PUMP.** A mine pump permanently placed, as distinguished from a movable sinking-pump.

**STEAM-HAMMER.** A heavy hammer, actuated by steam or compressed air.

**STEAM-STAMP.** A stamp actuated by steam.

**STEATITE.** Soapstone. A greasy mineral, having a talc base.

**STEP FAULT.** A series of faults, rising like steps.

**STOCKWERK.** Country rock penetrated by numerous small stringers of ore, the entire mass averaging sufficiently rich to permit its mining and treatment.

**STOPE.** Used interchangeably to designate the excavation above a drift, or the pay-rock remaining unmined above a drift.

**STOPING.** Breaking down the mass of pay-rock or ore above a drift. When stoping in an ore body of average width, miners can break rock much more quickly and cheaply than when driving the drifts, which are about 7x7 feet in size.

**STOPING GROUND.** Ground in reserve, opened by drifts, and ready for breaking down.

**STRATA.** The successive rock layers of the earth.

**STRATIFIED.** Having regular layers of varying rock forms.

**STRATUM.** A layer or bed of rock.

**STREAK.** The color given by a mineral when scratched or rubbed on porcelain.

**STRIKE.** The horizontal trend of a mineral body, measured by the points of the compass; a discovery of ore.

**STRINGER.** A thin seam of ore.

**STRIP.** To remove the drift or alluvial soil overlying an ore body.

**STRIPPING.** The drift or alluvial soil overlying an ore body.

**STRUCTURE.** The form of a mineral, whether granular, crystalline or amorphous.

**STUDDLE.** A prop in a mine.

**STULL.** The top-piece of a set of mine timber.

**SULPHATE.** An ore of any metal or metals with which sulphur and water are united chemically.

**SULPHIDE.** An ore of any metal or metals with which sulphur is united chemically. Sometimes called a sulphuret.

**SULPHOANTIMONITE.** An ore of any metal or metals with which sulphur and antimony are united chemically.

**SULPHOARSENITE.** An ore of any metal or metals with which sulphur and arsenic are united chemically.

**SULPHURET.** A sulphide. Term becoming obsolete.

**SUMP.** The pit at the bottom of a shaft, where water collects.

**SURFACE CAPTAIN.** A mine superintendent whose duties are wholly on surface.

**SURFACE RIGHTS.** The ownership of the surface of land only, where mineral rights are reserved.

**SWABSTICK.** A stick used to clean out drill-holes.

**SYNCLINAL.** A syncline; of the nature of a syncline.

**SYNCLINE.** A trough formed by rock strata that are low in the center and high on the sides. The reverse of an anticline.

**TABLE.** An ore concentrator taking finely crushed particles of ore and gangue for separation.

**TABLE LAND.** A plateau.

**TAILINGS.** Refuse matter from a mill.

**TAMP.** To closely pack clay or other sticky earth into a drill-hole above the cartridges, to give greater force to the blast.

**TAP.** To draw off molten metal or slag from the vent of a furnace.

**TAPER OFF.** Cornish for stopping work temporarily.

**TELERA.** Spanish for a roast-heap of sulphide ore.

**TENOR.** The average metallic content of an ore, matte or impure metal.

**TENSILE STRENGTH.** The resistance to breaking or elongation offered by metal when under strain from either end.

**TERRERO.** Spanish for burrows of partly leached ore.

**TERTIARY.** Rock forms of the third great geological period.

**TEST-PIT.** A shallow pit sunk to discover mineral.

**THROW.** The vertical displacement of a vein caused by faulting.

**TIMBER.** The wooden beams and sticks used for underground supports.

**TIMBER-BOSS.** The head timberman.

**TIMBERMAN.** One who works at timbering a mine.

**TON.** See metric, long and short tons.

**TONELADA.** Spanish for long ton.

**TOSSING.** Jigging finely comminuted ore.

**TOWN.** See Range for description.

**TRACHYTE.** A micaceous hornblende and feldspar rock.

**TRAM.** To load rock or ore in tram-cars and push same to the shaft; a tramway.

**TRAM-CAR.** A car running underground, on T-rails, used for carrying rock from the stopes and other workings to the shafts.

**TRAMMERS.** Men who load and tram the broken rock underground.

**TRAP.** A dense gray, blue or greenish rock of volcanic origin; of considerable variety in different beds, but usually of feldspathic-angitic nature.

**TRAPPEAN.** Of the nature of trap.

**TREND.** The general direction of a mineral body.

**TRESTLE.** A frame-work of timbers, connecting various mine and mill buildings on surface, usually carrying tram-tracks.

**TRIBUTE.** The royalty or percentage paid by workmen to owners for the privilege of working a mine. Apt to be a form of grand larceny, at the expense of the mine's future.

**TRIBUTOR.** One who works a mine on tribute.

**TRIPOD.** The three-legged iron frame on which the working parts of a power-drill rest; a three-legged wooden frame over the mouth of a pit or shaft.

**TROLLEY-CABLE.** A wire rope sometimes used in an incline shaft as a guide for the bucket.

**TROUBLED.** A vein is troubled when disturbed or faulted.

**TRUE FISSURE VEIN.** All mineralized fissures are true fissure veins. Term commonly used as meaning a fissure vein with promise of holding to great depth, in contradistinction to a gash vein.

**TSUBO.** A Japanese measure of six feet square, equalling 36 square feet.

**TUFA.** A porous limestone. Name frequently used in place of tuff for rock of volcanic origin.

**TUFF.** Scoriaceous material from volcanic vents, solidified by time and superincumbent pressure. Tufts range in density from porous pumice-stone to dense and exceedingly refractory conglomerates.

**TUNNEL.** A practically horizontal opening entirely through a hill or mountain. Term is commonly used instead of adit, which is a horizontal gallery having only one opening to surface.

**TURBINE.** The most efficient form of a water-wheel; also a new form of steam-engine in which the entire movement of the power producing parts is rotary instead of reciprocating.

**TUYERES.** The vents by which air is supplied, under pressure, to blast furnaces and bessemer converters.

**UNCONFORMABLE.** Rock strata that do not correspond as to bedding, or geological horizons.

**UNDERHAND STOPING.** Removing ore in descending steps.

**UNDERLAY.** The mineral bodies lying under a given tract, though not outcropping on surface.

**UNDERLIE.** The underlay.

**UNPATENTED.** Mining claims held from the United States Government, subject to annual assessment work.

**UNSTRATIFIED.** Rock forms not bedded in layers.

**UNWATER.** To free from water; to pump out.

**UPCAST.** A shaft having an upward air current.

**UPRAISE.** A raise.

**VAN.** To dress ore.

**VANNER.** A jig for dressing ore by means of vibratory motion, aided by jets of water to carry away gangue-rock.

**VARA.** A Spanish-American measure of length of 33 inches.

**VEIN.** A mineral body having defined walls. See contact vein and assure vein.

**VEINSTUFF.** Ore with its associated gangue.

**VENTILATION.** The system of natural or artificial air currents in a mine. See air-shaft.

**VERTICAL.** Perpendicular. Upright and downright.

**VERTICAL SHAFT.** One sunk at an angle of 90° with the horizon, or directly downwards toward the center of the earth.

**VINNEY.** Cornish for copper ore with a green coating caused by weathering.

**VIRGIN.** Native metal occurring elementally, as distinguished from ores, which are chemical compounds.

**VITREOUS.** Of a glassy nature.

**VOLATILE.** That which can be driven off as vapor, by heat.

**VUG.** A druse. A hollow, or cave, entirely surrounded by rock. Usually shows fine crystallizations.

**WALL.** Rock of a different formation adjoining a vein or other ore body.

**WATER DRILL.** A power drill in which a current of water runs through the bit of a drill, changing the rock-dust from the bit into sludge, which is expelled from the bore-hole by the force of the current.

**WATER-JACKET.** An outer casing for a blast-furnace, in which water circulates, to keep the metallic furnace-walls from melting because of the intense heat of the charge.

**WATER LEVEL.** The ground water level is the point above which water does not rise when a mine is allowed to fill. The basic water level is the point below which altered and enriched ores are succeeded by base unaltered sulphides.

**WEATHERED.** Rock altered in structure by exposure to air and water.

**WET PROCESS.** Lixiviation.

**WHEAL.** Cornish for mine. Synonymous with bal.

**WHIM.** A windlass with a horizontal drum.

**WHIP.** A rope and fixed pulley or pulleys for hoisting.

**WILFLEY.** A Wilfley concentrating table.

**WINCH.** A windlass.

**WINZE.** A blind shaft, usually short, leading downward from a horizontal opening of a mine.

**WINDLASS.** A winding device for hoisting from a pit or shaft, by means of coiling a rope or cable around a drum.

**WIRE BARS.** Refined copper cast into bars for wire drawing.

**WORKINGS.** The underground openings of a mine.

**ZINC BLENDE.** Sphalerite. Sulphide of zinc.

**ZINCIFEROUS.** Carrying zinc.

**ZINC SULPHIDE.** Sphalerite.

## CHAPTER XIV.

### COPPER DEPOSITS OF THE UNITED STATES.

Copper is found throughout the entire length of the Rocky Mountains, in Canada, the United States, Mexico and Central America, and in the cordillera of the Andes in South America from the extreme north to Punta Arenas on the Straits of Magellan. The North American copper deposits apparently are richer west of the main range of the Rockies, and the principal deposits, as a rule, occur in various isolated mountain ranges in the high tablelands between the Rocky Mountains and the Pacific. In the eastern part of the United States the Appalachian Mountain system carries copper ores from Maine to Alabama, the principal deposits occurring in the Green Mountains, Blue Ridge Mountains and Piedmont Mountains. In the Lake Superior district native copper is carried in the roots of an ancient mountain range. The mines of the United States furnish 55 to 60 per cent. of the total copper supply of the world. Occurrences of copper are treated by states, in alphabetical order.

**ALABAMA.** In the northeastern portion of Alabama the extension of the Ducktown district of Tennessee carries pyritic ores of a similar nature. Copper occurrences are noted in the counties of Cleburne, Clay, Coosa, Dean, Haralson, Marion and Randolph.

In Cleburne county considerable copper mining was done in the eighth decade of the Nineteenth Century. The Woods or Stone Hill mine showed a prominent gossan, with chalcocite in the secondary zone, succeeded by chalcopyrite at comparatively shallow depth. The ore was but slightly argentiferous and carried occasional sphalerite. The Smith mine, near the Woods, had a similar ore body.

Mines of cupriferous pyrites have been opened recently in Clay county, and copper ore is found near Goodwater in Coosa county. Cupriferous pyrites are being developed in Dean county. In Haralson county the Tallapoosa pyrite mine, about 25 miles east of Tallapoosa, shows lenses of slightly cupriferous iron pyrites.

**ALASKA.** The territory of Alaska is greater in area than France, Germany, Belgium, Holland and Denmark combined, and its copper deposits are scattered over a vast territory, in most cases but slightly explored. Transportation facilities are excellent for the coast mines, but lacking for the interior properties, which must have rail connections in order to become producers. The first important copper production was secured in 1904, from coast mines. The geography of Alaska remains somewhat vague as to the interior, by reason of the country being so vast, so sparsely populated and so slightly developed. It is known that certain tribes of aborigines possessed copper before the coming of the white man, and it is altogether probable that this copper was secured from the native deposits of the metal found in the Copper River country and adjoining fields.

The principal copper districts of Alaska, so far as now known, are those of Prince of Wales Island, Prince William Sound and the Copper River coun-

try, the latter an immense district with numerous occurrences of ore and native copper. Alaska never has been organized as a territory, and has no counties, hence the difficulty in giving anything like exact limits to the districts of the interior.

The principal copper field of the present is the Prince William Sound district, which includes a long stretch of mainland and outlying islands. This district includes Latouche Island, Knights Island and the Ketchikan field. Nearly all of the mines are located within a mile or less of tide-water, and are enabled to ship their ores easily and cheaply to smelters along Puget Sound. The ore is mainly chalcopyrite, commonly associated with pyrrhotite and occasionally with pyrite, with a little chalcocite and malachite, occurring along shear zones and in sedimentary slates and altered lava flows called greenstones. As a rule, there are fairly strong gossans of slight depth. Latouche Island has several promising properties that are shippers, and the Bonanza mine has a large ore body outercropping on a mural escarpment near the sea. Knights Island shows promising sulphide ores in greenstone and associated rocks of the Orca series. Glacier Island also shows ore of promise. Ketchikan is the principal town of this district.

Several mines have been developed on Prince of Wales Island, mainly on contact deposits between limestone and intrusive diorite or greenstone. Below a shallow zone of oxidation the ore is mainly chalcopyrite, associated with magnetite, in lenses up to 40 feet width and 150 feet length, the chalcopyrite carrying one to two dollars gold per ton, with small silver values.

The Copper River country includes a number of sub-districts of large area, around the headwaters of the Copper, Tanana, Shusitna and White rivers, including portions of the Wrangell, Chugach and Alaskan mountain ranges. The Copper River basin is a broad syncline, the central part of which is occupied by the Wrangell Mountains, of Tertiary age. The most prominent rock formation is the Nicholai greenstone, associated for about 300 miles with Permian limestone. The Nicholai formation consists mainly of amygdaloidal flows, resembling those in the Lake Superior district, and carries native copper and secondary sulphides. The flows are mainly altered basalts, containing considerable metallic copper in fissures, or in sedimentary rocks near the point of contact with the traps. Copper occurs native and as oxides in shear zones, or as chalcocite and bornite in veins in greenstone. Bornite, which is the principal ore, is slightly auriferous and argentiferous.

The basin of the Kotsina River, in the Copper River district, shows native copper with quartz gangue, near the basal flows of the greenstone series, filling amygdules in greenstone and associated with epidote, as in the Lake Superior district, there being a little bornite and chalcopyrite in connection with the native copper. This district is about 125 miles northeast of Valdez.

The Chitna district shows numerous occurrences of sulphide ores, with native stream copper along the valley of the river, and between the river and Mount Wrangell. On Nugget Creek, a tributary of the Kuskulana River, a mass of native copper reported as three by eight feet in size was found. Native copper is found on the headwaters of the Nizina River.

Numerous copper occurrences are noted on the headwaters of the White River, and small masses of native metal weighing up to ten pounds have

been found in greenstone dykes, said to traverse limestone and schists. The veins are small, and those noted seem of small importance. Along Kletsan Creek, near Scolai Pass, on the divide between the White and Chitna Rivers, native copper occurs as stream metal, evidently derived from ancient basaltic dykes intersecting diorite and Carboniferous limestone. Most of the valley is overlaid with a deposit of volcanic ash, up to one hundred feet in depth.

Native copper is reported from the Kenai Peninsula and the Turnagain Arm district, and copper sulphides occur in metamorphic rocks in the Kenai Peninsula. Copper ores are reported from Resurrection Bay and Lynx Creek, 50 miles north of Seward, and on the Knik River and Lake Iliama, west of Cook Inlet.

**ARIZONA.** Arizona is the second district of the United States and of the world in point of copper production, ranking second only to Montana. No other copper field has shown such heavy gains in production during the past decade, and there is none with brighter prospects for the future. About one-sixth of the copper mines of the United States are found in Arizona, and of this number many are of very doubtful value, while a few are of thoroughly demonstrated worth, and a considerable number are properties of much promise.

There are evidences of rude mining operations by prehistoric peoples at a number of points, but no traces of smelting, and, had the copper ores been reduced, the slags and possibly remnants of the furnaces scarcely could have escaped attention. It seems probable that azurite, malachite and ochreous iron were mined, in a crude way, for pigments, and prehistoric turquoise mines have been found at several points, notably in the Dragoon Mountains.

The first copper smelter of Arizona, built of adobe bricks, is said to have been located at the Ajo mines, in Yuma county, about 40 miles southeast of Gila Bend, and to have been operated by P. R. Brady and others, immediately after the Gadsen Purchase, in 1852. In 1873 copper production was begun from the Longfellow mine, near Clifton, Graham county, with an adobe furnace.

There are numerous copper districts in the various counties, these having, as a rule, a generally southeasterly and northwesterly trend, with copper deposits commonly on or near the contacts of igneous rock with Paleozoic limestones, mainly of the Carboniferous series. The greater portion of Arizona is included geologically in the Sonoran Plateau, with conditions much the same as in the adjoining Mexican state of Sonora.

Central and southern Arizona form a plateau of 1,000 to 5,000 feet elevation, grading to nearly sea-level along the western edge, with numerous isolated mountain ranges. Apparently this part of Arizona emerged from the seas late in the Tertiary age.

Arizona has copper mines, or attempts at mines, in the counties of Apache, Cochise, Coconino, Gila, Graham, Maricopa, Mohave, Pima, Pinal, Santa Cruz, Yavapai and Yuma, this list including every county in the territory. The principal districts, in order of importance, are the Warren district at Bisbee, Cochise county, the Greenlee district of Graham county, the Globe district of Gila county and the Jerome district of Yavapai county,

- with a number of minor districts of some present importance and considerable future promise.

Apache county has copper deposits, apparently of promise, mainly undeveloped and but slightly prospected.

In Cochise county the Warren district, lying in the Mule Mountains, commonly called the Bisbee district, is the only important producer. Copper ores are shown, however, in the Chiricahua, Dragoon, Huachuca, Rincon, Swishelm and Whetstone Mountains. In the California mining district of the Chiricahua Mountains no important mines have been developed, though considerable good ore has been uncovered. In the Johnson camp of the Dragoon Mountains an intrusive granitic core is flanked by schist, quartzite, conglomerate and limestone, the latter carrying ores near a quartzite contact, the oxidized ores including chrysocolla, with sulphides at depth. Considerable development work has been done in the Huachuca Mountains, but no producing mines have been developed as yet.

The Bisbee or Warren district may be compared in form to half of a peach, retaining the pit, which corresponds to Sacramento Hill, a big gossan blowout half surrounded by a semi-circle of irregular ore bodies in limestone, with granite-porphyry to the northeast, the gulch between the mountains being roughly the dividing line between the porphyry and limestone. There is a conglomerate capping over the junction between the porphyritic and limestone rocks, with numerous quartzite dykes intruding the limestone. The rocks of the Bisbee district may be divided into five groups, these being pre-Cambrian crystalline schists, Paleozoic sedimentaries, Mesozoic sedimentaries, Quaternary sedimentaries and igneous intrusives. The underlying crystalline schists, of pre-Cambrian age, are unconformable with the superimposed stratum of Cambrian quartzite, about 450 feet in thickness, above which lie about 4,500 feet of limestones of Cambrian, Devonian and Carboniferous ages, with copper occurring in the Carboniferous series, the ore developed so far occurring in the beds known locally as the Naco and Escobrossa limes, which are considerably faulted. The ore bodies evidently were caused both by contact metamorphism and by percolating waters. The mineralization obviously came from the porphyritic intrusives, presumably of Carboniferous age, and in the Cretaceous period a subsidence caused an accumulation of about 4,500 feet of superimposed sandstones, conglomerate, shales and limestone, followed by emergence and much erosion, with considerable faulting. There is much displacement, accompanied by thrust-faulting, with overthrusts of nearly two miles. The limestone has numerous caves, often showing beautiful stalactitic formations, and crystalline copper carbonates. Along the contacts of the igneous and sedimentary rocks there are large masses of low-grade cupriferous pyrite, partly oxidized, and Sacramento Hill contains low-grade disseminated copper and iron pyrites. The ore occurs in very irregular bodies, but with a marked tendency to follow the bedding planes of the limestone, and the principal ore bodies found so far are adjacent to, and, as a rule, not more than 1,000 feet from, the porphyry contact. The copper ore outcropped at what is now known as the Cave shaft of the Copper Queen mine, and dips under the gulch at an even sharper angle than the drop of the gulch itself.

All of the more common oxidized and sulphide ores are noted, and there is considerable native copper, occurring as masses up to some hundred-weights in size, and as finely comminuted native metal in the fluocan, which is heavy along the walls. The principal ores are disseminated chalcocite and chalcopyrite, the chalcocite usually being associated with manganese in a talc gangue, and being the source of more than half of the total copper production of the district. There are small but appreciable values in silver and gold, and to the northwestward of the cupriferous crescent are lead ores, and, in fact, Bisbee was a lead camp previous to the opening of the copper deposits of the Copper Queen mine, in 1880. The zone of oxidation is most erratic, and full oxidation is noted to the greatest depth yet reached, which is nearly a quarter-mile. The secondary sulphides are found with oxidized ores above and below, and even the unaltered sulphide, chalcopyrite, is sandwiched between oxidized ores and native copper, in a most confusing manner. Indications are not especially promising either north or south of the cupriferous crescent, though narrow fissure veins, containing high-grade ores, are noted in the granite-porphyry for nearly the entire length of the range.

In Coconino county there are promising copper outcrops on the southern plateau of the Grand Cañon of the Colorado River, and several small mines have produced limited quantities of ore, mainly rich carbonates, with occasional chrysocolla and a little chalcocite. There also are developing copper mines in the vicinity of Flagstaff, and at Ryan, in the northern part of the county, near the Utah line.

The first mines in the Globe camp of Gila county were opened for silver, in 1874, and were closed in 1877, copper mining beginning in the following year. The pioneers suffered severely from raids of the Apaches, and worked under great economical disadvantages, due to poor transportation facilities and expensive fuel. Oxidized ores only were smelted until 1902, when sulphide smelting was introduced. The geological base of the Globe district is the Pinal schist, of pre-Cambrian age, succeeded by the Apache group of pre-Cambrian rocks and the Globe limestone, including beds of age from Devonian to upper Carboniferous, faulted by the Gila conglomerate of Tertiary age. After the laying down of the Gila conglomerate there was much faulting and compression, with marked metamorphism, with a complex of eruptives enjoying a great variety of lithological cognomens, according to the fancy of the geologists. Roughly speaking it may be said that a limestone and diabase contact shows ore bodies occurring as irregular lenses, practically parallel with the horizontal bedding planes of the limestone series, up to nearly 600 feet in thickness, resting on quartzite. The Old Dominion fault is a very prominent geological landmark, ore occurring mainly on the southern side. There are fissure veins and fault-fissures, but many fissures are not all mineralized. The average strike of the veins is approximately northeast and southwest, with dips of 40 to 90 degrees. The ore bodies may be divided into three classes, these being irregular masses in limestone, fissure veins, and irregular mineralizations of the permeable rocks. Ores are mainly oxidized, but with occasional occurrences of sulphides, which may have oxidized ores below as well as above. The oxidized ores carry considerable hematite in their gangue, but are highly silicious and require heavy fluxing with iron as well as lime. The shortage of sulphide ores needed to furnish iron for fluxing the oxidized

ores is a drawback to the field. The Globe district is quite extensive in area, and the Gibson property shows veins of very high-grade massive secondary sulphides, in schist. Copper developments are under way in the San Carlos and Christmas districts, and elsewhere in Gila county.

The Greenlee district, in which are found the mining towns of Clifton, Morenci and Metcalf, is known commonly as the Clifton district, and is the oldest of the present important copper fields of Arizona, dating from 1872, and also is notable for the invention of the water-jacket blast-furnace. This district is second in Arizona as a producer, but is second to none in size of its ore bodies, though the ore, while occasionally found in high-grade fissures, is mainly of low copper tenor. The Arizona and Detroit mines are working low-grade ore bodies carrying 3 to 4 per cent. copper only, and the future of the district rests mainly on extensive development of ore bodies of even lower average tenor.

The geology of the Clifton district probably is more complex than that of any other important copper field of the world, and would require a monograph of a hundred pages or more for a complete exposition. A most critical and exhaustive study of this field has been made by Prof. Waldemar Lindgren, of the United States Geological Survey, and his report thereon is a monumental work. The Clifton district may be described as a geological island of pre-Tertiary granite-porphry, quartzite and limestone, surrounded by lava flows and a sedimentary series of Paleozoic age, including quartzite and conglomerate, upon which is imposed about 800 feet of limestone beds of Silurian, Devonian and Carboniferous ages, intruded by porphyry and partially covered with flows of rhyolite and andestite. The porphyry is essentially a monzonite and much of it is workable as an ore of low grade. Contact metamorphism apparently is responsible for most of the extensive mineralization, though there are evidences at many points of secondary enrichment. The oxidized zone extends from surface to a depth of 50 to 200 feet, usually carrying oxidized ores of greatly varying tenors, though sometimes barren. The zone of secondary sulphides is 100 to 500 feet in depth, carrying chalcocite and bornite, succeeded by the pyritic zone carrying chalcopyrite and sphalerite, associated with pyrite. The ores of the pyritic zone are low in copper tenor, and difficult of reduction, because of the considerable quantities of zinc associated therewith, but this zone contains enormous quantities of ore, which, without question, will be extracted in the future. The ore bodies include oxidized ores occurring in irregular forms near contacts, also fissure veins of sulphide ores in the porphyritic zone, and contact deposits in prophyry. There also are stockwerks, carrying veinlets of disseminated chalcocite, these occurring mainly in porphyry, but occasionally in quartzite. The cupriferous monzonite may be considered the predominant ore deposit, this containing finely disseminated chalcocite in a highly altered monzonite-porphry, with the gangue ranging from quartz to talc. Considerable brochantite is produced, this being one of the few districts where brochantite is found as a commercial ore. The rich oxide and carbonate ores of early days are practically exhausted, in the older and larger mines, but oxidized ores low in copper tenor are treated by leaching, this being one of the very few American copper fields in which leaching processes are employed successfully. The average of all ores treated in the district is about 3.5 per cent. copper and 18 cents gold per

short ton, while the oxidized ores treated by the Arizona Copper Co. average under 3 per cent. copper, and are the lowest in grade of any copper ores treated at a profit in Arizona.

In addition to the mines of the Greenlee district there are small copper properties elsewhere in Graham county, notably at Fort Thomas, Fort Grant, Pima, Safford, Solomonville and Wilcox.

Maricopa county has a considerable number of developing mines, of various degrees of promise. The principal copper mining districts are found at Wickenburg, Cave Creek and Morristown.

Mining operations in Mohave county have been mainly for the precious metals, but there are a number of developing copper mines in the vicinity of Kingman and Chloride, and copper properties of considerable promise are noted along the Colorado River, and on the Bill Williams Fork River that forms the boundary line between Mohave and Yuma counties.

Navajo county has no copper producers, but there are ore bodies apparently worthy of serious investigation. On the Navajo Indian Reservation, shortly south of the Utah line, Triassic sandstones show a stratum carrying chrysocolla and occasional melaconite, as speiss and nodules, rich but very erratic in occurrence.

The principal producing copper field of Pima county is the Silver Bell district, though production has begun from the Pima district. The principal mining fields of the county are found in the Sierrita, Santa Rita and Santa Catalina mountains. In the latter district, near Tucson, more or less exploratory and development work has been done for about seven miles. The mountains show a granitic core, with quartzite and limestone sedimentary beds, cut by intrusive dykes of diabase, with ore occurrences along the dykes.

The Silver Bell district is in the Silver Bell Mountains, a small, isolated range of less than 3,000 feet elevation. The hills have granite bases, with quartzite and limestone strata superimposed, the latter being much eroded, with the usual intrusive rocks, the ore bodies occurring as irregular masses with prominent gossans, in porphyry shear-planes, and in limestone and granite-porphyry, near the contacts. The ores are mainly chalcopyrite and bornite.

The Pima district, on the slope of the Sierrita Mountains, was mined first in 1880, for silver-lead ores. This district shows large bodies of low-grade ore in limestone, and occasionally in porphyry, along the contact of these rocks, the ore usually having a limestone gangue, there being intrusive quartzites.

In the Santa Rita Mountains the Helvetia district shows Carboniferous limestone strata, with prophyritic intrusions, the ore bodies showing good gossan outcrops.

Pinal county, while having no large copper producers, has several districts of decided promise, and should become an important copper field, with further development. The Ray or Kelvin district shows a zone of approximately one mile width, with a length of at least three miles, in which occur banded acid igneous rocks, giving strong evidences of thermal alterations and silicification, carrying chalcopyrite coated with chalcocite, in small particles and thin veinlets, with gangue of country rock, and also

showing occasional bunches of ore of fair size. The surface showing of gossan throughout this zone is good, and apparently copper continues into the diorite to the westward of the zone. There are no sedimentary rocks in or near the principal copper zone. A little high-grade ore is noted at points, but, as a rule, the ore is low in copper tenor, though in tremendous quantity. The Mineral Creek district, near Ray, shows silicious and argillaceous shales and quartzite, with intrusive dykes of granite-porphry, the quartzite being much faulted and brecciated along fault-planes. Carbonate ores of varying tenor are found throughout the district.

The Christmas district, on the Gila River, shows oxidized and sulphide ores, in altered limestone near porphyritic intrusives, ore being mainly chalcopyrite, associated with a profusion of magnetite.

The Pioneer district, sometimes called the Superior district, was worked originally for gold. The principal copper property in this district has two contact veins, between quartzite and limestone, carrying silicious oxide and carbonate ores, more or less auriferous and argentiferous, with occasional free gold, and associated with iron and manganese.

The Casa Grande district shows ore of good average tenor, and copper ores of more or less promise are noted at various other points in the county.

Santa Cruz is the smallest county in Arizona, lying near the Mexican border. Principal developments are in the Patagonia Mountains, where there are several mining districts. This mountain range shows the characteristics common to practically all of the isolated ranges of the Sonoran Plateau, and ore bodies occur mainly as contacts between limestone and porphyritic rocks, or in the limestone near the point of contact. The copper ores usually are auriferous and argentiferous, and in most cases are associated with galena and sphalerite, the latter causing considerable trouble in reduction.

The county of Yavapai in area would put to blush several of the smaller kingdoms of Europe, and is mineralized in all of its mountain ranges. This county is the principal gold district of Arizona, and shows copper ores, of more or less promise, in practically every one of its numerous mining districts. There are copper mines, or attempts at mines, near Big Bug, Briggs, Carrollton, Cherry, Crown King, Dewey, Gilbert, Granite, Groom Creek, Humboldt, Huron, Jerome, Kirtland, Maxton, Mayer, McCabe, Middleton, Minnehaha, Poland, Providence, Prescott, Stoddard and Turkey. The only important copper producer is in the United Verde mine, at Jerome, though the Bradshaw Mountains have small producers of promise, and there are other fields in which development work is under way.

The Verde district, which includes Jerome, is very rugged. The district was fissured and faulted, then cut transversely, at nearly right angles, by dykes, followed by extensive mineralization, apparently by metasomatic action. The country rock is a schistose slate, extensively intruded by igneous dioritic rocks, with an unconformable capping of limestones and sandstones of later age devoid of copper. The veins at Jerome and to the southward show strong gossans and promising surface indications, but many attempts at developing mines have resulted in the making of no important producers except the United Verde. This property shows two ore bodies separated by low-grade ore and a quartzite dyke very rich in gold

and silver. There is a limited zone of oxidized ores, largely worked out, but the principal values are in disseminated sulphides.

Yuma county was accessible with such difficulty, until the building of the Arizona & California railroad, in 1906, that copper-mining developments have lagged, though there are notable deposits of copper ore along the Colorado and Bill Williams Fork rivers. The Empire Flat district shows schist and limestone beds with intrusive granite, carrying fissure veins with strong gossans. The ores are of great variety, and exceptional richness, including considerable chrysocolla in the oxidized zone, and secondary sulphides of high average tenor. The district around Empire Landing, about 75 miles above Empire Flat, is partly in Yuma county, Arizona and partly in San Bernardino county, California. Although explored slightly during the preceding twenty years, development may be said to date from the advent of a railroad, in 1906, though some copper ore was mined and shipped by way of the Colorado River to Swansea, in early days. There are ore occurrences of considerable promise in this district.

**ARKANSAS.** Copper ores are noted sparingly throughout the Ozark uplift, and copper deposits are found in the counties of Baxter, Garland, Montgomery, Marion, Pulaski, Searcy and Sevier. The ore as a rule is chalcopyrite, and quite commonly is associated with galena and sphalerite. The lead and zinc deposits of the Ozark region apparently are of greater promise than the copper ores. Tetrahedrite and tennantite are noted ten miles north of Little Rock, in Pulaski county.

**CALIFORNIA.** Few states in the Union are more richly endowed with copper. The first discovery, made in 1840, when California was a portion of Mexico, was near El Paso Soledad, in what is now Los Angeles county, and in 1854 a little copper was produced therefrom. In 1855 copper was discovered in Alpine county, but the Napoleon mine, in Calaveras county, discovered and opened in 1860, was the first Californian copper producer of importance. There was a copper boom in 1862 and 1863, with hundreds of stock companies organized, and between 1863 and 1866, nine small copper smelters were built in the state, the local production being about two million pounds in 1864, in addition to considerable shipments of ore to Swansea, Baltimore and New York. After 1868 the industry was practically non-existent, until 1896, when the Iron Mountain mine, under English management, became an important producer. The high-water mark of production was reached in 1901, with an output of 34,931,985 pounds fine copper, in which year Shasta county produced 30,990,781 pounds, with between one and two million pounds each from Calaveras and Fresno counties, the balance of the output being composed of the small contributions of fifteen other counties. In 1900 California stood fourth among the copper producing fields of the United States.

There are occurrences of copper ore in about fifty of the fifty-seven counties of California, and there are copper mines of more or less importance in the counties of: Alameda, Alpine, Amador, Calaveras, Colusa, Contra Costa, Del Norte, El Dorado, Fresno, Humboldt, Inyo, Kern, Lake, Lassen, Los Angeles, Madera, Marin, Mariposa, Mendocino, Merced, Mono, Nevada, Placer, Plumas, Riverside, San Bernardino, San Diego, San Luis Obispo, Santa Clara, Shasta, Siskiyou, Sonoma, Tehama, Trinity, Tuolumne and Tuolumne.

The copper fields of the state may be divided into four groups, of which the first in productive importance is in Shasta county, the second in the Sierra Nevadas, the third along the Coast Range Mountains, and the fourth in the desert region of Southern California, near the Nevada and Arizona lines. The Sierra Nevada copper belt stretches along the western flanks and foothills of the mountains, showing practically continuous occurrences of copper for nearly 400 miles, reaching from Oregon on the north to nearly the Lower California line. This field contains many old mines, and is a district of much promise. The Coast Range field shows copper deposits for about 150 miles southward from the Oregon line, but the principal occurrences and developments are in Siskiyou and Del Norte counties, on the Oregon boundary. The southern extension of the Coast Range belt also shows copper ores in San Diego and adjoining southern counties. In Kern county there is an apparent branching of the Sierran copper range, with an offshoot that traverses Inyo and San Bernardino counties, reaching over into the neighboring territory of Arizona, thus establishing a close geographical and geological connection between the copper measures of southeastern California and central western Arizona. The mines of Shasta county are of preponderant importance, Calaveras county in the Sierra Nevadas coming second, with Fresno third, and with important developments under way in Siskiyou and Del Norte counties.

As a rule the alteration zone of Californian copper deposits is comparatively shallow, showing oxidized ores of high grade in profusion at surface, usually succeeded by unaltered chalcopyrite at an average depth of about one hundred feet only.

The copper district of Shasta county, as developed, is a crescent of two to three miles average width by about thirty miles extreme length. The principal developments are in the western third of the crescent, though there are properties of promise to the eastward. This district shows an extensive series of sedimentary rocks ranging in age from Miocene to Devonian, associated with igneous rocks of various ages, intercalated with the sedimentaries, or more commonly occurring as intrusives. The western end of the crescent shows slate to the west with granite-porphry and quartzite to the east. Copper ores occur as sulphide deposits in contact zones and shear zones and a wide and irregular belt of igneous rocks runs from Iron Mountain past Bully Hill, traversing a series of sedimentaries ranging from Devonian up to nearly the top of the Triassic series. A large portion of this rock is volcanic, embracing acid and basic lavas, with fossiliferous tuffs. The entire district is much faulted and sheared, with sulphide ore bodies occurring in shear zones ranging up to hundreds of feet in width. These lenses are usually flat-lying, with chalcopyrite disseminated in pyrite, almost invariably auriferous, but low in copper tenor. The gossan cappings are massive, and large bodies of silicious ore are lacking. The Iron Mountain mine was worked originally for gold and silver values in the gossan.

In Calaveras county the principal developments are in the vicinity of Copperopolis, where mining has been done, more or less regularly, for many years. The ore bodies occur in black pyritous slate, in a bed of amphibole schist, the geological horizon being the same as at the gold mines of the Mother Lode, twelve miles eastward.

Along the coast there are important deposits of cupriferous pyrites in the suburbs of Oakland, Alameda county, on San Francisco Bay, and copper has been found in sewer digging on Connecticut street, between Eighteenth and Mariposa streets, in the city of San Francisco.

Santa Clara county has promising copper deposits in the vicinity of the New Almaden quicksilver mines. Copper was discovered in Los Osos district of the Coast Range Mountains, San Luis Obispo county, in 1854. In San Diego county copper occurs in the Encinitas district, and at various other points.

In the desert country of southeastern California, comprised mainly in the counties of Inyo and San Bernardino, copper occurs at numerous points. The Ubehebe district of Inyo county shows promising surface indications and rich ores at several points. The Death Valley region of Inyo county was the scene of a copper boom in 1906-1907, when many mining companies were organized, and considerable work was done in the Greenwater district, which lies on the flanks of the Funeral Range, east of Death Valley. The formation of the Greenwater district consists of underlying granite-porphyry, with rhyolite flows and tuffs, the summits of the mountains being capped by remnants of basaltic flows, with no sedimentary rocks known as yet. The mineralized belt is about 30 miles in length, and ores, as found, are mainly of high average tenor, highly silicious, occurring in shear zones in granite, having a generally southwesterly trend, in streaks of one to three feet in width. The Greenwater district has proven disappointing.

**COLORADO.** Nearly one-third of the refined copper produced by Colorado smelters comes from ores mined in other states and territories, and upwards of half of the copper production from Colorado mines comes from Leadville, in Lake county, where the principal mineral products are lead, silver and zinc, but at depth there is a marked increase in copper values, and it is possible that Leadville may become a copper camp of importance, in time. Practically the entire copper output of the state is secured as a by-product from silver-lead and zinc ores. With the exception of a plateau in the eastern half of the state, Colorado is heavily mineralized throughout the mountains, but as a rule the geological conditions are not so favorable to the occurrence of large bodies of copper as in most of the other mountain states. Outside of the Leadville district the most promising copper fields seem to be in Larimer and Routt counties. There are copper mines, or mines carrying considerable copper values, in the counties of Boulder, Chaffee, Clear Creek, Costilla, Custer, Delta, Dolores, Eagle, El Paso, Frémont, Gilpin, Grant, Gunnison, Hinsdale, Huérzano, Jefferson, Lake, LaPlata, Larimer, Mesa, Montrose, Ouray, Park, Pitkin, Routt, Saguache, San Juan, San Miguel, Summit and Teller.

Larimer county shows numerous copper deposits near the Wyoming line, the Pearl district, lying about 20 miles southeast of Encampment, Wyoming, being the most important. The geology of the Pearl district is much the same as that of Encampment, except that quartzite is lacking, the prevalent rock formation being granite masses cut by pegmatite dykes. The ore is mainly chalcopyrite, associated with considerable quantities of sphalerite.

The Silverton mines of San Juan county produce considerable copper ore as a by-product from silver mines, San Juan county, ranking second

to Lake county in the state, as a copper producer, with an average yearly output rising two million pounds of fine copper.

**CONNECTICUT.** The first copper mine in the United States was opened at Granby, Hartford county, Connecticut, in 1705, this being the Newgate mine. The Bristol mine in the same county also was a producer. The Bristol yielded mainly chalcoite, bornite and chalcopyrite, with a little malachite from the upper portions and was opened in a fault zone between gray gneiss, hornblende schist and Triassic sandstone. Native copper is noted at Farmington, in the same county, and there are occurrences of copper ore at New Britain and Simsbury, the latter being cupriferous pyrites, which also occur in Hartford county. Native copper occurs at Farmington, in red sandstone. A 200-pound mass of native copper has been found in alluvium, near New Haven, and there are sulphide copper ores at Carmel Centre and Cheshire, in New Haven county. Copper ores are noted also at Brookfield in Fairfield county, Roxbury in Litchfield county, Middletown in Middlesex county, Bolton in Tolland county, and Montville in New London county.

**DELAWARE.** No workable deposits of copper ore are known in this state, but chalcopyrite has been found in a granite quarry on the Brandywine river, near Wilmington, New Castle county.

**FLORIDA.** Small veins of sulphide copper ores are reported from several points in Florida, but no workable copper deposits are known.

**GEORGIA.** A little copper mining was done in the Ducktown belt, circa 1870-1875. Fannin county carries the eastern extension of the Ducktown copper belt of Polk county, Tennessee, and the No. 20 mine, between Pierceville and Frytown, has a 20-foot vein of sulphite ore giving assays of 3 to 30 per cent. copper, and with the usual oxidized ores in the upper portion.

Lincoln county has gold, silver and copper ores at various points. The Seminole mine has three veins in a 300-foot shear zone in mica-schist, cut by diabase dykes. The ore is chalcopyrite, associated with galena, sphalerite and pyrite, in chutes averaging about 3 feet with a maximum width of 8 feet. The richer ores carry seven to twenty dollars gold and silver per short ton.

The Chestatee mine, six miles from Villa Rica, in Carroll county, has a bedded vein of cupriferous pyrite 20 to 30 feet in width, with pay-streaks along either wall, and has an outcrop traceable for about 2,000 feet. This vein is said to assay about 3 per cent. copper, but probably does not average more than about half that amount.

In addition to the occurrences noted in the preceding counties, copper ores are found in the counties of Cherokee, Haversham, Rabun and Wilkes.

**IDAHO.** Copper was discovered in Idaho in 1864, but very little actual mining was done for the metal until 1890. Copper ores are noted in the counties of Bannock, Bear Lake, Bingham, Blaine, Custer, Idaho, Kootenai, Lemhi, Nez Perce, Owyhee, Shoshone and Washington.

The Coeur d'Alene copper belt adjoins the lead belt on the south and east in the vicinity of Stevens Peak, and extends through Shoshone county, Idaho, into Missoula county, Montana. Although silver-lead mines have

been worked for years in the western part of the Cœur d'Alene belt, no serious attempts at copper mining were begun until 1898. This district now has one considerable producer, and a number of developing mines of promise. The Snow Storm mine, on Stevens Peak, near the Montana boundary, shows an impregnated cupriferous zone conforming to the bedding planes in Algongkian quartzite. The ore body, as developed, is 10 to 35 feet in width and upwards of 400 feet in length. The usual oxidized ores above are succeeded by chalcocite and bornite, disseminated in quartzite, with occasional bodies of chalcopyrite. The ore body as a whole averages about 4 per cent. copper, 6 ounces silver and \$2 gold per short ton, the ore being highly silicious and devoid of iron and alumina.

The Seven Devils and Snake River copper districts lie mainly in Washington county, Idaho, though with extensions on the west into Baker county, Oregon. These districts have been worked spasmodically since about 1888, the lack of adequate transportation facilities precluding regular operation. The Seven Devils district shows numerous copper deposits, over a considerable area. There is an extensive series of Triassic basic lavas, with intercalary slate and limestone, intruded by diorite, all of the igneous rocks being cupriferous, ores occurring mainly as primary and secondary sulphides, largely the latter, in fissure veins, contact veins and impregnation zones, most of the ore bodies carrying considerable garnet, epidote and calcite. In the Snake River district the ores are mainly malachite, bornite and chalcopyrite, occurring usually as contact deposits between limestone and dioritic rocks, garnet and epidote being characteristic associated minerals.

In the vicinity of Mackay, in Custer county, there are several mines, of which one is of some importance. Much work has been done at this point, but the best results were not secured, owing to the vacillating policy of the principal company. The ore is of low average grade, but exists in large quantities.

Bannock county, in the extreme southeastern part of the state, shows copper ores, occurring in veins and lenses in greenstone, schist and conglomerate near limestone, the ores being both auriferous and argeptiferous.

Copper ores are noted at various points in Lemhi county, notably in the Black Bird district, about 30 miles west of Salmon City, where there are well defined fissure veins, and an impregnation zone in mica-schist intruded by granite.

**ILLINOIS.** Float copper, in alluvium brought from the Lake Superior district by glacial action, is of rather common occurrence in Illinois, and deposits of copper ore in place have been found in the counties of Chittenden, Hancock and Hardin.

**INDIANA.** Occasional small pieces of native copper, brought in drift from the Lake Superior district, are found in alluvium in this state. The occurrence of copper ore in an oil-well drilled six miles northwest of Marion, Grant county, was reported, but not verified, in 1904.

**IOWA.** The only reported occurrences of copper in Iowa are occasional small pieces of native metal found in drift, evidently brought by glacial action from the native copper deposits of Lake Superior. It is probable

that occasional chalcopyrite would be found in lead mines near Dubuque if a close watch were kept for such ore.

**KANSAS.** Occasional chalcopyrite is found in the lead and zinc mines of Galena, Cherokee county, in southeastern Kansas. The rock strata of Kansas range from Carboniferous to Tertiary, but igneous rocks being lacking, there seems slight likelihood of the existence of copper deposits of commercial importance.

**KENTUCKY.** Chalcopyrite occurs in Livingston and Union counties, and copper ore was reported, in 1902, from the vicinity of Richmond, Madison county, but none of these occurrences seem of commercial importance.

**LOUISIANA.** The only known occurrence of copper ore in this state is in a peak deposit of galena, sphalerite and barite, in halite, on Belle Isle, near the mouth of the Atchafalaya river, in Iberia parish.

**MAINE.** There are occurrences of copper ore in the counties of Hancock, Penobscot, Sagadahoc and Washington, there being old copper mines near Calais, Washington county, on the New Brunswick border.

Occurrences of copper are noted in Brookville, Sullivan, Blue Hill and Franklin, in Hancock county, the more important being in the vicinity of Blue Hill, where there have been about a dozen attempts at actual mining, mostly unimportant, though several small mines were opened. This county had a copper mining boom, circa 1877, at both Blue Hill and Sullivan, mining being suspended about 1884, on account of the low price of the metal. The copper slump of 1907 came just in time to nip in the bud an attempt at reopening some of these old mines. At one time there were two mining exchanges in Bangor, but at last accounts these buildings were occupied as a saloon and barber shop, respectively. The Blue Hill ores were claimed to run 5 to 30 per cent copper, with an average of 10 to 12 per cent, which obviously is a great exaggeration, and the ores were claimed to average \$12 to \$15 gold per ton, also an obvious exaggeration. The old waste-dumps are said to average 3 to 4 per cent. copper.

**MARYLAND.** Small copper mines were operated in Maryland in colonial days and during the first half of the Nineteenth Century, the copper industry of Maryland being of some importance until the suspension of mining was brought about by the discovery and exploitation of the Lake Superior mines. The copper ores of Maryland are mainly chalcopyrite, with occasional chalcocite and bornite, and a small amount of malachite. There are three copper belts, in the three counties of Baltimore, Carroll and Frederick.

The most important copper district of the state is in Frederick county, where there is a cupriferous belt running along the Linganore hills, from New London northward to a point beyond Libertytown. This district shows chalcopyrite with occasional chalcocite and bornite, in dolomitic limestone and micaceous schists.

The second district, in Carroll county, is a fault-zone, traceable by occasional outcrops for a distance of about 25 miles, the principal operations of the past having been between Sykesville and Finksburg. The predominant rock form is slate, and the ore is mainly chalcopyrite, with some chalcocite and bornite.

The third district, in Baltimore county, shows copper ore within the city limits of Baltimore, but the principal mines are found at Mount Washington, in the Bare Hill district, a few miles northwest of Baltimore, where there is a vein of 2 to 5 feet width, in hornblende gneiss, near intrusive peridotite.

**MASSACHUSETTS.** In this state copper ore is noted in the counties of Berkshire, Essex, Franklin, Hampden, Hampshire, Norfolk and Worcester. A little native copper is found in some of the Triassic sandstone strata, and a little chalcopyrite is found in the lead mines of Southampton, in Hampshire county. In Franklin county, the Davis pyrite mine has been worked for sulphur values since circa 1880. Two miles west of the Davis mine is a Savoy schist, carrying a fahlband of 15 to 20 feet width and 750 feet apparent length, with a paystreak on the north wall carrying chalcopyrite. Chalcopyrite also is noted about 10 miles west of the Davis mine, in Hampshire county. At Sheldonville, Norfolk county, a 94-foot shaft was sunk, circa 1901, on a quartz vein in granite, carrying values in gold, silver and copper.

**MICHIGAN.** The Lake Superior copper district of Michigan was the first American copper field of importance and now is one of the oldest of the leading copper producing districts of the world, as well as the third in size of output. It is the lowest in average grade of any successful copper mining district, and probably contains the most copper of any single field. While the cupriferous Keweenawan formation of Lake Superior outcrops to the eastward in the district of Algoma, Ontario, and to the westward traverses northern Wisconsin and is found in several of the eastern counties of Minnesota, the developed and productive mines lie wholly within the limits of Michigan.

Apparently the aboriginal inhabitants of what is now the United States were entirely unacquainted with bronze or brass, and made but slight use of copper at the time of the discovery of the new world by Columbus, though both copper and bronze were used extensively at that time in Mexico, where the superior Aztec civilization flourished. There are extensive remains, however, of mining done in the Lake Superior district by some race preceding the North American Indians. This people, whose civilization was of a higher order than that of the races succeeding, is known vaguely as the mound-builders. By this long-gone race, many of the Lake Superior copper beds were mined to shallow depth, for mass copper, and at perhaps a majority of the early-day mines, opened around the middle of the Nineteenth Century, there were pits and other evidences of prehistoric mining, to a greater or less extent. That they were good judges of mineral values has been proven by the making of good modern mines under many of these ancient pits. The Ojibways, who were found in possession of the southern shore of Lake Superior by the first white man penetrating to this inland sea, were but slightly acquainted with the practical use of copper, and had no legends regarding the mining done by their predecessors.

The existence of native copper on the southern shore of Lake Superior was first published to the world in a book by M. Lagarde, issued in Paris, in 1636, though it is probable that the existence of the metal was known only from the statements of the Indians to early French explorers on the

lower lakes. Truchement Bruslé is quoted in this book as having in his possession an ingot of copper secured from the Huron Indians. It is probable that Bruslé's ingot was merely a small mass of native copper.

The next notation of Lake Superior copper deposits is found in the Jesuit Relacions for 1659 and 1660. At that time the Ojibways had a few crude utensils made from copper, but the metals in their possession were mainly rough lumps, which the Jesuits said were worshipped, but which, in all likelihood, were merely venerated as unusual works of the Gitehee Manitou.

In the Jesuit Relacion for 1666-1667 is a chapter giving the journal of the exploration of Lake Superior by Father Claude Allouez, who seems to have been the first white man who, of a certainty, saw copper along the southern shore of the lake. In quick succession Lake Superior was visited by Fathers Marquette and Meanard, and, as a result of their efforts, missions were established for the conversion of the natives. It was nearly another hundred years, however, before white men other than the Jesuit missionaries and French voyageurs and couriers du bois saw the shores of this remote and mysterious body of water.

In 1770 Capt. Jonathan Carver printed a book, in London, telling, among other things, of the native copper of Lake Superior, which, according to his account, could be had merely for the trouble of picking it up. This publication led to the formation of a mining company in London, and Alexander Henry, an adventurous Englishman, who was in turn hunter, trapper, explorer and miner, directed the operations of a party of English miners, who drove a long adit into a claybank beside the Ontonagon River, on property now owned by the Victoria mine, during the winter of 1771-1772. The spring rains caused the caving of the adit, and no further attempts at copper mining were made for seventy years.

When the treaty of Paris brought peace between the United States and Great Britain, Benjamin Franklin, who had heard of the mineral wealth of Lake Superior, deflected his pencil a trifle to the north, upon the crude map that was made the basis of delimitation, and thereby secured to the possession of the United States bodies of copper and iron that since have yielded those metals to the value of more than one thousand million dollars. Some effort was made by the American government, in 1798, to secure definite information regarding the Lake Superior copper deposits, and, in 1826, the Ojibways ceded their mineral rights to the United States government.

In 1830 the lake was first visited by Dr. Douglass Houghton, a young scientist combining rare technical skill with high courage and indomitable energy. Through his efforts was made the first survey of the Upper Peninsula of Michigan, comprising more than two-thirds of the southern shore of Lake Superior.

The first miners to reach the Lake Superior copper field were Jim Panil and Nick Miniclear, two backwoodsmen who came overland from southern Wisconsin in midwinter, suffering great hardships, and arriving on the shore of the great lake in March, 1843. Later in the same year a land office was opened by the Federal government at Copper Harbor, and a number of prospectors reached the field. The early mining locations were of immense area, and overlapped in a most haphazard and ridiculous

manner. Confusion grew until the government adopted the expedient of selling the mineral lands outright.

In 1844 other mineral seekers, mainly devoid of practical knowledge, arrived in the district, and the news of important discoveries became bruited about. In this year arrived the first Cornishmen, who were the first real miners to reach the district. The first actual mining of copper was done in 1844, the original product being a few tons of ore, called black oxide, but possibly chalcocite, taken from a fissure vein near Copper Harbor. This vein was abandoned quickly, but the same company opened a fissure vein carrying native copper, and begun the payment of dividends in 1849, since which year dividends have been paid annually by Lake Superior properties. Shortly after the opening of the Cliff mine, in Keweenaw county, the Minnesota mine was opened in Ontonagon county, at the other end of the district. Cross-fissures only were worked at first, but these, while producing several highly profitable mines, have pinched out or lost their workable values at 2,500 feet or less in depth. The stratified beds, on which all the productive mines of the present day are developed, were neglected in the early years, and the Portage Lake district of Houghton county, now much the most important portion of the field, was neglected because of the few fissure veins found crossing the stratified beds. The first successful mining on cupriferous beds was done by the Quincy, which made a success of an amygdaloid lode, and gradually other amygdaloid beds were developed. The first successful mine to be opened on a conglomerate bed was the Calumet & Hecla, in 1866, which remains the largest and most profitable mine of the Lake Superior district, and has paid greater dividends than ever declared by any other mining company in the history of the world, these exceeding one hundred millions of dollars.

The first efforts at smelting were made in 1846, when a small furnace was built, by Prof. Jas. T. Hodge, on the Gratiot river, in Keweenaw county. This ran for two short campaigns only, as selected copper rock, assaying about 20 per cent. metal, gave smelter returns of only 3.5 per cent. copper, showing that nearly five-sixths of the metal was lost in the slags. A second furnace was built about 1847, by the Suffolk Mining company, seven miles southeast of Eagle River, but this was not a success. In 1849, a third furnace was built, on Isle Royale, but never put in commission. Until about 1850 all lake copper was smelted in Baltimore, but in that year J. G. Hussey & Co. built a copper smelter at Cleveland, and a smelter was built in Detroit in the same year, and shortly thereafter a successful local smelter was built at Hancock, in Houghton county. About 1863 a smelter was built at Ontonagon, and previous to 1867 a small and unsuccessful smelter was built at Lac La Belle, in Keweenaw county. The Calumet & Hecla smelter, at Hubbell, was built in 1886, the Dollar Bay works in 1888, the Quincy smelter in 1898 and the Michigan smelter in 1904.

The Keweenawan formation in Michigan may be divided into four parts, the first including Keweenaw Point at the eastward, the second, comprising the Portage Lake or central district, which includes the Calumet and South Range fields, and practically Houghton county, while the mines of Ontonagon county, and the trans-Ontonagon extension in Ontonagon and Gogebic counties comprise the third field. The fourth district is Isle Royale, nearly all of the island showing cupriferous beds, with many old and idle mines, mainly small.

The richest cross-veins of Keweenaw county were at the western end, the most notable being developed by the Cliff, Central and Phoenix mines. The fissure veins of Keweenaw county usually cross the stratified beds at approximately right angles. The most promising copper ore body of the Lake district was opened, circa 1845, on the northeastern side of Bohemian Mountain, and some ore therefrom was shipped to Swansea. The ore was mainly bornite, with some massive chalcopyrite, occurring in an 18-inch vein. There are narrow fissure veins of ore, mainly arsenical, in the Mohawk mine of Keweenaw county, and also in the South Range mines of Houghton county. Chalcopyrite has been found in the Huron shafts of the Isle Royale mine, at Houghton, and at Copper Harbor, in Keweenaw county, two shafts were sunk, to a depth of about 20 feet each, on what was believed to be melaconite, and about forty tons of ore were extracted therefrom, the deposit apparently being merely a pocket. The green stains of malachite are found in many cupriferous beds, in the partly decomposed portions at or near surface, but it is altogether probable that the carbonates were evolved from native copper by weathering.

The Lake Superior copper formation, at least four hundred miles in extreme length, with one hundred and fifty miles in Michigan, on which more or less mining has been attempted, and about one hundred miles on which actual mining and development work is in progress, consists of a series of stratified beds, resulting from old lava flows. The Keweenawan series is a succession of extrusive lavas, more than two hundred in number, with intercalations of conglomerate, about thirty in number, and occasional intercalary sandstones. This formation has an average thickness of 25,000 to 30,000 feet in the main series, with a secondary series of conglomerates and sandstones outcropping in the Porcupine Mountains of Keweenaw county. Overlying the Keweenaw series, to the north and west, is a conformable sandstone, while to the east and south is an unconformable sandstone, equivalent in horizon to the Potsdam sandstones at the top of the Cambrian series. The Keweenawan series is of Algonkian age, and at the base of the Azoic or Archean system, lying above the Huronian ferruginous series, with a fault against which the copper strata are tilted. The entire series of beds, including both traps and conglomerates, has been tilted to angles varying from  $20^{\circ}$  to  $72^{\circ}$  with the horizon. The overlying sandstone shows small specks of copper, not in workable quantities, while the underlying unconformable sandstone shows occasional impregnations of native copper, and apparent evidence of igneous metamorphism, near the point of contact.

The Keweenaw Peninsula rises to an extreme height of nearly 800 feet above the waters of Lake Superior, and it is supposed that it once formed the shore of a sea, over which poured vast floods of lava, gradual subsidence bringing the lava beds beneath the sea. The conglomerates were supposed to be of sedimentary origin, but this supposition calls for no less than thirty subsidences and emergences of the Keweenawan series, which seems a strain upon the imagination, especially as there are only occasional patches of sandstone in place of the considerable beds that might be looked for in connection with the conglomerates, though some of the conglomerates shade into sandstone in spots, and the upper series of the Keweenawan formation, not mined at present, shows thick beds of sand-

stone, some of which are cupriferous. It is probable that the conglomerates are partly tufts of volcanic origin, though some undoubtedly are ancient sea-beds, formed by material laid down from rocks broken from adjacent shores. The Keweenawan series forms a syncline, of which the southern edge outcrops on the Keweenaw Peninsula, with dip to the north and northwest. The northern fold of the series outcrops on Isle Royale, with dip to the southeast. The axial line of the syncline runs somewhat north of east, but there is a marked divergence in the trend of the southern outcrops along the district where the principal mines are opened, the strike of the formation being approximately North thirty degrees East, in the Houghton county field, which produces nearly nine-tenths of the total copper output of the Lake Superior district.

Toward the middle of the Keweenaw Peninsula the western sandstone is lost under the lake, and at Bete Gris Bay the eastern sandstone also plunges beneath the waters, leaving the Keweenawan series in sole possession of the eastern tip of the peninsula. The eroded edges of the solid rock formations of the Keweenaw Peninsula usually slope, under glacial drift, to the shore lines. The district was glaciated from northeast to southwest, at a comparatively recent age, when considerable drift was deposited in the lower portions of the surface, much of the district being covered with sand, gravel and boulders ranging from a few feet to three hundred feet in depth. As a result of glaciation and erosion the harder strata, notably the green-stone of Keweenaw county, outcrop prominently, and there are moraines at various points on the southern and eastern side of the peninsula, with quicksands that are difficult to sink through. In many places, especially at the crests and escarpments of crystalline igneous strata, the naked rock stands out strongly, but the lower portions are covered with drift. From Keweenaw Point toward the south and west there is a considerable thinning of the flows, with a corresponding thickening of the conglomerates. In addition to the main series of the Keweenawan belt, consisting principally of eruptive rocks, where is a second series, mainly of sedimentary rocks laid down at a later period, this second series being found in the Porcupine Mountains of Keweenaw county, and apparently resulting mainly from the breaking down of the eruptive rocks of the preceding formation, with redeposition of detrital material so secured, in the form of conglomerates and sandstones, mainly the latter. Rich cupriferous conglomerate float has been found from time to time in the Porcupine Mountains, but the bed has not been found in place. The Nonesuch shales and sandstones of the Porcupine belt contain very finely comminuted copper, with occasional silver.

The Keweenawan formation shows extensive fissuring, more notably in the middle and eastern portions of Keweenaw county, and there is considerable faulting. The longest throw that has been noted is 284 feet, on the east vein of the Central mine, in Keweenaw county, along the Kearsarge conglomerate, estimated as equivalent to a movement horizontally northward of more than two and one-half miles.

The dip of the strata of the Keweenawan series varies greatly from point to point along the strike, and in any given cross-section is sharpest along the eastern sandstone, and flattest along the western sandstone, an evidence of thrusting exerted from the direction of the eastern or Potsdam sandstone. The contact between the Keweenawan rocks and the eastern

sandstone shows the latter much tilted from the horizontal position occupied a short distance further east, the sandstone standing almost vertically at some points adjoining the eruptive rocks. At the Delaware mine, in Keweenaw county, the average dip of the Keweenawan beds is about  $20^{\circ}$ ; at the Arnold mine, about  $25^{\circ}$ ; at the conglomerate mine of the Calumet & Hecla, in northern Houghton county  $37^{\circ} 30'$ ; at the Osceola mine,  $41^{\circ}$ ; at the Franklin Junior mine,  $47^{\circ}$ ; at the Quincy mine,  $51^{\circ}$ ; at the Arcadian mine,  $53^{\circ}$ ; at the old Atlantic mine,  $54^{\circ}$ ; at the Isle Royale mine,  $59^{\circ}$  and at the Baltic mine,  $72^{\circ}$ .

The Keweenawan series, in Houghton and Keweenaw counties, may be divided lengthwise into three approximately equal parts. The flows of the upper third, lying to the north and west, have developed no paying mines. In the second series, including the beds approximately from the Atlantic to the Osceola amygdaloids, there are a number of successful mines, including the conglomerate mine of the Calumet & Hecla, while the lower third includes the Kearsarge and Baltic amygdaloids, which have shown the greatest persistence in retention of payable mineral values along their strikes, of any of the cupriferous beds yet opened in the Lake Superior district.

In the matter of arsenic, which is a deleterious element that is giving considerable trouble to many of the Lake mines, there are certain rules that seem to hold good in most cases, though with possible exceptions. The first of these rules is that arsenic increases with depth. In the cases where no arsenical cross-veins have been noted in the mines affected, it is possible that the increase of arsenic comes from the gangue. The second rule is that there seems, in the district from Portage Lake to the southern end of Keweenaw county, an increase in arsenic from south to north. The third rule, which is based on indubitable evidence, is that in any given cross-section the percentage of arsenic in the copper secured increases from the upper to the underlying flows, in a fairly steady ratio, the copper produced from the felsitic beds at the base of the series being notably arsenical.

A cross section of the Keweenawan series at any given point would show a large number of trap and conglomerate strata, varying greatly in thickness and of unusual persistence both as to length and depth. There necessarily must be an end to even the most extensive lava flow, and owing to inequalities existing on the land-surface and sea-bed over which these old flows were spread, any given stratum may be cut out temporarily, to reappear, at greater depth, or to either or both sides of the point of disappearance. The conglomerates afford the geological bases of measurement for the series, these being much more readily distinguishable than the trap beds, owing to cleaner walls and divergence in appearance from the surrounding and more numerous trap strata, and the correlation of cupriferous beds by means of measurements of the conglomerates has made great progress during the past decade. The conglomerates are composed of rounded pebbles of igneous rock, cemented mainly by reddish and yellowish particles of quartz-porphyry. The Calumet & Hecla conglomerate is felsitic. Of the conglomerate beds many carry copper in minute quantities, but only two have been mined seriously, these being the Calumet and Allouez conglomerates, of which the former has made the greatest mining success of the district, while the latter has been, on the whole, a failure.

The lava flows of the Keweenawan series have experienced long continued metamorphic action, producing amygdaloidal structures in the upper portions of the various beds, and these amygdaloidal portions of the trap flows, mainly melaphyrs, carry native copper as replacements of amygdules leached out, as irregular masses in beds or along contacts between different strata, and in fissure veins. Nearly all of the amygdaloids carry some copper, but the majority are too low in tenor to be workable.

The lava flows, as a rule, are composed of dark basaltic rock with the texture of diabase. Felsite rock are of rare occurrence, except in the lower part of the belt, the basal series being felsitic. The chief original minerals are felsite, augite, magnetite and olivine, the typical rock containing about 55 per cent. felsite and 30 per cent. augite, the balance being composed of magnetite, olivine and allied secondary minerals, the base of each flow being more augitic than the amygdaloidal upper portion. Of the basaltic rocks an average type would contain about 45 per cent. silica, 15 per cent. alumina, 13 per cent. iron oxide, up to 10 per cent. calcium, about 10 per cent. of combined sodium and magnesium, and one to two per cent. each of carbon dioxide, titanic oxide and water. According to Lane the formula of the average amygdaloidal rock, deprived of its copper, might be written  $\text{CaO} \cdot \text{MgO} \cdot \text{Na}_2\text{O} \cdot \text{FeO} \cdot (\text{Fe}, \text{Al})_2 \cdot \text{O}_3 \cdot 4\text{SiO}_2$ . Both amygdaloids and conglomerates carry much epidote, and other minerals, notably calcite, occur in connection with copper, calcite crystals that carry occluded crystallized native copper being fairly common, while some occurrences are among the largest and most perfect specimens of crystallization afforded by the mineral world. In the typical amygdaloids there are considerable quantities of prehnite, laumonite and other related silicates.

The genesis of the native copper deposits of Lake Superior remains obscure, and none of the theories provided by scientists is absolutely satisfactory, though synthetic laboratory experiments lend corroborative evidence to the theory more commonly accepted that the metal was deposited in native form from sea-water, where it had been held in solution. Dr. Koenig has found mine-waters depositing copper at the bottom of the Quincy mine, where the waters are strong brines, carrying considerable bromine. In the upper workings of the Lake Superior mines, to a depth of about 1,000 feet, the mine-waters are soft, or slightly hardened by sodium silicate. Below this depth the waters become briny with sodium chloride and calcium chloride, the latter increasing rapidly with depth, while below a half-mile the mine-waters contain a few grams of copper chloride per ton, and deposit copper therefrom as opportunity offers. Carbon dioxide is lacking almost entirely from the deep mine waters of the district. It seems probable that the native copper was deposited by sea-waters from sulphide solutions through chloride reactions. Such a reaction has been found in nature in New Zealand, where the sulphide ores of a mine abandoned for forty years were found partly transformed to native copper, by the action of the sea, which had broken into the workings. Another theory, quite commonly held, is that the metal was included originally in the magma of the basic lavas and was deposited in its present form by local concentration and metasomatism. Lava flows somewhat similar to those of the Keweenawan series carry native copper in Alaska, Newfoundland and elsewhere.

Metallic copper is found in all rocks of the Keweenawan series, including the superimposed western sandstone, and along the contact of the unconformable eastern sandstone as well, but excepting the sedimentary secondary series of the Keweenawan belt, in the Porcupine Mountains, none of the sandstones contain copper in workable quantities. The metal is found in both traps and conglomerates of the main series, the metal of the conglomerates occurring largely as cementing material. Copper occurs occasionally in the very dense trap rocks, but is found more commonly in the more open upper portions of the trap flows, where the amygdalules have been leached out and replaced to greater or less extent by the native metal. It is obvious that the amygdaloidal portions of the flows were much more suitable for the physical reception of the metal than the extremely dense traps at the base of each flow.

In the amygdaloidal cupriferous beds the copper usually favors either the foot or hanging wall, but occasionally, in wide beds, occurs in streaks toward the centre, and usually is disseminated more or less irregularly through the entire width of the amygdaloid, but, with a tendency, perfectly natural in view of the physical structure of the amygdaloidal traps, to favor the hanging wall. Occasionally the mineralization is so strong that the dense basal portion of the superincumbent trap flow forming the hanging wall has been impregnated with fine copper for a few inches, or even for a number of feet, and is found workable for its metallic values.

The percentage of copper contained in the rock decreases in all mines opened to more than 4,000 feet in depth. As a rule, the amygdaloid mines usually show decreased values below a depth of about one-half mile. The payable cupriferous beds show copper courses in practically all instances, these being diagonal chutes of richly mineralized ground descending on the plane of the bed with a rake about midway between the strike and dip. Apparently the beds themselves will continue, in practically all cases, to much greater depth than mining is possible. The ultimate depth of mining cannot be foretold with any certainty, in view of the steady progress that is being made in knowledge, methods and equipments. The deepest mines of the world are in this district, the Tamarack having a vertical shaft of nearly one mile depth, while the Calumet & Hecla has a shaft sunk at an angle of  $37^{\circ} 30'$  that is 8,100 feet in depth, with a winze of 190 feet sunk from the drift on the bottom level of this shaft. The great heat and briny waters found at the bottoms of the deep mines render work somewhat difficult, and these factors, combined with increased hoisting and mining costs, coincident with decreased copper contents, must, of necessity, eventually furnish a bottom for even the most ambitious of mines.

Considerable silver is carried in connection with copper in many of the Lake Superior mines. The mines of the Evergreen belt, in Ontonagon county, are the richest in silver, followed by the mines in the immediate vicinity of Portage Lake in Houghton county. The silver is mechanically admixed with the copper, but the two metals are not alloyed.

Various theories of cross-sectional mineralization in zones are held by students of this field, but none of them have been fully elaborated, and while there seems some basis for such theories, there are conflicting features precluding their full acceptance at present.

Throughout the native copper district of Lake Superior there are puzzling magnetic earth currents, these being most marked on Isle Royale

and near Duluth, and the aberrations of the mariner's compass are such that navigation is rendered somewhat difficult, and even dangerous, at times. In this connection it may be stated that the first wireless telegraphy was done in Ontonagon county, Michigan, by Ayers Stockley, shortly after the laying of the first successful Atlantic cable in 1866. Mr. Stockley used crude home-made apparatus, but succeeded in transmitting telegraphic messages correctly, for a distance of nine miles, by utilizing the magnetic earth currents traversing the cupriferous strata.

While practically the entire copper production of Michigan is from the native metal, nearly all of the principal commercial copper ores are found in the native copper district, and copper ores are found in many other counties of the Upper Peninsula of Michigan. The list of Michigan copper ores includes cuprite, melaconite, azurite, malachite, chalcocite, bornite, chalcopyrite, chrysocolla, algodonite, domeykite, whitneyite, mohawkite and keweenawite.

The active copper mines of Michigan are in the three counties of Keweenaw, Houghton and Ontonagon, with a considerable number of old and idle mines in Isle Royale county. The Keweenawan copper belt extends through the Wisconsin boundary through Gogebic county, and small quantities of chalcopyrite are noted in several of the iron mines of this county.

In Baraga county there is an isolated outlier of the Keweenawan formation, known as Silver Mountain, and the same formation, carrying native copper, is noted on the Huron Islands.

Native copper is said to have been found near Perkins, Delta county, but the discovery does not seem of commercial importance.

Native copper, evidently brought by glacial action from the Keweenawan measures to the north, has been found in drift above the iron ore body of the Cyclops mine, at Norway, Dickinson county, and chalcopyrite is noted in small quantities in connection with hematite in the Emmett mine, and also in the Chapin mine at Iron Mountain, in this county.

Copper ore has been reported from the vicinity of St. Ignace, Mackinaw county, but the occurrence has not been fully verified.

In Marquette county chalcopyrite and native copper occur on Presque Isle, in the city of Marquette and chalcocite is noted on Mount Mesnard and on the Chocolay river, near the same town, while a variety of copper ores occur near Sauk Head. Small quantities of copper sulphides are found in the gold mines north of Ishpeming, and the granite rocks extending from the serpentine lying north of Ishpeming to the shore of Lake Superior show numerous gash veins carrying copper ores and other minerals.

In Menominee county copper ores have been found near Carney, and some attempts at mining have been made thereon.

**MINNESOTA.** The western continuation of the Keweenawan cupriferous series extends from the Upper Peninsula of Michigan across northern Wisconsin into Minnesota. The northern fold of the Keweenawan syncline is noted in Cook and St. Louis counties, north of Duluth, where attempts at mining have been made. There also are promising bodies of sulphide copper ore, near Lake Superior, in this county. In St. Louis county, in 1900, a mass of native copper in sheet form, weighing about 100 pounds, was found embedded in iron ore, at a depth of 300 feet below the surface, in the Montana shaft of the Minnesota Iron Co.

The southern fold of the Keweenawan syncline extends into Pine and Chisago counties, shortly north of St. Paul and Minneapolis, and several tentative efforts at mining have been made in these counties, native copper being found near Hinckley, Pine county, and native copper and malachite occurring in Chisago county.

**MISSOURI.** This state has a producing copper mine in Madison county, and has old mines or attempts at mines in the counties of Benton, Clare, Cole, Cooper, Crawford, Dade, Dallas, Dent, Franklin, Greene, Iron, Lawrence, Marion, Ste. Genevieve, St. Francois, Shannon and Washington, and also shows copper ores in the counties of Jasper, Jefferson and Wright. Copper ores are noted mainly along the Ozark uplift, in the southern part of the state, and in the lead district of southeastern Missouri.

The first copper production of Missouri was made in 1837, from carbonate ores, and at various times smelters have been erected in Crawford, Madison, Ste. Genevieve and Shannon counties. Franklin county once had a small copper producer, near Sullivan, but the output was very small. Native copper and various ores are found in the Stanton mine in this county.

In the Circle Diggings of Cole county, malachite, azurite and chalcopyrite are found, and a limited production has been made from this district.

The Collins mine, in Cooper county, shows chalcopyrite and carbonate ores.

The Cherry Valley mines of Crawford county have produced a small quantity of malachite.

In the zinc and lead mines of Jasper county a little chalcopyrite and occasional native copper occur in connection with sphalerite.

In Ste. Genevieve county, near the Mississippi river, attempts at mining were made previous to the American Civil War.

Shannon county has sulphide copper ores and in 1901 was the scene of a short-lived copper boom.

The principal copper mining operations of both past and present are noted in Madison county, in southeastern Missouri, which long has been an important lead field, being the site of the Mine La Motte, the oldest American lead mine west of the Alleghany Mountains. In 1863 copper mines were opened at Cornwall on parallel blanket veins of disseminated chalcopyrite with cherty gangue, having a country rock of Silurian limestone, and some little production was secured from this property. Chalcopyrite is noted occasionally in connection with sphalerite, pyrite and small quantities of nickel and cobalt sulphides, in the Mine La Motte. To the southward of the Mine La Motte, and about two miles east of Fredericktown, is the Buckeye mine of the North American Lead Co. On this tract the Buckeye copper mine was opened in early days, and produced a little ore. The present company opened a new mine, for lead, but at depth this has yielded an increasing quantity of chalcopyrite, and this ore became so common that a smelter has been erected for its treatment. The chalcopyrite averages about 6 per cent. copper after selection, and carries combined nickel and cobalt values, mainly the latter, to the extent of about 3 per cent. The country rock in the vicinity of Fredericktown is limestone, of various ages from Carboniferous to Cretaceous, with bosses of intrusive granite-porphry, the ore occurring as irregular contact deposits, in limestone, near the contact with igneous intrusives. I have found copper ore in

all directions from Fredericktown, and believe this district to be one of the most promising copper fields between the Mississippi river and the Rocky Mountains.

**MONTANA.** This state has copper mines or attempts at mines in the counties of Beaverhead, Broadwater, Cascade, Deer Lodge, Flathead, Gallatin, Granite, Jefferson, Lewis & Clarke, Madison, Meagher, Missoula, Park, Powell, Ravalli, Silver Bow, Sweetgrass and Teton. The Butte camp in Silver Bow county is overwhelmingly preponderant in importance, being the largest and most important copper district of the world.

The mines of Jefferson county, which are found principally in the vicinity of Corbin, Clancy and Basin, seem next in promise to those of Silver Bow county, though production is not large as yet.

Missoula county, in the extreme western part of the state, carries the eastern extension of the Cœur d'Alene copper belt of Shoshone county, Idaho, with similar geological conditions, and at present, is a district of small development but considerable promise.

Meagher county has a number of small attempts at copper mines, including copper deposits in shale near White Sulphur Springs.

The Butte camp of Silver Bow county dates from 1863, when placer gold mining was begun. This was followed by silver mining in the following year, and copper was first discovered by crosscutting at depth from the shafts of the silver mines. The increasing percentage of copper in several of the silver mines in the western part of the camp led, in 1879, to the building of the first copper smelter by Senator W. A. Clark, the product being a highly argentiferous copper matte, in which the principal value was silver, the copper being used mainly for a carrier. In 1880 the Parrot and Boston & Colorado mines were making argentiferous copper matte, and in 1881 the great Anaconda mine was opened, treating ore at first that averaged about 30 oz. silver per short ton, the silver bullion being very base and containing about half copper. In 1882, at a depth of about 300 feet, the Anaconda found massive chalcocite in a crosscut, and from this find a considerable shipment of 50 per cent. copper ore was made to Swansea. From that date copper production increased rapidly, while the output of the silver mines has declined, though Butte became a much larger silver producer than ever before, owing to the metal secured as a by-product from the copper mines.

The Butte camp is known officially as the Summit Valley district, but this name is used rarely. The town is in the heart of the Rocky Mountains, and, in addition to being the largest copper camp, is the second largest mining camp of the world, ranking immediately after Johannesburg, while if white population only were counted, Butte probably would lead its South African competitor. In addition to the city of Butte, with nearly 75,000 people, that has grown up around the shafts, the copper industry of this camp supports the smelting towns of Great Falls and Anaconda, with nearly 20,000 people each.

The Butte camp is approximately a rectangle of four by seven miles, but the district as now proven is approximately two miles wide and three miles in length from east to west, the principal production coming from an area that is approximately one and one-half miles north and south by two miles east and west. The deepest shaft of the district is 2,800 feet,

showing good ore on the bottom level. Developments since the beginning of the century have increased considerably the area in which rich mines are opened, and, in addition, work of an exploratory nature has shown promising bodies of copper ore outside of the area formerly considered as including all of the possibly productive ground. The new developments have been mainly to the eastward.

The development of mines in this camp was seriously hampered for many years by the most extensive, bitter and protracted litigation to be found in any mining district, but, happily, this was settled in 1906, by a compromise in which both principals saved face, while benefiting by the cessation of litigation that was costing an average of nearly \$2,000,000 yearly.

The Butte district shows an extensive area of igneous rocks of Tertiary age, with later intrusives. The oldest rock is a dark basic granite, or quartz-monzonite, known as the Butte granite, surrounded by altered limestone and other sedimentaries, and partly covered by andesite, the copper veins, so far as known, occurring exclusively in this rock. The Butte granite is cut by dykes of an intrusive, probably of the Eocene period, known as the Blue Bird granite, and aplite of later age. There is a still later intrusive of rhyolite-porphyr or quartz-porphyr, known locally as the Modoc porphyry. The older rocks are faulted by intrusive fracturing, producing fissures with a generally east and west trend. Those were faulted by prolonged volcanic activity, and are cut by intrusive rhyolite, conforming in trend with the dykes. The big butte north of the town, from which the city takes its name, is an eroded remnant of a small rhyolite volcano.

The mineralized veins in the northwestern portion of the camp, which were first to be mined, carry mainly silver and zinc values to the depths yet worked, but there are strong indications of increasing copper values at the bottoms of the deeper shafts. The most productive copper veins, which have a generally east and west trend, give poor surface showings, and, as a rule, are almost entirely barren to depths of 300 to 500 feet, and occasionally to a depth of 1,000 feet. The outcrops of these veins are decidedly unpromising in appearance, and gossans are almost entirely lacking. There are lower fissures, causing displacements of both the cupriferous and argentiferous veins, but these are poorly mineralized, as a rule. The silver veins show rather prominent gossans.

At depth there is a tendency of the wider copper veins to split into smaller parallel veins, separated by country rock that is considerably altered and somewhat mineralized. There also is an increase at depth in the number of smaller mineralized fissures, while some of the fault veins not mineralized in the upper workings carry good values at depth. The veins are very erratic in size, with many pinchings and bulgings from point to point, and with a general tendency toward increasing width at depth, this being followed by forking of the veins. The walls are poorly defined in many cases, and frequently are more or less mineralized. The heart of the Butte district forms almost a gigantic stockwerk.

No important copper district now worked shows such extensive alteration as is noted in the Butte camp. The process of secondary enrichment has been carried on so long, and so actively, that the gossanas of the copper veins, undoubtedly large and prominent at one time, have

been lost almost entirely, through the combined effects of leaching and erosion. The leaching process has been so thorough that the principal copper veins show but slight traces of values for hundreds of feet from surface, but, in compensation, the zone of secondary enrichment is the deepest found in any important copper camp, and massive chalcocite, in large bodies, has been found at a depth of 2,400 feet below surface, while the deepest shaft in the district shows secondary sulphides of good average tenor on its bottom level. There is, however, a general tendency toward decreased values with depth, as in all other mining fields, but the greatly decreased average tenor of the copper ores of Butte, as now smelted, is due partly to other factors than actual impoverishment of ore at depth, the most important of these causes being the greater thoroughness with which mineral values are extracted, the scrapping of ore left standing from early mining operations, and the vast improvement and cheapening of metallurgical processes, by reason of which it is now possible to work at a profit ores that were absolutely unpayable only a few years ago. The tenor of ore produced by the leading mines, except North Butte, shows a marked decline from the figures noted at the end of the Nineteenth Century, present extraction averaging as low as 2.5 to 3 per cent. copper from several of the more important mines.

The principal copper values of the Butte district are found in chalcocite and enargite, which furnish about 90 per cent. of the total production of the camp. Chalcocite occurs massive, in immense veins, also disseminated in granules. There is considerable bornite, which occurs extensively in the western mines, but is found sparingly in the eastern properties. The mines also produce considerable quantities of chalcopyrite and cupriferous pyrite, with more or less tetratedrite and tennantite. The large amount of enargite smelted is responsible for the heavy arsenical fumes from the Washoe smelter, it being estimated that upwards of 30,000 tons of arsenic pass off yearly in the smelter fumes from the Washoe works.

The gangue of most of the ore bodies is granitic or siliceous, consisting largely of altered country rock. The veins frequently show considerable fluccan, but, as a rule, partings are poorly defined, the ore fading into the country rock, which is impregnated to some distance on either side of the vein. The ores are highly silicious, averaging about 55 per cent. silica, 15 per cent. iron oxide and 10 to 15 per cent. sulphur, the high grade ores ranging 5 to 15 per cent. copper, with an average tenor of about 6 per cent., while 90 per cent. of the production of the district, excepting North Butte, is concentrating ore averaging 2 to 4 per cent. in copper tenor.

In addition to the ore bodies now worked there are immense deposits of ore of a grade still lower, and of a tenor too low to permit profitable working at present, though it is probable that eventually these ores will be extracted and treated at a profit.

While the Butte district has shown a marked tendency toward decreased values within the past decade, a similar tendency is noted in most other districts, and Butte, far from being a decadent camp, bids fair to hold its position at the head of the copper districts of the world for years to come.

**NEVADA.** This state has copper resources of prime importance

under development, and the Ely field promises to make a copper camp of the first magnitude, while developments elsewhere, notably in the Yerington district, are of promise. The state has copper mines, or attempts at mines, in the counties of Elko, Esmeralda, Eureka, Humboldt, Lander, Lincoln, Lyon, Nye, Storey, Washoe and White Pine. With the improvement in general mining conditions, brought about by the discovery of the gold bonanzas of Tonopah and Goldfield, and the improved facilities given by construction of new railroad lines, copper mining is making substantial progress.

In Esmeralda county the Sodaville and Mina copper districts are at the northern end of the Pilot Mountains, showing a contact zone of about twelve miles length, on the borders of a granite intrusive.

In Humboldt county there are promising copper deposits in the vicinity of Winnemucca, and in the Jackson Mountains, circa 60 miles north of Humboldt.

The Bunker Hill district, in the northwestern part of Lincoln county, shows nickel-copper ores, somewhat similar to those of Sudbury, with an average of about one-third ounce of platinum per ton of ore, in some cases.

The Yerington district, in Lyon county, circa 20 miles southeast of the Comstock lode, is in the Mason Valley Mountains, a small range of about 25 miles length and 5 miles width, with an extreme elevation of 6,500 feet. The core of this district is an intrusive granite, exposed by erosion in the higher peaks and deeper cañons, and covered by metamorphosed sedimentary strata on both slopes, with rhyolite flows along the eastern base. Copper ores occur in fractures and shear zones, and as bedded veins in dolomitic limestone, also as impregnations in limestone of Carboniferous age. The ores found in the dolomitic limestone are mainly oxidized, with quartz and calcite gangue, while the Carboniferous limestone shows mainly chalcopyrite, with a little chrysocolla and covellite in the oxidized zone, but the secondary sulphides, chalcocite and bornite, are found rarely. Owing to the heavy limestone gangue, carrying garnet and epidote, concentration is not effected readily, and the ores must be considered upon a smelting basis. Fortunately ore charges of about two-thirds sulphides and one-third oxides and carbonates are self-fluxing. Water supplies are available from the Walker river and from artesian wells.

In Nye county the Lone Mountain district is roughly eight miles wide by about twenty miles in length, showing at the northern end a monadnock lying about fourteen miles west of Tonopah. This district carries gold, silver, copper and lead ores.

In White Pine county the Robinson district, as it is called officially, but more commonly known as the Ely camp, is a low grade district of very unusual promise. This field, as now proven, is a belt of about one mile width by six miles length, having a generally easterly and westerly trend, transverse to the Egan Mountain range. There is an intrusive monzonite-porphyry of post-Carboniferous age cutting Carboniferous sedimentary strata, with intrusive monzonite dykes, copper deposits occurring in both the monzonite and the sedimentary strata adjoining. The principal ore body is that portion of the monzonite-porphyry lying under the zone of oxidation, and apparently is about 400 feet in thickness. According to

Prof. Lawson the workable ores are tertiary and not secondary, having resulted from the leaching of the former secondary ores of the oxidized zone. The porphyry mass shows large quartz blowouts that cover nearly one-third of the porphyritic area, these occurring mainly along the contact between the monzonite and limestone. The limestone on the northern flank of the porphyry shows small bodies of slightly argentiferous lead ore, and on the southern flank of the intrusive monzonite gold ores are found, in the sedimentary beds. The monzonite ores of the principal Ely mines sample 2.32 to 2.6 per cent. copper, 0.03 to 0.05 oz. silver and about 40 cents gold per short ton.

**NEW HAMPSHIRE.** Copper ores are found at a number of points in this state, especially in Grafton county, where more or less mining has been attempted. Occurrences of copper are noted at Bath, Franconia, Haverhill, Littleton, Lyne, Oxford, Warren and Woodsville in Grafton county, near Jackson and Madison in Carroll county, at Westmoreland, Cheshire county and at Croydon and Unity in Sullivan county.

**NEW JERSEY.** This state has copper deposits in the counties of Bergen, Hudson, Mercer, Middlesex, Passaic, Somerset, Sussex, Union and Warren, and more or less mining has been done in several of these counties, the principal operations having been near Arlington, Griggstown and Somerville. The Schuyler mine near Arlington, Hudson county, was the first New Jersey copper mine, and apparently was the second in the British colonies that later became the United States. This mine, only eight miles from New York city, was found in 1719 by a negro slave of the Schuyler family, which was made wealthy therefrom. The first steam engine in the United States was a pump of the Newcomen type, installed at this mine, and the first machine shop in the country was built in 1794 near Belleville, New Jersey, by the owners of this mine, and the first American copper smelter was built in connection with this mine. The property was a fairly steady producer until the American Revolutionary War, and thereafter was worked intermittently, being in the hands of an English company for some time after peace was restored between England and the United States. In the Arlington district there are cupriferous sandstones overlying trap beds, with impregnations of copper in shale adjoining the trap. Except in Warren county the New Jersey copper deposits occur in amygdaloidal traps, and in Triassic sandstone and shale adjoining traps.

In Somerset county, in eastern New Jersey, copper occurs in red beds of Triassic age, associated with intrusive diabase, showing oxidized ores above, with sulphides occurring at a depth of about 600 feet, while below a depth of 600 feet native copper and occasionally chalcocite in bunches are found, giving strength to the theory that the oxidized ores above are alteration products from native copper. The main ore bed varies from 3 to 15 feet in thickness, and has been traced five miles and worked more or less for that distance. At one mine there is an incline shaft of 2,360 feet in depth. Enough copper was secured from a mine near Bound Brook to cast a brass cannon for the American army, during the Revolutionary War.

In Pahaquarry township, on the Delaware Water Gap, in Warren county, the northeastern slope of the mountain shows red shales and Medina sandstones, some of the gray sandstones interbedded with red

shale carrying impregnations of chalcopyrite, cementing the grains to the extent of one to two per cent. copper. These beds aggregate fully 200 feet in thickness, and may become highly valuable at some future time, when ores of lower tenor than now worked will be available commercially.

**NEW MEXICO.** The first New Mexican copper mining in historic times apparently was done in the Santa Rita district, Grant county, about the beginning of the Nineteenth Century. Mining development, after the territory passed under American control, was hampered somewhat for many years by the old Spanish system of land titles, but this trouble has been remedied, in the main. New Mexico shows extensive areas of Permian red beds carrying finely disseminated copper ores in sandstones and shales and has copper ores in nearly all parts, copper occurrences being noted in the counties of Chaves, Colfax, Donna Ana, Grant, Lincoln, Mora, Otero, Rio Arriba, Sandoval, San Miguel, Santa Fé, Sierra, Socorro, Taos, Union and Valencia.

Donna Anna county has promising copper deposits in the Oro Grande Mountains, about 15 miles northeast of Las Cruces, and in the Organ district has copper mines on contact deposits between metamorphosed limestone and igneous intrusives.

In Otero county there are mines of copper in the Jarilla Mountains, with considerable development under way in the vicinity of Orogande.

Rio Arriba county has extensive copper deposits in the Bromide district. These apparently are of low average tenor, though of considerable size, but have been developed only slightly.

In Sandoval county chalcocite is noted, in Triassic sandstones, in the Nacimiento district.

Socorro county is large and has a number of copper districts of various degrees of promise, including the Cooney, Kelly, Magdalena and other districts in the Mogollon Mountains, also copper fields in the Socorro and Oscura Mountains. The Cooney district, on the western side of the Mogollon Mountains, in the southwestern corner of the county, shows dacite flows, cut by rhyolite dykes, copper ores occurring in brecciated fissures near contacts, and as true fissures that carry argentiferous secondary sulphides and gold in the oxidized zone.

Taos county has pre-Cambrian deposits of sulphide copper ores associated with sphalerite.

Grant county is the source of the principal copper production of New Mexico, and has two important fields, and several others of promise. Among the new fields the Hachita district shows promising properties.

The Lordsburg district of Grant county is about eight by eighteen miles in extreme area, and is located in the Pyramid Mountains. The development of this field dates from 1870, and its history is filled with ups and downs. The Pyramid range apparently dates from about the close of the Tertiary age, showing fissure veins and shear zones carrying all of the common oxides and carbonates, secondary sulphides and chalcopyrite, with considerable galena, occasional sphalerite and cerussite, and a variety of silver ores.

The Santa Rita district of Grant county was the scene of the first copper mining in this territory. This district shows an underlying core of igneous rock, with an overlying bed of quartzite impregnated with oxidized ores and occasional native copper, some sulphide ores occurring

in the underlying porphyry. Although mining has been done in this district for about a century, the workings were merely superficial until a deep shaft was begun in 1906.

The Burro Mountain district of Grant county is the most important in the territory. This field lies about fifteen miles south of Silver City, at the base of the Burro Mountains, and mining dates from 1879. Several small copper smelters were erected in the ninth decade of the Nineteenth Century, but the most important development dates from about 1903. The Burro Mountains are a short isolated range of only about five miles extreme width by ten miles length; showing narrow veins of cupriferous pyrite in porphyry, and associated deposits of disseminated chalcocite, with some ore bodies of unusually large size carrying sulphide ores of low average tenor, frequently zinciferous and refractory. The mineral values occur principally in chalcocite and cupriferous pyrite, with small quantities of gold and silver. The sulphides average 3.5 to 4 per cent. in copper tenor, and there are some oxidized ores, but the zone of oxidation is quite shallow.

**NEW YORK.** The only copper mine ever opened in the state of New York was at Canton, St. Lawrence county, but this never became an important producer. There are occurrences of ore, however, at numerous other points in the state. Chalcopyrite is found in the Ancram and Beckee lead mines in Columbia county; at Crown Point in Essex county; at Alexandria and Antwerp in Jefferson county; at Salisbury in Herkimer county; at Ladentown, Rockland county, where malachite and cuprite occur in the seams in the trap; at Ellenville and the Red Bridge lead mines in Ulster county; cuprite, azurite, malachite and chalcopyrite occur in the vicinity of Concklingville, Saratoga County; at Chester, Warren county, and at East Chester and Ossining in Westchester county.

**NORTH CAROLINA.** This state has copper in the counties of Alexander, Alleghany, Ashe, Buncombe, Cabarrus, Caldwell, Catawba, Chat-ham, Clay, Davidson, Gaston, Granville, Guilford, Jackson, Lexington, Lincoln, Madison, Mecklenburg, Mitchell, Montgomery, Moore, Person, Randolph, Rockingham, Rowan, Stanley, Swain, Transylvania, Wautauga, Wilkes and Yadkin. As a rule the ores occur in mountainous districts near the contacts of basic rocks altered to hornblende-schists, which apparently were the source of the metal, and which still contain small quantities of chalcopyrite and pyrite. The ores of North Carolina are mainly sulphides, but native copper and practically all of the commercial ores of copper, as well as many rare minerals, have been found. Copper mining was followed to a small extent previous to the American Civil War, mainly in Ashe and adjoining counties. The state is notably rich in available water powers, which should prove valuable in the development of its mineral resources.

The Virgilina district lies along the border of Virginia and North Carolina, including the counties of Person and Granville in the latter state. The length of this belt is about twenty five miles, with a width of about three miles. The Virgilina district is in the sub-Piedmont division of the Appalachian belt, and contains a number of small mines of some promise.

In the same division of the Appalachian belt, but some distance to

the south, is found the Gold Hill district of Rowan county. This field was worked originally for gold, yielding about \$3,500,000 from 1842 to 1893, inclusive, but the mines eventually were closed down, because of change of values at depth from gold to copper. The district is about one mile wide and twenty miles long, lying on a plateau of the Piedmont Mountains. The predominant copper ore is chalcopyrite, with gangue of quartz and decomposed schist. The outcrops of prominent ore bodies carry one to twenty per cent. copper, and some ores can be concentrated ten into one. The average sulphide ore of this district carries 2 to 4 oz. silver and 50 cents to \$2 gold per short ton. The ore occurs in fissure veins, the secondary zone carrying considerable native copper and rich oxides and carbonates. The deepest workings are nearly 1,000 feet.

In Webster county, in the Cullowhee district, there is one producer and several developing properties of promise. This field shows lenticular bodies of chalcopyrite with quartz and corundum gangue, and prominent gossan cappings in a fracture plane following a basic band in schist.

**NORTH DAKOTA.** Copper was reported December, 1906, as occurring in this state, but a satisfactory verification of the statement has not been secured.

**OHIO.** Small masses of native copper, brought from Lake Superior by glacial action, are found occasionally in drift in this state, and native copper ingots and ornaments are taken from mounds built by a prehistoric race, but, so far as known, no copper has been found in place.

**OKLAHOMA.** Copper ore has been found in small quantities at several points in the state of Oklahoma, notably in the mountains of Woods and Woodward counties, where auriferous copper ores have been found, but no mines have been developed.

**OREGON.** Copper ores are found in this state in the counties of Baker, Douglas, Grant, Jackson, Josephine, Lynn, Marion, Umatilla, Union and Walla Walla. Oregon enjoyed a small share of the California copper boom of 1860-1868, when there was considerable activity in southwestern Oregon, notably in Josephine county, where a smelter, one of the earliest on the Pacific coast, was built for treating oxidized copper ores. Josephine county carries the northern extension of the Coast Range copper belt found in Siskiyou and Del Norte counties of California. This belt, about 25 miles wide and approximately 50 miles long, shows large copper veins, usually carrying fair gold values near surface. The ore is mainly chalcopyrite, with occasional bornite, disseminated in pyrite and pyrrhotite. The district has one small but modern smelter, which can work only four to five months yearly, because of the heavy snows and rains that render the mountain roads impassable except in the summer.

Baker county, in eastern Oregon, has a number of developing copper properties of considerable promise. This county carries the western extension of the Seven Devils district of Idaho, along the Snake River. The copper deposits occur mainly in basaltic flows; interbedded with sedimentary rocks of Triassic age, showing fine grains of chalcocite and bornite, with occasional chalcopyrite, in lavas and tuffs, the mineralization apparently following the jointing planes.

The copper production of Oregon is small, but promises to increase.

**PENNSYLVANIA.** This state has copper ores, and in several cases old copper mines, in the counties of Adams, Berks, Bucks, Chester, Co-

lumbia, Lancaster, Lebanon; Montgomery and Philadelphia. The first copper producer of Pennsylvania was the Gap mine in Lancaster county, which was opened as a copper mine, late in the Eighteenth Century, and as such was a failure, but was reopened as a nickel mine, circa 1850, and was a successful producer of that metal, with a small incidental output of copper, until 1893, when it was closed by the competition of the richer nickel-copper mines of the Sudbury district of Ontario. The old mines at Cornwall, in Lebanon county, show native copper, cuprite, azurite, malachite, chalcopyrite, chrysocolla and brochantite. In Montgomery county the Perkiomen mine shows fully as long a list of copper minerals. Near Gettysburg, in Adams county, native copper and cuprite are noted, and native copper, cuprite, melaconite, malachite, chalcopyrite, aurichalcite and chrysocolla occur in Jones's mine, near Morgantown, and elsewhere in Bucks county. Oxide, carbonate, sulphide and silicate ores of copper have been found in the Frankford stone quarries, in the city of Philadelphia.

**RHODE ISLAND.** There are no mines of copper in this state, but chalcopyrite occurs near Portsmouth, Newport county, and occurrences of azurite, malachite, bornite and chalcopyrite are reported from other points, though apparently found nowhere in commercial quantities.

**SOUTH CAROLINA.** Chalcopyrite is noted sparingly at the Fair Forest gold mines of Union county, but no copper deposits of promise have been found in the state.

**SOUTH DAKOTA.** Copper ores are noted in the counties of Custer, Lawrence and Pennington, all in the Black Hills, and a little copper mining has been done in these counties. Copper ores are used to a limited extent for fluxing refractory gold ores at some of the local smelters. Geologically, the copper measures of the Black Hills are comparable with those of the Ducktown district of Tennessee.

**TENNESSEE.** This state has important active copper mines in Polk county, small and idle mines in Sullivan county, and occurrences of copper ore are reported from Lawrence county and from Jellico Plains, Monroe county.

The discovery of copper in the Ducktown district of Polk county was made in 1843, by a gold hunter, who mistook crystals of cuprite for gold. As early as 1854 there were two small matting furnaces in commission, and 14 mines were worked, most of the ore being hauled by wagon 40 miles to a railroad, and shipped to Swansea for reduction. The district prospered until 1863, when work was suspended, owing to the American Civil War, and the mine remained idle until 1866, when work was resumed and continued until 1878, after which the entire district remained idle until 1891, when a British company began work on a modern scale, and has scored a marked success. The Ducktown district lies in the extreme southeastern corner of Tennessee and extends into the adjoining states of Georgia and Alabama. The Ducktown basin is an eroded plateau, enclosed on three sides by mountains rising 500 to 2,500 feet above the general level of the country, the basin having an average elevation of about 1,500 feet above sea-level. The country rock of the Ducktown plateau consists of foliated mica-schist, with intercalary gneiss, and the ore occurs in a fault-zone in rocks of lower Cambrian age. The mines

show a heavy gossan of fair grade hematite, which is shipped extensively to iron furnaces. The oxidized zone is comparatively shallow, and has been worked out in the active mines, leaving only chalcopyrite, associated with pyrrhotite in a gangue of quartz, epidote and other metamorphic minerals. The sulphide ores average about 2 per cent. in copper tenor, and are neither auriferous nor argentiferous, occurring as great lenses in metamorphic schist, sometimes with sharply defined walls and again grading into the country rock.

**TEXAS.** Copper ores in this state are noted in the counties of Anderson, Archer, Baylor, Burnet, Clay, El Paso, Hardeman, Haskell, Knox, Lincoln, Llano, Mason, Montague, Presidio, Stonewall, Taylor, Wichita, Wilbarger and Wise. A little native copper is found in Burnet and Llano counties, with chalcopyrite in both counties and argentiferous tetrahedrite in the latter. Along the Brazos river there are Permian red beds showing carbonate and silicate ores in sandstone. There have been occasional sporadic attempts at development of copper mines, but as yet nothing serious has been accomplished, the ores as a rule being low grade carbonates, sulphides and silicates, distributed in beds of Permian age.

**UTAH.** This state, while now ranking fourth in point of production among American commonwealths, is scarcely second to any in promise, and possesses in one of its camps the largest bodies of ore of any metal known anywhere upon the globe. The copper production is increasing rapidly, and, in 1906, the copper output of Utah was about as great as the production of either Michigan or Montana in 1887, and about as large as the output of Arizona in 1897. The state has copper mines, or attempts at mines, in the counties of Beaver, Box Elder, Davis, Emery, Grand, Iron, Juab, Morgan, Piute, San Juan, Salt Lake, Summit, Tooele, Uintah, Utah, Wasatch, Washington and Weber.

In Box Elder county, near the Nevada line, there are promising copper deposits in limestone, showing good gossans above, and, as a rule, having heavy fluccans along either or both walls.

The first mining in Utah was done in Beaver county, just before 1860. The principal copper developments in this county are in the Cactus district, and at Milford. The richness of the Beaver county ores has been exaggerated, for stock-selling purposes, but one of the mines, under careful management, has reached the point of paying dividends, and it is probable that Beaver county will be given more serious attempts at mining in the future.

Juab county, in the central western portion of the state, has a number of old and large producers of silver and lead, and with increasing depth there is an increase in copper values, with considerable gold. The Tintic district, of which Eureka is the principal town, shows Carboniferous limestones, with intrusive quartzite on the west and rhyolite on the east, with ore occurring as contact deposits in both the sedimentary and igneous rocks, the ores being almost exclusively sulphide and carrying good values in lead, zinc, copper, silver and gold.

Piute county has been almost exclusively a gold and silver mining field, but shows considerable copper.

In San Juan county there is a copper field showing sedimentary rocks of Carboniferous age, these including limestone, shale and quartzite,

which have been intruded and fissured, with extensive metamorphism. Quartzite is the predominate rock form, with intercadae limestone below, and Carboniferous shales, sandstones and limestones in the upper part. The lower limestones, of dolomitic nature, carry copper ores, as do the Carboniferous shales of the upper portions. There are many intrusive dykes and sills of monzonite-porphry. Ore occurs in the intrusive zone in limestone, or at the point of contact in deposits roughly parallel with the bedding planes of the country rocks, which are mineralized in lenticular chutes dipping with the bedding planes, and with moderate pitch.

Tooele county is primarily a gold district, with considerable silver production, and small outputs of both lead and copper, but has copper deposits of promise.

Summit county was originally a silver-lead district, and these metals still predominate in output, but considerable sulphide copper ore is found in the lower workings of the argentiferous lead mines.

Salt Lake county contains three important mining fields, of which one is a copper camp of the first magnitude. The Little Cottonwood district, with Alta as its center, shows good values in lead, copper and silver, and has several good mines. The Big Cottonwood district, with Brighton as its center, shows mainly silver and lead values, but copper indications are promising.

The Bingham camp, known officially as the West Mountain district, in Salt Lake county, already an important camp, is certain to become one of the greatest copper mining fields of the globe. It lies about 20 miles southwest of Salt Lake City, on the eastern slope of the Oquirrh Mountains, with an area of about fifteen square miles. Water is scarce, being supplied chiefly from the mine workings. This is an old camp, worked originally for silver-lead values, and dates from the opening of the Old Jordan mine in 1863. The extraction of gold from the heavy gossans was begun in 1880, but did not prove profitable. The first copper mining, begun in 1896, was done on fissure veins carrying disseminated copper sulphides averaging 3.5 per cent. copper, 2.5 oz. silver and \$1 gold per short ton, with irregular but sometimes important lead values, and with occasional sphalerite. Several large and profitable mines have been opened on the sulphide veins which occur in dolomitic limestones near igneous intrusives, the lenticular ore bodies lying roughly parallel with the beds and the country rock, some of these lenses being of great size, ranging up to 200 feet in thickness and several hundred feet in length and depth, and carrying excellent average values.

While the mines opened on the contact deposits of sulphide ore have rendered Bingham an important producer of copper, recent developments on the monzonite ore bodies are of far greater importance. While a limited amount of mining of monzonite ores has been done in Graham county, Arizona, it may be said that Bingham is the first camp in the world to turn country rock into ore upon any large scale. The monzonite ore bodies of Bingham are of the very greatest commercial importance and contain hundreds of millions of tons of ore. The ore concentrates excellently, though there is a loss of nearly 25 per cent. at present, mainly due to milling, but this probably can be reduced to 20 per cent., and possibly to 15 per cent., eventually, by various minor improvements in milling. The ore of

the monzonite-porphyry is chalcopyrite, quite evenly disseminated in small grains throughout the porphyritic mass, with occasional veinlets carrying high-grade chalcocite and bornite. The porphyritic ores range from 0.72 per cent. to 1.75 per cent. in copper tenor, and, at the principal property, the average of six thousand assays gave 1.98 per cent. copper, 0.15 oz. silver and 0.016 oz. gold per ton. Owing to the system of mining, by which the monzonite mountains are quarried off by steam shovels, this copper field should give the lowest average mining cost of any in the world, with milling costs nearly as cheap as in the Lake Superior district, and eventually the present smelting costs should be reduced materially.

**VERMONT.** In this state there are copper mines in the counties of Lamoille and Orange, the latter being the more important, and copper ores are noted also in the counties of Franklin, Madison and Rutland. Copper mining was an industry of some importance in Vermont previous to the opening of the Lake Superior district, and the largest mine of the state was a famous producer for many years. The Vermont ore is chiefly chalcopyrite, and is noted at Brandon and Cuttingville in Rutland county, at Bridgewater in Madison county, at various points in Franklin and Lamoille counties, and at South Strafford, Copperfield, Vershire, Corinth and elsewhere in Orange county.

There are three principal copper districts in Orange county, the northern being at Corinth, where the Union mine is the most important property. The middle district is at Copperfield, where the Ely mines, opened in 1821, were the largest in the state, and the southern district is at South Strafford, where the Elizabeth mine has been a considerable producer. The ore is mainly chalcopyrite disseminated in pyrite and pyrrhotite, with a small amount of other gangue. The Elizabeth mine is the oldest in the state, having been opened in 1793 and long worked for cupriferous pyrrhotite. The Orange county deposits considerably resemble those of the Capelton district in Quebec, to the north, and are somewhat similar to those of the Ducktown district of Tennessee. The country rock is mainly contorted metamorphic sericite schist, surrounded by sedimentary beds of Paleozoic age, with pegmatite dykes. The Ely ore body is 20 to 30 feet in thickness, up to 150 feet in width, and has been mined to a depth of 3,600 feet. According to Weed the mineralization was pneumatolytic, due to emanations from granitic magma.

**VIRGINIA.** The existence of copper in this state has been known from early colonial days, and copper ores are noted in the counties of Albemarle, Buckingham, Carroll, Charlotte, Culpepper, Fauquier, Floyd, Fluvanna, Franklin, Grayson, Greene, Halifax, Loudoun, Louisa, Madison, Montgomery, Nelson, Orange, Page, Rappahannock, Rockingham and Stafford. In Louisa county the copper ore bodies have strong hematite gossans, which were mined for iron ore at one time. In this county cupriferous pyrite mines are worked, but no attempt is made to save the copper values, except by the leaching of mine waters, from which a little cement copper is secured.

The copper fields of Virginia may be divided into four principal groups, known as the Virgilina, Blue Ridge, Gossan Lead and Loudoun-Culpepper districts. In the Piedmont region there also are copper deposits in Albemarle, Buckingham and Charlotte counties.

The Virgilina district lies in Halifax county, Virginia and in Granville and Person counties, North Carolina. The field is about three miles in width by twenty-five miles in length, and in Virginia runs from the state line to the Hyco River, about 8 miles north. The ore is mainly chalocite, with occasional bornite, having a gangue of quartz and talcose altered country rock, the ore averaging about 3 per cent. copper, but with chutes of high grade ore running 5 to 25 per cent. in tenor. Selected ores, as shipped average 6 to 10 oz. silver and 75 cents gold per ton. The ores which are highly silicious and require concentration, occur in lenticular chutes of varying sizes, from 6 inches to 20 feet in width, and with an extreme length of several hundred feet, lying in fissure veins cutting schistose rocks altered from andesite and similar volcanic rocks. The average copper tenor of the ores of the district is said to be about 2 per cent.

The Blue Ridge district runs along the mountains in the counties of Warren, Fauquier, Rappahannock, Madison, Page and Greene. This district shows pre-Cambrian basaltic flows, capped by sedimentary beds and intruded by granitic rocks, later faulted and subjected to regional metamorphism. The gossans are not prominent and the copper occurs mainly native and as cuprite, with small quantities of carbonates and occasional bornite and chalcopyrite. This district shows mainly gash-veins, with promising surface ores which do not hold to depth.

The Gossan Lead of Grayson, Floyd and Carroll counties, in southwestern Virginia, shortly above the North Carolina line, is traceable for upwards of ten miles in a fault fracture between schists and slates of Cambrian age and metamorphosed schistose diorite. This district has been worked extensively for iron ore, from its limonite gossans, and produced a little copper in the decade previous to the American Civil War, from chalocite disseminated in pyrrhotite, but the average copper contents are estimated as slightly under one per cent.

The fourth district includes Loudoun and Culpepper counties, where copper ores are noted at various points, and where there have been some desultory attempts at mining at various times.

**WASHINGTON.** This state has a number of copper deposits of considerable promise, and bids fair to become an important producer eventually. Copper ores are noted, and there are mines, or attempts at mines, in the counties of Chelan, Clarke, Cowlitz, Ferry, King, Kittitas, Lewis, Lincoln, Okanogan, Pierce, Skagit, Skamania, Snohomish, Stevens and Whatcom.

In Chelan county there are large bodies of ore of low average grade, and the district is regarded as promising.

In Ferry county there are copper ores in the vicinity of Republic, and most of the mines in that camp carry cupriferous values to a greater or less extent.

In King county the Skykomish or Foss River district shows promising occurrences of ore, mainly chalcopyrite, with good outcrops.

In Kittitas county the Cle Elum district shows a cupriferous belt, nearly a mile in width by several miles in length, carrying copper ores of good average tenor that show strong outcrops.

Okanogan county, near the British Columbia boundary line, shows

numerous bodies of copper ore, mainly of low grade, but of considerable size, and the field is one that may develop important low grade mines in time.

In Pierce county native copper occurs near Eatonville, and various copper ores are found elsewhere in the county.

The Mount St. Helens district lies mainly in Skamania county, with portions in Cowlitz and Lewis counties. There are several promising mines under development in this field.

In Snohomish county the Darrington district, in the Cascade Mountains, has a number of developing mines, opened on a wide ore zone carrying pay streaks of massive bornite and chalcopyrite. The Index district of Snohomish county shows a number of properties, on which more or less work has been done, but has suffered severely from wildcat promotions. The veins generally are narrow, and values irregular, occurring in concentrations and kidneys of bornite, with small granules of bornite disseminated in a granitic gangue. For concentration the ore must be crushed to about sixty mesh, and slimes so badly that on an average less than half the copper values have been recovered.

In Stevens county the Chewelah district shows chalcopyrite, both massive and disseminated in pyrrhotite, in schist, near a granite contact. This district has been a small producer of copper for many years.

**WISCONSIN.** Copper ores are noted in this state in the counties of Ashland, Burnett, Chippewa, Crawford, Douglas, Grant, Iowa, Lafayette, Polk and Sauk.

The northern fold of the Keweenawan trap formation extends across the Lake Superior shore of northern Wisconsin, from Hurley to the Minnesota line, carrying more or less native copper in the amygdaloidal portions of various trap beds. The Keweenawan series is fully described in the article on Michigan. Some remains of prehistoric mining have been discovered east of the Fond du Lac mine, near the Brule river, and in the vicinity of the Percival mine, in Douglas county. The first attempt at copper mining, in historical times, was made in Douglas county, in 1845, by the North American Fur Company, which opened a shaft on a lean vein of tetrahedrite. Further mining attempts in this district were made in 1855, 1862, 1873 and 1898. Work was resumed in 1907 on a property on the Minong range, which is on the southern fold of the Keweenawan syncline, in the southern part of Douglas county.

In Crawford county an attempt was made at copper mining just previous to 1880, in the vicinity of Prairie du Chien. Copper ores are noted in the lead and zinc districts of southwestern Wisconsin at Shullsburg, Lafayette county, and at Mineral Point, Iowa county, where some crude attempts at copper mining have been made. Chalcopyrite and malachite have been found in Sauk county, and auriferous and argentiferous copper ore was found in 1902 in a diamond drill hole bored north of Oceola, Polk county. Copper ores are found south of Boscobel, Grant county, and chalcopyrite of good grade occurs near Mellen, Ashland county, where some attempts have been made at mining.

**WYOMING.** This state has copper mines or attempts at mines in the counties of Albany, Big Horn, Carbon, Converse, Frémont, Laramie, Natrona, Sheridan and Weston. The state has copper fields of consider-

able promise, but production has been small, owing to lack of transportation facilities in the principal districts.

The Grand Encampment copper district is of immense size, having an estimated area of 2,500 miles, lying in the southern half of Carbon county and the southwestern quarter of Albany county, and being divided into nearly equal parts by the North Platte river. The Sierra Madre Mountains lie to the west and the Medicine Bow range to the east. Gold prospecting was begun in 1898, but was not especially successful, and was followed a year or so later by copper prospecting. The district has been a producer since 1900, hand-selected ores shipped for treatment ranging 30 to 49 per cent. in copper tenor in carload lots, the higher grade ores carrying \$8 to \$10 gold and silver per ton. The general formation of the Sierra Madre Mountains is an irregular core of red granite, with superimposed Algonkian mica-hornblende schists. Associated with the schist, and conformable in strike and dip, are huge ledges of limestone and altered schist, known locally as lime dykes, being composed mainly of limestone and silica. There are extensive evidences of alteration and replacement in the granite, diorite and schists. The principal ore bodies occur on the contacts between the schists and adjacent rocks, notably quartzite. The gossans usually are of soft spongy limonite, with some hematite and a little quartz. The veins range from mere stringers to 20 feet in width, and the zone of oxidation, as determined, is from 35 to 100 feet in depth, being succeeded by bornite and massive chalcopyrite, the oxidized zone showing mainly azurite and malachite, with a little native copper. The Medicine Bow range shows a core of gray and red granite, flanked irregularly by schist and gneiss, with dykes similar to those of the Sierra Madres. The Rambler mine, in the Medicine Bows, was opened in 1900, for gold, abandoned as worthless, and relocated for copper. This mine is notable for its large quantities of covellite, and for carrying platinum, palladium, osmium and iridium, this being the first known occurrence of platinum in connection with copper.

In Albany county, in addition to a portion of the Grand Encampment district, there are copper mines in the Spring Hill and War Bonnet divisions of the North Laramie Peak district.

The Laramie Hills district runs along the southern boundary of the state, from Laramie through Albany and Converse counties, to Casper, Natrona county. This range shows a granite core, with generally north and south trend, flanked by schists and various sedimentary beds. Copper occurs native, in red altered granite, at Sherman Hill, and as sulphide ores at Hecla, Slate Creek, Cooney Hill and to the northward of Laramie Peak. Laramie county includes the Hartville uplift, in east central Wyoming, showing a considerable geological resemblance to the Black Hills of South Dakota. Copper ores are found throughout the entire uplift in fissure veins and lenses, usually pinching out at slight depth, and also as blanket veins. Some copper mining was done in this vicinity as early as 1881, when 75 men were employed at the Sunrise mine, but the industry was not successful, owing to lack of rail transportation.

## CHAPTER XV.

### COPPER DEPOSITS OF CANADA AND NEWFOUNDLAND.

In this chapter the copper deposits of Canada are treated in detail by provinces and territories, and, for geological convenience, Newfoundland is added, although Newfoundland is not a part of the Dominion of Canada, being the oldest colony of the British crown. Because there seems no other place for it, the few lines referring to the discovery of copper in Greenland are added to this chapter, though Greenland is an appanage of the Danish crown.

Although copper has been mined for many years in the eastern provinces of the Dominion of Canada, and the mines of Georgian Bay, in Western Ontario, are of practically the same age as the oldest of the Lake Superior properties in Michigan, the Canadian copper industry did not come to importance until the exploitation of the great nickel-copper deposits of the Sudbury district, beginning with about 1886. Ten years later the production of the Trail district in British Columbia became important, and was followed by far greater developments in the Boundary district of the same province, this field now ranking among the really important copper districts of the world. Despite its considerable present development, the copper industry of Canada must be rated as merely in its infancy, and the dominion must be included in any list of the principal copper producing countries of the present or future.

British Columbia produces more than three-fourths of the Canadian copper output, and Ontario furnishes nearly all the balance of the production, but there are small mines in most of the other provinces, and the territory of Yukon is a potential producer of importance.

**BRITISH COLUMBIA.** This Canadian province is a kingdom in both area and resources and its developed wealth in timber, minerals, arable lands and fisheries is trivial, compared with its possibilities. The first mining was for gold, in placer washings, shortly after the middle of the Nineteenth Century, after which the mining industry languished, until the completion of the Canadian Pacific railroad, when quartz mining was begun, in a small way, first for gold and silver, and later for lead. It was found, about 1896, that the mines of the Trail district carried considerable copper values, and the copper industry of the province dates from that discovery. In the last years of the century the first copper mines were opened in the Boundary district, and these have become of great importance. Most of the gold and silver mines of British Columbia carry more or less lead and copper, highly useful as fluxing agents, while the copper ores almost invariably have appreciable values in gold and silver, this comity of the metals aiding greatly in the development of the various mining fields of the province, most of which are low in grade, though with large ore bodies.

In 1906 the Boundary district made 75 per cent. of the total copper production of British Columbia, followed with 12.5 per cent. from the

mines of the Pacific coast, and 11.5 per cent. from the Rossland mines of the Trail district. Nearly all of the other mining districts of British Columbia have copper ores, with small mines, or attempts at mines, but, in 1906, the production of all the other districts combined was 1.25 per cent. of the total output of the province. With better transportation facilities, some of the other districts, now negligible as producers of copper, should become of importance.

The copper smelting industry of the province is well developed, and British Columbia has some of the largest, most modern and best managed copper smelters now in existence, and the Gramby mine, of the Boundary district, holds the world's record for low smelting costs.

The Boundary district, lying along the northern border of the state of Washington, includes the Kettle River, Grand Forks and Osoyoos mining divisions, which are contiguous. The mountains are not especially rugged, and as a rule the western and southern slopes are open. The formation includes somewhat altered sedimentary rocks, mainly limestones, with granite, greenstone and other eruptives, the ores of the district occurring mainly in altered limestone near the contacts with igneous intrusives. The ore bodies are almost exclusively disseminated sulphides, very low in grade, but of immense size, slightly auriferous and argentiferous, and self-fluxing, requiring only small charges of coke for reduction. The Boundary district is an important copper field, and must continue to increase in production for many years to come. This district is comparable with the Lake Superior copper field, not only in the low grade of its average ores, but also in the enormous size and certainty of its ore deposits, and the magnitude of the investments and equipments required for profitable copper production. These heavy investments afford assurance of permanent operation, and heavy production, regardless of fluctuations in the price of the metal.

The copper deposits of the Pacific coast include numerous mines on the various islands scattered from Puget Sound to the Alaskan boundary, and also on the mainland. Most of these mines are on Vancouver Island, where copper ores are found along the western side. Ore occurs mainly as replacements in marble and greenstone, along and near the contacts with dykes of igneous rock. The ore bodies are very irregular, and carry magnetite and garnet gangue, with segregations of chalcopyrite and local enrichments of bornite. On Texada Island the nature and occurrence of ore bodies are practically similar to those on Vancouver Island, and, in the main, the coast deposits are of this same class.

The Trail district, of which Rossland is the center, shows an area of eruptive rocks, mainly diorite, cut by many porphyritic dykes of one to eighty feet width, having a mainly north and south strike. Veins are shear-zone fissures, ores consisting of country rock more or less replaced by or impregnated with cupriferous pyrrhotite, the metallic values being mainly in gold, but including considerable copper, and a small amount of silver.

The Yale district includes the Similkameen division, with exposures of copper ore, mainly refractory, at many points. Development is slight but the district is of considerable promise. The Aspen Grove field of the Similkameen division shows eruptive rocks in parallel flows, ore occurring

mainly in a red breccia that carries native copper and chalocite, intermixed. There also are promising showings of ore at various points in the Keremos section of the Similkameen, the best of these being in the vicinity of Olalla and Princeton.

**FRANKLIN.** Indications of copper are reported from several points along the eastern side of Baffins Land.

**KEEWATIN.** In the southern portion of this district, north of the Albany River, native copper is shown in conglomerate, and there are indications of copper on the western side of Hudson Bay. The Copper Mine River, flowing into a bay of the Arctic Ocean, must have been named for some real or fancied exposure of the metal. The district of Keewatin is wild, and but little known, though it gives indications of mineral wealth at various points.

**LABRADOR.** There are fairly good indications of copper in the Chibougamou district, and also on the East Main River. Labrador is in the peculiar situation of being a district without a regular local government, the management of its affairs being divided between the Canadian province of Quebec, which looks after the bulk of the peninsula, and the crown colony of Newfoundland which administers the narrow strip along the eastern shore that is known as Ungava.

**MACKENZIE.** An immense outcrop of high grade sulphide ore is reported to exist near the mouth of the Mackenzie River on the Arctic Ocean, some distance north of the Arctic Circle, but it is possible that the value and size of this deposit have been exaggerated, as the information comes from whalers, devoid of geological knowledge or practical mining experience.

**MANITOBA.** Along the eastern boundary of this province, near Lake of the Woods, is a small area of mineral land, and a vein of 18 to 20 inches width, reported to occur between granite and trap and to be traceable for a half mile, showing a cupriferous, nickeliferous and slightly auriferous pyrrhotite, has been prospected slightly at Ingolf station, near the Ontario border.

**NEW BRUNSWICK.** Copper ores are found in the counties of Carleton, Charlotte, Gloucester, St. John and Westmoreland, and native copper is found in red sandstones of Carboniferous age. These sandstones range nearly to conglomerates, and apparently carbonaceous material has been replaced, to a large extent, by copper sulphides. Attempts have been made at mining both ores and native copper.

**NOVA SCOTIA.** This province has copper mines in the counties of Cape Breton, Cumberland, Inverness and Pictou. Native copper occurs in the counties of Annapolis, Cumberland, Digby and Kings, and, in addition to these counties, copper ores are found in the counties of Antigonish, Colchester and Sydney. The ores are mainly sulphide, and nickeliferous copper ore is reported from Cape Breton county. At Brier Island, Digby county, native copper occurs as nodules in an amygdaloidal trap, similar to occurrences in the Keweenawan formation of Lake Superior. The deposits of Inverness county are of auriferous and argentiferous chalcopyrite, and those of Cape Breton county are of a similar ore, having a silicious

gangue, and occurring in veins traversing diorite and felsite. The more important mining developments are in Cumberland, Inverness and Cape Breton counties, the Coxheath mines of the latter county having been the principal producers in the past.

**ONTARIO.** Copper was discovered on the northern shore of Lake Huron as early as 1770, but the first real mining was begun at the Bruce Mines, on the northern shore of Georgian Bay, in 1846, immediately after the opening of the first Lake Superior native copper mines in Michigan. Copper is found native at numerous points, and in the Sudbury district occurs as nickel-copper sulphides, but the deposits mainly are iron-copper sulphides. As a rule, the oxide and carbonate ores of the alteration zone are missing in Ontario, the iron sulphides, mainly chalcopyrite, reaching to surface with slight traces of change, though small quantities of bornite are noted at times.

Ontario is a large province, and shows a great diversity of geological and topographical conditions, its frontier marching with New York in the east and Minnesota on the west. The province has copper mines in the counties of Frontenac and Hastings and in the districts of Muskoka or Parry Sound, Nipissing, Algoma, Thunder Bay and Rainy River, and, in addition, has copper ore in Lanark and Lanark counties, and elsewhere.

The Muskoka district lies along Parry Sound, on the eastern shore of Georgian Bay. The surface of the country is glaciated, showing mainly rock exposures. The prevailing rock-forms of the district are gneisses and schists, the formation showing much flexure and faulting, with numerous small quartz veins and frequent pegmatite dykes of large size and great persistence. The topography is rough, and much of the rock is utterly devoid of vegetation or covering of any sort, the bald knobs alternating with marshes and swales in the lower ground. The mineralized zone is apparently about a quarter of a mile in width, with a generally northeast and southwest strike, and has been prospected for about twelve miles in length. Ores occur as extended and approximately parallel series of lenses, with a general trend in line with the mineral belt, practically along the fault zone, lenses varying from 5 to 40 feet in width, as a rule, though occasionally showing much greater width, and usually carrying a limonite gossan. The ore is mainly chalcopyrite disseminated in pyrite, showing occasional chalcocite and bornite, and carrying \$8 to \$10 gold per ton. Sphalerite is associated with copper, as a rule, and some of the beds are nickeliferous, ranging as high as 2.5 per cent in nickel tenor.

The Sudbury district, discovered 1882, where mining was begun in 1886, is an oval of about 40 miles length by 20 miles width and is considered locally as two ranges, each crescents with ends joined. The principal developments are on the south or old range, running from Sudbury to Carson. The interior of this oval shows a trough of rocks of Cambrian and Silurian ages, consisting of slates, sandstones and volcanic tuffs, flanked on the outside by granite. The ores occur as irregular chutes, in mammoth lenses varying greatly in metallic values, but with an average of 2.5 per cent. to 5 per cent. nickel, and carrying, as a rule, about one-half as much copper as nickel.

Copper developments in the Nipissing district have been overshadowed

by the sensational discoveries of native silver in the Cobalt field, but there are bodies of copper ore in this district that seem worthy of exploitation.

The district of Algoma is very extensive, and shows copper at many points. Principal development in the past has been in the Bruce Mines district, on the northern shore of Georgian Bay, where the ore is chalcopyrite, with quartz gangue, in strong fissure veins. Between Sault Ste. Marie and Sudbury there are several developing mines of considerable promise, in the Massey Station district, and good sulphide ores have been found in the Goulas Bay region, circa 30 miles north of Sault Ste. Marie. The Keweenawan formation of Michigan is found on Michipicoten Island, and also on the mainland east of the island, at Mamainse Point, about 50 miles north of the Soo, but exploratory work has not as yet shown workable values in the native copper deposits. Michipicoten Island also carries various sulphide and arsenide ores of copper.

In the Thunder Bay district, on the northern shore of Lake Superior, native copper has been found on Battle Island, east of Thunder Bay, on St. Ignace Island, in Nipigon Bay, at Black Bay, on Shebandowan Lake, at Pointe-aux-Mines, and elsewhere. Chalcocite is noted on Spar Island, and chalcocite and malachite are found on Silver Islet, this tiny island having been the location of the first great native silver mine of the world, which was fully as rich as any of the present-day bonanzas of Cobalt. Chalcopyrite also occurs at Neesbing and elsewhere.

In the Rainy River district, sulphide ores of copper have been found at various points, but the mining in that district has been mainly for gold, in the numerous fissure veins with quartz gangue that traverse granite, and which have an unfortunate habit of going wrong at a depth of 400 to 500 feet.

There are strong evidences of copper in the wild and little known district between Sault Ste. Marie and James Bay, and with the completion of a projected railroad, certain to come sooner or later, this district may prove an important producer of both copper and iron, and very likely of silver as well.

**QUEBEC.** Copper ores have been found in the counties of Arthabaska, Bagot, Beauce, Browne, Dorchester, Drummond, Levis, Lotbiniere, Megantic, Missisquoi, Richmond, Shefford, Sherbrooke and Wolfe, also on the northern shore of the Gulf of St. Lawrence in the district of Saguenay, and promising specimens of ore have been secured from the Lake St. John district, near Labrador.

The principal copper deposits of Quebec, judged from development in the past, lie in three zones, shortly north of the Vermont border, in Sherbrooke and adjoining counties. These belts average about two miles width, and are about 25 miles apart. The eastern belt has been the principal producer, from mines in the vicinity of Capelton. The western belt is about 60 miles east of Montreal, showing ore bodies in limestone, near igneous intrusives. The ores of the Capelton district are mainly chalcopyrite, or cupriferous pyrite and pyrrhotite. The pyrite of this district occurs in lenses, following cleavage planes, varying from 12 inches to 30 feet in thickness, and up to 100 feet in length. The principal mines have been opened in limestone associated with slate, in contacts with

diorite and serpentine. The cupriferous pyrites are of good sulphur tenor, and while the Capelton mines carry only 2 to 4 per cent. copper, and 3 to 4 ounces silver per ton, the sulphur values render these low-grade ores profitable, when worked with skill and prudence.

**YUKON.** The principal copper deposit, and the only developed copper mines of Yukon, are found in the vicinity of White Horse, near the Alaskan border. The White Horse district, at the head of navigation on the Lewes River, is connected with Skagway, Alaska, by the White Pass & Yukon railroad, 110 miles in length, which has such tremendous grades that five 110-ton locomotives are required to take a train over the summit. Copper was discovered in this district in 1898, and a number of small but rich mines have been developed, these being much hampered in production by exceedingly high freight rates, and lack of local smelters or local fuel available for smelting purposes.

The White Horse copper belt is 15 to 20 miles in length, with a generally north and south trend, west of and nearly parallel with the Lewes River, with a width, as developed, of one-half mile to nearly 3 miles. The belt shows copper deposits along the contact of limestone and granite, the contact deposits connecting with fissure veins traversing granite. The developed mines are 4 to 10 miles southwest of White Horse, and the district has been prospected for about 20 miles, with assessment work done on about 200 claims. The zone of secondary enrichment shows occasional carbonates, but principal ores are sulphide, formerly reported as mainly chalcopyrite with occasional chalcocite and bornite, but the ores now developed are mainly bornite. It is probable, however, that pyritic ores will succeed at slightly greater depth. The enriched sulphides carry fair values in both gold and silver, and the ores shipped have been of very high tenor. Exploratory work is hampered by a glacial moraine, which leaves only occasional exposures of ledge-rock. This district is of some present importance, and of much greater promise for the future.

**NEWFOUNDLAND.** The first copper mines of importance were opened in the Tilt Cove district in 1862, and remain considerable producers. There are deposits of chalcopyrite and cupriferous pyrite at many different points on the island, with occurrences of native copper in Placentia Bay, and elsewhere. The developed mines carry cupriferous iron pyrites, in which the sulphur values are an important factor. The island produced about 1,500,000 tons of cupriferous pyrites to the end of the Nineteenth Century, and apparently has far greater available resources for the future.

The Newfoundland deposits occur mainly in serpentine rocks and chloritic slates lying parallel to the serpentine in rocks of lower Silurian age. The principal cupriferous districts are on Notre Dame Bay, in the northeastern portion of the island, this including the Tilt Cove and Betts Cove fields, at Bay of Islands, in the western portion, and at Lady Pond and Birchy Cove. On Oderin Island, in Placentia Bay, in the southeastern portion of the island, native copper occurs in stratified archaic rocks, and one mass of copper weighing 55 pounds has been taken from a melephyr, in strata of a geological horizon corresponding to that of the Keweenawan formation of Lake Superior.

The Tilt Cove district, on Notre Dame Bay, in the northeastern portion of the island, has been traced for about 40 miles, and the Tilt Cove mines are the only steady copper producers on the island. The district shows 4 main series of lenses, carrying pyrite in which is disseminated chalcopyrite having an average tenor of about 4 per cent. copper, 50 per cent. sulphur and \$1.50 gold per long ton. The ore is bumpy in occurrence, the ore beds ranging from 4 to 10 feet in average thickness, but being much broken and disturbed, while the veins frequently become barren, and sphalerite is found in frequent connection with chalcopyrite.

**GREENLAND.** An exploratory expedition, sent to Greenland in 1908, by N. Bernberg, a public-spirited merchant of Copenhagen, reports the discovery of large deposits of copper ore at Alanjarassnak, on the western coast of the island.

## CHAPTER XVI.

### COPPER DEPOSITS OF MEXICO.

The Republic of Mexico has made relatively greater progress in copper production, since the beginning of the Twentieth Century, than any other country, and in actual increase of output stands second only to the United States. There is every reason to predict a large and fairly steady growth in Mexican copper output, as all of the essentials of a large and profitable production are found in more than one state of the Republic, each essentials being enormous deposits of ore of medium to high grade, transportation facilities, that in many cases are excellent, and which are being improved by extensive railroad construction, and settled political conditions. Occasionally complaints are made by foreigners, operating mines in Mexico, of unjust treatment by the authorities, but, as a rule, these complaints fall into two classes, the first being due to neglect to comply with the just but stringent Mexican laws regarding titles and methods of keeping accounts, while the second, having a foundation of fact, relates to the petty exactions of petty officials. In cases where the operators of mines have experienced arbitrary or unjust treatment from local officials, complaints to the governors of the states, or to the president of the Republic, have resulted, almost invariably, in the speedy correction of any injustice.

Previous to the Spanish conquest the Anahuac races had acquired considerable mining experience and metallurgical skill. The work of extracting metallic values done by the aborigines of Mexico deserves to be called real mining, as the antiguas of date previous to the conquest show shafts and tunnels of considerable extent. The metals found by Cortez in more or less general use, and for sale in the great market place of Tenochtitlán, included gold, silver, copper, tin and lead. Copper was employed freely in the mechanical arts, the metal being used mainly in the form of bronze, through alloying copper with tin, and was hardened by hammering. The best tools of the natives, made previous to the Spanish conquest, assay about 94 per cent. copper and 6 per cent. tin. Not only did the Aztecs utilize the metals for industrial purposes, but they had, apparently independent of old-world influences, developed a system of metallic currency, with gold in quills and copper coins in the shape of the Gothic letter T.

In 1895 the Mexican copper output was only 11,620 long tons, and ten years later exceeded 55,000 long tons, a growth of practically five hundred per centum in a single decade, being much the largest proportional increase made by any country, and the largest actual increase made by any nation except the United States. At the end of July, 1906, there were mines as follows in Mexico: copper, 956; iron and copper, 209; copper and lead, 25; silver and copper, 773; silver, copper and lead, 310; gold, silver and copper, 1,314, a total of 3,587 copper mines and mines with cupriferous values, as compared with 2,931 different cupriferous mines in the preceding year. In July, 1907, there were upwards of 1,000 copper mines alone,

and nearly or quite 4,000 mines in which copper values were of appreciable importance. These figures are not for single pertenencias, as is the case in Chile, but are for individual properties, ranging in size from a single hectare to thousands of hectares in the case of the Greene-Cananea and other large mines.

The smelting industry of Mexico is highly developed and is increasing rapidly in importance. The production of copper in a given field depends not only upon the richness and extent of its ores, and the experience and energy of its miners, but also is dependent to a very large extent upon the items of transportation and smelting. The transportation facilities of Mexico are excellent, for so rugged a country, and are being improved steadily, by the construction of new railroads of prime importance. The republic now possesses some of the largest and most modern smelters of copper and lead to be found anywhere upon the globe, and further enterprises of great importance are projected. It is doubtful if any country of equal extent anywhere upon the earth's surface possesses mineral values equal to those of Mexico.

Mexico has copper mines in the states of Aguascalientes, Chihuahua, Coahuila, Durango, Guanajuato, Guerrero, Hidalgo, Jalisco, Mexico, Michoacán, Nuevo León, Oaxaca, Puebla, Queretaro, San Luis Potosí, Sinaloa, Sonora, Tabasco, Tamaulipas, Zacatecas, and in the territories of Baja California and Tepic. In point of production of copper, Sonora easily leads, with Lower California second, but there are copper developments of prime importance in a number of other states, notably in Chihuahua, Coahuila, Guerrero, Jalisco, Michoacán and Puebla.

Copper in almost every known form is found in some part of the republic, the supriferous measures being very extensive and including a great variety of types. Argentiferous copper ores are found frequently near the crystalline states of the Azoic group, a typical example occurring in the district south of Puebla. Copper accompanied by hematite is noted in cretaceous beds of Mesozoic age, while in the Cenozoic group copper is found in regular veins in hornblendic andesite of the Pliocene system, also in the stratified sedimentary beds of the upper Miocene and lower Pliocene, as at the Boleo mine in Baja California. Copper deposits occur frequently in acid Tertiary rocks. The Sierra Madres are highly mineralized, not only as to the main range, but also, as a rule, in their foot-hills and outlying spurs. In northern Mexico there seems a preponderance of silver-lead deposits on the eastern slope, and of copper and gold values on the western slope of the cordillera. The principal mining portion of Mexico extends, unbroken, for a distance of fully 1,500 miles, with an average width of 250 miles, from the American border on the north into the state of Oaxaca in the south and the possibilities of Mexican mining developments in the future are past human computation.

**AQUASCALIENTES.** In July, 1907, this state had 49 registered copper mines, in addition to numerous other properties carrying copper as other than the principal metal. The principal copper developments are in the dioritic rocks of the Tepezalá district, where the ore is mainly chalcopyrite, with silicious gangue. The copper ores of the Pánuco district occur mainly in pegmatite dykes, as chalcopyrite.

**BAJA CALIFORNIA.** Though known to the early Spanish conquistadors, little mining was done in Lower California until the middle of the Nineteenth Century, and the first copper mining of real importance dates from the discovery of the Boleo mines, in 1868, and the beginning of their exploitation, in 1871. The Boleo mines occur in a district of approximately three miles width by seven miles length, on a plateau lying parallel with and near the coast. The development of this district has been in the hands of a single company, and it is probable that other deposits of value remain for later development. The Boleo mines are opened on beds occurring in a formation of Tertiary sandstones, conglomerates and tuffa. The cupriferous beds, three in number, of large area, lie upon conglomerates of varying horizons, and are overlaid by argillaceous tuffs, all traversed by fissures. In the upper bed, above the water level, the values are in disseminated oxidized ores, such as cuprite, melaconite, azurite, malachite, atacamite, crednerite and chrysocolla, all in quantities of commercial importance. In the second ore bed there are peculiar globular concretions of oxide and carbonate ores, called boleos, whence the name of the mine. The third bed, in addition to the oxide, carbonate and silicate ores, carries the secondary sulphides chalcocite, covellite and bornite. The ores are disseminated in irregular masses, veinlets and concretions, in a clayey tuff, with a marked tendency toward concentration upon the underlying conglomerates, where the ores occur compact in layers of six to ten inches.

In July, 1907, Baja California had 65 registered copper mines, and in addition to the Boleo mines of Santa Rosalia, there are promising beds of copper in the municipalities of La Paz, Mulegé, Comondú, Todos Santos and San Antonio, and in Baja California Norte there are rich copper ores, apparently of considerable extent, near San Fernando and about 70 miles south of San Quintin, with promising ore bodies in the Santa Catarina division.

**CHIAPAS.** The only developed copper property of importance in this state is the Santa Fé mine, though extensive remains of prehistoric operations are shown, these including surprisingly long tunnels, showing that the ancient miners were both persistent and skillful.

The Santa Fé mine, near the Tabasco line, is a contact deposit of most unusual type, the ore outcropping in strata of wollastonite resting on slate, with underlying massive igneous rocks, as contact deposits in wollastonite and between wollastonite and the igneous intrusives. The ore body is of great size, carrying bornite, chalcopyrite, bournonite and tetrahedrite, with chimneys of oxidized ores, all of the ores being argentiferous and associated with free gold, the ore having a garnet gangue. The ore values average 3 to 4 per cent. copper, 6 to 8 ounces silver and \$6 to \$30 gold per ton.

There also are auriferous copper mines, slightly developed, in the Pichucalco district.

**CHIHUAHUA.** This state is mainly a producer of silver and lead, being one of the greatest lead mining fields of the globe. Copper frequently is found associated with silver-lead ores, and there are some deposits in which copper is the predominant factor of value. Copper production is

increasing steadily and gives promise of much future importance. Copper is produced on a commercial scale, not only at a number of distinctively copper mines, but also from cupriferous sulphide ores in silver-lead deposits. There are copper mines in the districts of Bravos, Guerrero, Jiménez, Ocampo, and Parral, and in addition to these, copper deposits are known in the districts of Arteaga, Galeana, Iturbide and Matamoros.

**COAHUILA.** In July, 1907, the state of Coahuila had five copper mines, and a considerable number of other mines carrying copper values. The most important cupriferous district, judged by present developments, lies near Jimulco, a short distance south of Torreón, in which copper ores of excellent average tenor occur in limestone strata in a district showing no igneous outcrops.

**COLIMA.** In July, 1907, the state of Colima had twelve registered copper mines, all with small development, and oxide and carbonate ores of high grade have been found at numerous points in this state.

**DURANGO.** There were fifty-one copper mines officially registered in Durango in July, 1907. The principal cupriferous developments are in the Velardeña district, where highly important mines have been developed on copper-lead ores. There are small copper mines in other fields, with numerous occurrences of copper ore throughout the state.

**GUANAJUATO.** The state of Guanajuato is one of the most famous mining districts of the world, and its silver mines are credited with a production of about \$600,000,000, measured by gold values. The silver mining industry of Guanajuato is being rejuvenated by American enterprise and capital, and the future of the district is brighter than for many years. One of the old mines of the city shows considerable copper ore, apparently in workable quantities, but this never has been utilized, because silver was the metal desired. In July, 1907, the state had four registered copper mines.

**GUERRERO.** The state of Guerrero had 44 copper mines and a number of other mines carrying copper values, in July, 1907. These mines are located in the districts of Ajuchitlán, Aldama, Bravos, Minas, Tavares and Taxco.

The most important copper mines are La Dicha group, in the districts of Bravos and Tavares, south of the Balsas river, on the Pacific coast of the southern Sierra Madre range, and about forty miles from the port of Acapulco, where extensive developments are under way. The ore exposures of this group are more or less continuous for four to five miles, showing mainly chalcopyrite, associated with pyrrhotite, in micaceous metamorphic schist with quartzite bands, the deposits carrying a thin but rich bed of secondary sulphides immediately above the pyritic ores. The average values of the pyritic ores probably are 3 to 4 per cent. There are copper deposits of promise adjacent to La Dicha group, along the Balsas river.

In the Ajuchitlán district, fissure veins with quartz gangue, in granite, carry prominent gossans, showing considerable chrysocolla in the oxidized zone, in addition to the usual oxide and carbonate ores. Auriferous copper veins occur in aplite and Tertiary diorite, in the Minas district.

**HIDALGO.** There were five registered copper mines in the state of Hidalgo in July, 1907, the principal copper district being at Zimapán, where considerable work is under way.

**JALISCO.** The state of Jalisco leads all the others of Mexico in the number of copper mines, official figures showing no less than 302 copper properties in the state in July, 1907. Most of these mines, however, are small, though there are many of considerable promise, and a good start has been made at mining and smelting under modern conditions. Jalisco was the seat of a primitive copper mining, smelting and manufacturing industry of considerable importance, under the Aztec races, previous to the Spanish conquest. The principal auriferous fields of the state include the districts of Ameca, Autlán, Ayutla and Cacoma, in all of which active copper developments are under way. Auriferous copper veins occur in Tertiary diorite in both the Ameca and Cacoma districts. The ores are mainly oxides and carbonates, with a little chalcopyrite, all strongly argentiferous, and at Autlán in addition to large quantities of malachite, sulphide ores are much in evidence.

**MEXICO.** The state of México had three copper mines in July, 1907, and shows native copper and tetrahedrite in beds on the border, near Tejupilco, Jalisco.

**MICHOACÁN.** According to official records there were 95 copper mines in the state of Michoacán in July, 1907. This state is mountainous, and with rather indifferent transportation facilities, these drawbacks retarding development. One present-day property, the Inguráñ, was worked extensively in the days of the aborigines, and other copper mines were wrought by the Aztecs.

There are deposits of copper ore of more or less importance in the districts of Angangueo, Ario, Churumuco, Huacana, Huetamo, Oroalo, Patzcuaro and Tacambaro, the principal copper mines as now exploited being in the district of Augangueo and in the Inguráñ division of the Tacambaro district.

In the Inguráñ field ore deposits are found in micaceous quartzose diorite country rock and granite in several stages of alteration, with a capping of siliceous limestone of 200 to 300 feet in thickness. The deposits show oxidized ores above, but the principal values are in disseminated chalcopyrite, with a little bornite, both carrying fair silver values and a little gold, with a gangue of granite-porphyry, the ores being disseminated through the country rock.

The Churumuco district shows high grade ores in fissures in dioritic porphyry. In the Oroalo district veins occur in feldspar-porphyry, similar to those of Real del Monte in the state of Hidalgo.

**NUEVO LEÓN.** According to the government records there were three copper mines in Nuevo León in July, 1907, but none of extensive development or of unusual promise. There are copper ores at a number of points in the state.

**OAXACA.** According to government records, there were only four copper mines in the state of Oaxaca in July, 1907, but there were many mines in which there were considerable copper values. There are copper mines in the Ocotlán and Ejutla districts, south of the city of Oaxaca,

and there are copper ores also in the districts of Miahuatlan, Villa Juárez and elsewhere.

**PUEBLA.** There were five registered copper mines in this state in July, 1907, including the Teziutlán mines, which are much the most important copper producers in southern Mexico. The ores occur in irregular deposits as an intimate mixture of chalcopyrite, galena and sphalerite, in highly metamorphosed calcareous Cambrian slates. Impregnations of copper in andesite are noted near Colucán, and copper ore exists at various other points.

**SAN LUIS POTOSÍ.** There were fourteen registered copper mines in this state in July, 1907. In the Matehuala district, which is the most important producer of metal, the copper ores are mainly stibphides, with garnetiferous gangue, occurring as contact deposits between limestone and porphyritic rocks. There are cupriferous deposits of promise in the districts of Catorce and Salinas, and copper ores exist at a considerable number at other points.

**SINALOA.** There are copper ores in nearly every district in the state of Sinaloa and the number of registered copper mines in July, 1907, was 25. The northern part of this state is a continuation of the Sonoran plateau, but owing to indifferent transportation facilities, no important mines of copper have been developed, though there are several properties of considerable promise. With the completion of two new railroad lines now under way, traversing this state, copper mining should become an important and profitable industry. In olden times considerable high-grade copper ore, mainly argentiferous, was smelted in crude adobe furnaces, near the mines.

**SONORA.** The state of Sonora, one of the richest in the Republic of Mexico, is of immense size, being nearly twice the area of the state of New York, or as large as Michigan and Indiana combined, and is one of the richest mineral fields in the world. It is much the most important copper producing state of Mexico, and one of the leading copper fields of the globe, with unusually brilliant prospects for the future. According to the government records there were no less than 234 copper mines in the state in July, 1907, in addition to mines carrying mixed metallic values. Considerable copper was produced in adobe smelters, during the years of Spanish domination, and under the republic, previous to the modernization of the copper industry begun in the closing years of the Nineteenth Century. Humboldt predicted, nearly one hundred years ago, that the mineral wealth of the world would be developed in Sonora, which then consisted of the present states of Sonora and Sinaloa in the Republic of Mexico, and the territory of Arizona in the United States. This prediction is being borne out to the letter, as there is no richer mineral field, of equal area, upon the globe.

Sonora, lying on the western slope of the Sierra Madres, is far richer in copper and gold than is Chihuahua on the eastern slope, where the values are mainly in silver and lead. The principal Sonoran copper deposits are of the Carboniferous system of the Paleozoic group. Copper development, which requires the best of transportation facilities, has been hampered by lack of railroads, but a considerable amount of railroad build-

ing is now under way. The frequent outbreaks of the Yaqui Indians also have caused much trouble in several of the mining fields. There are copper mines in the districts of Alamos, Altar, Arizpe, Hermosillo, Magdalena, Moctezuma, Sahuaripa and Ures.

The Alamos district is essentially a silver field, but contains much copper, this metal being an important by-product from the Quintera silver mines. The Piedras Verdes copper deposit is one of considerable promise, and there is little doubt that copper mines of importance will be opened, in time, in this district.

The Altar district has mines of gold, silver and copper, but developments in the copper line have been on a rather limited scale in the past, though the district has properties of promise.

The Arizpe district is the scene of the most extensive copper mining development in Mexico, and is the site of one of the greatest copper industries of the globe, in the municipality of Ronquillo, generally known as the Cananea field. The Cananea mines were worked as early as the Eighteenth Century, by the Casa Gua, of Chihuahua, later by Don José Perez, and eventually, in the latter half of the Nineteenth Century, by Governor Pesqueira, passing, in 1899, to the predecessors of the the present owners. The Cananea Mountains are an isolated range of about 25 miles length, lying in the free zone of northern Mexico, only a few miles south of the Arizona border, the range being of the short, isolated, variety typical of the Sonoran plateau in both Sonora and Arizona, and to the southeast is the Sierra Manzanal, almost a continuation of the Sierre de Cananea. The Cananea range of mountains consists of shattered and altered Paleozoic limestones, with intrusive masses of diorite and rhyolite, flanked by bedded tuffs. The mountain range has a north-westerly and southeasterly strike, the highest point being Elenita Peak, 7,600 feet above sea-level, and there is a zone of fissuring along the axis of the belt, ore bodies occurring as concentrations and replacements in either limestone or porphyry, the former being of Paleozoic age and the porphyries being largely rhyolitic. The district gives every indication of great volcanic activity at some remote date, followed by heavy erosion. As a rule the gossans are not heavy, much of what appears to be gossan at a short distance proving, on closer inspection, merely stained and weathered conglomerate. There are numerous ore bodies occurring as contacts between limestone and the igneous eruptives, largely as patches surrounded by crystallized rocks. The ores are of a great variety, ranging from native copper, in masses up to a hundredweight or even greater, through the rich oxidized ores and secondary sulphides, down to disseminated chalcopyrite. The ore of the Capote zone is almost exclusively pyrite coated with very thin films of chalcocite, usually with a porphyritic silicious gangue. The Capote ore body occurs in shattered quartzite, the ore being soft and containing sericite, causing trouble in concentration. The mines show a considerable variety of forms of occurrence, including contact metamorphic deposits, impregnated sedimentary rocks and fissure veins.

The principal developments in the Cananea field are in the southeastern half of the range, which is separated into two nearly equal portions by Puertecitos Pass. There is reason to believe, however, that ore deposits of value exist in the northern half of the range, this opinion being based upon personal inspection.

In addition to the great copper mines developed and developing in the Cananea Mountains, there are other highly promising deposits of copper ore in various other fields of the Arizpe district, including prospects in the Sierra Manzanal, and remarkably rich surface ores in the Sierra Azul, or Ajo Mountains, to the eastward of La Cananea. In fact, nearly every municipality of the district of Arizpe shows more or less copper ore.

The Magdalena district is a gold field, primarily, but each of its six municipalities shows more or less copper, and many of these are not devoid of promise.

The district of Moctezuma ranks in importance second only to that of Arizpe, in the state of Sonora. There are large developed mines in the neighborhood of Nacozari, the hill on which the Moctezuma mine is opened being a body of cupriferous monzonite, too low in grade to work at present, but possibly available at some future time. Good mines of copper, carrying considerable values in silver and lead, are being developed in the vicinity of Cumpas, in the Moctezuma district and exploratory and development work on copper properties is noted at several other points.

The district of Sahuaripa, in the central eastern part of Sonora, has its eastern boundary on the line of the state of Chihuahua. The topography is exceedingly rugged, as a rule, but the district is better watered than some other portions of the state. Rail transportation is lacking, and the Yaqui Indians are very troublesome, at times, but the district is one of great promise for some future period when the Indian uprisings shall have been quieted finally, and cheap transportation is afforded by rail.

The Ures district contains a number of developing copper mines, in addition to mines of other metals, and while its production is small, at present, the time should come when rich and profitable copper mines will be steady producers of the metal.

**TABASCO.** The state of Tabasco has no copper mines, but is supposed to have copper ores near the Chiapas line, as the Santa Fé mine of Chiapas is but a very short distance from the state of Tabasco.

**TAMAULIPAS.** In July, 1907, the state of Tamaulipas was credited with the possession of eleven copper mines, of which only one or two are of present importance. There are copper deposits at a number of points in this state.

**TEPIC.** In July, 1907, the government statistics of Mexico credited the territory of Tepic with the possession of two copper mines, and there are mines of other metals carrying material copper values. Copper ores exist at a number of points in this territory, though the principal mining industry is based upon gold.

**TLAXCALA.** There are no recorded copper mines in the little state of Tlaxcala, but beds of copper ore outcrop near Monte Tlatlay.

**VERA CRUZ.** There are no copper mines in the state of Vera Cruz, but copper ores have been found in the district of Zomelahuacán, and probably exist at other points as well.

**YUCATÁN.** It is reported, though the statement does not seem fully verified, that for some centuries the Maya Indians have worked cop-

per mines, in a crude way, in the interior of Yucatán. The greater portion of this state was held, practically undisputed, by the war-like Mayas, from the time of the Moctezumas until a recent period, the Spaniards finding it easier to leave the aborigines in undisputed possession of their territory than to attempt a conquest. Under the wise and pacific government of Don Porfirio Diaz the extension of the power of the Federal government over the entire state of Yucatán has been accomplished with very little bloodshed, through the exercise of great tact, patience and firmness. The interior of Yucatán is wild and little explored, but it is probable that considerable mineral values exist.

**ZACATECAS.** According to government records there were fourteen copper mines in the state of Zacatecas in July, 1907, the principal copper producing districts being those of Mazapil and Concepción del Oro, south of Saltillo. The mines of Mazapil show a considerable variety of copper ores, existing in large quantities, and this is a field of promise. The Bolaños and Ramos districts also are of slight present importance, and of considerable future promise.

## CHAPTER XVII.

### COPPER DEPOSITS OF CENTRAL AMERICA AND THE ANTIÈLES.

In this chapter detailed references are made to the copper mines and copper producing districts of Central America and the West Indies. While the production from this field is small, these countries are not devoid of ore bodies of considerable promise.

**COSTA RICA.** Las Concavas mine, opened in the Eighteenth Century, or possibly earlier, was a small copper producer, at intervals, for many years, but has been idle for some time. There are outcrops of copper ores, at several points in the republic, but no serious attempt at mining has been made except at Las Concavas. With the present large investment of foreign capital in Costa Rica, and the rapid extension of transportation facilities, further attempts at the exploitation of copper deposits would seem only a matter of time.

**CUBA.** The first American copper mines worked by Europeans are said to have been in Cuba, in the province of Santiago. There are copper mines, now idle, in the provinces of Matanzas, Pinar del Rio, Puerto Principe, Santa Clara and Santiago.

In the province of Matanzas copper areas are noted at El Negoso, a vein of one to twenty inches width having been traced for a distance of about a quarter of a mile.

In the province of Pinar del Rio copper is noted near Arroyo de Manatua, in the form of chalcopyrite associated with pyrrhotite, and with occasional chalcocite, occurring as lenticular chutes in metamorphic schist, and carrying strong limonite gossans.

In the province of Puerto Principe there are small mines that were worked many years ago, on fissure veins carrying chalcopyrite with quartz gangue, but none of these seem of especial promise.

The province of Santa Clara has copper ores at various points, including several localities northeast of Cienfuegos, and old copper mines are found at San Juan de Malaga, 6 miles northeast of the city of Santa Clara, and at the Finca San Joaquin, 12 miles west of Manicaragua, and also a short distance from Cumanayagua.

The mines of El Cobre, 8 miles west of Santiago Bay and about 30 miles north of Santiago de Cuba, were opened by the Spanish, A. D. 1532, the first production having been used for the casting of bronze cannon. The various mines were consolidated, in 1832, in the hands of an Anglo-Spanish company, and were worked until the plant was burned by insurgents, in the Cuban rebellion of 1868, producing, according to the custom-house records of Santiago, 610,200 tons of ore, exported to Swansea, averaging about 16 per cent. in copper tenor, and valued at \$50,186,225, probably in depreciated Spanish currency. The ores of the Minas de Cobre occur in a mineralized zone of about 200 feet width, and of at least a mile

in known length, the belt showing several parallel veins, with rocks between much altered, the ore occurring as chutes with extreme widths of about 20 feet, and lengths of 20 to 200 feet, along fracture veins in serpentine. The ore is primarily chalcopyrite, associated with pyrrhotite, with quartz gangue, the grains of chalcopyrite frequently being coated with covellite.

**GUATEMALA.** The republic of Guatemala possesses considerable mineral wealth, but owing to lack of transport and rugged topography, mining development is limited, being confined mainly to placer gold mining. With the completion of the Ferrocarril Guatemala del Norte, various cupriferous districts will be rendered accessible, and doubtless copper mining developments will follow. There were small copper mines in Guatemala under Spanish domination, as early as the Seventeenth Century, but metallic production was mainly silver.

Small veins carrying massive malachite occur near Ravinal, in the department of Baja Verapaz, also near Cabulco.

In the department of Chuquimula, in eastern Guatemala, there are copper deposits, claimed to average 5 to 20 per cent. copper tenor, but these are idle, though they will be available for exploitation on the completion of the new northern railway. This department is mountainous and isolated, but apparently rich in minerals.

In the department of Huehuetanango, on the southern slope of the Cuchumatanes Mountains, there are contact veins between limestone and granite, showing high grade carbonates. Near Chiantia there is an occurrence of copper ore said to resemble that of the Santa Fé mines of Chiapas, in Mexico. There are developed silver-lead mines in this department.

Copper carbonates are found in sedimentary beds not far from the city of Guatemala, in the department of that name.

**HAYTI.** There are deposits of copper ore at various points in the republic of Hayti, notably in the Hotte Mountain range, in the southern part of the island, and extensive deposits of copper ore, in and near igneous rocks of andesitic nature, associated with Tertiary limestones, are said to occur at Terre Nueve, about 10 miles from the seaport of Gonaves. There also are exposures of copper ore at Grande Riviere, south of Le Cap, 6 to 10 miles south of the sea, and at Limonade, copper ores carrying platinum, iridium and osmium are noted. Previous mining developments have been of the crudest, but efforts are now being made to develop a copper property along modern lines, with American capital.

**HONDURAS.** Copper ores occur in nearly every department of this republic, but development is limited, and the mines are of small size. There are copper mines in the departments of Tegucigalpa and Comayagua. In the department of Yoro, in the northwestern part of the republic, promising deposits of copper ore are reported from a district about 40 miles from the Ulloá river. This district is said to show a vein up to 14 feet in width, claimed to be traceable for miles, giving ores assaying 15 to 18 per cent. copper, which seems a statement liable to reduction.

**JAMAICA.** There is a cupriferous district near the middle of the island, showing several veins of 3 to 4 feet width, on which a little ex-

ploratory work was done, and from which one small shipment of ore was made, circa 1854. Since that date there have been repeated efforts to organize mining companies, and develop mines, but no permanent results have been secured. Apparently the deposits first opened were of small extent and of low value. There are indications of copper and other metals at various other points in the island.

**LEEWARD ISLANDS.** Copper ore has been noted on the island of Virgin Gorda, one of the Virgin Island group.

**NICARAGUA.** A very small amount of copper is produced in Nicaragua, as a by-product from the smelting of silver ores, the copper acting as a carrier in the matting of argentiferous sulphides. Occurrences of copper ore are noted along the Atlantic coast, and there are epiriferous belts on the Escondido and Mico rivers. The most promising ores are noted in the department of Segovia, but development is rendered difficult by a mountainous country and poor roads. Copper ores are noted also in the vicinity of Jinotega in the department of Matagalpa, in the department of León, and near Prinzapulca, on the gulf coast, in the department of Zelaya.

**PANAMÁ.** This newest of American republics has deposits of copper and other minerals, but lacks developed copper mines.

**PORTO RICO.** Copper mining in Porto Rico began in 1869, when La Abundancia mine was opened, in the barrio of Rio Blanco, and this was followed by the exploitation, on a small scale, of several adjacent properties. The Rio Blanco deposits carry a vein of pyrrhotite of 6 to 10 feet width, with a paystreak of 8 to 15 inches, mineralized with bornite and chalcopyrite, the paystreak averaging 10 to 12 per cent. copper. Work was abandoned because of the heavy cost of transportation, after several hundred tons of rich ore had been produced. Copper outcrops are noted at various points along the mountain range that crosses the island from east to west, the richest being in the barrio of Rio Blanco.

Since the American occupation, numerous mining claims have been filed, but no actual mining has been done, except a little placer work for gold. At the end of 1906 eleven claims had been filed for copper, and one for iron and copper, these being mainly in the western end of the island, in the departments of Mayaguez, Arecibo and Ponce.

**SALVADOR.** Copper ores are noted in the department of Chalatenango, near the Honduran frontier, and some attempts at mining in a crude way have been made. There also are copper ores near Melapán, in the department of Santa Ana.

**SANTO DOMINGO.** A little mining for copper is said to have been done by the Spanish, during the Eighteenth Century, but such operations must have been conducted on a small scale. The Sierra de Diferencia, constituting the backbone of the island, shows copper ores at various points, the most important occurrences noted being near the Jaina and Nigua rivers, in the province of San Cristobal, on the northern side of the island, and on the southeastern flanks of the mountains, in the same province, about 25 miles northeast of the city of Santo Domingo. At the latter point ores are said to occur in tuffs, near the point of contact with Cretaceous limestone, the ores being chiefly chalcopyrite, associated with limonite, with some malachite and brochantite.

## CHAPTER XVIII.

### COPPER DEPOSITS OF SOUTH AMERICA.

The cordillera of the Andes carries copper from its northern end in Columbia to Punta Arenas, at the southern tip of the continental mainland. Apparently the copper ores favor the western slopes of the cordilleran belt, as the principal mining fields lie mainly along the coast range, or between the coastal and central mountain ranges, largely in the table-lands between these two Andean ranges. There are occurrences of copper ore in Argentina and elsewhere, on the eastern slopes of the Andes, but these apparently are of less importance than the copper measures to the west. The principal cupriferous developments in South America are in the Republic of Chile, with Perú a good second, and there is every reason to believe that not only these, but other countries, will become increasingly important producers of copper.

**ARGENTINA.** The republic of Argentina has copper mines in the province of Buenos Aires, near the capital, which apparently are of small extent and little promise, and in the Andean provinces of Catamarca, Córdoba, Jujuy, Rioja, Salta, San Juan and Tucumán, of which the more important are in the province of Rioja. All of the latter named provinces are in the northwestern part of the republic, lying on the eastern slope of the Andes, in a rugged district offering serious obstacles to economical transportation.

The production of copper by Argentina has been small for many years, but eventually should become important. The ores are mainly sulphide, but, like those of the eastern slope of the Andes, run largely to arsenical and antimonial forms, enargite being an ore of frequent occurrence.

In the province of Rioja is found the Famatina district, in a field of only about ten by fifteen miles area, which includes the Mexicana, Tigre, Caldera and Cerro Negro sub-districts. The Sierra de Famatina is a great mass of metamorphic rocks, 60 to 100 miles in width, with peaks of nearly 20,000 feet in height. Near Chilécito is a vast upheaval of geologically recent eruptives, showing copper ores in fissures. The district is very rugged, and difficult of access and transport. The mines of the Mexicana district occur at elevations of 13,100 to 14,800 feet, the veins being numerous, narrow and rich.

The Capillitas district, in the province of Tucumán, is very small, having an area of about 4 square miles only. The topography is exceedingly rugged, and there is no wood, and no water, except in the mines, which can feed the boilers, but are unable to supply water for mills. The Cerro de Capillitas shows a mass of fissure veins, forming almost a gigantic stockwerk, in granite, gneiss and porphyry, with a capping of trachyte. The ores developed are cuprite, melaconite, azurite and malachite, with a limited amount of bornite and occasional highly argentiferous tetrahedrite. It is probable that chalcopyrite will come in at greater

depth, but the richer ores in the alteration zone evidently are of considerable depth, and are both auriferous and argentiferous, as a rule.

**BOLIVIA.** Mines of both silver and copper were worked in Bolivia by the Incas. Geological conditions are somewhat similar to those found in the adjoining countries of Peru and Chile, but the exploitation of Bolivian copper mines has been hampered by a variety of disadvantages. The mines lie in the high cordilleran plateau and lack of rail-transportation has been a serious drawback, but arrangements were made, in 1906, between the governments of Bolivia and Chile, for the construction of a rail line from Arica to La Paz, with a branch to Coro Coro, and the completion of this line cannot operate otherwise than as a great stimulus to production from the rich mines of the Coro Coro district. Most of the copper produced in Bolivia is shipped through the Peruvian port of Mollendo, though occasional shipments are made by way of Tacna, a Chilean port. The mining districts of Bolivia are arid, as a rule, and but slightly developed outside of Coro Coro.

There are copper mines in the departments of Aurora, La Paz, Litoral, Lipez Norte, Lipez Sur, Oruro, Pacajos and Potosi.

There are copper ores and mines at several points in the department of La Paz, but the most important mines of the department, and of the republic, are at Coro Coro. These mines are believed to have been worked by the Incas. The district is arid, and the only available local fuel is coffeea and cagajon. The nearest water supply is the Desaguadero river, 14 miles distant, which is a navigable stream, and copper is shipped by way of the port of Desaguadero. The Coro Coro district lies in the basin of Lake Titicaca, in the cordillera of Chacarilla, between the Andes to the eastward and the Cordillera Real, or coastal mountain range, to the west. This district shows two dissimilar sedimentary strata, apparently of different geological horizons, similar only in their origin and copperiferous nature. The older and underlying formation, Las Vetas, is an arenaceous conglomerate of argillaceous tendencies, having a generally northeasterly trend. Superimposed upon this stratum is another conglomerate, Los Ramos, having a generally southwesterly trend. The upper conglomerate is much like the lower, but is darker in color and mottled with red and white particles of gypsum and other minerals in the older stratum. The country rocks are eruptive, mainly dioritic, and the copper occurs native as a rule, and but rarely as ores in quantities of commercial importance. The conglomerates range from 2 to 6 feet in thickness, with an extreme thickness of 50 feet in the Veta El Dorado, which has a minimum width of about 3 feet. These conglomerates carry native copper averaging about .5 per cent. with copper ores in small quantities, mainly chalcocite and domeykite, scattered irregularly through the beds, and native silver occurs sparingly. The mineralized district has been proven for about one-half mile in width and for about 5 miles in length, but traces of copper are noted for a considerably greater distance, and about 25 miles to the southeast what apparently is a continuation of these beds has been found, and mined slightly, while the same formation also outcrops still further south, in a region west of Poopo. The southerly continuations of the Coro Coro belt are difficult of access, though of considerable promise. The native copper occurs usually in small nodules, though masses, commonly of small size,

but sometimes large, are encountered at times. The silver associated with copper is mechanically admixed, but not alloyed, this method of occurrence of the two native metals being the same in the Lake Superior district.

The Bolivian government estimates the average cost of copper production from the Coro Coro district, per quintal of practically one hundred-weight, averaging 80 per cent. in copper tenor, at 5.34 bolivars for mining, 3.27 bolivars for milling and 1.39 bolivars for general expenses, a total of 10 bolivars for 80 pounds of fine copper. Cost of transportation to the coast averages 3.24 bolivars via Tacna, and 2.87 bolivars via Mollendo, the latter port taking the major part of the exports, with an average cost of ocean freight to European smelting ports of 2.78 bolivars per quintal, giving an average cost of 15.6 bolivars at Swansea and other principal British smelting points, with an average European price of 20 to 22 bolivars per quintal.

The departments of Lipez Norte and Lipez Sur show extensive remains of Inca workings, obviously for silver, with evidences of later operations by Spaniards. There are promising deposits of highly argentiferous copper ores in these departments.

The smelting point for the mines of Huanchaca, department of Potosí, is at Pulacayo, on the line of the Antofagasta & La Paz railroad, at a distance of 184 miles from the first named city. The Huanchaca mines lie at an elevation of about 17,000 feet. The vein is 3 to 9 feet wide, in intrusive micaceous andesite cutting Silurian slates. Pay ore occurs in chutes, and is mainly highly argentiferous tetrahedrite, associated with chalcopyrite, sphalerite, galena and pyrite, all argentiferous, with quartz and barite gangue. Selected ore is shipped to Antofagasta, where smelted, or forwarded to New York for reduction. Selected ore averages about 6 per cent. copper, 8 per cent. lead, 16 per cent. zinc and 1.5 per cent. silver.

The department of El Litoral is included by the Bolivian government in its copper statistics, but inasmuch as this department has been occupied by Chile since 1879, and is now part of the Chilean province of Antofagasta, and will not be given up by Chile except to superior power, which Bolivia lacks, its inclusion in any article dealing with Bolivia must be considered a patriotic reminiscence, rather than a fact of present importance.

**BRAZIL.** The existence of native copper and of various copper ores in Brazil has been known for many years, but few systematical attempts have been made at mining, until within the past few years, and official records are lacking in most cases. In fact, but for private enterprise very little authentic information would be available, and credit is due to Prof. A. J. de Souza Carneiro, of Bahia, for much of the information that has been gathered regarding Brazilian copper deposits.

The immense size of the republic of Brazil renders it altogether probable that deposits of copper will be found at numerous points, in addition to those now noted, and as a fair beginning has been made on copper mining and smelting, under modern conditions, in the state of Rio Grande do Sul, it is probable that this republic will become, sooner or later, a considerable producer of the metal.

A mass of native copper weighing 2,616 pounds was found many years ago in the neighborhood of the city of Bahia, in the state of that name, and now reposes in the royal museum at Lisbon. This state contains numerous copper deposits, but the only active mines of importance are at Carahyba. There are about a dozen districts in the state of Bahia where copper ores have been found in greater or less profusion, and in the majority of cases these copper measures would seem worthy of careful investigation. In addition to the mines of the Carahyba district, copper has been found to the north, near the Cerro de Barracha district, also at Patamuté, Urtigas and Curacá. In the central part of the state copper ore exists at the Cachoeira do Inferno and at Jacobina. In the western part of the state copper ores occur at Chapa da Velha, and in the eastern part ores are known on the Paraguassú river, near Cachoeira, at points near the city of Bahia, at Belem, Genipapo and Murikiba. In the south central part of Bahia copper has been found at Maracás, and in the southern part at Condeuba and along the line of the Rio Verde, near the boundary of the state of Minas Geraes.

In the state of Ceará copper ores exist at a number of points, and have been worked to a slight extent. The principal occurrences are near Buhira, in the municipality of Bucuosa, where abandoned explorations show native copper and cuprite. Copper also exists in the Cerro Cantagaló.

In the state of Goyaz various deposits of copper ore of more or less promise are noted on the Jaurié River.

In the state of Maranhão there are rich copper ores at a number of points, notably in the municipality of Chapado.

In the state of Matto Grosso copper ores of considerable promise are exposed at various points along the Jaurié River, which forms the boundary line between the states of Matto Grosso and Goyaz.

In the state of Minas Geraes, long noted for its gold mines, the occurrences of copper ore probably are of greater promise than are noted in any of the other Brazilian states except Rio Grande do Sul and Bahia. The principal occurrences are noted near Ouro Preto, Sete Lagoas and Lavras. At the latter point copper deposits, found in 1901, gave assays running up to 75 per cent., and a little mining work was done thereon.

In the state of Paraná copper deposits are known at Campo Largo, in the Carapuava district and along the river Parapanema.

In the state of Rio de Janeiro copper ores are noted in the vicinity of Campos and São João do Barra.

Copper exists in the northern part of the state of Rio Grande do Norte, near the boundary of the state of Ceará.

In the state of Rio Grande do Sul are found the principal Brazilian copper mining operations of the present day, at Camaquam, 3 kilometers from the Rio Camaquam, and about 80 kilometers from Rio Negro, a station on the Southern Brazilian railway. The formation shows an intrusive core of melaphyr, surrounded by conglomerate, ore occurring in the latter as chalcopyrite associated with pyrite, with occasional particles of chalcocite and showing occasional dendrites of native copper, gangue being of quartz. The veins occur as fissures in conglomerate and extend to the adjacent sandstone, but therein are not as rich as in the conglomerate, where four ore bodies are being worked.

These lack regularity, and even continuity, having an average width of about 4 feet and giving average assy's of about 6.5 per cent. copper and 30 grams of gold, per metric ton. Elsewhere in this state copper ores are noted at Cacapava, where two small mines have been opened, and at Guarahina, Sao Gabriel, Cerro Martino and Cerro do Geraldo.

In the state of Sao Paulo chalcopyrite associated with sphalerite and galena has been found, in limestone, near Paranaiba, but attempts at mining were abandoned, as the ore was found in small pockets only. Copper occurs also in the Sporanga Mountains.

**CHILE.** This country was, about the beginning of the last quarter of the Nineteenth Century, the largest copper producer of the world, but now holds only sixth place, having been passed by the United States, Mexico, Spain, Japan and Australia. The copper output of Chile has decreased, not only relatively, but actually, owing mainly to the exhaustion of the principal bodies of oxidized ores in the older mines. From this decline in output it must not be inferred that Chile is exhausted as a copper producer; on the contrary, the possibilities of copper production are greater than in almost any other country except the United States, Mexico, Canada and Australia. It will be necessary in the future, however, to obtain a much larger proportion of the product from sulphide ores than has been gained in the past. The production from sulphides of low and medium copper tenor is increasing, and with the increase of railroad facilities, and the better equipment of mines and smelters along modern lines, Chile must become an increasingly large producer of copper. The largest annual production ever made was about 43,000 long tons of fine copper in 1882, and total production from 1844 to 1900, inclusive, is estimated at 1,830,000 long tons of fine copper.

Copper deposits were worked in a limited way before the first white man set foot on the soil of Chile, and a little metal was produced under Spanish domination, but the industry did not gain real importance until during the fourth decade of the Nineteenth Century, after the gaining of independence. Until 1842 the high grade oxide and carbonate ores were smelted in charcoal furnaces, but in that year the first reverberatory furnace was built by Charles Lambert at Coquimbo, and in 1857 the first blast-furnace was built by the same pioneer. The period of greatest prosperity of the Chilean copper industry includes the three decades from 1850 to 1880, followed by twenty years of slow but fairly steady decline, with a turn of the tide, followed by improvement, setting in with the beginning of the Twentieth Century.

In 1903, according to the official records of the republic, there were in Chile patented mines as follows: copper, 7,106; gold and copper, 124; silver and copper, 427; copper and iron, 16; copper and lead, 4; gold, silver and copper, 38; silver, copper and lead, 14; silver, copper and cobalt, 1, a total of 7,730 cupriferous mines. The number of working properties was 748, not quite 10 per cent. of the total. In this connection it should be explained that a mine in Chile consists of one hectare, or pertenencia, many of the properties including a considerable number of pertenencias. The mining laws are very liberal, and the government cannot be accused of retarding the mining industry. Each holder of one pertenencia, of practically two and one-half acres, is taxed \$10 yearly, and, after officially

surveyed, the property is freehold as long as taxes are paid regularly. Transportation facilities are poor, and there is considerable complaint of dishonesty and favoritism in the management of the state railroads.

Chile has two parallel copper belts, running nearly due north and south, along the axis of the Andes, these belts being approximately one hundred miles apart. The principal developments have been secured in the western or coastal belt, because of better transportation facilities. The cupriferous fields of Chile show mainly strata of the Permian system, with sandstones predominating. These have been much faulted, twisted, broken and upheaved by eruptive rocks, largely diorite. The auriferous copper veins of Atacama and Coquimbo usually are associated with highly silicious eruptives, while the argentiferous copper veins are associated commonly with diabase. General geological conditions are somewhat similar to those of the Mansfeld district of Germany, and in the Ural Mountain range of Russia, though the topography of Chile is much more rugged. The cordilleran belt, on the main chain of the Andes, lies back from the coast some distance, and the country is so mountainous, and the altitude is so great, and transportation facilities so poor, as a rule, that mining developments are on a scale that is trivial, compared with the possibilities of great production from this belt. The two parallel cupriferous belts stretch from Perú on the north to nearly the southern end of Chile, in what formerly was called Patagonia, a wild country that has been divided between Chile and Argentina, the Andes forming the line of division. In the desert regions comprising the greater part of Chile, the oxidized zone usually is of great depth.

There are copper mines in the provinces of Aconcagua, Antofagasta, Atacama, Colchagua, Coquimbo, O'Higgins, Santiago, Tacna, Tarapacá and Valparaíso, with copper ores known to exist in practically all of the other provinces. Antofagasta, Coquimbo and Atacama lead in production and in the number of important mines.

The principal copper mines of the province of Aconcagua are in the department of La Ligua, where there are a number of important mines, and in the departments of Petorca and Putaendo.

In the province of Antofagasta there are mines of importance in several districts, including Calama, San Pedro de Atacama and Tocopilla, the latter being an old field. Important mines are being opened in the department of Gatico, under modern methods. In the Chuquicamata district the copper mines were worked originally for atacamite, this assaying 2 to 3 per cent. only in copper, but being reduced easily. Developments at depth, however, have shown much richer ores, ranging from 5 to 20 per cent. in copper tenor, and important developments are under way. The center of this field, 163 miles by rail from Antofagasta, has an average elevation of about 9,000 feet above sea-level. The richer ores, principally atacamite, occur in small veins, with gangue of quartz and feldspar, and ore as now mined averages 10 to 12 per cent. copper. In the Taltal district the rich gold mines of Guanaco have become copper mines at depth, a phenomenon noted at numerous other points in the world.

The province of Atacama has copper mines in a large number of departments and includes several of the most important copper districts of Chile. The ores mined in this province must average about 6 per cent.

in copper tenor to be profitable, unless specially suited for fluxing purposes, in which case lower grades are utilized. Labor is inefficient; and power drills run by compressed air prove unsatisfactory, owing to the great altitude, while electric drills, for some reason not apparent, have not given satisfactory results. The department of Copiapó has a number of famous old producers, and some new mines of importance. Production in 1903 was 6,605 metric tons fine copper, from about 40,000 tons of ore, giving an average extraction of better than 15 per cent. for the entire district. The department of Chañaral was the second largest producer in 1903, ores as smelted giving average returns of 8.6 per cent. copper. The Cerro Blanco district is in the cordillerean zone, with mines mainly in trachyte, opened for silver, but changing to argentiferous copper values at an average depth of about 600 feet, and deeper to copper sulphides of good average value, the deepest workings being about 1,500 feet. In the department of Chañaral there are old and important mines, and the departments of Carmen Alto, Carrizal Alto, Freirina, Puquio and Vallenar have copper mines of importance.

In the province of Coquimbo there is very general complaint about of San Vicente, but there are copper ores at numerous other points.

In the province of Coquimbo there is a very general complaint about both the scarcity and inefficiency of labor. In this province there are important mines in the departments of Coquimbo, Combarbalá, Guiayacán, Illapel, La Ligua, Ovalle, Tamaya, Tongoy and Vicuña.

In the territory of Magallanes, in the extreme southern part of Chile, two veins of 5 to 7 meters in width have been found, carrying bornite and chalcopyrite, associated with hematite and limonite, with a quartz gangue.

In the province of O'Higgins there are copper mines, of more or less importance, in the vicinity of Rancagua.

In the province of Santiago the principal copper mines are at Lo Espejo and Melipilla, and in the department of Victoria.

The province of Tarapacá has copper mines, mostly small, near Iquique, Huantajaya, Huara and Tarapacá. Production by these mines is small, though they are by no means devoid of promise.

In the province of Valparaíso there are copper mines of some present importance, and of considerable future promise, near Llai-Llai and Quillota.

**COLOMBIA.** The production of copper is an industry of great age in the republic of Colombia, but one that never has assumed great importance. Considerable copper was secured during the centuries of Spanish government, mainly from the rich oxidized ores at and near surface, extracted and smelted along primitive lines. There are old copper mines in the provinces of Antioquia, Tolima and Boyaca, the mines of the latter producing a little copper for purely domestic uses. Copper also is found in the departments of Bolívar, Cauca, Cundinamarca and Santander. The principal deposits of Cauca are at San Lorenzo, Yocoto, Colí, Pichincha and Andagüela. In the province of Tolima copper ores exist near Anchique, and at Nacoroco, southwest of Natagaima. With the improvement of transportation facilities, and the introduction of foreign capital that will follow the more settled political conditions brought about by the wise government of General Rafael Reyes, the copper industry of Colombia,

now of merely academical interest, should take upon itself proportions of commercial importance.

**ECUADOR.** This republic has copper deposits in the provinces of Azuay and Loja, and an attempt at mining on a modern scale was made, some years ago, but did not prove successful. Mining operations are confined mainly to the production of gold from a number of small mines, and copper ore is found frequently in small quantities in these mines. It is altogether probable that Ecuador possesses copper deposits of prime importance, in its mountainous mining fields, but developments to date are trivial.

**PARAGUAY.** There are deposits of copper ore at various points in the northern part of Paraguay, from which specimens of native copper have been taken, but no mines have been opened. Copper ores also are noted near Incarnacion, in the southern part of the republic.

**PERÚ.** This country was a small producer of copper for some hundreds of years, but about the middle of the Nineteenth Century the industry fell into decay, and its rejuvenation dates from shortly after the decline in the price of silver, around 1885, which caused the miners of the Cerro de Pasco district to utilize their rich ores of copper, previously thrown aside in the search for silver values. The immense investment of American capital in the Cerro de Pasco district, estimated at \$17,000,000 gold, promises to revolutionize the copper industry of Peru. Among the disadvantages of Peruvian mining are the tremendous height of the mountains, which have taxed the engineering skill of man to pass, the lack of fuel in certain districts, and the inefficiency of labor, which is inclined to be both drunken and lazy, a state of affairs scarcely to be wondered at, in view of the padrone system in quite general use.

Peru is the second largest copper producer in South America, and in 1906, made 13,474,383 kilograms fine copper, a gain of 1,261,332 kilos over the preceding year, the production amounting to about 2 per cent. of the world's total supply of the metal. According to the official Peruvian statistics of 1900, there were in Peru 104 copper mines, 104 mines of silver and copper, and 2 mines of gold, silver and copper, which number had increased, in 1905, to 349 copper mines, 1,022 silver and copper mines and 351 copper and lead mines, a total of 1,722 cupriferous properties, showing a gain of more than 700 per cent. in five years.

Peru has the usual ores of the Andean cordillera, with geological surroundings similar to those of Chile. Copper ores are scattered all along the Peruvian Andes, and down to the coast. The principal ores are bornite, chalcopyrite, enargite and tetrahedrite, there being an unusual proportion of arsenical and antimonial minerals among the minor ores, found in considerable quantities in various places, with occasional native copper, cuprite, malachite, bournonite and chalcocite, usually associated with sphalerite and frequently with galena, all ores being more or less argentiferous.

In addition to copper ores in practically all of the other departments, Peru has copper mines in the departments of Ancachs, Arequipa, Cajamarca; Huancavelica, Huánuco, Ica, Junín, Libertad, Lima and Puno.

In the department of Ancachs the production of fine copper in 1906:

was 440 metric tons, the district of Pallasca leading with 229 metric tons, followed by Recuay with 154 metric tons, balance of production being from the districts of Bolognesi, Cajatambo, Huallas and Huari.

The department of Arequipa produced 102 metric tons of fine copper in 1906, from the districts of Arequipa, Acari, Camaná and Islay, the formerly important district of Acari furnishing less than 9 tons of this small output.

The production of the department of Cajamarca, in 1906, was 162 metric tons, the Cajabamba district leading with 137 tons, with small products from the Contumazá and Hualguayoc districts.

In 1906 the production of fine copper from the mines of the department of Huancavelica was 254 metric tons, the district of Castrovirreina leading with 234 metric tons, followed by small products from the districts of Angaraes and San Juan. This department, which lies a long distance nearly due south of Cerro de Pasco, shows copper ores in promising quantities, mainly in eruptive rocks. The ores smelted in 1905 averaged about 25 per cent. copper, and 0.1 to 0.135 per cent. silver.

The department of Huánuco produced, in 1906, fine copper to the extent of 235 metric tons, of which the district of Huánuco made 141 metric tons, and the district of Huallanca 94 metric tons.

The 1906 production of the department of Ica was only 28 metric tons fine copper, all coming from the district of Ica, which was worked extensively at one time, but was practically abandoned in 1892. The largest mine was the Canza, with selected ores averaging about 30 per cent. copper, lower grades being rejected. Disadvantages in this district are lack of water and of decent roads for transportation.

The department of Junín is much the most important copper field of Perú, and is of great promise. The output of fine copper, in 1906, from the various districts of this department, was 9,440 metric tons, of which 6,741 metric tons came from the Cerro de Pasco district, with 2,697 metric tons from the Yauli district. The district of Huancayo produced only 2,156 kilos fine copper.

The Cerro de Pasco district, worked for nearly 300 years for silver, and an enormous producer of that metal, has become a very important copper field, since 1890, and is now mainly in the hands of a single American corporation. Unlike most of the other Peruvian mining fields, which are arid, there is an excess of water at Cerro de Pasco, and there are numerous streams that could be made to furnish power. Timber is scarce, except in a few districts difficult of access, but coal of fair quality is found in abundance, within 20 miles, and a branch railroad has been built to the coal fields. An extension of the Meiggs railroad has been built from Oroya to Cerro de Pasco, cutting to a comparatively trivial sum the former freight rate of \$40 per ton for this distance, all transportation having been on the backs of mules and llamas. The Cerro de Pasco district is a basin of approximately one mile width and two miles length, entirely mineralized and bounded on the west by andesite, with limestone on the three other sides. The formation is in some doubt as to age, but apparently is lower Cretaceous, with strata of slate, sandstone and limestone, upon which is superimposed a mass of limestone conglomerate, of marshy rather than marine origin, fractured by eruptive acid andesite rocks, that

in many cases engulf the sedimentary strata, the limestone being highly metamorphosed. Apparently the entire basin in a mammoth stockwerk, with impregnations of silver and copper ores, the ore occurring in immense pockets, up to hundreds of thousands of tons in weight, and largely, though less frequently, in veins. The deposits are said to be metasomatic, at the western end, east of the andesite, occurring mainly as veins in or near the andesite, while to the eastward, west of the limestone, the ore occurs in large pockets, in and near the limestone. The alteration zone is 200 to 300 feet in depth, succeeded by a zone of lean cupriferous pyrites, followed in turn by highly argentiferous sulphides and arsenides. Below the water-level the ores include bornite as well as chalcopyrite, with considerable tetrahedrite, associated with sphalerite, galena, arsenopyrite and pyrite.

The Huayllay division is about 25 miles southwest of Cerro de Pasco, at an elevation of about 15,000 feet. Copper occurs at various points, mainly as enargite, with considerable tetrahedrite and some chalcopyrite. Bismuthinite is shipped in considerable quantities from one property, and there are a number of old copper mines, mostly small, in this field.

The Yauli division of the Cerro de Pasco district is a short distance east of Oroya, the principal copper deposits occurring between wollastonite strata and andesitic rocks, such as dacite and prophyllite. The Morococha sub-district of the Yauli division has a number of important producing mines, and is located on a 10-mile spur of the main line of the Oroya railroad that runs from the western end of the Galera tunnel, which passes under Mount Meiggs. The Yauli mines, including the Morococha sub-division, are located at an average elevation of more than 13,000 feet above sea-level.

The department of Libertad produced, in 1906, only 74 metric tons fine copper, of which 73,654 kilograms came from the district of Santiago de Chuco, and only 690 kilos from the district of Salpo.

The department of Lima is the second largest producer of Peru, having made 2,547 metric tons fine copper, all from the district of Huarochirí, in 1906.

The American consul at Iquitos writes that prospectors on the upper Maranón river, an affluent of the Amazon, found copper in the dumps of a half dozen abandoned mines, worked by Spaniards previous to the Peruvian War of Independence, at a distance of three weeks journey from Iquitos.

The production, in 1906, of the mines of the department of Puno, was 187 metric tons fine copper, all from the district of Lampa.

**URUGUAY.** Mining is but little developed in this republic, and while copper ores have been found at various points, no serious attempts have been made at developing copper mines.

**VENEZUELA.** Venezuela has produced no copper since 1894, but was a producer of importance at one time. Copper ores are known to occur in the departments of Barquisimeto, Carabobo, Lara and Mérida, but the only mines of importance have been developed in the department of Lara.

There are traditions that the Quebrada mines, in the Aroa district of Lara, were worked by aborigines, before the coming of the Spanish. In the first half of the Nineteenth Century a Baltimore company operated

several of these mines, securing therefrom about 43,000 tons of high grade carbonate and oxide ores. Later the mines were taken over by local capital, and circa 100,000 tons of medium and high grade ores extracted. The principal period of production was in the years 1872 to 1894, when fine copper to the extent of about 65,000 tons was produced. The Quebrada mines are developed on the Narvaez or Bolivar tract, of 1,150 square miles, between the Tocuyo and Yaracuay rivers, granted to one Narvaez, by the Spanish crown, in 1598, and passing, in 1802, by marriage, to the ownership of Simon Bolivar, the liberator. The developed cupriferous portion of this tract shows strata of slate and limestone, intruded by various eruptive rocks, the ore occurring in lenses, frequently of considerable width and length, and of unknown depth, the lenticular bodies occurring in series with a strike of nearly north and south. The usual oxidized ores are found at and near surface, succeeded by chalcopyrite at slight depth.

The copper measures of Venezuela obviously are of importance, even if judged solely by past production from a single district, and when the present unsettled and unsatisfactory political conditions are adjusted, Venezuela will resume its position among the important copper producing countries.

## CHAPTER XIX.

### COPPER DEPOSITS OF EUROPE.

The copper deposits of Europe are described briefly in this chapter, in alphabetical order, by countries.

**AUSTRIA.** Copper has been mined and smelted in Austria for centuries, and it is probable that copper mines were worked in Roman times. The industry is now of comparatively little importance, employing only about 1,000 men, with an average annual production of between two and three million pounds fine copper. The principal mines of Austria are in the Tyrol, where there are about a half dozen small mines in operation. In southeastern Bohemia there is an extensive area of sandstone and slate, containing veins carrying impregnations of copper ore, mainly chalcocite, and the Grasltizer mine of this district was perhaps the most celebrated copper mine of mediæval times. There also are a few small mines in Salzburg, near the city of that name.

**BOSNIA.** The production of fine copper from the mines of Bosnia was only 39 metric tons in 1905, a heavy falling off from the output of 237 tons in 1901, in which year the output was secured from 4,747 tons of ore smelted, giving an average extraction of almost exactly 5 per cent. A little ore is mined and smelted at Sinjako, and small quantities of ore are sent to Hungary for smelting.

**BULGARIA.** The principality of Bulgaria has copper mines in the provinces of Bourgos, Vidin and Vratza, and 1,400 tons of ore are estimated to have been produced in 1904. There are evidences of copper mining operations in Roman times, and possibly at an even earlier period. In the province of Vratza, near where modern mines are operated, there are considerable slag-piles, remaining from ancient smelters of a date so remote that no vestiges are found of the works themselves, and in other provinces there are similar but smaller slag-dumps, with waste-burrows containing mere traces of lean ore, the values of which have been leached most effectually by the rains of twenty centuries.

At Plakalaitza, in the province of Vratza, the ore is mainly bornite, with occasional chalcopyrite, and a little malachite in the upper workings.

In the province of Bourgos, chalcopyrite in considerable quantities is found at Kara Bair, immediately west of the port of Bourgos, on the Black Sea, and there are remains of copper mining operations dating from some remote period. At Kara-Tepe and Soulou-Dere there are ores ranging up to 40 per cent. in copper tensor, on which some mining has been done, in no case exceeding 100 feet in depth.

At Belogradchik, in the province of Vidin, mines are being developed on ore bodies yielding mainly chalcopyrite. At Milkovtzy, in the district of Trn, there are small ore bodies showing malachite, chalcocite and chalcopyrite, with gangue of barite.

In the department of Sofia, not far from the capital, in the extreme

western part of the principality, chalocite is found at Gornya-Danya and at various other points. Native copper and rich oxidized ores have been noted in the districts of Slevan and Samakof, and elsewhere.

**CORSICA.** The island of Corsica has a cupriferous district about 20 miles wide by 50 miles in length, showing copper ores, mainly sulphide, in contact deposits between limestone and igneous intrusives. In this district there are a number of small and unimportant mines, mostly of considerable age, of which the Lancone mine was once a considerable producer. The present copper production of Corsica is trivial, coming mainly from a single small mine that ships about 200 tons of ore yearly to Great Britain.

**CYPRUS.** The Latin word cuprum, from which comes the English word copper, and its equivalents in most of the other European languages, is derived from *aes cyprium*, the earliest Latin name of copper, derived from the name of this island, where the Romans first secured their supplies of the metal, and it is probable that copper mines were worked by the Greeks before the Romans. The latest attempt at modern mining, early in the Twentieth Century, was in the vicinity of Limassol, but the island now has no active copper mines.

**ENGLAND.** English tin was known to the Phoenicians nearly or quite three thousand years ago, and copper has been produced, in all likelihood, for as many years as tin, the same veins carrying both metals, in Cornwall and Devon. At the close of the Eighteenth Century England occupied relatively the same position in the copper industry as held by the United States one hundred years later, producing 55 to 60 per cent. of the copper supply of the world, and, including the Welsh mines, then large producers, Great Britain was as important a factor in the copper trade, at the beginning of the Nineteenth Century, as North America is in the same trade at the present time. In 1799 the output of copper by English mines was 4,928 long tons, but had shrunk, in 1899, to 367 tons.

The mines of Cornwall and Devon, adjoining counties in the southwestern corner of the island, have been important producers of tin for a hundred generations, and it is no wonder that the Cornishmen are counted the world's best practical miners. A small, though relatively important production of copper, was secured from these counties during the middle ages, but systematic copper mining may be said to date from about A. D. 1700. The quantity of copper ore produced by the mines of Cornwall and Devon, during 126 years ending with 1865, was 7,844,305 long tons, valued at £50,964,388. The average yield for the last 70 years of this period was about .8 per cent. fine copper. The metalliferous belts of Cornwall and Devon may be considered as one geographically, occurring in a district showing metamorphosed sedimentary rocks, mainly clay-slates of the Devonian system, with frequent bosses of granite, both slate and granite being intruded by a quartz-porphyry of later age. There are numerous fissure veins cutting all of these rocks, these averaging 2 to 3 feet only in width, and frequently showing prominent gossans, the cappings being more numerous and stronger above copper ores than above the tin ores. The same veins carry ores of tin and copper, but there is a marked segregation of these minerals, governed by the nature of the wall-rocks, tin occurring mainly in portions of the fissures traversing granite, while copper favors

the slatea. There are exceptions to this rule, and in places tin and copper alternate in occurrence, but, in the main, the metals favor the different rocks as noted. As a rule the veins are best mineralized where having the sharpest dip. The copper ore is mainly chalcopyrite, with quartz gangue, but the upper workings show the usual oxidized ores and native copper. One mass of virgin metal, weighing three tons, was secured from a mine near Mullion, Cornwall. The secondary sulphides are found to some extent, and copper silicates occur in small quantities, while there are occurrences of many of the rarer copper minerals, of scientific interest rather than of commercial importance.

The county of Cumberland was a producer of copper from a number of mines at one time, but these have been idle for a century or more. The Goldscope, in this county, was the most famous English copper mine during the Tudor era, working a fabulously large force of men to obtain the very moderate amount of copper secured.

The county of Cheshire contains numerous deposits of oxidized ores, averaging about 1.5 per cent. in copper tenor, disseminated in sandstone, which are not of present commercial importance, though possibly of future value.

There are deposits of copper in western Shropshire, along the Welsh border.

In Staffordshire the Ecton mine, owned by the Duke of Devonshire, was opened in Roman times, and was operated as recently as 1840. This was the first English mine to use gunpowder for blasting, in 1677.

The Laxey mines, in the Isle of Man, produce lead, zinc, copper and silver, the principal values being in the two metals first named.

**FAROE ISLANDS.** On the western side of the island of Luderø there are a number of superimposed cupriferous amygdaloidal traps. The copper occurs in thin vertical sheets, as virgin metal, of about one thirty-second inch in average thickness, and some of the gangue rock, from which metallic copper of appreciable size had been removed, assayed 1.88 per cent. copper.

**FINLAND.** The grand duchy of Finland, which, though closely bound to the Russian Empire, is not a portion thereof, as quite generally considered, has copper mines in the provinces of Viborg and Kupio. The most important is the Pitkäranta, on the northern shore of Lake Ladoga, in the province of Viborg, where mining dates from about the middle of the Nineteenth Century. The ore is mainly chalcopyrite, occurring in veinlets and disseminated in beds of "skarn," or sahlite, which is a granular mixture of augite, granite and ferromagnesian silicates, traversing granite. The ore body averages about 15 feet width, and is low in grade, but has been developed more or less extensively for about one and one-half miles in length.

**FRANCE.** There are no copper mines of present-day importance in France, the old mines of Chassy, which were famous properties and considerable producers in the middle ages, having been exhausted and idle for many years. In 1903 French copper production was 10,900 metric tons of cupriferous pyrites, of an average value of \$13.25 per ton, a considerable portion of the value being in the sulphur contents, coming mainly from the department of Ariège, with a small output from the department of

Gard. The production is principally from mines of cupriferous pyrites at St. Bel, northwest of Lyons, where the ore occurs in series of lenses having a known length of about 1,300 meters. One of the lenticular masses is of mammoth size, having an ascertained thickness of 140 feet, at the depth of 544 feet, with a known length of 1,968 feet, consisting of massive pyrite with a little intruded quartz, slightly cupriferous. There also are small mines of argentiferous tetrahedrite in the department of Ariège, and in 1900 the production of such ore was 1,184 metric tons, valued at 812,393 francs, mainly in silver, sent to Great Britain for smelting.

There also are small copper mines in the department of Var, and in Savoy. There are very small copper mines in the department of Isère, and in the Basses-Pyrénées some exploratory and development work was done in the early years of the century. At Cap Garonne, near Toulon, there are Permian quartz-conglomerates carrying a cupriferous bed of 2 to 4 feet thickness, the lower portion mineralized with chalcocite and melaconite.

**GERMANY.** In production and importance, the copper mines of Germany rank second in Europe only to those of Spain, and the Germanic copper industry is of considerable antiquity, the Mansfeld mines having been important producers in the middle ages. In 1799 Germany produced only 372 long tons of fine copper, nearly all from the Mansfeld mines, and one hundred years later made 20,875 long tons, of which about 90 per cent. was from the Mansfeld mines.

There are copper mines of greater or less importance, and other mines carrying cupriferous values, in Bavaria, Brunswick, Elsass, Hanover, Hessen-Nassau, Prussian Saxony, Rheinprovinz, Saxe-Coburg-Gotha, Saxe-Meiningen, Saxony, Silesia, Weimar and Westphalia.

The copper mining industry of Saxony is of overwhelming importance, values being secured mainly from a single property in a single district, though there are cupriferous quartz veins in Schneeberg. The production of Saxony, in 1904, was 710,911 tons of ore, from three mines, of which one, the Mansfeld, is one of the world's greatest copper producers, while a second, the Rammelsberg, is of considerable importance.

The Mansfeld mines are at Eisleben, in the southern Harz Mountains. In this portion of the Ober Harz the copper occurs in rocks of the Permian system, resting unconformably upon crystallized strata of Paleozoic rocks, the metalliferous bed lying in the Zechstein, a member of the Permian formation. These horizons of the series consist mainly of unstratified gypsum, associated with bituminous dolomitic limestones, beneath which is a stratified fetid limestone, below which lies the true Zechstein, giving name to the formation. At depth this passes into a bituminous marly shale, the lowest part of which, ranging from 18 inches to 3 feet in thickness, forms the cupriferous strata, carrying disseminated copper sulphides to the extent of 2 to 5 per cent. copper, with an average tenor, as mined, of about 2.8 per cent., and carrying an average of about 0.15 kilos silver per metric ton. Under the cupriferous shale is a calcareous sandstone-conglomerate, sometimes carrying disseminated copper carbonates, and containing also small values in cobalt and nickel, all of the ore being more or less argentiferous. The copper-bearing shales of the Mansfeld district are about 200 square miles in area.

The Rammelsberg deposits, in the northern Harz Mountains, two miles south of Goslar, Prussian Saxony, occur in lenticular bodies of banded ore, with layers conformable to the bedding of the Goslar slate, in folded beds of Devonian age. The Rammelsberg is the second largest copper producer of the German Empire.

In 1904 the production of Westphalian mines was 47,718 metric tons of ore, secured from three copper mines and as a by-product from eighteen mines of other metals, and in the same year two copper mines in Silesia produced 1,760 metric tons of copper ore.

**GREECE.** The first Grecian copper mining was done at Chalkos, in the island of Eubea, in semi-historic times, and the Greek name of the metal, chalkos, came from this source. The eastern coast of Attica shows argentiferous sulphide ores of lead and zinc, including the important silver-lead mines of Laurium, the argentiferous galena and sphalerite carrying occasional chalcopyrite. Copper ores occur in small veins only, as a rule, in eastern Attica, but in 1907 one copper mine was being worked, in a small way.

There are deposits of copper ore in Thessaly, but apparently these are not of large size or especial promise.

**HERZEGOVINA.** This country, nominally under Turkish suzerainty, but actually administered by the crown of Austria-Hungary, has a few small and exceedingly primitive copper mines, but none worthy of serious consideration, as now developed.

**HUNGARY.** Copper mining is an industry of great antiquity in the kingdom of Hungary, and there is a considerable number of old mines, mostly worked out or idle, and nearly a dozen copper smelters, all small and antiquated in design. Sulphide ores predominate as a rule. In 1901 the production of copper ore in Hungary was 161,547 metric tons, from 16 working mines, of which five produced the bulk of the ore won, and, of the larger producers, three mines were owned by the government and two were under private ownership.

There are copper mines in Transylvania, in the eastern portion of Hungary. The copper measures of the Banat, formerly worked for copper values, are now producers of iron ore only, though auriferous copper ores are found as contact deposits at the junction of garnetized Tertiary limestone and intrusive monzonite. At Herrengrund, north of Neusohl, near the Galician boundary, there are small copper mines, and at Dognacska there are very old and very small mines, that are limited produceers of copper sulphides.

**IRELAND.** In 1906 the copper production of Ireland was about 3,000 tons of low grade cupriferous pyrites, valued at about £4,000 only, a considerable proportion of the values being in sulphur. At one time the Irish copper mining industry was of much importance, the production of the Connecree mines being 677 tons of fine copper in 1799, equivalent to nearly 8 per cent. of the world's production in that year, while in 1899 the Irish output was only 17 tons of fine copper, all obtained by leaching and cementation. The Irish copper ore sold in Swansea and Liverpool, from 1875 to 1882, amounted to 670,681 tons, of 21 cwts. each, valued at upwards of £1,000,000, but after 1882 the copper mining industry was practically extinct for

twenty years, though efforts are now under way to revive the industry. The Irish copper mines, however, have been material contributors to the progress of the industry, the wire rope tramways now in general use having been invented by Chas. Hodgson, of Wicklow, for use in the local mines, and the single rail was first utilized by Capt. Geo. Oates at the Cronnebane mine.

The Irish copper ores are mainly chalcopyrite and cupriferous pyrite, and there are copper mines in the counties of Cork, Kerry, Waterford and Wicklow, and in addition there are copper deposits in County Tipperary.

In County Cork the principal cupriferous districts are in the western part, including the Berehaven district, where mines were worked early in the Nineteenth Century, the Schull district and the Crookhaven and Kilcrohane districts.

The copper measures of County Cork extend into the adjoining county of Kerry, where mines have been opened at various points, including Ross Island in Lake Killarney. The Mountain and Keallonge mines, operated during the early decades of the Nineteenth Century, were each more than a quarter of a mile in depth, and were considerable producers in their day.

In County Waterford the Knockmahon mines were large producers at one time, the output of finished copper from the mines of this county exceeding 900 long tons in 1843. The ore is mainly cupriferous pyrite, occurring in large bodies in clay-slate, and, as selected, gave average returns of about 10 per cent. copper. The cupriferous measures of this county would seem worthy of serious exploitation.

In County Wicklow the Cronnebane mine was the principal property, and, as early as 1799, the Connecree mines yielded 677 tons of fine copper, rendering this one of the largest copper mines of that period. Copper mining practically ceased about 1840, but there was a small production of more or less cupriferous pyrite from the old copper mines for several decades later. In the Ovoca Valley of Wicklow, sulphide ores occur in clay-slates, as in the adjoining county of Waterford, and as in Cornwall and Devon. The ore occurs as chalcopyrite, in small veins, and as cupriferous pyrite, in lenses in Silurian slates, near granitic intrusives. The Ovoca copper belt is about six miles in length, and is of considerable promise, though the average grade of the ore is low.

**ITALY.** Copper was mined in Italy by the Romans several centuries before the Christian era, and, before their day, in semi-historic times, mines were worked by the Etruscans. The copper production was small during the middle ages, but the industry never has suffered complete cessation since its birth. Several of the Italian copper mines are well equipped, and managed with technical skill, and production is increasing. In 1902 the output of all Italian mines was 101,142 long tons of copper ore, and in 1907 probably was considerably more than twice as large.

The Italian copper deposits of commercial value occur mainly in the Appenines of Northern Italy, in the departments of Liguria, Piedmont, Tuscany and Venetia, those of Tuscany being of the greater importance. The principal mines are in the districts of Volterrano, Grosetto, Liguria and in the western Alps.

Principal developments and production are in the Grosetto district, where the largest Italian copper company is operating, in the vicinity of

**Maasa Marittima**, the Maasa Metallifera of Roman days. The Grossetta district lies ten to twenty miles southeast of Leghorn, in the foothills of the Etrusean Appenines. The principal ore bodies occur in fissure veins, in a great laccolith of gabbro and diorite intruding Eocene limestone, the intrusive rock being strongly basic, with an altered crushed zone of serpentine. In this district are to be found the largest Italian producers.

The Ligurian mines, above Genoa, lie near the Mediterranean coast, the ore bodies occurring in stratified Azoic rocks, as contact veins between diorite or serpentine and the metamorphic rocks, the ores being mainly sulphide, with quartzose gangue.

The ore of the Volterrano district is mainly chalcopyrite, with a small quantity of chalcocite found in fissures in a red gabbro, known locally as porfido rosso. This district has been the scene of copper mining operations from very early times.

In the Piedmont district mines were worked in Roman days, and traces of old workings are to be seen at many points. The ores occur in stratified archaic rocks, no fissure veins being found, and nickel and cobalt frequently are associated with copper.

In the island of Sardinia there are copper deposits near Freigas, on Monte Tramonto, in a bed of clay-slate alternating with limonite schist, the copper often occurring near the contact and showing considerable chrysocolla above, with chalcopyrite below. There are minor copper deposits, mainly in small bodies and of low grade, at several other points in Sardinia. In 1905 the production of Sardinia was 98 metric tons of copper ore, all from the province of Cagliari.

**LUXEMBURG.** There is a small copper mine at Stolzenburg, near Diekirch, opened 1896. The vein averages about 20 inches in width and carries ore of good copper tenor.

**NORWAY.** The copper mining industry of Norway is of considerable antiquity, and in 1799 Norway produced 480 tons of fine copper, mainly from the Røros mines of Trondhjem, and one hundred years later the output was 3,935 long tons of fine copper, Norway being one of the few European countries to increase its copper output during the Nineteenth Century. Most of the Norwegian mines are opened on lenses of cupriferous pyrite, some of these lenticular masses being of large size. As a rule the lenses have a nearly vertical dip, but are deep rather than wide, being comparable in shape to eggs on end, rather than to the ordinary lenses having their greatest length along their axes of strike.

There are copper mines in the provinces of Christiania, Christiansand, Trondhjem and Tromsø. The principal mine of the present day is the Sulitjelma, in the amt of Nordland, stift of Tromsø, north of the Arctic circle. The country rock is mica-schist, of lower Silurian age, with eruptive greenstone flows conformable with the schist, the ore bodies occurring as extended lenses, very persistent in strike and dip, on the contact of the schist with metamorphosed amphibolite and olivenite gabbro, the ore being exclusively cupriferous pyrite, averaging 2.25 per cent. copper, with small quantities of nickel and silver, and of good sulphur tenor.

In the stift of Trondhjem are the Røres and Meraker districts, the oldest copper fields of Norway, and among the oldest in northern Europe, which

remain producers of some present importance. In these districts the ores occur as sulphides, in schist and slates of lower Silurian age.

In Telemarken, Christiansand, there are a number of old mines carrying numerous veins of sulphide ore, mainly of narrow width but great persistence.

**PORUGAL.** The important copper mines of Portugal are all in the province of Alemtejo, near the border line of the Spanish province of Huelva, but there are a few small properties in the southern province of Algarve, next south of Alemtejo. As the mines of Alemtejo are opened on the western extension of the Sierra Morena, their geology is practically the same as that of Huelva, described in the article on Spain. The principal Portuguese mines are in the districts of San Domingos, Grandola and Aljustrel, production averaging about 500,000 long tons of cupriferous pyrite annually.

**ROUMANIA.** There are no large copper mines in this kingdom, the principal producers, all very small, being in the Mehedintze district. In the Carpathian Mountains carbonate ores and chalcopyrite, slightly argentiferous, are found at Valea Choboroasa. Copper ores also exist near Salaiastea and in the district of Dobroudja, at the towns of Balabancea, Islam-Geafer and Carapelist, also at Altan-Tepe, near Tcheamourli.

**RUSSIA.** There are extensive cupriferous districts in the Russian Empire, those of Siberia being treated separately in the chapter on copper deposits of Asia, with the exception that the Transcaucasian copper mines are included in this article on Russia, as also are the copper measures on the eastern slope of the Ural Mountains, that lie in the governments of Perm and Orenburg, each of these divisions lying partly in Europe and partly in Asia.

There are copper mines in the governments of Perm, Orenburg, Ufa and Samara along the Ural Mountains, and in the governments of Viatka and Kasan, next west. In Transcaucasia there are mines in the governments of Elizabethpol, Kutais and Tiflis. In the Russian Empire there are a considerable number of copper mines and nearly or quite 30 smelting plants, mainly small and antiquated in design, though a few properties, notably the Kisdebek, have modern reduction works. The comparatively small output of Russian copper is no criterion of the possibilities of production inherent in the copper measures of this, the greatest empire in existence, and there are various fields of much promise awaiting extensive exploitation at some future time.

The Permian formation, taking its name from the government of Perm, is very extensive, being found in the governments of Perm and Orenburg, on both sides of the Urals, and in the adjoining governments of Ufa; Samara, Kasan and Viatka. The mines of these governments are opened in Permian and Triassic formations, the ores occurring oxidized, and of low average tenor, not to exceed 2 to 3 per cent., but with occasional enrichments, notably as massive malachite, of excellent average tenor. The bedded deposits of the western slope of the Urals are mainly of Permian age, with some cupriferous strata of Triassic age. Among the Permian mines of interest is the Miednoroudiansk, where a single body of massive malachite weighing 339 tons was extracted in 1836. At depth the pockets of carbonate and oxide ores pass into chalcopyrite and cupriferous pyrite.

The Transcaucasian mines, in the three governments of Elisabethpol, Tiflis and Kutais, furnish about half the copper production of the empire. In the Kedabenski district of Elisabethpol, ore occurs as irregular lenses, often of large size, in veins with quartz-porphyry gangue, with walls of diorite and diabase porphyrite, the lenses shading gradually into the country rocks. The ore is a mixture of slightly auriferous and argentiferous covellite and chalcopyrite, carrying sphalerite and occasional galena, associated with pyrite and pyrrhotite, with a heavy barite gangue.

Copper ores were worked in a small way, toward the end of the Eighteenth Century, near Kielce, in Russian Poland, and were reopened for a short time in 1904. There also are old copper mines at Chenciny, Poland, carrying mainly carbonate ores, on which some efforts at mining have been made since the beginning of the Twentieth Century.

**SCOTLAND.** There are old copper mines, which never were of importance, in Renfrewshire and Rossshire, with deposits of chalcopyrite, apparently of some promise, in Perthshire, and occurrences of copper ores are noted in Kirkcudbrightshire.

**SERVIA.** There has been a small but fairly continuous copper industry in Servia for some hundreds of years, and it is possible that copper mines were operated by the Romans. The production of fine copper by Servian mines in 1900 was 270 metric tons.

The principal producing copper field is in the vicinity of Majdenpek, and in the adjoining districts of Rebelj and Wis, in northwestern Servia, in the basin of the Yablonica river, the copper belt running for about 15 miles northwest and southeast along the northern slope of the Povljent Mountains. The Rebelj deposits occur in serpentine, with intercalated argillaceous limestone, in lenses up to 100 feet in length, carrying a core of crystalline pyrite with disseminated chalcopyrite averaging about 5 per cent. copper, with the outer shell of the lense carrying ore up to 15 per cent. in copper tenor. There also are deposits of copper ore at Radanovci, Staninareta and Wuinovatz.

**SPAIN.** Of all the producing copper fields of the present age, the Hispano-Portuguese cupriferous measures of the provinces of Huelva and Sevilla in Spain, and the provinces of Alemtejo and Algarve in Portugal, are the most ancient. The first copper mining on the Iberian peninsula was done, in all likelihood, by the Phoenicians, some three thousand years ago, and was continued by their kindred, the Carthaginians. Upon the destruction of Carthage by the Romans, that people succeeded to the dominion of the peninsula, and extensive traces of their work remain observable to this day in the copper mines of the Sierra Morena. Mine timbers, in all likelihood set by Roman workmen nearly or quite two thousand years ago, remain in place, effectually protected from the gnawing tooth of time by the preserving action of copper sulphate, with which the mine waters are strongly charged. Upon the disruption of the Roman Empire, Spain and Portugal fell to the lot of the Visigoths, and, a few centuries later, the Moors conquered the southern half of the peninsula, remaining in possession for some seven centuries, and operating the Huelva copper mines to some extent. Upon the expusion of the Moors by Ferdinand and Isabella, late in the Fifteenth Century, the Spanish gained possession of the

rich mines of the Sierra Morena, and the larger of these odd properties were worked, in a spasmodic way, with frequent hiatuses, until 1860, when the Tharsis mine—supposedly the Tarsish of the ancients—was reopened, and worked along modern lines. The Rio Tinto, much the greatest of Spanish mines, and one of the four greatest copper mines in the world, passed into the hands of the present owners in 1873, and was reopened in 1876. Further particulars of interest in this connection will be found in the article descriptive of the Rio Tinto mine.

Spain ranks third among the copper producing countries of the world, and was second only to the United States as recently as 1902, having been passed by Mexico in 1903. As recently as the early years of the ninth decade of the Nineteenth Century, the production of copper by Spain, Chile and the United States was practically on a parity. There is no other copper field in the world that has been worked, practically continuously, for three thousand years, notwithstanding which the outlook for the Spanish copper mining industry is excellent.

In the kingdom of Spain there are copper mines of more or less importance in the provinces of Almeria, Asturias, Barcelona, Burgos, Ciudad Real, Córdoba, Coruña, Gerona, Granada, Huelva, Huesca, Jaén, León, Madrid, Menorca, Navarra, Palencia, Santander, Sevilla, Teruel and Zaragoza.

In 1901 the official Spanish returns gave 271 productive copper mines in the province of Huelva, but in many cases these counted separately numerous mine openings held by a single company, hence the number of actual producers was much smaller, including only about a dozen with outputs of importance. The active portion of Huelvan cupriferous belt is a zone of about 15 miles average width, with an extreme length of about 80 miles, running practically east and west through the entire province of Huelva, with its eastern end in the province of Sevilla and its western extension in the provinces of Alemtejo and Algarve in the kingdom of Portugal. This district lies along the Sierra Morena, and, in addition to the dimensions before given, which are those of the fairly proven copper territory, there are indications of copper, of more or less promise, in a district of about 30 miles extreme width by 125 miles or more in length, along this range of mountains and beyond its limits. The Sierra Morena, or Andevallo, cupriferous belt, is divided into four zones, the eastern, known as the Cerro Muriano, including various mines near the city of Sevilla, while the western zone lies in Portugal, with the village of Grandola as an approximate center. The northern zone includes the principal mines of Huelva and Alemtejo, while the southern zone includes a number of mines of considerable importance, the largest being the Tharsis. All of these zones present the same general characteristics, carrying lenticular masses of ore, usually at the junction of slates of the lower Carboniferous system with intrusive syenite and diabase. The ore bodies lie parallel with the slate, with northwesterly strike, and dip to the north. The slates are of a yellowish cast at surface, where weathered, but are bluish at slight depth. Apparently the ore bodies, while occurring as immense lenses, may be considered true contact veins. The deposits are of varying size, sometimes of immense proportions, the largest, owned by the Rio Tinto, reaching a length of nearly 4,000 feet, with an extreme width of 500 feet. The ore bodies have, or once had, iron cappings, and the richer ores above ranged about

5 per cent. in copper tenor, being succeeded, at a depth of about 200 feet, by a sulphide zone carrying an intimate mixture of chalcocite and pyrite, with values averaging 3 to 4 per cent. in copper, with some ore of high grade. The decrease in values is fairly steady from the top of the deposits below the altered zone, and at a depth of about 500 feet values range only about 1.5 to 2 per cent. copper, and at still greater depth the copper tenor declines to about one per cent. with indications that the bottom of the immense lenses will carry less than one per cent. copper, though probably they will remain workable, owing to the sulphur values in the pyrite. All ores are slightly argentiferous and auriferous, the precious metals being extracted closely, and while the amount per ton in gold and silver is very small, the aggregate values so saved are very great, owing to the immense tonnage of ore that is treated.

The mines of Sevilla probably rank next to those of Huelva in present importance and future promise, though the production is trivial as compared with the immense Huelvan output. In 1903 there were 23 productive copper mines in Sevilla, which yielded only 2,204 metric tons of copper ore, but production has increased largely since.

In 1902 the province of Gerona had 25 mines of copper and 4 mines carrying copper in connection with other metals, all of which were idle.

In the Guadix district, about 15 miles from the city of Granada, in the province of that name, rich copper sulphides are found in a bed of marl, on which some mining has been done.

The province of Huesca has old copper mines and other mines carrying considerable copper values, but copper mining is practically non-existent.

In 1902 there were 41 copper mines, all idle, in the province of Lerida.

The northern part of the island of Menorca shows a copper belt of 16 to 18 miles length, with ore occurring in a bed of marl of one to two feet thickness, lying in clay-shales and sandstones of the lower Triassic system. The Puebla mine shows ore under peculiar circumstances, mainly as chalco-cite and chalcopyrite in connection with lignite, the conclusion being inevitable that the copper values were precipitated by the carbonaceous material.

There are copper deposits and attempts at copper mines in the province of Teruel, and the same may be said of the province of Zaragoza. There also are old mines of small importance, now idle, in a considerable number of other Spanish provinces.

**SWEDEN.** The famous copper mines of Falun have been producing copper for more than 600 years. Copper mines are found in the läns of Dalarne, Östergothland, Kopparberg, Malmöhus, Norbotten, Orebro and Vestmanland. The copper production of Sweden was about 850 long tons in 1799, and 100 years later was only about one-half as much.

The famous mines of Falun are worked by what probably is the oldest stock company now existing, its charter dating from A. D. 1288. The Stora Kopparberg is the best known mine of the district, and furnishes much of the copper and practically all of the gold produced in Sweden. The ore deposits resemble those of the Rio Tinto, and carry 2 to 3 grams gold per ton, occasionally with much higher gold values. The ore is chalcopyrite, disseminated in pyrite, and is divided, as mined, into two classes, known respectively as hard pyrites, carrying about 3.5 per cent. copper, and soft

pyrites, carrying about one per cent. copper only. The sulphur values are of considerable importance in these ores.

**SWITZERLAND.** Copper ores, mainly bornite, occur in a conglomerate stratum of Permian age near Murtschenalpe, in the canton of Glarus, but apparently no mining ever has been attempted.

**TURKEY.** Extensive copper deposits are noted at several points in the Balkan Mountains. The present copper production of the Turkish Empire, including holdings in both Europe and Asia, probably is about 3,000 metric tons yearly, with exports of 1,000 to 2,000 tons, the principal mines and production being in Asiatic Turkey. In European Turkey there are copper mines along the southern part, and there is a copper mine at Yardinli, in the Rhodope Mountains. Copper mines belonging to the crown are found in the island of Thasos, and an island in the Sea of Marmora shows copper sulphides, with evidences of extensive mining operations in the past.

**WALES.** The copper mines of Anglesea were worked by the Romans, and possibly by the Phoenicians before them. Up to about 1830 Wales was a considerable producer, and, in 1799, made about 1,900 long tons of fine copper, rendering this the second copper producing district of the world, but in 1899 the production was only 49 tons, nearly all secured from leaching the mine-waters from old properties.

The Mona and Parys mines of Anglesea, among the most ancient in the world, show sulphide ores with quartz gangue in contact veins of 5 to 60 feet width, between Silurian slate and felsite, copper occurring also as impregnations in felsite.

In addition to the mines of Anglesea there are old copper mines, now idle, in the counties of Caernarvon, Cardigan and Merioneth.

## CHAPTER XX.

### COPPER DEPOSITS OF AFRICA.

The copper deposits of the various countries, colonies, districts and spheres of influence in Africa are treated in detail in this chapter.

**ABYSSINIA.** Copper deposits exist at various points, but details are indefinite. Abyssinia is a mountainous country, lacking both railroads and good wagon-roads, and the development of mines, especially of copper, is apt to await better transportation facilities.

**ALGERIA.** The production of Algeria in 1906 was only 440 tons of copper ore, from copper mines in the departments of Alger and Constantine. The argentiferous gray copper ore of Kabylia occurs in rocks of Jurassic age. The Ain-Barbar mine, in the department of Constantine, near the Tunisian frontier, has a rather remarkable lens of sulphide ore, absolutely isolated and enclosed in Ligurian schist, ore being chalcopyrite associated with galena and sphalerite, and claimed to average 8 to 15 per cent. copper, which obviously is much too high. Along the Mediterranean coast, in the same department, are found a number of small deposits, apparently gash-veins, carrying sulphide ores with quartz gangue. Near Ain-Sefra an ore body claimed to show 600,000 tons of copper ore was discovered in 1904. In the department of Alger there are several idle mines of argentiferous antimonial copper ores.

**ANGOLA.** This Portuguese province, in western Africa, shows copper deposits at several points. At Senza do Itombe, 12 miles from the Cuanza river, and near a railroad, there is a conglomerate carrying ores that are oxidized above, with chalcocite, associated with galena, occurring at depth. There also is a mine at Bembe, said to average 12 per cent. in copper tenor, but this has poor transportation facilities, and has not proven a success in operation.

**ASHANTI.** The occurrence of native copper, apparently in dendritic forms, in a district several days' journey back from Sekondi, on the Ivory Coast, was reported in 1902.

**BASUTOLAND.** This district, while attached to Cape Colony, is managed directly by the British crown. Strong copper indications are shown at various points, but white settlement is forbidden, precluding all development of minerals.

**BRITISH CENTRAL AFRICA.** This protectorate shows a cupriferous belt of roughly 25 miles width by 175 miles length, between the Zambesi and Congo rivers, and a little crude mining and smelting of oxidized ores has been done by natives.

**CAPE COLONY.** Though copper exists elsewhere, the developed mines of the Colony of the Cape of Good Hope are exclusively in Little Namaqualand, on the western coast, in the vicinity of O'okiep and Wittwater, all exports and imports being made through Port Nolloth. Attempts at mining in this district were made by Governor Van der Snell, near Spring-

bokfontein, in the Concordia district, as early as A. D. 1685, and these attempts were repeated in 1799, but the first shipment, of eleven tons of ore, was not made until August 31, 1852, since which time production has been continuous. The ore occurs in lenses, often of great size, in granitic rocks. The predominant rocks are gneiss and schist, with a generally east and west trend, and flat dip to the north, traversed by series of fractures, with diorite dykes, in which occur lenses of sulphide ore, mainly chalcopyrite, but with an appreciable percentage of bornite, with dioritic gangue. The principal ore bodies occur at or near the point of intersection of the diorite dykes with barren fissures. The ores range from 7 to 21 per cent. in copper tenor, after careful selection.

**CONGO FREE STATE.** The principal copper deposits of Congo Free State, as now known, are in Katanga, the southeastern province, around the headwaters of the principal affluents of the Congo river. Principal mining operations of the present are between the Lualaba and Lufira rivers, where a considerable area shows oxidized and sulphide ores, occurring in blanket veins, impregnations and stockwerks, mainly in talcose and siliceous schists. These ore bodies are of unusual size, and are said to be of unusual richness, averaging 15 per cent. copper, but apparently this reference is to the enriched ores of the upper workings, and such values are not likely to hold to great depth. There are considerable remains of native workings, and a limited production is secured by natives. More than eighty old workings are shown in one district, where the oxidized ores are smelted in pits, with charcoal, and the product is used for ornaments, buttons and various utensils. This district is of considerable promise.

**EGYPT.** There are copper deposits in the Nubian region of the Upper Nile, but no attempts at serious mining have been made in historic times.

**FRENCH CONGO.** Malachite and chalcocite have been found in place in Triassic sandstone, in the Crystal Mountain range, near the coast of Gaboon. Near Comba, between Brazzaville and Loudima, along the fine of the Congo Free State, there is a cupriferous district in the Kouilou-Niari basin, ore occurring in cupriferous sandstone above limestone. These deposits have been worked by natives in a primitive way, for centuries, and a considerable trade once existed in copper manufactured from these mines, but this became extinct with French occupation. The native workings are pits and trenches not exceeding about 35 feet in depth, and show azurite, malachite, chalcocite and tetrahedrite. The deposits apparently are of low average tenor, but cover a considerable area. This district has been but slightly explored by Europeans, though some work has been done at the Mindouli mine, which seems the principal deposit. The district is about 300 kilometers from the coast, and probably copper mines would not be workable without railroad transportation, now lacking.

**GERMAN EAST AFRICA.** Copper ores exist at various points in this protectorate, but no mines have been developed.

**GERMAN SOUTHWEST AFRICA.** This protectorate has copper deposits in Damaraland, Ovamboland and Hereroland, the latter containing the notable Otavi mines. The copper mines of the Otavi Mountains were worked to slight depth, in a primitive manner, by the natives, apparently for some hundreds of years. A great block fault, in limestone, traversed

by numerous cross-faults, producing diverse deposits, shows ore occurring mainly in sandstone, laid down in sink-holes. This district includes Otavi, on the southern side of the range, and Tsumeb on the northern side. The mine shows native workings, deepest about 35 feet only, over an area of about 200 by 500 feet, with irregular fault veins, carrying mainly chalcocite, with occasional malachite, associated with galena, in masses ranging from microscopic size to two tons in weight, with sandstone gangue, and impregnations in both walls.

In Damaraland there is copper in the Rehoboth district and on Gross and Kleinen Spitzkopf, 20 kilometers northeast of Rehoboth. The ores, as developed, are mainly malachite and chalcocite, with quartz gangue. From the Otyizongati district, about 40 miles east of Okahandja, 100 tons of carefully selected ore sent to Germany in 1904 gave returns of 28.5 per cent. copper.

**LIBERIA.** Copper ore is said to exist in the interior of this country, but the extremely dense forest growth operates to prevent the acquisition of definite knowledge. Copper has been used to a limited extent, in the making of weapons, by the Mandingoes, a tribe in the far interior. The law prohibits the holding of land by other than Liberian citizens, and until this law is repealed, modified or evaded, there can be no copper production of importance from Liberia.

**MADAGASCAR.** Copper ores have been smelted by natives, in a primitive way, and to a limited extent, for generations. There are small native mines at Ambataofaugehana in the district of Ambositra, and at Vohinana. The ore is mainly malachite, surface workings giving returns of 10 to 45 per cent. copper. Ore is reported to occur in mica schists, and the mines are said to be nearly worked out. Native mines are reported also from the Betafo country, and in the district of Imerinarive. In the Cercle de Tsiafahy native copper has been found, and virgin metal is reported also from the district of Vonizongo. Rich ores are said to exist near Lake Kinkony, in the Cercle de Mahavavy, and traces of copper are reported from the province of Vohemar.

**MOROCCO.** Copper ores exist at a number of points in this country, and about 1860 were mined and smelted, in a small way, near Tarudant, capital of the province of Sus. There are occurrences of copper ore near Tangier, also at Tablah, near Mequinez, and at Mesfiwa, in the vicinity of Mogador.

**NATAL.** There are a number of known occurrences of copper ore in Natal, but the colony lacks producing mines. In Zululand sulphide and silicate copper ores are noted near the Insusi and Umhlatuzi rivers, in the N'kandila district, but these lack adequate transport. A syndicate was formed, in 1905, to exploit copper deposits on the Buffels River, along the border of Natal and Zululand. Various local syndicates have done more or less exploratory work at Undweni and vicinity, near the Vryheid border, in Zululand, where a vein, said to be traceable for several miles, shows rich carbonate, silicate and sulphide ores, usually zinciferous, occurring largely as impregnations, but with erratic distribution. The Dania and Magdalen properties, in this district, show fine samples of copper ores.

**PORTEGUESE EAST AFRICA.** This colony has copper ores in Mozambique, Nyassaland and Zambesia, the latter district showing considerable traces of old mining operations, apparently conducted mainly for gold, but copper ore exists at numerous points, and apparently in promising quantities.

**RHODESIA.** There are remains of ancient mining operations, for both gold and copper, in the colony of Rhodesia, and it is evident that the ancients possessed small and crude furnaces for smelting. The mining laws of Rhodesia are very liberal, and the harnessing of the Victoria Falls of the Zambesi river should greatly stimulate mining and other industries, through furnishing the first cheap power known in Rhodesia.

Copper ores have been found at a number of points, but principal developments are in the northeastern section, in the Victoria district, mainly along the northern reaches of the Kafue river, an affluent of the Zambesi. The cupriferous zone is a limestone belt, lying approximately east and west, with a width of about six miles and length of about sixteen miles, bounded mainly by Cambrian and Silurian schists, carrying deposits with shallow surface zones of oxidized ores, succeeded at little depth by sulphides, these deposits occurring occasionally as pipe veins, and being more or less argentiferous. The Lomagunda district of Mashonaland, circa ninety miles northwest of Salisbury, shows copper impregnations in siliceous and calcareous schists, ores being mainly malachite, with some chrysocolla. The Blue Jacket mine shows old workings to a depth of 100 feet, with lateral workings of 10 to 400 feet in length, on ore bodies occurring in limestone and schists. Apparently these mines were worked to the depth of the oxidized ores, the ancient miners stopping when base ores were reached. It is obvious from the depth and extent of these workings, and the remains of crude smelters, that the work was done by some race much further advanced in civilization than the present natives.

**SENEGAL.** The existence of copper ores has been reported from various points along the Senegal river, but no mines have been developed.

**SUDAN.** Prospecting has been done in various parts of the Anglo-Egyptian Sudan, but nothing of importance found, though there is believed to be copper in the Suakin district. The only producing copper mine is the Hofret-el-Nahas, in southwest Kordofan, where mining and smelting are conducted on a primitive scale, to secure copper used for purely local consumption.

**TRANSVAAL.** Apparently copper was worked to some extent by the ancients, and there are numerous remains of prehistoric diggings, especially near the Messina mines, in the Zoutpansberg district of northern Transvaal. There has been considerable activity in copper development, and even greater activity in the formation of small local mining syndicates, since 1905. Copper ores occur in the districts of Lydenburg, Middelburg, Potchefstroom, Pretoria, Rustenburg, Waterburg, Zeerust and Zoutpansberg.

The most promising copper developments are noted at the Messina mines, near the Limpopo river, in the Zoutpansberg district, and there are numerous smaller developments, on which a little work has been done, in this district. Work is under way at Barberton and vicinity, in the Middel-

burg district, and there is a copper belt, on which a number of explorations are being made, near the Olifants River, about 45 miles northeast of Pretoria. Some of the copper prospects of the Transvaal are of promise.

**TUNIS.** Copper ore exists at various points in Tunis, occurring mainly as oxidized ores in small bodies, and tetrahedrite, frequently rich in silver, these ores being found mainly in limestone, with ochrous iron gangue. Mines have been worked at Chouichia for some time, the production, which is small, being shipped to Europe, as a matte of 35 to 50 per cent. copper tenor. On the little island of Galita, off the northern coast of Tunis, a small mine has been opened on a vein of about 3 feet width, traversing diorite. The ore is mainly chalcopyrite, averaging about 5 per cent. copper and the vein is traceable for several hundred meters. There are several parallel veins, one of which, slightly developed, shows carbonate ores giving average assays of about 12 per cent. copper.

**UGANDA.** The British protectorate of Uganda, in Central Africa, near Lake Tanganyika, has copper ores in the Central Province, but apparently no serious attempt has been made at development, transportation facilities being poor.

## CHAPTER XXI.

### COPPER DEPOSITS OF ASIA.

The copper deposits of Asia are treated herein, by countries, in alphabetical order, as in the preceding chapters.

**AFGHANISTAN.** The northern part of Afghanistan is said to be rich in copper, and in this section there are small local mines, worked by old methods for some centuries. The copper deposits are considered valuable, but the government refuses to grant either railroad or mining concessions to foreigners, and will not allow a white man to take up permanent residence in the country, hence until the present policy is changed there can be no copper developments of importance.

**ANNAM.** Copper ores are known to occur at various points in the province of Quang-Nam, but nothing has been done in the way of modern mining.

**ARABIA.** The ancient Egyptians mined both copper and turquoise at Maghara, in the Sinai Peninsula, and it is evident, from old inscriptions, that copper was smelted at that point in both the Fourth and Twelfth Dynasties. These mines evidently never were rich in metal, but probably were among the very first copper mines ever opened, and the date of the first mining probably is as remote as 5000 B. C. These mines were the cause of various wars between the races coveting them, but were held mainly by the Egyptians, for several thousands of years. It seems probable that after being worked, more or less steadily, for about three thousand years, they were abandoned finally, before Moses led the children of Israel out of Egypt, and about a thousand years before the opening of the Rio Tinto mine which occurred circa 1,000 B. C. An attempt at reopening some of these ancient mines was made, early in the Twentieth Century, after about four thousand years of idleness. The ore is mainly chrysocolla, associated with turquoise, in porphyry, and there are remains of ancient furnaces and old slag-piles near the adits. Analyses of the slags do not show the use of fluxes in the reduction of the ores, and it is probable that they were smelted with charcoal, in small brick kilns. There are deposits of copper ore at other points in Arabia Petrea, lying along the shores of the Red Sea.

**BURMAH.** The discovery of a body of promising copper ore was reported from Mimbu, in 1906, and several copper mines are being opened in the Upper Shan states.

**CHINA.** Copper ores occur in more or less profusion at a considerable number of points in the vast Chinese empire, and copper mines have been worked in several provinces, notably in Yun-Nan, certainly for many centuries, and probably for several thousand years, remaining active to this day, the ores being mined and smelted in a primitive manner. The production of the empire is estimated at five million pounds yearly, all of which is required for domestic consumption, in addition to heavy imports.

Owing to the existence of vast coal measures of prime quality, and a large and steady supply of efficient and tractable labor, the development of copper mining and smelting, when once begun in earnest, along modern lines, should be rapid, and China should become, during the second or third decade of the Twentieth Century, an important producer of the metal.

A few mines, operated in a primitive manner, with correspondingly small production, are found at San-Kia-Tschang, in the province of Ho-Nan.

In the province of Hupeh, near Ichang, there are large beds of cupriferous shale, containing disseminated ores of low average tenor.

There are deposits of copper ore at various points in the province of Kwang-Si, with a few small mines developed along primitive lines.

There are copper mines in the province of Kwei-Chau, in southern China, of considerable antiquity, as evidenced by extensive slags resulting from old smelting operations. The ore bodies of Kwei-Chau resemble those of Yun-Nan.

The mountains of Manchuria contain promising deposits of copper, at several points, and some of these have been worked by natives, in a small way, along very crude lines. The most modern mining and smelting plant in the Chinese empire is found near Kaya, this having been installed early in the Twentieth Century.

Copper deposits and small copper mines are found at several points in the province of Shan-Tung, and this province is believed to be rich in minerals.

A limited copper production is secured from a few small and ancient mines in the province of Sze-Chuan, where the metal is extracted mainly from low grade cupriferous sandstones.

The province of Yun-Nan has the principal copper mines of China, and furnishes the moiety of Chinese copper production, the annual output of the mines of Yun-Nan being estimated at one to two thousand tons of fine copper. The copper mines of northeastern Yun-Nan have been exploited for many centuries, and in the aggregate their production is by no means trivial. The ores are mainly sulphide, and are slightly auriferous and argentiferous. The principal centre of copper mining and smelting is at Tung-Chau.

**FEDERATED MALAY STATES.** In this British protectorate there are copper deposits, some apparently of promise, at several points, but these remain undeveloped, mining efforts having been centered upon tin.

**FORMOSA.** Copper ores exist at various points on this island, now held by Japan. In the Kinkwaseki gold mines, in the Keelung district, copper ores have been discovered, and their exploitation was begun in 1906.

**INDIA.** The beginnings of the copper industry of India antedate reliable historical records, but it is known that copper ores have been mined and smelted for a score or more of centuries. India was a considerable producer of copper during the middle ages, and up to about the middle of the Eighteenth Century, after which the output fell off slowly, and has dwindled to merely trivial figures. During the first half of the Eighteenth Century India shipped large quantities of copper to Europe, but in the latter half of that century the current was reversed, and the Indian imports of

copper for 1901 were 7,998 long tons, and at present must range in the neighborhood of 10,000 long tons yearly.

In Bengal there are old copper mines at various points. The last active mining was done from 1887 to 1891, at Baragunda, Hazaribagh, but proved unprofitable, all ore being carted 24 miles to a smelter at Giridhi. The ore occurs as chalcopyrite running 1 to 3 per cent. copper, with gangue of country rock, in mica schist. A single small pocket of ore discovered in the Singhboon district produced a small quantity of 13.5 per cent. ore in 1892, but additional pockets were not found. The Chota Nagpur mines, approximately 150 miles from Calcutta, are in about the center of a cupriferous belt of about 75 miles length, showing numerous old workings, and paralleled by a railway. The extensive remains of former work evidence considerable activity, and a respectable production, at some time in the past.

Copper ore exists at various points in the Central Provinces, and a mine is being developed near Sleeminabad, 40 miles from Jubbulpore, in a formation of Silurian age showing dolomite, slate, quartzite and mica schist, folded and metamorphosed, with numerous porphyritic dykes, ore occurring in the stratified rocks near the intrusive porphyries. The veins, having well defined walls and average width of about 6 feet, have been traced by outcrops for nearly two miles. The ores are auriferous and argentiferous malachite and argentiferous tetrahedrite, giving assays up to 25 per cent. copper, 197 oz. silver and 15 dwts. gold per long ton. In 1901 twenty-five long tons of ore were mined in Rajputana, where chalcopyrite occurs disseminated through black Paleozoic slates. These deposits have been worked in a very small way for centuries.

In the Northwest Provinces copper ores of some promise are found in the Kumaon division, lying in the Himalayan region between Nepal and the Punjab, the Rai mine being the principal property. The ores of the Rai district occur in fissure veins showing gossan cappings, with the usual oxidized and sulphide ores, with quartz gangue, and occur at times as impregnations. Labor is plentiful, cheap and poor, and transportation facilities are inadequate, but the district is considered of some promise. In the division of Garhwal considerable copper mining has been done in the past, at Dhanpur and elsewhere. The Dhanpur deposits occur as bornite and chalcopyrite, in the joints of calcareous clay-slates, and in siliceous limestone, near igneous intrusives, the workable deposits occurring at the intersections of vertical and horizontal bedding and jointing planes, with quartz gangue.

At El Agur there is a stockwerk in quartzite, carrying carbonate ores, chalcopyrite and tetrahedrite, of an estimated average copper tenor of about 5 per cent., the zone being traceable for nearly fifty miles, and being worthy of careful study when adequate transportation facilities are furnished. Small pockets of rich ore have been found at various other points, but the uncertainty of these has not permitted continuously profitable mining.

**JAPAN.** Copper was discovered in Japan about the beginning of the Seventh Century, and until well toward the close of the Nineteenth Century, mining and smelting were done along primitive lines, the ore being reduced in clay pits, with charcoal for fuel. The first exports, other than

to China, were made in the Seventeenth Century, when the Dutch, who had a monopoly of Japanese foreign trade, exported seven hundred to twelve hundred tons of copper yearly for many years. In 1799 Japanese mines made about 2,800 long tons of fine copper, and in 1899 produced 27,560 tons, a tenfold increase, and the early years of the Twentieth Century have seen a steady gain in production. The modernization of mining and smelting methods was begun in the ninth decade of the last century, but beginning with the tenth decade progress was rapid, and all of the principal mines of the empire now have mining and smelting equipments of a most modern sort, and are managed with as great a degree of technical skill as can be found in any mining field of the world. Several of the largest copper mining companies of Japan have made a regular practice, for ten years or more, of sending their chiefs of departments around the world in search of information, and the benefits of such an unusually wide-awake policy are reflected in the increased outputs and greater profits of the best Japanese copper mines. Foreigners or foreign corporations cannot hold title to Japanese mines, but foreigners can become interested, as partners, with Japanese subjects, in mining properties. The mining industry, however, to all practical purposes, is exclusively in the hands of the Japanese, and likely to remain so.

Copper is much the most important metallic resource of Japan, and this country now holds fourth place among the copper producing countries of the world. The local consumption was about three thousand tons in 1899, and probably was about seven thousand long tons in 1906. Fully three-fourths of the copper produced is exported, this forming an important commercial resource of the empire.

Copper ores are widely spread, occurring on all of the principal islands, and showing nearly every variety of type. There are copper mines of importance in the provinces of Awa, Bingo, Bitchu, Bizen, Hida, Higo, Hyuga, Iwami, Iyo, Izumo, Kaga, Mimasaka, Mino, Nagato Rikagyu, Shimotsuke, Tosa, Ugo and Uzen. There are nearly two hundred copper mines, or mines in which copper is a factor of importance, of which about forty are mines making annual products of one hundred thousand to fifteen million pounds each, fifteen of the number exceeding an average annual production of one million pounds each, three of these making about half of the copper production of the empire. Ores are almost exclusively sulphides, though limited quantities of oxidized ores are noted, with occasional native copper.

The Ashio mine, in the province of Shimotsuke, is the largest copper mine of Japan. The veins are of wonderful profusion, being hundreds in number, of which about thirty are worked, these veins occurring as synclines, being opposed, in pairs, the seven main veins averaging 6 to 7 feet in width. A little melanite and bornite are carried in the upper levels, but the principal values are in chalcopyrite, associated with galena, sphalerite, arsenopyrite and pyrite, with clay, gouge and quartz gangue.

The Kosaka mine, in the province of Rikuchu, is in the extreme northern end of the main island of Japan. This was an old silver mine; supposedly exhausted, but now is the second largest copper mine of Japan, with prospects of becoming first. The ore is chalcopyrite, associated with sphalerite and pyrite, impregnating and cementing a volcanic tuff. The

ore bodies, five in number are of enormous size, the largest being 100 to 600 feet in thickness, of one-half mile known length, and proven by drill-holes to a depth of 1,700 feet.

The Beashi is a famous mine in the province of Iyo, island of Shikoku. The ore body is a vein of 4 to 30 feet width, with an average of 20 feet, developed for a length of about 6,000 feet, and occurs in alternating layers of chloritic and graphitic schist, each enveloped by a quartz schist known locally as "habu," with interstratification of piedmontite schist. Step-faults run nearly parallel, from east to west, giving throws of 10 to 20 feet, with occasional throws up to 60 feet. The ore is chalcopyrite, disseminated in pyrite, averaging about 4.5 per cent. copper.

Further details of the geography and geology of Japanese ore deposits are given in the detailed descriptions of the various mines.

**KOREA.** Copper ores are noted at a number of points in the northern and southern parts of the Korean peninsula, but have been found only rarely in the central part. Copper had been mined by natives for some centuries, the product being utilized in the making of household utensils. By Korean law mineral deposits are the property of the crown, hence it is altogether probable that mines will be developed mainly by the Japanese. The production of copper in 1903 was estimated at 280 tons.

The Kap San mine, in the province of Hamgyeng, is the principal property, and is under development by the Japanese firm of Mitsui & Co. Another property of some promise is the Chhyang-Uön mine, about one ri north of Chhyang-Uön, which was opened about 1885 by the Korean throne, and was transferred to Japanese control in 1893, and worked until 1905, when the rich ores were exhausted and the mine closed down. There also are old mines, opened early in the Nineteenth Century, but worked until 1904, at Hu-Chhyang and Sin-Työn.

**PERSIA.** The empire of Persia is known to be rich in copper, and there are small mines, many of them very old, from which copper ores are mined and smelted, in an exceedingly crude way, the small production being sufficient merely for the limited domestic demand. Until there are better transportation facilities, and foreign capital is enlisted, the copper mines of Persia are not likely to become producers of international importance.

There are primitive copper mines south of Kerman, but these lack facilities for economical transport. At Seman the deposits consist of disseminations and veinlets of oxidized ore in clay-slate, with an estimated average tenor of about 3 per cent. copper. There also are small copper mines at Sabzwar and in the Turbat district, worked on primitive lines.

**SIAM.** Copper ores were worked at several points by natives until the early years of the reign of the predecessor of King Chulalongkorn, but there is no present production, though copper deposits of more or less promise are found at a number of points, notably in the mountain ranges along the valley of the Menam river. Outcrops of copper ore are noted frequently along the railroad line leading to Korat, with rather extensive remains of ancient workings, where a little prospecting was done, and some ore found, by a Danish syndicate, circa 1901.

**SIBERIA.** The extent of Siberia is so great, the lack of transportation facilities so utter, except in a narrow stretch along the Trans-Siberian railroad, and the country is so thinly populated and so new, with the attendant lack of capital, found in all new countries, that it is scarcely to be wondered at that only a beginning has been made in the development of the undeniably extensive and valuable copper measures. The principal copper mines are found in the governments of Semipalatinsk and Akmolinsk. There are two small producers in the Russian Altai, and other small producers nearer the city of Semipalatinsk, the largest making about two million pounds of copper yearly. The output of the Altai mines, in 1903, was only 228 long tons of fine copper.

In the government of Akmolinsk, in the Kirghiz Steppe, there is one highly promising mine, known as the Spassky or Yusupensky, where considerable production has been secured in the past, along very crude and wasteful lines. This property is now in the hands of an Anglo-French company, but is hampered by lack of rail transport. There are other properties of promise in the government of Akmolinsk.

In the government of Krasnojarsk, in central Siberia, next east of Semipalatinsk, there are copper deposits, apparently large and promising, extending from near the line of the Trans-Siberian railroad to the Altai Mountains.

There are copper deposits of uncertain size and tenor in the vicinity of the city of Tomsk, in the province of that name, lying next north of Semipalatinsk, and to the northward of the Trans-Siberian railroad.

In the Trans-Baikal province, east of Lake Baikal, there are several copper deposits said to be of considerable promise. One of these is in the basin of the Chida river, where native copper occurs in masses ranging up to several pounds in weight, in amygdaloidal melaphyrs, under conditions somewhat similar to the occurrence of native copper in the Lake Superior district.

There are copper deposits, considered promising, in the northern province of Yeniseisk, and it is probable that copper ores exist also in the province of Irkutsk, and very likely in practically all of the other Siberian provinces.

**THIBET.** Copper is mined and worked in a small way and a primitive manner in southeastern Thibet, but the extent and promise of the copper measures are undetermined.

**TONQUIN.** Copper mines are found in the provinces of Son-Tay, Lang-Son and Lao-Kay, near the frontier of the Chinese province of Yun-Nan, and, like the mines of Yun-Nan, these have been worked in a primitive way for centuries, but never have become as important as those across the Chinese border. Various concessions have been granted for the exploration of copper deposits in Tonquin, but no producing mines have resulted therefrom as yet.

**TURKESTAN.** There are a number of small copper mines in Turkistan, the largest being the Karankuski, near Tashkent, and since the occupation of Turkestan by Russia there has been renewed interest in mining operations. A small smelter was built in 1903, on the shore of the Syr Daria river, at the foot of the Supetau Mountains, and new copper mines

are being opened along the Syr Daria river in the Namangan and Khokand districts. There also are ores in the Ferghanah district, occurring as impregnations in sandstone to the extent of 1 to 5 per cent. copper, with occasional local enrichments up to 10 per cent. and as high as 40 per cent. in copper tenor.

**TURKEY.** The principal copper mines and the most promising copper deposits of the Turkish empire occur in Asia. The best known mines are those of Arghana-Maaden, located between Diarbekir and Kharput, in the Armenian Tauros of Asia Minor. At the beginning of the century these mines were producing about 1,500 tons of fine copper yearly, exported mainly to England via Alexandria. The ore is of high grade, though mining and smelting methods are by no means modern. Copper ores occur also in several of the cazas in the Vilayet of Cosova. There are mines of importance in the vicinity of Bakir-Maaden, near Diarbekir, and formerly there were mines in operation near Tokat. Copper has been produced to greater or less extent by the mines of Kalabak, near Mount Ida, from time immemorial, these having been old mines in the time of Strabo, who described them. The ore of the Mount Ida mines is chalcopyrite, occurring in Tertiary slates and limestones. There also are small old mines near Dendengatsch.

In the Vilayet of Trebizond, between Kerassund and the Russian frontier, along the Black Sea, there is a copper district of some promise, with a number of small producers, and copper mines are said to have been worked in this district as early as the beginning of the Thirteenth Century.

## CHAPTER XXII.

### COPPER DEPOSITS OF AUSTRALIA.

The copper deposits of the Commonwealth of Australia, which includes the island of Tasmania, are treated in alphabetical order, by states, in this chapter, and those of New Zealand follow. Copper production dates from 1843, when the first shipment was made from the Kapunda mine, opened in the previous year. Production in 1906, by states, was by Tasmania, South Australia, Queensland, New South Wales and Western Australia, in the order given, Victoria not being a producer. Development has been hampered, except along the coast and in specially favored interior districts, by lack of transportation facilities, lack of water and lack of the large capital necessary to make successes of mines of low and medium grade copper tenor.

**NEW SOUTH WALES.** Copper was the first metallic product of this state, the first mining attempts having been made in 1845, but the Great Cobar mine, opened in 1869, was the first important producer and remains much the largest mine of the state.

There are nearly 300 localities in the state where copper has been found, and in most of these mines have been opened or attempts made at mining. There are three principal copper districts, known as the Cobar, Coast and Central fields. Copper is found mainly in the counties of Bathurst, Blaxland, Canberrago, Cunningham, Mouramba, Murray and Robinson. The principal cupriferous field is in Robinson and adjoining counties, in the western districts, where copper deposits of more or less promise are shown over an area of about 400 square miles. This field includes the Cobar, Gilgabone, Nymagee, Melrose, Mount Hope and smaller cupriferous districts. The formation over this entire territory is mainly Silurian slates, with few occurrences of eruptive rocks, ore bodies occurring as bedded veins in Silurian schists. The district is a desert plateau, with occasional hills and short mountain ranges. There is a cupriferous district in the central part of the state where eruptive rocks predominate, and there are a number of scattered mines along the coast. The Budgery district is one of the newest fields of promise.

**QUEENSLAND.** The copper deposits of Queensland probably are the most promising found in any of the Australian states, but the industry suffers, not only from the aridity of many of the principal districts, and lack of railroads in certain of the fields, but also from untoward political conditions, there being universal suffrage, with the labor element in the saddle and inclined to captious and arbitrary methods. The state was a regular though small producer of copper until the collapse of the Secretan Syndicate in 1889, after which the industry was greatly depressed until about 1898, since which year there has been marked and fairly steady progress. The older copper fields were at Peak Downs, Mount Perry and Cloncurry, native copper being mined in the last named district from amygdaloidal traps, under conditions greatly resembling those found in the Lake

Superior district. Work at this point was suspended because of lack of rail transport. There are copper mines in the counties of Beaconsfield, Bowen, Cardwell, Clermont, Cook, Gilbert, Lynd, Merivale and Palmerston, and occurrences of copper minerals at other points.

The Herberton district is the third largest producer of the state and includes the Chillagoe sub-district. This is a field of considerable promise, and was the largest copper producer of the state previous to the development of the copper measures of the Mount Morgan field. The Chillagoe district covers about ninety square miles, with smaller subsidiary districts adjoining. Copper and lead occur in conjunction with garnet and wollastonite, usually at or near the point of contact of Carboniferous limestone with granite-porphyr, the latter being much decomposed. The ore bodies vary greatly as to size and dip, ore occurring mainly as irregular segregations and being very bunchy. The existence of ore deposits without regular walls is a feature typical of this field. The surface ores as a rule are decidedly rich.

The Mount Perry district, in Bowen county, near the coast of southern Queensland, is a field of considerable importance. The predominant rock form is granite, and the fissure veins therein are mineralized only for portions of their width, the rich paystreaks averaging under one foot as a rule. Ore values have disappeared with depth in some cases, but in others have held to at least 800 feet. The ores are highly silicious and the gossans are both auriferous and argentiferous as a rule.

The change at depth of the Mount Morgan mine, in the Mount Morgan field, from a big gold mine to a big copper mine, is referred to in detail in the description of that mine.

The Stanthorpe field is an old district of considerable promise, but is now a small producer only.

The Tenterfield district is fourth in the state in point of production, and has several properties of promise.

The Glassford Creek district is a new and promising field, with active development work under way at several properties.

The Cloncurry field, in northern Queensland, shows copper deposits at various points over a district about 75 miles from east to west and about 150 miles from north to south, the center of this district lying about 150 miles south of the Gulf of Carpentaria. The climate is hot and wood supply inadequate, with shortage of water at some points. Ore bodies are numerous and rich, but narrow, though showing good outcrops, and are said by Thos. Gibb to present the appearance of bedded deposits rather than of fissure veins. There also are occasional veins of greater width, but not outcropping so prominently, these carrying a gangue of kaolin, and the slate walls are impregnated with pyritic ore. Indications point to deposits of low grade sulphides at depth, and some of the oxidized ores are considered amenable to cheap leaching processes. Mining and smelting have been hampered by lack of cheap transportation, but a railroad to connect Cloncurry with the port of Townsville, to be in operation about 1908, should greatly stimulate mining and smelting developments.

**SOUTH AUSTRALIA.** The Kapunda mine was found in 1842, a decade before the discovery of gold, and in 1845 the Burra Burra mine began production, since which time South Australia has been a regular

producer of copper to some extent. The first smelter was built in 1851 at Port Adelaide, and the second at Wallaroo in 1861. There are about 500 mines, or attempts at mines, in South Australia, of which about 25 have been developed to an important extent. The principal mines are in the counties of Adelaide, Burra and Daly, with other mines of less importance in the counties of Flinders, Light and Robe, and in the Northern Territories.

The Wallaroo and Moonta mines, in Daly county, on the Yorke Peninsula, much the most important producers of the state, are old mines, dating from 1863. The country rock is porphyritic and ores are mainly sulphide, though the usual oxidized ores, including a considerable percentage of atacamite, occur in the upper workings, with a barren zone of 50 to 125 feet between the oxidized ores and chalcopyrite.

In the Kapunda district, about 50 miles north of Adelaide, where the first copper discoveries were made, the ores are mainly oxides and carbonates, with an appreciable amount of native copper. In the Burra Burra district, about 125 miles northeast of Adelaide, the predominant rocks are limestone and shale, carrying very irregular deposits of secondary ore, with increased regularity in vein formation noted at considerable depth. The promise offered by various cupriferous fields of this state would seem to justify a much larger copper production than has been secured as yet.

**TASMANIA.** Copper production on an important scale dates from the opening of the Mount Lyell mine, in 1896, and this remains the only important producer of the state. All of the copper fields under exploration or now producing are in the northwestern corner of the island, in the counties of Montagu, Russell and Wellington.

The Mount Lyell district, in Montagu county, is the only developed field of the state. Rainfall is heavy and the topography of the district is rugged. The principal ore bodies now exploited occur as mammoth lenses of pyritic ore, mainly chalcopyrite, with occasional bornite, disseminated through pyrite, occurring in conglomerate and quartzite, associated with mica schist. A limited amount of chalcocite, and a little native copper, are shown at some properties; but the production is almost exclusively from low-grade disseminated sulphide ores, though one mine is working on native copper.

Considerable prospecting has been done on Mount Darwin and Mount Jukes, adjoining peaks known as the Darwin and Jukes field. In the North Dundas field some prospecting has been done, and considerable ore shown; this being mainly of low grade.

**VICTORIA.** The principal copper field of this state, so far as can be judged from the very limited amount of work done, is the Beechworth district, where outcrops of ore have been noted at a number of points in an area of about 50 square miles. Total production of copper ore from all the mines of Victoria, to the end of 1905, was only 17,470 long tons, valued at £206,895. Prospecting was resumed, on a small scale, in 1907.

**WESTERN AUSTRALIA.** Copper ore was discovered in the Northamptton district as early as 1842, and the first production was secured in 1855, but no large copper industry has been built up, though a number of small mines, near the coast, were worked in the eighth and ninth decades of the Nineteenth Century. Production has been secured mainly from selected ores, gained by hand-dressing, shipped to distant smelters for

reduction, and, of course, only high grade ores can afford a profit under such circumstances. Production in 1906 was 7,430 long tons of ore, valued at £50,337, and 296 men were employed in the industry that year. A copper smelter erected by the state has been sold to a private company, with the proviso that custom smelting be done for all comers at reasonable rates, and it is possible that the building of this smelter may mark the beginning of a substantial industry, as Western Australia is by no means devoid of copper deposits of promise. The principal copper fields of the state are in the districts of Ashburton, Champion Bay, Mount Margaret, Mount Morgans, Murchison, Northampton, Phillips River and Pilbara.

The Mount Margaret goldfield of the Mount Morgans district is much the largest producer, having mined 4,361 long tons of ore, valued at £21,934, in 1906, and the smelter now in operation in this district should stimulate development and production.

The Murchison goldfield has several properties of promise; but the production of 1906 was only 133 long tons of ore.

The Phillips River goldfield, in the extreme southern part of the state, was the only copper producer in 1905, and in 1906 shipped 2,885 long tons of selected ore. The principal ores of this district, as mined, are malachite and chalcocite, giving average assays of 31.48 per cent. copper, 2.16 oz. silver and 0.15 oz. gold per long ton.

The Pilbara goldfield has copper ore deposits of promise, but these have been idle for several years. In the West Pilbara district the ore occurs in bodies of considerable size, as oxides and carbonates of high grade, in schistose slate adjoining an igneous intrusive.

**NEW ZEALAND.** Copper was discovered in 1842 on Kawau Island, and copper mines were opened and worked on Kawau and Great Barrier Islands, circa 1865. A copper property at Nelson, opened about 1880, had a smelter, but none of these mines were successful. Ore has been found at Omaunu, in Whangaroa county. The production of copper ore from 1853 to 1904, inclusive, was valued at £18,211. One copper property was under development at last accounts.

## CHAPTER XXIII.

### COPPER DEPOSITS OF OCEANICA.

The copper deposits of this grand division are treated under the names of the various islands in which they occur, in alphabetical order, no attempt being made to group the holdings of the various great powers.

**BORNEO.** Copper ores and other minerals are noted at several points in the northern part of the island, but these remain undeveloped.

**CELEBES.** A Dutch company has done some development work in the Pagoeat district, south of Palehleh, in the northern part of the island, where the ore occurs as sulphide impregnations in slate. In the same general district, about ten miles west of Somalata, on Demerki Bay, a brecciated vein carries about 20 per cent. of slightly auriferous and argentiferous sulphides in the form of chalcopyrite, sphalerite, galena and pyrite.

**JAVA.** Prospecting work during 1903, in the Poelonz district, near Soerabaia, exposed a large mineral body carrying fair values in auriferous and argentiferous chalcopyrite, sphalerite and galena. The vein is about two meters in average width, opened by several shallow shafts and 223 meters of tunnels, the ores shown assaying from 0.9 to 5.25 per cent. in copper tenor.

In the Gunong Kendeng district there are springs carrying copper iodides in solution, and from these thermal waters crude iodide of copper is secured by evaporation, the production amounting to 2,346 kilograms in 1899.

**NEW CALEDONIA.** More or less copper production was secured from the mines of New Caledonia during the last quarter of the Nineteenth Century, but the mines have been practically idle since 1902, when the output was 3,721 metric tons of copper ore, the greatest production having been 6,349 metric tons, valued at f492,310, in 1899.

There are copper mines in the districts of Bonde, Diahot and Noumea, in the northern part of the island, ore occurrences being noted in the valleys of Diahot, Nehoue and Koumac. The ore occurs as lenses in talcose and chloritie schists, and as stockwerks, the oxidized ores near surface carrying 2 to 4 grams gold per metric ton, while the sulphide ores, mainly chalcopyrite at depth, give considerable silver, this ranging up to 200 to 400 grams per ton from selected ores.

**NEW GUINEA.** Copper deposits are being exploited in the Astrolabe Mountain range, on the Laloki River, about 15 miles from Port Moresby, in the British portion of New Guinea. The stratified beds are mainly limestone, with occasional sandstone and shale and a few conglomerate tuffs, with diabase intrusions, the district somewhat resembling the Mount Lyell field of Tasmania. A shipment of 17 tons of selected ore, in 1906, gave returns of 26.8 to 32 per cent. copper, with traces of gold.

**PHILIPPINES.** Copper ores occur in the islands of Luzon, Mindanao, Mindoro, Masbate and Panay, and their occurrence is reported, though not verified, from the island of Balabac, in the Paragua group. Native copper is said to occur in stream-copper gravels, in addition to lode deposits. Apparently the Philippines contain considerable copper deposits, and are likely to become a producing field of some importance, eventually.

In the island of Luzon there are occurrences of copper ore in the provinces of Batangas, Benguet, Camarines Norte, Lepanto and Tayabas. Much the most important copper measures of the island occur in the province of Lepanto, where natives were mining and smelting copper ores before the Philippines were discovered by Magellan. The Mancayan mines were worked by Igorrotes before the Spanish conquest, and their metallurgy was surprisingly good. The processes of reduction consisted of alternate roasting and matting, with eventual production of ingots of good quality, and the methods presumably were derived from Japanese or Chinese sources. In addition to supplying their own needs, the Igorrotes exported about twenty tons of manufactured copper yearly, leading to an invasion by the Spanish, ending in the organization of the Cantabro-Filipino mining company, by which the Spanish and natives joined forces, and two mines were worked extensively from 1864 to 1874, with an average yearly production stated to have been about 1,100 tons, work ending with the death of Don José María Santos, an exceptionally able man, who had been in charge of the work. Since 1874 the small production has been secured by natives only, along crude lines, but important development work is under way by several companies, notably one composed of American and English capitalists, who plan building a railroad from Mancayan to a seaport on the western side of the island. The Mancayan and Suyoc districts, in the southern part of Lepanto, are but a few miles apart. The Mancayan ores are said to average about 16 per cent. copper, and in the Suyoc district there are several deposits of auriferous tetrahedrite, tennantite and enargite, assaying 9.7 to 32.9 per cent. copper and 85 cents to \$4.75 gold, per short ton. Chalcopyrite is known to exist in the Bontoc district. In the province of Batangas copper ores occur in the Loboc Mountains, in veins of 6 inches to 2 feet width, carrying oxidized ores, secondary sulphides and chalcopyrite, all auriferous and argentiferous, with quartz gangue. In the province of Benguet, Luzon, promising copper ores are noted on the Buld River. In the province of Camarines Norte, in the southern part of Luzon, there are occurrences of copper ore apparently worthy of investigation. In the Pangasinan district, at Salasa, 10 miles west of Dagupan, auriferous copper deposits are worked to a very slight extent. Copper ore is reported also from the province of Tayabas, in the island of Luzon.

Samples of native copper have come from the island of Masbate, but attempts at mining seem to have proven unsuccessful.

In the island of Mindanao copper ores are noted in the province of Surigao, and mines have been worked by Moros and Chinese, in a crude way. A German company did some mining, going to the point of building a small smelter, but did not meet with success.

In the island of Mindoro occurrences of copper ore, apparently all chalcopyrite, are reported from various points.

Carbonate ores of good tenor have been secured in the province of **Antigue**, in the island of Panay.

**SOLOMON ISLANDS.** In this British protectorate copper is believed to exist on several islands, and some prospecting was done in 1901, and a little ore was found on the island of Rendova, but nothing came of the discovery.

## CHAPTER XXIV.

### COPPER MINES OF THE WORLD.

As in the four preceding annual editions of this work, the detailed descriptions of copper mines and companies given in this chapter are printed in alphabetical order, regardless of location. This plan, though having some obvious disadvantages, is found, upon the whole, the best of any tried or suggested, as it renders the work fully self-indexing. In actual practice the plan is not always easy to carry out, owing to the large number of duplicate names, and for various other reasons as well. The definite article has been omitted from all titles in English and German, but could not well be omitted from Spanish and French titles. In cases where the Spanish or French articles are used, the descriptions have been filed upon the name of the mine, rather than the article, except that in the case of American or English companies having Spanish titles, the filing has been done upon the article, whether La, Las, Los or El. This plan of indexing may seem somewhat awkward, but the difficulties encountered in dealing with titles in many different languages, each with its own individual idioms, are by no means inconsiderable.

There are nearly 7,000 titles given in the present chapter, as compared with 256 mine titles in Volume I. and 4,626 titles in Volume VII.

#### AAMDAL COPPER MINES SYNDICATE, LTD.

NORWAY.

Dead. Property sold and company wound up, circa 1903. Formerly was at Mo, Telemarken, Christiansand, Norway.

#### AAMDALS KOBBERVAERK.

NORWAY.

Mine office: Aamdaals Vaerk, Telemarken, Christiansand, Norway. Charles McCully, manager. Was opened circa A. D. 1600 and was a considerable producer for nearly three centuries, making 240 tons fine copper in 1895. Was reopened 1906. Veins formerly worked were narrow, but rich, and considerable low grade ore was developed circa 1903, when under option to the Tharsis Sulphur and Copper Co., Ltd. Diamond drill borings, 1907, gave good cores at depth of 1,400'. Employs circa 300 men.

#### ABBEY MINING CO.

NEW MEXICO.

Office: 1007 Bessemer Bldg., Pittsburg, Pa. Mine office: Socorro, Socorro Co., N. M. Nelson Weddle, Jr., president; Earl A. Wheeler, vice-president; H. A. Spangler, treasurer; J. F. Hinckley, secretary; Nathan Hall, general manager. Organized December, 1901, under laws of New Mexico, with capitalization \$1,000,000, shares \$1 par. Lands, 19 claims, area 380 acres. The Abbey group, 22 miles north of Magdalena, shows 2 parallel veins with about 600' of workings, carrying ore assaying up to 40% copper and 80 oz. silver per ton. The Washington group, circa 10 miles west of Upham, has a 165' shaft. Idle several years.

#### ABBOT CREEK GOLD & COPPER MINING CO.

NORTH CAROLINA.

Office: care of W. J. Brent, Portsmouth, Va. Lands are in Lexington county, North Carolina. Main shaft, 80', is in a vein giving average assay

values of \$15 per ton, in copper and gold. Has a concentrator and mill with Tremain stamps and crusher. Presumably idle.

**AEEDEEN COPPER CO.****NEW MEXICO.**

Dead. Formerly at Lordsburg, Grant Co., N. M. Fully described Vol. V.  
**ABERFOYLE COPPER MINING CO., LTD.** **AUSTRALIA.**

Mine office: Armidale, N. S. W., Australia. Organized 1907, under laws of New South Wales, with capitalization £15,000, shares £1 par. Lands, 160 acres, 35 miles from Armidale, on the Aberfoyle river, in the New England district, showing a 4' vein carrying sulphide ore of about 17% average copper tenor.

**ACARI COPPER MINING SYNDICATE, LTD.****PERU.**

Main office: Acari, Camaná, Arequipa, Perú. Mines idle at last accounts.  
**ACCIDENTAL MINING & MILLING CO.** **COLORADO.**

Mine office: Granite, Chaffee Co., Colo. Ores carry gold, silver, lead and copper. Presumably idle.

**ACHAICHES MINE.****ALGERIA.**

Mine office: Collo, Algeria. Lands, 36 kilometers from Collo, show chalcopyrite and cupiferous pyrites in schist. In June, 1907, a 50-ton water-jacket blast furnace was being installed to matte the ore.

**ACME CONSOLIDATED GOLD & COPPER MINING CO.****WYOMING.**

Office: 7 Congress St., Boston, Mass. Mine office: Laramie, Albany Co., Wyo. Otto Gramm, president; Geo. M. Colby, vice-president; Arthur S. Howe, secretary and treasurer. Organized May 16, 1905, under laws of Maine, with capitalization \$1,000,000, shares \$1 par. Is a securities-holding corporation, controlling, through stock ownership, the Acme Gold & Copper Mining Co., and owns a large amount of standing timber, sawmill, planing-mill and a lumber yard at Centennial, Wyoming, an office building at Laramie, town lots at Laramie and Centennial, the Centennial Post newspaper and the Centennial Trust Co.

**ACME GOLD & COPPER MINING CO.****WYOMING.**

Office: 7 Congress St., Boston, Mass. Letter returned unclaimed from former mine office, Laramie, Albany Co., Wyo. L. W. Thompson, president; Fred A. Miller, vice-president; Arthur S. Howe, secretary and treasurer. Capitalization \$400,000, shares \$4 par. Is controlled, through stock ownership, by Acme Consolidated Gold & Copper Mining Co. Lands, 20 claims, 12 patented, area reported by company as 514 acres, also a 60-acre mill site. Property, known as the Gold Hill group, has 2,454' of workings. Improvements include necessary mine buildings, sawmill and stamp-mill. Presumably idle.

**ACME MINING & MILLING CO.****COLORADO.**

Mine office: Cotopaxi, Frémont Co., Colo. Has a 50' shaft, planned to be sunk 800'.

**ACME MINING & REDUCTION CO.****ARIZONA.**

Office and mine: Tucson, Pima Co., Ariz. H. H. Pilling, president; Adolph Bail, vice-president; Chas. F. Slack, treasurer; Chas. W. Lewis, secretary; Lyman Bridges, manager; L. W. Waer, mine superintendent. Capitalization, \$1,000,000. Lands, 24 claims, unpatented, known as the Acme group, in the Amole district, 12 miles from Tucson. Ores carry copper, gold, silver and lead.

**ADA COPPER MINING CO.****MONTANA.**

Mine office: Basin, Jefferson Co., Mont. H. L. Frank, president; Jas. B. White, manager. Organized 1904, under laws of Montana. Property is the Ada mine and adjoining claims, carrying gold, silver and copper. Idle.

**ADAKAI MINE.****JAPAN.**

Mine office: Adakai-mura, Yatsuka-gori, Izumo, Japan. County rocks

Digitized by Google

are Tertiary shale and sandstone, alternating. Principal vein strikes NNE. Ores are bornite, chalcopyrite and pyrrhotite, accompanied by native copper and sphalerite, with clay gouge. Idle.

#### **ADAMS COPPER CO.**

#### **WYOMING.**

Mine office: Saratoga, Carbon Co., Wyo. Idle.

#### **ADAMS COPPER MINING & REFINING CO.**

#### **COLORADO.**

Office: 513 Cooper Bldg., Denver, Colo. Operating office: 317 McCormick Bldg., Salt Lake City, Utah. Mine office: Steamboat Springs, Routt Co., Colo. Boyd R. Adams, president; B. F. Barnett, vice-president; W. F. McQuarrie, treasurer. Lands, 7 claims, having a 200' shaft carrying ore averaging about 4% copper. Has steam power. Presumably idle.

#### **ADDIE COPPER MINING CO.**

Letter returned unclaimed from former office, Denver, Colo.

#### **ADELAIDE STAR MINES, LTD.**

#### **NEVADA.**

Office: 33 Benfield St., Glasgow, Scotland. Mine office: Golconda, Humboldt Co., Nev. P. Coats, chairman; D. M. Boyd, secretary; Glasgow & Western Exploration Co., Ltd., general managers; Otto Stahlman, manager; C. G. Smith, general superintendent; Joseph Farren, mine superintendent. Organized Apr. 21, 1897, under laws of Great Britain, with capitalization £350,000, shares £1 par. No financial statement issued since 1903. Lands, 486 acres, including the Adelaide group of 13 claims, area 238 acres, 10 miles south of Golconda, and the Star group, 4 claims, area 78 acres, at Cherry Creek, White Pine Co., Nevada, also a 170-acre mill site. The Star mine is but slightly developed. The Adelaide mine has a 300' shaft and in the upper levels carried native silver, the 200' level showing a good body of medium grade auriferous and argentiferous copper ore, a carload mill test returning \$9.40 per ton. A 12-mile narrow gauge private railroad connects the mine with the mill at Golconda. Mine equipment includes a 200-h. p. steam plant, with hoist and 2 air-compressors.

The 100-ton reduction works include a 30-ton sampler and treat custom ores as well as company's own production. The mill uses the Macquiston flotation process of concentration, by which ore is first put through crushers, then through steel rolls, going to Huntington mills and then to the Macquiston plant, which has 100 concentrator tubes, each 18" in diameter and 6' in length, arranged side by side in 4 tiers. More than one-half of the tubes are immersed in water, and ore is carried through by endless screws, going out of the tubes at surface into settling tanks below. Concentrates not caught in the first tier of tubes pass into the next set, and so on, the process being completed in the third set. It is claimed that this process gives extraction of better than 99.75% of assay values, which claim seems too good to be entirely true. Work was resumed, 1907, at the Adelaide mine, which was producing circa 70 tons daily in August, 1908.

#### **ADELINE MINES, LTD.**

#### **AUSTRALIA.**

Office: 50 Lime St., London, E. C., Eng. Mine office: Drake, N. S. W., Australia. G. Martin Inglis, chairman; W. N. Redman, secretary. Organized Sept. 5, 1902, under laws of Great Britain, with capitalization £100,000, shares £1 par; £30,577 issued, fully paid. Idle.

#### **ADIRONDACK MINE.**

#### **MONTANA.**

Owned by North Butte Mining Co.

#### **ADMIRAL GOLD & COPPER MINING CO.**

#### **NEW MEXICO.**

Office: Sterling, Kansas. Letter returned unclaimed from former mine office, Tusas, Rio Arriba Co., N. M. C. A. Cooper, president; W. M. Bisbee, secretary. Organized 1900, under laws of New Mexico, with capitalization \$500,000, shares \$1 par. Lands, 5 claims, area 120 acres, in the Bromide dis-

trict, showing 3 fissure veins of 10' average width, carrying sulphide ores, opened by 3 shafts, deepest 130'. Idle for some time.

#### **ADMIRAL TOGO-ELY COPPER CO.**

#### **NEVADA.**

Letter returned unclaimed from former mine office, Ely, White Pine Co., Nev. A. R. Worth, president; C. R. Faulstich, secretary. Organized under laws of Arizona, with capitalization \$3,500,000, shares \$1 par. Lands are 2 claims about 5 miles north of Ely; one claim 24 miles north of Barstow, California and 2 placer claims in the Coolgardie district of San Bernardino county, California. Apparently a stock-jobbing enterprise.

#### **ADVANCE DEVELOPMENT & MINING CO.**

#### **ARIZONA.**

Office and mine: care of Parker L. Woodman, president, Bisbee, Cochise Co., Ariz. Alex. Erickson, superintendent. Organized 1906, under laws of Arizona, with capitalization \$1,000,000, shares \$2.50 par. Lands, sundry claims 3 miles from Bisbee, opened by a 30' shaft, showing ore assaying well in gold and copper. Idle.

#### **ADVENTURE CONSOLIDATED COPPER CO.**

#### **MICHIGAN.**

Office: 32 Broadway, New York, N. Y. Mine office: Greenland, Ontonagon Co., Mich. Jas. L. Bishop, president; Chester L. Dane, vice-president; W. R. Todd, secretary and treasurer; preceding officers, Chas. J. Devereaux, James S. Dunstan, Stephen R. Dow and Chas. D. Hanchette, directors; W. A. O. Paul, assistant secretary and treasurer; Chas. L. Lawton, general superintendent; A. H. Sawyer, engineer; S. A. Prince, clerk.

Organized Oct. 17, 1898, under laws of Michigan, with capitalization \$2,500,000, shares \$25 par; paid in, \$20.50. American Loan & Trust Co., Boston, registrar; Old Colony Trust Co., Boston, transfer agent.

Lands include the old Adventure and Hilton tracts, in one body to the eastward, and the Knowlton tract, one mile southwest, with total area of 1,696.22 acres on the mineral belt, also a millsite on Lake Superior. The mineral lands are located in Sections 35 and 36, Town 51 North, Range 38 West, and in Sections 1 and 2, Town 50 North, Range 39 West. The Toltec and part of the Belt lie on the north, Aztec on the east, Toltec and Mass on the south, and the Mass on the west of the main tract. The Knowlton tract has the Mass to the north and east, Flint Steel to the south and Michigan to the west, the Ridge mine of the Mass lying between the two Adventure tracts. The village of Greenland lies on the northwestern corner of the Adventure's principal tract, and the village of Maple Grove, controlled by the company, is near the mine.

The old Adventure mine was opened in 1850, along a line of ancient pits showing prehistoric mining. The largest annual production was 116 tons, 1,941 lbs. fine copper, in 1857. After closed by the owners, the old openings were worked for years by tributors, proving notably rich in silver.

The Hilton, or Ohio mine, opened 1863, on the Mass lode, never was worked vigorously. The Knowlton was opened in 1853. These three old mines made 974 tons, 1,173 lbs. fine copper, previous to their merging as the Adventure Consolidated, which started work Nov. 1, 1898.

The Adventure has a series of 7 parallel copper-bearing beds in a cross-section of about 1,200' and these, coupled with the existence of Adventure Bluff, a 300' hill, have caused the opening of the mine by adits as well as by shafts. The "South Range," or "Evergreen Belt" of Ontonagon county, comprises a belt of bedded traps, amygdaloids and conglomerates, 7 of these amygdaloids carrying copper on the Adventure tract. These beds were fully described in Vols. I to VII, inclusive.

The cupriferous lodes of the Evergreen belt are notoriously bunchy, being rich in spots and worthless at other points. The strike of the parallel lodes of the Adventure is N. 73° E. on the main tract, where operations were con-

ducted, shafts being sunk at an angle of 45°. There are 4 tunnels and 4 shafts, latter, except No. 1, in the Merchant lode, being sunk on the Knowlton bed, at 45°, and numbered from west to east.

The mine equipment includes a 38x59' steel boiler-house with three 500-h. p. Burt boilers; a 59x59' steel engine-house having an Allis-Chalmers duplex double-cone direct-acting hoist with 42x60" cylinders, capable of raising a 12-ton load from a depth of 5,000' on an incline of 45° at a speed of 2,000' per minute, and a 38x65' steel compressor-house having a 60-drill Rand-Corliss air-compressor. There is a complete electric light and power plant and protection from fire is furnished by water-mains. The principal mine buildings are sheathed with steel and painted, and the property is served by a spur of the Copper Range railroad.

The stampmill, at Edgemere, on Lake Superior, went into commission Sept. 22, 1902. The mill, built and equipped by the Allis-Chalmers Co., which has been sued for defective construction, is 135x217', of steel on stone foundations, with a 69x72' boiler-house and 32x72' pump-house. Equipment includes 3 Allis-Chalmers heads, fitted with Parnall-Krause mortars having 11-16" openings in discharge screens, with two horizontal revolving screens having 5-16" openings for each head. The stamp pistons are automatically rotated, equalizing wear on the shoes. From the revolving screens of the heads the crushed rock goes to the separator jigs, 24 for each head, or 72 for the mill, thence to 36 finisher jigs. There are round slime-tables, 3 Overstrom and 3 Wilfley concentrators, and Huntington mills for the raggings. The rock-bins have a storage capacity of 4,500 tons. Coal is delivered from trestles to boiler-rooms by gravity, through chutes. The pump is a 16,000,000 gallon Riedler, drawing its supply from Lake Superior through a tunnel extending 1,200' under the lake. Miscellaneous improvements at the mill site include an office, smithy, machine-shop, dwellings, etc. There is 8' to 12' of clear water offshore, permitting the landing of cargoes from scows, in good weather.

The operation of the Adventure mine proper proved disappointing, every year showing a loss. The average contents of all rock stamped was only 12.29 lbs. fine copper per ton, and during the last half of 1907 fell to 8.7 lbs. per ton, an absolutely hopeless figure, hence mining was entirely suspended early in 1908. Production, 1907, was 1,244,874 lbs. fine copper.

By reason of the highly promising copper discoveries made by the Lake Copper Co., diamond drill boring was begun in the spring of 1908, with 2 drills, and 3 rich cores have been secured, 2 having been cut July, 1908, from a single hole, about 750' apart, the second being supposed to have been taken from the Lake bed, though this is not certain, and having about 10' only of solid core, balance being sludge assaying 4.5% copper. The cores were taken from beds of 26' and 30' estimated width, the wider bed not carrying copper for the entire width. The overburden is very heavy, holes being drilled from swampy ground. The future of the Adventure evidently lies in the new beds, though possibly, if a big and successful mine is opened thereon, the old workings can be operated to advantage at some future time. The horizon of the 2 rich beds must be opened by an entirely new line of shafts. The company's deficit for 1907 was about \$86,000, and quick assets May 31, 1908, were \$51,475.

#### **AEOLIAN CONSOLIDATED COPPER MINING CO., LTD. IDAHO.**

Mine office: Mullan, Shoshone Co., Idaho. Alfred Andrieux, president; Geo. E. Phipps, vice-president; Marguerite Andrieux, treasurer; Clara Phipps, secretary; preceding officers, Louis L. Durand, Alexis Daneau and Henry P. Knight, directors. Lands, 9 claims, area circa 140 acres, near the head of Deadman's Gulch, 3 miles from Mullan. Property, fairly timbered, shows 2 well defined veins in quartzite, circa 400' apart, the south vein being 10' to 40' and the north vein 4' to 10' wide, opened by a 310' tunnel on the south

vein and a crosscut tunnel on the north vein, showing ore assaying well in copper, gold and silver.

**AETNA COPPER CO.****MICHIGAN.**

Dead. Sold lands, 1905, to Keweenaw Copper Co. Formerly in Keweenaw county, Michigan.

**AETNA GOLD & COPPER MINING CO.****UTAH.**

Mine office: Bingham Canyon, Salt Lake Co., Utah.

**AETNA MINING CO.****WYOMING.**

Office: Merrill, Wis. Mine office: Riverside, Carbon Co., Wyo. Julius Thielman, president; E. F. Hanf, secretary. Organized under laws of Wyoming, with capitalization \$1,000,000, shares \$1 par. Lands, 7 claims, area 140 acres, in the vicinity of Beaver Creek, circa 12 miles south of Encampment, showing 4 veins of 3' to 6' width, as fissures and as contact veins between granite and quartzite, carrying chalcopyrite, bornite and chalcocite, estimated to average 25% copper, and developed by a shaft of 200' and tunnels of 125' and 380'. Has a 40-h. p. steam plant.

**AFTONADADA COPPER MINES, LTD.****SPAIN.**

Dead. Title changed, 1903, to Rio Rimal Copper Co., Ltd. Formerly at Figueras, Gerona, Spain.

**AFRICAN & AUSTRALIAN CO., LTD.****AUSTRALIA.**

Office: Broad Street House, London, E. C., Eng. J. B. Palmer, chairman; H. J. Dixon, secretary. Organized Apr. 7, 1902, under laws of Great Britain as a third reconstruction of the West Australian Mining Co. and Victoria Copper Co., with capitalization £120,000, shares 2s. par. Holds stock interests in the Copper Selection Syndicate, Ltd., and various other enterprises.

**AFRICAN COPPER DEVELOPMENT CO.****TRANSVAAL.**

Mine office: Middelburg, Transvaal. J. F. Davies, consulting engineer. Lands, in the Middelburg and Pretoria districts, are being developed by shafts.

**AFRICAN COPPERS, LTD.****TRANSVAAL.**

Office: Exploration Bldg., Johannesburg, Transvaal. Mine office: Middelburg, Transvaal. Jerry F. Davies, manager. Organized under laws of Transvaal with capitalization £15,000. Lands are 1,025 claims on the farm Bietkloof, having 3 shafts, known as No. 1, New and Marnitz, latter, 160' deep, showing malachite and bornite. Begun shipping ore to Middelburg by wagon, September, 1907.

**AFRICAN NOBLE DUKE GOLD & COPPER MINING CO.****ARIZONA.**

Dead. Formerly infested Bisbee, Cochise Co., Arizona.

**AFCO-AMERICAN MINING & MILLING CO.****MONTANA.**

Mine office: Butte, Silver Bow Co., Mont. Chas. F. Jones, president; Anna Lee, secretary; Andrew G. Hansen, treasurer. Organized 1905, by negro residents of New York and Montana, with capitalization \$500,000. Lands, 18 claims, including 5 claims in the northwestern part of Butte district, 5 claims in Madison county and 5 claims in Lewis & Clark county, Montana, latter having a 100' shaft showing ore giving fair assay values in copper, silver and gold.

**AFTERTHOUGHT MINING CO.****CALIFORNIA.**

Dead. Lands sold to Great Western Gold Co. Formerly at Redding, Shasta Co., Cal.

**AFTON MINING & SMELTING CO.****MONTANA.**

Dead. Formerly at Helena, Lewis & Clark Co., Mont. Described Vol. V.

**AGASSIZ MINING CO.****ARIZONA.**

Dead. Formerly at Ray, Pinal Co., Ariz. Described Vol. VI.

**AGATE HARBOR MINE.****MICHIGAN.**

Office: care of Mrs. Anna Scott Block, owner, 100 Washington St., Chi-

cago, Ills. Mine office: Eagle River, Keweenaw Co., Mich. Lands were slightly prospected, many years ago, but property never was a producer.

#### **AGGER CONSOLIDATED MINES, LTD.**

**GERMANY.**

Letter returned unclaimed from former office, Finsbury Pavement House, London, E. C., Eng. Mine office: Siegen, Prussia, Germany. F. Lewis, secretary; Heinrich Noelling, mine manager. Organized Feb. 15, 1906, under laws of Guernsey, with capitalization £150,000, shares £1 par. Property is the Aggerburg group of copper, zinc and lead mines, area 2,880 acres, in the Bensburg district of western Prussia.

#### **MINA AGUA BLANCA.**

**MEXICO.**

A property at Autlán, Jalisco, Mexico, controlled by the Mexican Investment & Development Co.

#### **AGUASCALIENTES METAL CO.**

**MEXICO.**

Office and mine: Asientos, Ocampo, Aguascalientes, Mex. Dr. Chas. L. Bennett, president; Chas. P. Doerr, vice-president; Victor Hunton, secretary and treasurer; Albert Doerr, general manager; Geo. A. Crowder, mine superintendent; Robt. N. Woodworth, engineer. Organized Dec. 31, 1900, under laws of Mexico, with capitalization 35,000 pesos, shares 500 pesos par.

Lands, 82 hectares, in the Asientos and Tepezalá districts, including the Merced and San Simon mines at Asientos, and a group 3 miles from Tepezalá. Properties show 5 lenticular ore bodies, between limestone and calcareous slate and porphyry, with silicious limestone gangue, of which 4, under development, average about 5' in width, carrying ore averaging about 3% copper, 10 oz. silver and \$2 gold per metric ton. The Merced-Orito, 8 kilometers west of Cobre station, on the Mexican Union Railway, has 2 veins of 3 to 5 meters average width, carrying lenticular ore chutes, opened by shafts of 300' and 400', with about 2 miles of workings. Mine is very dry and is lighted by incandescent lamps. The San Simon y Anexas group has tunnels of 100 and 125 meters, and a 200' shaft and the San Nicolás has a 150' shaft.

Equipment is excellent, including a 100-h. p. De Laval steam turbine dynamo and Cameron electric triplex pump, with 20-h. p. and 50-h. p. electric hoists, good respectively for 1,000' and 3,000'. Buildings include a 15x30' stone machine shop, 20x40' stone and adobe carpenter shop, 20x30' smithy, power-house, hospital, office building, etc. Fuel is West Virginia coal, costing 16 pesos per metric ton. Average cost of mining is 10 pesos per metric ton, and of smelting 12 pesos. Production, 1906, was circa 1,000,000 lbs. fine copper, and for 1907 was circa 600,000 lbs. fine copper. Mine employs about 200 men. Company, which is a close corporation, controlled by one family, is wisely managed, and has accumulated a considerable surplus, instead of beginning dividends immediately, as is too commonly the case.

#### **AGUILA AMALGAMATED MINING CO.**

**MEXICO.**

Office: care of J. Burpee Neily, 183 Summer St., Boston, Mass. Mine office: Hostotipaquito, Ahualulco, Jalisco, Mex. Jas. P. Burlingame, vice-president; Eugene N. Estis, secretary; Jas. A. Floyd, treasurer. Organized with capitalization \$6,000,000, practically as a reconstruction of the Mazeppa Consolidated Mining Co.

#### **AGUASCALIENTES SMELTER.**

**MEXICO.**

Owned by American Smelting & Refining Co.

#### **AKMEEK MINING CO.**

**MICHIGAN.**

Office: 199 Washington St., Boston, Mass. Operating office: Houghton, Mich. Mine office: Kearsarge, Keweenaw Co., Mich. Albert S. Bigelow, president; Norman W. Haire, vice-president and general manager; W. J. Ladd, secretary and treasurer; preceding officers, Clarence H. Bissell, Thos. L. Chadbourne, Edward S. Grew and Walter A. S. Chrimes, directors; Wm. J. Uren, superintendent; Frank H. Haller, assistant superintendent; Russell Smith,

surface superintendent; Thomas Rapson, chief mining captain; Chas. D. Hohl, engineer; John T. Reeder, chief clerk and purchasing agent; Wm. Veale, clerk; H. B. Clausen, superintendent motive power. Organized 1880, under laws of Michigan, with capitalization \$1,250,000, shares \$25 par; \$17 paid in. Last call on capital stock was \$5, Feb. 5, 1904. Annual meeting, first Friday in July.

Lands, 920 acres, lying west and south of the Mohawk, set off, 1880, by the Seneca Mining Co., to work the Kearsarge, or Houghton, conglomerate. Under the management of Capt. John Daniell 2 shafts were sunk on this bed, which averages about 70' width, with 3 pay streaks, of 2' to 3' width each, aggregating 7' width, each carrying copper in good quantities, but not payable, owing to great width of partially or wholly barren rock. Resumed work Dec. 2, 1902, and exchanged 11.188 acres with the Allouez, in July, 1903, for an equal area, this giving each property a better arrangement of lands for development. The Kearsarge lode was located by diamond drill in the spring of 1903, and was immediately opened.

The mine is opened by two 3-compartment shafts, 1,445' apart, sunk at 42°, No. 1 being 1,204' deep at the 9th level, and No. 2 being 1,334' deep at the 10th level. Drift-stoops were carried in the early stages of production, providing considerable stamp-rock while permitting rapid increase of reserves. No. 1 shaft, which will be cut off by the side lines of the Allouez at a depth of about 3,000', apparently is the richer of the two. Reinforced concrete has been substituted for wooden sleepers in the shafts, ties being moulded in place upon the natural anchorage of rough rock, cores being left for rods to bolt the rails to the stringers. Concrete stringers are cheaper than wood, and presumably of longer life, though harder upon rails and rolling stock. Each shaft has 2 skips in operation. No. 2 shaft has a rock chute 625' long, reaching from the 4th to the 9th levels in the hanging, inclining toward the shaft which connects at the 9th level, from which point all hoisting is done. The end of the chute has an apron of one skip-load capacity, loading 7-ton skips in 20 seconds, one man looking after the dumping and filling of both skips, this system effecting a great saving.

There is room for 2 new shafts between the present workings and the Mohawk boundary and sand-pipes have been sunk for opening 2 shafts, which will be started from surface at an angle of 80°, in the form of an inverted "V," with a single shafthouse and rockhouse for both, somewhat similar to the plan used at the Allouez.

Each shaft has a shafthouse connecting with a centrally located rockhouse of brick with a cylindrical steel rock-bin 32' in diameter and 45' high, set on a concrete foundation with a tunnel and railroad track beneath, permitting filling of cars by gravity, one man loading a 40-ton car in 15 seconds. The bins have 1,600 tons capacity with an electric shaker and endless conveyor running from crushers to bins.

The power plant, about midway between shafts Nos. 1 and 2, is in 3 sections, the boiler-house being flanked on either side by engine-houses Nos. 1 and 2 for the respective shafts. The boiler house, having 5 boilers, with room for 8, is of structural steel, and the power-houses are of concrete and brick. No. 1 power-house has a 45-drill Nordberg air-compressor and electric light and power plant, liberal use being made of electric power throughout the plant. No. 2 power house has a 60-drill 2-stage Nordberg air compressor. The hoists are duplicate, capable of raising 10-ton loads from a depth of 1 mile, having double conical drums with maximum diameter of 18' 6", hoisting 10-ton skips in counterbalance. Buildings include a new machine-shop, 36x160' warehouse of structural steel frame, connecting with the railroad tracks, and a 44x46' office

building. The townsite contains about 70 dwellings, with waterworks having upwards of 1 mile of 6" mains, with 10 hydrants.

The Ahmeek has no mill of its own, about 75% of the rock production being milled by the Osceola, and 25% by the Tamarack.

Production to end of 1907 was 10,518,136 lbs. fine copper, of which 5,510,985 lbs. were made in 1907, the 1907 production being secured from 302,733 tons of rock, and the average for 3 years being 18.5 lbs. fine copper per ton, which probably will be exceeded in the future, only 8% of the rock broken underground having been discarded. The mineral returns about 75% copper. The cost of copper for 1907 was about 12 cents per pound, and probably will prove about 10 cents per pound in 1908, and should be reduced in the future. In July, 1908, the mine was producing about 1,000 tons of rock daily, but is in a position to furnish 1,500 tons. It is planned to make, eventually, 20,000,000 lbs. fine copper yearly, and the property is capable of doing it, with further development. The company began 1908 with a balance of quick assets of \$385,571, and further assessments are entirely improbable, though it is likely that earnings will be drawn upon to provide a mill. The Ahmeek is a magnificent property, with a great future, being perhaps the most promising mine yet opened on the Kearsarge lode, and has been developed and managed with great skill and signal success.

#### **COMPAGNIE DES MINES D'AIN-BARBAR.**

#### **ALGERIA.**

Office: 39 Rue Dulong, Paris, France. Mine office: Bône, Constantine, Algeria. Lands, 22 kilometers northwest of Bône, show several veins carrying complex sulphide ores, mainly chalcopyrite, associated with sphalerite and galena. Has a magnetic concentration plant and is experimenting with the Korda process of copper reduction by leaching and electrolysis. Production, 1906, was 7,545 metric tons of washed copper ore, and 1,800 tons of washed mixed ore, ore being calcined and giving, after magnetic separation, 710 tons of copper ore and 649 tons of sphalerite, former estimated to contain 225,000 lbs. fine copper. For 1906 made a net profit of \$31,807, paying a 7% dividend.

#### **AJAX MINE.**

#### **MONTANA.**

Mine office. Fox, Beaverhead Co., Mont. Noyes & Morse, owners. Ores carry gold, silver, lead and copper. Has a 5-stamp mill.

#### **AJAX MINING CO.**

#### **UTAH.**

Office: Salt Lake City, Utah. Mine office: Robinson, Juab Co., Utah. Thos. Weir, president and general manager; Jno. M. Burt, secretary. Capitalization \$300,000, shares \$10 par. Has liquidated a considerable former indebtedness, ending the fiscal year Oct. 1, 1907, with a \$20,000 surplus. Mine has a 1,000' main shaft, and produces ore averaging circa 3.75% copper, 9 oz. silver and \$7 gold per ton. Production, 1907, was 123 carloads of ore, carrying circa 150,000 lbs. fine copper.

#### **AJO COPPER MOUNTAIN MINES CO.**

#### **ARIZONA.**

Dead. Property sold, January, 1907, to Rendall Ore Reduction Co. Formerly at Gila Bend, Maricopa Co., Ariz. Fully described Vol. VI.

#### **AK-SAR-BEN COPPER CO.**

#### **WYOMING.**

Dead. Formerly at Encampment, Carbon Co., Wyo. Described Vol. VI.

#### **ALABAMA GOLD & COPPER CO.**

#### **NEW MEXICO.**

Letter returned unclaimed from former mine office, Orbgrande, Otero Co., N. M. Property shows large outcrops of iron ore, also veins carrying copper and gold values, with more or less turquoise.

#### **ALADDIN MINING CO.**

#### **MONTANA.**

Mine office: Clinton, Missoula Co., Mont. Idle for some years.

#### **ALAKNUNDA COPPER SYNDICATE, LTD.**

#### **INDIA.**

Office: 20 Bucklersbury, London, E. C., Eng. Mine office: Devanghur, Garhwal, Oudh, India. Organized Sept. 25, 1907, under laws of Great Britain,

with capitalization £6,750, in 600 A shares and 6,000 ordinary shares of £1 par each, and 3,000 deferred shares of 1s. par. Lands are leasehold.

#### **ALAMEDA MINING CO.**

Office: care of P. J. Winters, manager, Encampment, Wyo. Mine office: Saratoga, Carbon Co., Wyo. Lands, 3 claims, near the Charter Oak property, opened by shallow shafts, deepest 30', and a 100' tunnel, said to show encouraging ore. Idle.

#### **ALAMOS MINING CO.**

Office: care of L. C. Hanks, secretary and treasurer, Douglas, Ariz. Letter returned unclaimed from former mine office, Alamos, Sonora, Mex. Harry F. Smith, president. Organized February, 1906. Lands, sundry claims below Guaymas, in the Alamos district of Sonora, Mexico, slightly developed, said to show argentiferous copper ores. Presumably idle.

#### **ALAMOS SILVER & COPPER CO.**

Office: care of J. S. Obermiller, general manager, Philadelphia, Pa. Mine office: Alamos, Sonora, Mex. Lands, circa 200 acres of mineral property and about 300 acres of millsites and water rights, including the Promontorios mine, opened A. D. 1720, having a 600' shaft showing a 48' ore body. Has a 50-ton smelter.

#### **ALASKA AMALGAMATED COPPER CO.**

Office: Seattle, Wash. Mine office: McCarthy's Creek, Copper River district, Alaska. W. A. Mears, president; L. C. Dillman, vice-president and general manager; E. V. Dillman, secretary; H. H. Greer, superintendent. Organized December, 1905, under laws of Washington, with capitalization \$1,250,000.

Lands are 113 claims, area circa 2,260 acres of copper claims, stretching along about 60 miles, also 168 gold placer claims, 1,200 acres of coal lands and 3 water powers, one of latter having a 500' vertical fall, available for power purposes about 6 months yearly. Of the copper claims the Walters, Statesman, Ramshead and Dillman groups give the best surface showings.

The Statesman group, 10 claims, shows native metal, occurring as fine shot and flake copper, in slightly amygdaloidal trap, with greenstone walls, the trap bed, said to be 350' wide, mineralized for entire width and traced 2,400', carrying occasional copper masses, said to range in weight from a few pounds to 10 tons each.

The Walters group, 7 claims in length, shows a vein of 8' to 10' average width for 1,000', reported then to swell to 200' width for 3,000', then narrowing to 8' to 10' only, being traceable about 6,000' in all. Ores are massive bornite and chalcopyrite.

The Ramshead group, exposed to depth of 100' by erosion, shows a vein of 12' to 16' width, claimed to carry 8' to 10' of massive chalcocite and a 12' streak of quartzose material, balance of ore being a good grade of disseminated bornite and chalcopyrite, with spar gangue.

The Dillman group, exposed for a depth of about 300' by erosion, has a vein of 4' to 22' width, traceable by outcrop 6,000' on company's lands, carrying an average of about 6' of massive chalcocite, considerably weathered at surface, showing green carbonate stains.

#### **ALASKA-CALUMET COPPER CO.**

Office: 645 New York Blk., Seattle, Wash. Mine office: Valdez, Alaska. H. M. Herrin, president; F. Freeman Evans, secretary; Walter Bowen, treasurer; Fred Elkins, agent. Organized Jan. 13, 1906, under laws of Washington, with capitalization \$2,000,000, shares \$1 par. Lands, 17 claims, in 2 groups, in the Copper River district, adjoining the Hubbard-Elliott, showing bornite and chalcocite assaying up to 56% copper and \$169 combined gold and silver values per ton.

#### **WYOMING.**

#### **MEXICO.**

#### **MEXICO.**

#### **ALASKA.**

#### **ALASKA.**

**ALASKA CONSOLIDATED COPPER CO.****ALASKA.**

Office: 512-60 Wall St., New York, N. Y. Hon. W. F. Bay Stewart, president; Ambler J. Stewart, vice-president; Peter Stederoth, secretary; preceding officers, John R. Miller, Chas. J. Hutchins, W. B. Bousman, C. B. Watt, Frank P. Lauer, Herman Barrington and Robert Gwynne, Jr., directors. Capitalization \$5,000,000, shares \$5 par. Company has no connection with any corporation of somewhat similar title. Lands, 34 claims, mainly on Nugget Creek, in the Chitina Basin of the Copper River district, Alaska, said to have a 20' fissure vein traceable 1,000', carrying ore of 10% average copper tenor.

**ALASKA CONSOLIDATED MINING & SMELTING CO.****ALASKA.**

Dead. An abortive reorganization, 1907, of the Alaska Copper Co.

**ALASKA COPPER ASSOCIATION.****ALASKA.**

Letter returned unclaimed from former office, Valdez, Alaska. Organized 1907, with capitalization \$25,000.

**ALASKA COPPER CO.****ALASKA.**

Office: 316 Globe Bldg., Seattle, Wash. Mine office: Coppermount, Prince of Wales Island, Alaska. H. B. Bryson, president; A. P. Burchfield, vice-president; Frank C. Lane, treasurer; Henry W. Armstrong, secretary; H. T. Granger, receiver. Organized Feb. 28, 1903, under laws of Washington, with capitalization \$5,000,000, shares \$25 par. Lands, 18 claims, patented, area 360 acres, also 8 patented millsites, area 80 acres, on Copper Harbor, a land-locked haven with deep water. Lands, well timbered, on Copper Mountain, rising to a height of 3,600', have a partially developed water power, with a 22" steel pipe-line of 1,000' length, from Reynolds Creek to the power plant, where there are 2 water wheels of 300 aggregate horse power.

The Brooklyn vein, 10' to 30' wide, carries chalcopyrite assaying 8 to 34% copper. The New York vein, a contact between porphyry and limestone, 10' to 60' wide, has given smelter returns of 16.9% to 29.06% copper. Principal vein is the Indiana, in limestone, near porphyry, giving average assays of 6% copper and \$6 gold per ton. Mine has 6 shafts, 2 deepest, 230'. Principal development is by tunnels, 8 in number, of 7,200' aggregate length. Ores at surface are oxidized, with occasional native copper, with sulphides at depth. Mine has a 1,400' ground-tram, connecting with an aerial tram leading to the smelter, which has a 350-ton Allis-Chalmers blast-furnace. Buildings include a 30x60' frame machine-shop, 20x70' frame carpenter shop, 24x36' smithy, and various other structures, with a total of 16 buildings. Property includes a 15,000' saw-mill and gasoline launch. Property produced some matte, latter half of 1906, but since idle. Is said to have an indebtedness of circa \$175,000, and to have sold its lands. Bankruptcy apparently is inevitable.

**ALASKA COPPER CO.****NEVADA.**

Letter returned unclaimed from former mine office, Ely, White Pine Co., Nev. Lands are in litigation with Nevada Consolidated Copper Co.

**ALASKA COPPER & COAL CO.****ALASKA.**

Office: 146-45 Broadway, New York, N. Y. Ernest Truslow, secretary and treasurer. Organized under laws of West Virginia, with capitalization \$3,500,000, shares \$10 par, as Alaska Copper Co., and name changed to present title. Lands, circa 3,000 acres, patented, 180 miles northeast of Valdez, are known as the Kennicott group. The Bonanza mine, 6 miles above the foot of Kennicott glacier, has a 2' to 7' fissure, cutting both bedded rock and limestone, apparently at right angles to contact, and is exposed to height of 150' on a slope in the greenstone, immediately above the contact. Ores at surface are massive chalcocite and bornite, mainly the former, giving average assays of about 70% copper and 18 oz. silver per ton. A 40' shaft apparently has penetrated the ore body, which seems merely a surface enrichment. Property formerly was controlled by the Havemeyers, but apparently now is controlled

by the Guggenheim interests, through the organization of the Kennicott Mines Co.

**ALASKA-GALENA MINING CO.****ALASKA.**

Offices: care of W. W. Catlin, Seattle, Wash. Mine office: Ketchikan, Alaska. Property is a short distance from tidewater, and the installation of an aerial tram is planned.

**ALASKA GOLD & COPPER CO.****ALASKA.**

Dead. Title changed to Central Alaska Gold & Copper Co. Formerly at McCarthy's Creek, Copper River district, Alaska.

**ALASKA IMPERIAL MINING CO.****ALASKA.**

Dead. Formerly at Ketchikan, Alaska. Described Vol. VI.

**ALASKA INDUSTRIAL CO.****ALASKA.**

Office: 11 Broadway, New York, N. Y. Mine office: Sulzer, Prince of Wales Island, Alaska. Chas. A. Sulzer, president and general manager; S. I. Frankenstein, vice-president; Col. A. M. Lowry, treasurer; Louis Sarecky, secretary; Evan Jones, mine foreman. Organized Oct. 30, 1899, under laws of New Jersey, with capitalization \$1,000,000, shares \$1 par. Annual meeting, second Monday in November.

Lands, 60 patented claims, area 1,200 acres, also 60 acres in millsites, 80 acres in homestead, and various patented properties. Lands show 7 contact deposits, between limestone and granite, giving average assays of 6% copper, 3 oz. silver and \$3 gold per ton. Ore beds are irregular, lying in metamorphic contact veins between igneous rocks and limestone, carrying mainly chalcopyrite, with some malachite, azurite, bornite and a little tetrahedrite, with magnetite and quartz gangue. Mine has 4 shallow shafts, but development is mainly by tunnel, with numerous opencuts, having a large amount of ore blocked out for stoping.

The property carries an available water power, rated at 5,000 h. p., and this has been partially developed by a 36" Pelton wheel, taking water from Beaver Creek and actuating a 6-kw. generator, and a 16" Pelton wheel taking water from Jumbo Creek, through a 10" pipe-line of 3,000' length, this actuating a 55-kw. 3-phase 2,300-volt 60-cycle generator, current being stepped down to 220 volts for lighting and power. Mine is equipped with electric fans, blowers and Temple-Ingersoll electric drills.

Mine has a 9,000' Biblet aerial tram, carrying 22 buckets of 1,000 lbs. capacity each, operated by gravity, with a 600' auxiliary tram, both loading and discharging automatically, requiring only one brakeman for operation. The main tram has small bins at the mine, and 4,000-ton storage bins at tidewater, where there is a 200' wharf, company having a 47' gasoline launch. Equipment and buildings are of an extensive nature, including a 35x40' warehouse, 35x30' power plant, smithies, store, office, dwellings, bunk-houses and numerous smaller buildings.

Production, 1907, was 1,545,941 lbs. fine copper, 13,699 oz. silver and 1,065 oz. gold. Ore went to Ladysmith smelter, 1907, and to the Tacoma smelter 1908. Company weathered the financial storm of 1907 in excellent shape, without reducing forces, and has no liabilities other than current accounts. Property considered valuable and management good.

**ALASKA METALS CO.****ALASKA.**

Mine office: Bruce, Prince of Wales Island, Alaska. Harry Corbin, superintendent. Property, on the west coast of Prince of Wales Island, formerly known as the Corbin mine, is under development, and a little ore has been shipped.

**ALASKA MINING CO.****UTAH.**

Office: 230 Atlas Blk., Salt Lake City, Utah. Letter returned unclaimed

from former mine office, Silver City, Juab Co., Utah. J. W. Neill, secretary, at last accounts. Capitalization \$400,000. Idle.

#### **ALASKA MINES SECURITIES CO.**

**ALASKA.**

Office: 25 Broad St., New York, N. Y. Samuel I. Silverman, president and general manager; Samuel W. Erich, treasurer; preceding officers, Lester Turner, Maurice McMicken and B. E. Barinds, trustees. Organized under laws of Washington, with capitalization \$2,500,000, shares \$5 par. Controls, through stock ownership, the Hadley Consolidated Copper Co., Uncle Sam Copper Co., and Big Tiger Gold Mining Co. of Nevada. Is said to have paid, 1906, a dividend of 15 cents per share.

#### **ALASKA-NORTHWEST COPPER CO. ALASKA & BRITISH COLUMBIA.**

Office: Alaska Bldg., Seattle Wash. J. L. Hutton, president; Hon. Edgar Dewdney, vice-president; Porteus B. Weare, first vice-president; Nathan W. Hendricks, secretary; John W. Black, treasurer; Pierre Duryee, assistant treasurer. Organized under laws of Washington, with capitalization \$5,000,000, shares \$1 par. Lands are in 2 groups, one, of about 50 claims, being near the property of the Valdez-Boston Copper Co., 160 miles by rail from Valdez, at the head of the Lakina river, which empties into the Chitida river, an affluent of the Copper river, carrying native copper in amygdaloidal diabase. The Indian Chief group, on Vancouver Island, British Columbia, which has the principal development, carries mainly bornite and chalcopyrite, said to give average assays of 7% copper and \$2.50 gold per ton, opened by 3 tunnels and various opencast workings. Mine has 4,000' aerial tram to tidewater, where 300-ton bunkers are planned.

#### **ALASKA SMELTING & REFINING CO.**

**ALASKA.**

Office: 82 Beaver St., New York, N. Y. Mine office: Coppermount, Prince of Wales Island, Alaska. Works office: Hadley, Prince of Wales Island, Alaska. Geo. D. Mumford, president; W. J. Steadman, Jr., secretary; Henry Harris, superintendent; Gordon Knox Bell, assignee. Organized July, 1905, under laws of New Jersey, with capitalization \$1,000,000. Is closely connected, in ownership and management, with the Brown-Alaska Copper Co.

The smelter, rated at 350 tons daily capacity, has steel buildings, and is connected by an aerial tram and rail with the Brown-Alaska mines. The smelter, blown in Sept. 20, 1904, has a 44x160" furnace, treating ores from the Brown-Alaska and Hadley Consolidated, and obtaining silicious ores for fluxing from the Britannia, making 50% matte, which is sent to the Crofton smelter for refining. Was said, early 1908, to plan a smelter, to be completed 1909, on Resurrection Bay. Employs, normally, circa 150 men. In hands of assignee since Oct. 1, 1907.

#### **ALASKA UNITED COPPER EXPLORATION CO.**

**ALASKA.**

Office: 551 Coleman Bldg., Seattle, Wash. L. C. Dillman, president and general manager; I. B. Hammond, vice-president; E. V. Dillman, secretary; W. A. Mears, treasurer; preceding officers, W. W. Phillips, Jas. A. Mundy, R. LaBar Goodwin and P. S. Clarkson, directors; Geo. Davidson, superintendent. Organized Nov. 14, 1906, under laws of Washington, with capitalization \$12,500,000, shares \$1 par. Lands, 137 claims, area circa 2,750 acres, in 12 groups, also 80 acres in smelter-sites and 900 acres miscellaneous lands, on the Chitina and Nizina rivers, in the Copper River district of Alaska. Only exploratory work has been done, property having 4 small tunnels and numerous trenches showing copper ore.

#### **COMPAÑIA MINERA DE ALBAYALDE.**

**MEXICO.**

Mine office: Gomez del Palacio, Mapimí, Durango, Mex. C. E. Wilbert, manager. Has silver and copper ores.

#### **ALBERNI GOLD & COPPER CO., LTD.**

**BRITISH COLUMBIA.**

Dead. Formerly at Alberni, Vancouver Island, B. C.

**ALBION COPPER MINING CO.****MONTANA.**

Mine office: Sunday, Granite Co., Mont. Christian Reichert, president; James M. Hinkle, secretary. Lands, opened by tunnels, show 3 veins, carrying concentrating ore with values in copper, lead, silver and gold. Idle.

**ALBION MINING CO.****UTAH.**

Office: care of Hatfield & Sons, Salt Lake City, Utah. Mine office: Alta, Salt Lake Co., Utah. Wm. Hatfield, general manager. Property is the Albion group, said to have yielded about \$1,000,000 worth of ore under former ownership. A tunnel of 2,800', being driven, to drain old workings and open new ground, shows a fissure vein assaying up to 15% copper, with silver values. Has water power and plans a concentrator.

**ALDA COPPER MINES, LTD.****SPAIN.**

Dead. Liquidated May, 1906. Formerly at Cabrales, Asturias, Spain.

**ALDA MINING & SMELTING CO., LTD.****SPAIN.**

Dead. Reorganized, 1900, as Alda Copper Mines, Ltd. Formerly at Cabrales, Asturias, Spain.

**SOCIÉTÉ MINIÈRE D'ALDEIRE.****SPAIN.**

Dead. Formerly at Aldeire, Guadix, Granada, Spain.

**COMPANHIA MINEIRA ALEMTEJANA.****PORTUGAL.**

Office: 4 Praça d's Remolares, Lisbon, Portugal. Mine office: Beja, Alemtejo, Portugal. Waldemar d'Orey, superintendent. Property is a group of old mines in the San Domingos district, carrying two ore bodies in schists, the carbonate and sulphide ores giving a selected product of about 25% copper tenor. Mines were worked by the Romans.

**ALESSANDRO COPPER MINING CO.****NEW MEXICO.**

Dead. Lands sold, 1908, to Copper Gulf Mining Co. Formerly at Silver City, Grant Co., N. M. Fully described Vol. VI.

**ALEXANDER Y CIA.****BOLIVIA.**

Office and mine: Coro Coro, La Paz, Bolivia. Firm is a very small producer of native copper.

**ALEXANDRIA GOLD & COPPER MINING CO.****CALIFORNIA.**

Letter returned unclaimed from former mine office, Randsburg, Inyo Co., Cal. Organized under laws of Nevada, with capitalization \$1,000,000, shares \$1 par. Lands, 10 claims, unpatented, area 160 acres, in the Argus Mountains, circa 40 miles from Randsburg. Mine was worked formerly in a small way, with a 5-stamp mill, destroyed by waterspout. Has about one-half mile of workings, showing mainly gold and silver values, expected to turn into copper at depth.

**COMPAGNIE INDUSTRIELLE ET MINIÈRE****ALGERIA.****DES CUIVRES D'ALGERIE.**

Letter returned unclaimed from former mine office, Oran, Algeria. Lands, 3,800 hectares, circa 14 kilometers west of Oran, showing cupriferous sandstone beds of several hundred feet thickness, said to assay 2 to 2.5% copper. Beds are too low in copper tenor to mine profitably, and company is searching for local enrichments of sufficiently high grade to prove workable.

**ALGOA COPPER CO., LTD.****TRANSVAAL.**

Mine office: Zoutpansberg, Transvaal. C. A. Rickard, chairman. Organized circa 1908, under laws of Transvaal, with capitalization £4,000. Lands are mining claims, well watered and timbered, on the farm Rotterdam, lying on the west side of the Sand river. In liquidation June, 1908.

**ALGOL MINE.****CALIFORNIA.**

Mine office: Spenceville, Nevada Co., Cal. Opened circa 1865; reopened 1890. Has a 50' vein, with 2" to 10" pay streak, developed by two 120' shafts.

Ores are cuprite, malachite and azurite, also native copper and a little gold, giving average smelter returns of 20% copper. Has steam power. Idle.

**ALGOMA & CALUMET DEVELOPMENT CO.** ONTARIO.

Dead. Lands transferred, June, 1903, to Hermina Mining Co., Ltd. Formerly at Massey Station, Algoma, Ont.

**ALGOMA COMMERCIAL CO., LTD.** ONTARIO.

Office: Sault Ste. Marie, Ont. Mine office: Sudbury, Algoma, Ont. C. M. Boss, superintendent. Property includes the Elsie, Wilmott and other mines, 4 miles from Sudbury, Algoma, Ont.

**ALGOMA COPPER & SMELTING CO.** ONTARIO.

Office: care of Eugene Warner, vice-president, Prudential Bldg., Buffalo, N. Y. Mine office: Bruce Mine, Algoma, Ont. Mark B. Schwab, president; Ben. Newman, secretary; Bernard J. Hillman, treasurer. Organized, circa 1905, under laws of Arizona, with capitalization \$3,000,000, shares \$10 par. Lands, 1,550 acres, about 9 miles from Bruce Mine, opened by a 425' shaft and a 175' tunnel. Has a 300-ton concentrator. No recent developments and company apparently inactive. Property fully described under title Rock Lake Mining Co., Ltd., in Vol. III.

**ALGOMA CUSTOM SMELTING & REFINING CO., LTD.** ONTARIO.

Office: Hermann Blk., Fifth St., Calumet, Mich. Works office: Thessalon, Algoma, Ont. Jos. Hermann, president; F. H. Pollock, vice-president; W. B. Anderson, treasurer; H. Appleton, secretary; Merchants & Miners' Bank, Calumet, registrar. Capitalization \$250,000, shares \$5 par. Is closely connected, in ownership and management, with the Hermina, and has begun construction of a custom smelter to contain reverberatory furnaces of the Kirby type, with estimated daily capacity of 500 tons.

**ALGONQUIN COPPER CO.** WYOMING.

Dead. Formerly in Wyoming.

**MINA EL ALICANTE.** MEXICO.

Mine office: Mazapil, Zacatecas, Mex. M. Dolores Aguirre y Ca., owners; Vicente Banavides, superintendent. Ores carry gold, silver, lead and copper.

**ALICE CONSOLIDATED MINING CO.** UTAH.

Office: care of C. C. Dailey, secretary and treasurer, Salt Lake City, Utah. Mine office: Callao, Juab Co., Utah. W. R. Hutchinson, president; W. F. Calloway, vice-president. Capitalization \$1,000,000, shares \$1 par. Lands, 6 claims, in the Dugway division of the Deep Creek district, near the St. George Copper Mining Co.

**ALICE GOLD MINING CO.** WASHINGTON.

Dead. Formerly at Chewelah, Stevens Co., Wash. Described Vol. VI.

**ALICE GOLD & SILVER MINING CO.** MONTANA.

Mine office: Butte, Silver Bow Co., Mont. John D. Ryan, general manager. Has 400,000 shares, and is controlled, through stock ownership, by Butte Coalition Mining Co. Has a 1,500' shaft. In 1906 extracted 3,170 tons of ore giving gross returns of \$7.70 per ton and costing, to mine, mill and smelt, \$9.30 per ton.

**MINA DE ALJUSTREL.** PORTUGAL.

Mine office: Aljustrel, Alemtejo, Portugal. Is said to be owned by a Belgian company. Ore is chalcopyrite, associated with iron pyrites, carrying 1 to 7% copper. Mine is a small but fairly regular producer.

**ALLEGHENY MINING CO.** NEW JERSEY.

Dead. Property was the Pahaquarry mine, opened by the Dutch, circa 1660. Mine was reopened, 1860, by the first Allegheny Mining Co., now dead, and reopened 1901, by the second Allegheny Mining Co., also dead. Formerly at Belvidere, Warren Co., N. J.

**ALLEN MINE.**

Owned by Oregon Homestead Mining & Reduction Co.  
**ALLGEMEINE ELEKTRO-METALLURGISCHE**

**OREGON.****GERMANY.****GESELLSCHAFT.**

Works office: Papenburg a/d Ems, Germany. Has a small electrolytic plant with capacity of about 500 pounds of cathodes daily, treating nickel-copper anodes.

**ALLIANCE COPPER CO.**

Office and mine: Butte, Silver Bow Co., Mont. Augustus T. Morgan, president. Organized May 19, 1906, under laws of Montana, with capitalization \$400,000, shares \$2 par. Property is very small acreage in the north-eastern portion of the Butte district, with surface rights to sundry town lots. Development is by a shaft, sunk jointly by the Alliance and Farrell companies, and a little ore of good grade was shipped, 1907, from the 200' level. Presumably idle.

**ALLIANCE COPPER-GOLD CO.**

Mine office: Greenwood, Boundary district, B. C. H. H. Shallenberger, superintendent, at last accounts. Lands include the Moreen claim, in the Deadwood camp, developed by open cuts and a tunnel, showing veins of 4 to 20' width carrying low grade auriferous copper ores.

**ALLIANCE COPPER MINING CO.****WASHINGTON.**

Dead. Absorbed, 1902, by Iconoclast Consolidated Mines Co. Formerly at Keller, Ferry Co., Wash.

**ALLIGATOR & TIGER LEASING CO.****COLORADO.**

Mine office: Red Cliff, Eagle Co., Colo. A. S. Little, manager. Lands, 2 claims, showing massive bornite and chalcopyrite, in fissure veins, traversing granite, ores assaying up to 15% copper, 5% lead, 50 oz. silver and \$10 gold per ton.

**ALLOUEZ MINING CO.****MICHIGAN.**

Office: 60 State St., Boston, Mass. Mine office: Allouez, Keweenaw Co., Mich. Harry F. Fay, president; Geo. G. Endicott, secretary and treasurer; Jas. MacNaughton, general manager; preceding officers, Alexander Agassiz, F. L. Higginson, F. W. Hunnewell, Quincy A. Shaw, Jr., R. L. Agassiz and W. L. Frost, directors; A. Warne, mining captain. Organized September, 1859, under laws of Michigan, with capitalization \$500,000, shares \$25 par; reorganized and reincorporated, 1889, under laws of Michigan, with capitalization \$2,500,000, shares \$25 par; \$22.25 paid in. Last assessment, \$3 per share, was levied 1904. Old Colony Trust Co., Boston, registrar. Annual meeting, second Tuesday in March.

Control was secured, 1907, by the Calumet & Hecla Mining Co., through purchase of a large stock ownership. For 1907 the company showed a mining profit of \$106,374, and net earnings of \$21,528, but the purchase of a half interest in the Centennial mill used up the cash balance, and necessitated the borrowing of \$185,000 from the Calumet & Hecla. The year's construction account, including the mill purchase, amounted to \$423,000, so that the company began 1908 with a deficit of \$38,557.

The old mine, opened 1859, is on the Allouez conglomerate, a bed underlying the greenstone. The conglomerate, 30' wide in many places, with strike of N. 39° E., and dip of 89°, averages 0.7 to 1% copper, and is very refractory under the stamps. There are 3 shafts, deepest about 3,700'. Mining was begun actively in 1869, and stopped in 1877, with an exhausted treasury. The mine was then leased to Watson & Walls, who made money from it, after paying a royalty of one-eighth on gross production. In 1880 the company resumed control, to quit once more, financially exhausted, in 1885. Watson & Walls took the mine again, and once more did well; the company resumed

work on its own account for the third time, and again lost money, stopping all work in 1892. The old mine has been idle for some years, except for exploratory and development work in 1898-1900, when a shaft was sunk 1,200' on the Osceola lode, and nearly 4,000' of openings secured thereon, with indifferent results. The shafthouse at the Osceola shaft has been demolished. The stamp-mill, on Hills Creek, has three old-fashioned heads and cannot be used for the new mine. The old Allouez made 13,025 tons, 1,528 lbs. fine copper, 1869-1892.

Lands are circa 3,400 acres, including the main tract of 640 acres on which the mine is opened. In 1903 an exchange of 11.188 acres was made with the Ahmeek. The new Allouez mine is opened on the Kearsarge amygdaloid, which does not outcrop on Allouez lands, hence was opened on the underlay, the bed lying under the entire 640-acre tract. There are 2 shafts, No. 1, with 3 compartments, on the extreme southeastern corner of the tract cutting the lode at 1,480' depth, with first level opened at depth of 1,264', the shaft being circa 2,500' deep. No. 1 shaft leaves surface at an angle of 75°, but at slight depth takes an angle of 80°, continuing thereon to about 1,485' depth, when a curve of 60' brings the shaft to the angle of the dip of the bed, at 38° 30'. Owing to the steep pitch of the shaft, back-rails of 6x10" timber are set so close to the wheels of the skips that their flanges cannot leave the steel rails, the wooden timbers serving as guides. At the change of angle from 80° to 38° 30', on reaching the lode, a single idler with a very wide flange carries for the cables passing at either end. In order to save pumping charges on surface water, a gutter has been cut entirely around the shaft, this leading to an incline 38' long, used as a sump, from which the water is forked. The bottom levels of No. 1 shaft are not showing as well as before. No. 1 has a 42x62' steel shaft-rockhouse, with two 18x34" crushers.

No. 2 shaft is circa 1,500' northeast of No. 1, and must go to a depth of about 2,400' before cutting the Kearsarge lode, but the bed will be reached by crosscuts eastward before intercepted by the shaft. This shaft was forced to start further in the hanging wall than No. 1, on account of the proximity of a lake, and was 1,800' deep in August, 1908. No. 2 was sunk 120' in the month of February, 1908, which is a record for the Lake Superior district. The collar of No. 2 shaft is of concrete, Washington fir and 16x24" steel "I" beams, with 14x14" square-timber wall plates and 4" plank-sheathing. The interior, from collar to solid rock ledge, is lined with 22" of concrete, dividers having their ends bedded in concrete, this giving an impregnable shaft through the treacherous sand overburden. Each shaft can be sunk about 9,500' before reaching the western boundary of the property.

Machinery equipment includes a Nordberg hoist with 32x72" duplex cylinders and 18' double-conical drum. No. 2 has the temporary hoist with which No. 1 was sunk. The engine-house is of mine rock with redstone trimmings. A stone boiler-house has five 125-h. p. boilers and a 120' self-supporting steel smokestack. No. 1 engine-house has 12-drill and 18-drill air compressors, and No. 2 has a 60-drill Laidlaw-Dunn-Gordan air compressor. Miscellaneous buildings include a redstone machine shop and smithy, and a large warehouse. The mine is reached by a spur of the Mineral Range railroad.

Production was begun Aug. 1, 1905, at the Centennial mill, and for 1905 averaged 28.4 lbs. copper per ton. For 1906 production was 3,486,900 lbs. fine copper, and in 1907 was only 2,934,116 lbs., secured from 214,720 tons of rock stamped, which yielded an average of only 13.66 lbs. fine copper per ton, or less than half the returns of 1905. For the first half of 1908 rock tonnage and copper percentage were at about the same rates as in the preceding year. The bed averages about 16' in width, and for 1907 only 5.6% of the rock hoisted was discarded, the mineral returning 63.56% fine copper. About 400 men are employed. The Allouez has proven very much lower in grade than

was anticipated at the time it was first opened, but an improvement may be looked for with reasonable confidence, and the property, being in strong and experienced hands, should make a fine mine in time.

**ALLPORT MINING CO.**

Mine office: Basin, Jefferson Co., Mont. Capitalization \$500,000, shares \$1 par.

**ALMA COPPER MINING CO.**

Office: Des Moines, Ia. Mine office: Carbó, Ures, Sonora, Mex. Abner Graves, general manager; Nelson D. Graves, superintendent. Lands, 747 acres, in the Ures district, showing auriferous, argentiferous and somewhat bismuthiferous cuprite, malaconite, azurite, malachite and chrysocolla, assaying up to 37% copper and \$13 gold per ton. Has gasoline power. Idle since circa 1905.

**ALMA GOLD MINING CO.**

Office: Idaho Springs, Clear Creek Co., Colo. Theo. Mixsell, manager. Ores carry gold, silver and copper. Has steam power.

**ALMA MAY COPPER CO.**

Office: care of Silas H. Jenkins, general manager, Chicago, Ills. Claude M. Smith, second vice-president; LeRoy Pierce, secretary; preceding officers, Louis Auerbach, John C. Eads and Joe L. Ebner, directors. Organized Apr. 19, 1906, under laws of Arizona, with capitalization \$1,500,000, shares \$1 par. Lands, 4 claims, area circa 60 acres, in the Medicine Bow Mountains, Albany county, Wyoming, showing a good gossan capping, opened by a 50' shaft.

**ALMA MINING & MILLING CO.**

Office: care of P. B. McCabe, Los Angeles, Cal. Letter returned unclaimed from former mine office, Canitas, Zacatecas, Mex. C. A. Heberlein, general manager. Organized 1903. Lands include the San Antonio, San Luis, Torrington and Rosario mines, showing ores carrying 15 to 150 oz. silver per ton, with appreciable copper values.

**ALMADO & TERITO CONSOLIDATED MINING CO.**

**MEXICO.**

Succeeded by Negociacion Minera de Clemente Ybarra.

**SOCIEDAD MINERA DE ALMANZORA.**

**SPAIN.**

Office and mine: care of Don Camilo Bilarge, agent, Javier Sanz, 4, Almeria, Spain. Property is sundry idle copper mines in Almeria.

**ALMEDA CONSOLIDATED MINES CO.**

**OREGON.**

Office: 207 Board of Trade, Portland, Ore. Mine office: Galice, Josephine Co., Ore. O. M. Crouch, president; L. B. Simons, vice-president; R. C. Kinney, secretary and treasurer; John F. Wickham, general manager; P. B. Wickham, mine superintendent. Organized July 18, 1905, under laws of Oregon, with capitalization \$15,000,000, shares \$5 par, as successor of Almeda Mining Co. Annual meeting, second Tuesday in December. Lands, 40 claims, area 800 acres, well timbered, on the Rogue river, showing 3 large and well defined contact deposits between altered diorite and slate, estimated by company to average 200' width and said to be traceable 2,300', showing mainly chalcopyrite, giving average assays of 3.5% copper, 3 oz. silver and \$3.50 gold per ton. Development is by tunnels of 250', 160', 280', 450', 150' and 45', with 2,800' of workings, estimated to show 800,000 tons of ore. Property was worked to slight depth for free gold, circa 1860-1870. Equipment includes 6 mine buildings and a 15,000' sawmill. A smelter, building 1908, by the Willamette Iron & Steel Co., will have a 100-ton water-jacket blast-furnace. Property is considered promising.

**ALMEDA MINING CO.**

**OREGON.**

Dead. Succeeded July 18, 1905, by Almeda Consolidated Mines Co. Formerly at Galice, Josephine Co., Ore.

**SOCIEDAD MINERA EL ALMENDRAL.****CHILE.**

Office: Valparaiso, Chile. Mine office: Coquimbo, Chile. Organized Jan. 5, 1906, under laws of Chile, with capitalization 1,000,000 pesos, shares 50 pesos par.

**ALMERIA QUICKSILVER & COPPER CO., LTD.****SPAIN.**

Dead. Liquidated, voluntarily, 1906. Formerly at Berja, Almeria, Spain.

**COMPANIA MINAS DE ALMOLOYA, S. A.****MEXICO.**

Is the Mexican incorporation of the Almoloya Mining Co.  
**ALMOLOYA MINING CO.**

**MEXICO.**

Office: 60 Wall St., New York, N. Y. Mine office: Baca, Ramal de Parral, Chihuahua, Mex. Nils O. Bagge, president, I. B. Newton, secretary; W. C. Paterson, treasurer; D. W. Shanks, general manager; D. C. Joslyn, mine superintendent. Los Angeles Trust Co. and New York Trust Co., registrars. Organized 1903, under laws of Arizona, with capitalization \$2,000,000, shares \$1 par, in \$800,000 preferred stock, at 10%, non-cumulative, and \$1,200,000 common stock. Lands, 270 pertenencias, area 730 acres, also a 100-acre mill-site, with total holdings of circa 1,000 acres, in the Allende district, about 4 miles from the railroad station at Baca. The Sierra de Almoloya is an isolated mountain range, about nine miles long, formation being limestone of Cretaceous age, with two eruptive intrusions. Property adjoins the well-known Cigarrero mine, which shows four ore bodies of good width. Development is by shafts of 68', 140', 270', 350', and 700', and by tunnels of 180', 360', 1,320' and 1,600', with a total of about 6,400' of openings. Property has gasoline, electric, and pneumatic power, with a 60-h. p. producer gas-plant for drills. Employs circa 90 men.

**ALPHA COPPER MINING CO., N. L.****AUSTRALIA.**

Mine office: Cobar, Robinson Co., N. S. W., Australia. Organized 1907, with capitalization £1,000, shares £1 par.

**ALPHA MINING CO.****ALASKA.**

Office: Grand Rapids, Mich. Mine office: Dolomi, Prince of Wales Island, Alaska. F. L. Loomis, superintendent. Lands, 3 claims, showing a 5' ore body traceable circa 2,500', giving assays of 2.5 to 7% copper and \$3 to \$20 gold per ton.

**ALSACIA DEVELOPMENT CO.****MEXICO.**

Dead. Reorganized, 1905, as Alsacia Mining Co. Formerly at Fronteras, Arizpe, Sonora, Mex.

**ALSACIA MINING CO.****MEXICO.**

Office: care of Chas. F. Wrenn, secretary and general manager, Bisbee, Ariz. Mine office: Fronteras, Arizpe, Sonora, Mex. R. L. Whaley, president; John Hermann, engineer. Lands, 23 miles east of La Cananea, in the Ajo Mountains, are opened by a 400' shaft. The 350' level shows argentiferous copper ores giving average assay values of about \$25 per ton. Machinery includes a hoist good for 1,000'. Idle.

**ALTA CENTRAL COPPER CO.****ARIZONA.**

Office: 506 Citizens National Bank Bldg., Los Angeles, Cal. Mine office: Florence, Pinal Co., Ariz. Julian P. Jones, president; A. R. Hueth, vice-president and secretary; Citizens National Bank of Los Angeles, treasurer; Col. G. W. Griffey, mine superintendent. Organized Apr. 3, 1907, under laws of Arizona, with capitalization \$500,000, shares \$1 par. Lands, 7 claims, area circa 125 acres, carrying about one-half mile of the strike of a system of 5 fissure veins, having a north and south trend, in a width of about one mile, passing through Mineral Hill. The Alta Mining & Smelting Co. lies to the north, and the Oklahoma to the south. Country rock is Pinal schist, intruded by porphyry dikes, the 5 fissure veins cutting the schist unconformably with strike or dip, sometimes cutting the porphyry dikes and occasionally running

beside them. The veins outcrop 20' to 50' in width. Several prospect tunnels and shafts show 1' to 6' of ore carrying copper carbonates, oxides, and chalcocite, with gangue of quartz and manganeseous iron ore, carrying combined gold and silver values of \$1 to \$14 per ton. Geological conditions are markedly similar to those at the Gibson and Live Oak mines, distant about 20 miles to the northeast. Company plans developing through a drift, to be run from the 400' level of the main shaft of the Alta Mining & Smelting Co.

**ALTA COALITION COPPER CO.****UTAH.**

Office: care of N. Y. Stringham, secretary, Salt Lake City, Utah. Mine office: Brighton, Salt Lake Co., Utah. F. R. Snow, president; B. F. Grant, vice-president. Organized, early 1907, to develop a group of claims in the Big Cottonwood district.

**ALTA COPPER CO.****MONTANA.**

Mine office: Jefferson, Corbin Co., Mont. Was promoted by Marcus L. Hewett, with capitalization \$10,000,000, shares, \$10 par. Lands include the Alta mine, supposed to carry the continuation of the ore body in the Bertha claim of the Boston & Corbin, also 700 acres of placer ground and sundry water rights. The old Alta mine has a 1,600' incline shaft, and a new shaft is planned. Has a concentrator.

**ALTA COPPER MINING CO.****IDAHO.**

Mine office: Ketchum, Blaine Co., Idaho. Lands, 5 quartz claims and 8 placer claims, in Cain Cañon, near the base of Mount Hindman, 18 miles from Ketchum, opened on the American claim by a 150' tunnel cutting a 7' vein.

**ALTA CROWN COPPER CO.****CALIFORNIA.**

Office: 10 Howard St., Spokane, Wash. Jas. F. Marrs, president; Frank Liddell, vice-president; G. Major Taber, secretary and treasurer. Organized under laws of Arizona, with capitalization \$2,000,000, shares \$1 par. Lands, 10 claims, area 200 acres, in the Bullion district of Inyo county, California. According to prospectus of this company, the predominant rock form is a white crystalline limestone-granite, with intrusive dikes of porphyry with greenstone carrying "amygogules" of copper pyrite, which certainly is a most unusual and decidedly interesting formation. Has shafts of 40' and 110', with several short tunnels, showing azurite, malachite, chalcocite, bornite and chalcopyrite, assaying 12 to 32% copper, from 4 to 15 oz. silver and from a trace to \$8.20 gold per ton. Smelter returns have given 18 to 20.5% copper, 9 to 10 oz. silver and 92 cents to \$11.66 gold per ton.

**ALTA & HECLA MINING & MILLING CO.****UTAH.**

Office: 210 Brooks Arcade Bldg., Salt Lake City, Utah. Mine office: Alta, Salt Lake Co., Utah. Employs 14 men. H. Bamberger, president; S. Golden, vice-president; Geo. H. Watson, secretary, treasurer and general manager; preceding officers, C. H. Gabrielson and A. J. Byron, directors; A. C. Newell, superintendent. Organized May 22, 1906, under laws of Utah, with capitalization \$150,000, shares 25 cents par. Lands, 14 claims, area 250 acres, partly patented, also a 10-acre millsite, in the Little Cottonwood district, showing 6 fissure veins and contact deposits, of which 3 have been opened, by the 900' Scott tunnel, 160' Never Sweat tunnel, and an 80' crosscut tunnel, mine having 1,620' of workings, estimated to show 10,000 tons of ore, veins averaging 7' width, and said by company to average 3% copper, 26% lead, 8% zinc, 22 oz. silver and \$2.40 gold per ton. Has several mine buildings and plans continuing development.

**ALTA-IDAHO GOLD & COPPER MINING CO.****IDAHO.**

Office: care of John M. Nuss, secretary, Nescopek, Pa. Mine office: Pardee, Idaho Co., Idaho. J. B. Nuss, president; Geo. M. Snyder, vice-president and general manager. Organized December, 1902, under laws of Delaware, with capitalization \$1,000,000, shares \$1 par. Lands, 11 claims, area 209 acres,

also a 5-acre smelter-site, in the Lolo district. Development is by sundry test-pits, deepest 35', and three tunnels, longest 1,500', showing stringers of melanite, azurite, chalcocite, bornite and chalcopyrite.

#### **ALTA MINING & MILLING CO.**

**WYOMING.**

Office: 490 Quincy Bldg., Chicago, Ills. Mine office: Lusk, Converse Co., Wyo. P. C. Conley, secretary and treasurer. Property is the Rawhide Butte group. Idle.

#### **ALTA MINING & SMELTING CO.**

**ARIZONA.**

Office: 514 Delta Bldg., Los Angeles, Cal. Mine office: Florence, Pinal Co., Ariz. L. H. Sherman, president; Col. G. W. Griffey, vice-president and general manager; J. C. Ferrall, secretary and treasurer. Organized Sept. 8, 1905, under laws of Arizona, with capitalization \$5,000,000, shares \$1 par. Annual meeting, first Tuesday in September. Lands, 25 claims, area 470 acres, also a 200-acre ranch, in the Mineral Hill district, near the Lake Superior & Arizona, circa 16 miles east of Florence. Lands show veins in schist and contact deposits between schist and porphyritic rock, ranging 5' to 50' in width, opened by shafts of 96', 127' and 150', with about 3,000' of workings, showing ore assaying 2 to 57% copper, with gold and silver values, also a lead vein showing ore assaying 2 to 57% lead, 4 to 15 oz. silver and 80 cents to \$14 gold per ton. Has steam power, with hoist good for 1,000', a 4-drill Leyner air-compressor and 9 mine buildings. Company plans continuous development along sensible lines.

#### **MINA ALTAMIRA.**

**CHILE.**

Mine office: San Lorenzo, Combarbalá, Coquimbo, Chile. Jerónimo Tapia, owner and manager. Property is 18 leagues from a railroad station, with 20 pesos freight charges per metric ton. Mine shows a vein of about one meter average width, developed to depth of 260 meters. In 1903 production was 122 metric tons of 22.5% copper ore, made by 27 men.

#### **ALTAMIRA MINING CO.**

**MEXICO.**

Office: care of W. W. Mathews, president, Etztlán, Jalisco, Mex. Mine office: Ahualulco, Jalisco, Mex. R. R. Landrum, superintendent. Property is said to be controlled, through stock ownership, by the Jalisco Mining Development Co.

#### **ALTA MIZPAH COPPER & GOLD MINING CO.**

**UTAH.**

Letter returned unclaimed from firm office, care of C. J. Jenkins, Salt Lake City, Utah. Mine office: Alta, Salt Lake Co., Utah. Organized 1907, to develop property near Alta, which is said to show considerable ore of milling grade.

#### **ALTAMONT MILLING CO.**

**NEW MEXICO.**

Office: Altamont, Ills. Mine office: Jarilla, Otero Co., N. M. Capt. L. H. Williams, president. Lands include the Cuprite mine, having a 140' shaft, said to show 12' of medium grade chalcopyrite, with limestone gangue. A small smelter shipment from the 80' level gave net returns of \$8 per ton.

#### **ALTA-PERUVIAN MINING & MILLING CO.**

**UTAH.**

Office: Springville, Utah. Letter returned unclaimed from former mine office, Alta, Salt Lake Co., Utah. F. J. McAuliffe, president; T. R. Kelley, secretary and treasurer. Organized 1904 with capitalization \$200,000, shares \$1 par. Lands, 4 claims, in the Little Cottonwood district. Idle.

#### **ALTA-QUINCY MINE.**

**UTAH.**

Dead. Merged, 1906, in South Columbus Mining Co. Formerly at Alta, Salt Lake Co., Utah. Described Vol. VI.

#### **ALTA-ST. LOUIS MINE.**

**UTAH.**

Letter returned unclaimed from former mine office, Alta, Salt Lake Co., Utah. W. M. J. Craig, manager, at last accounts. Mine has a vein between

limestone and shale carrying a 12" to 18" paystreak assaying 15 to 25% copper and 15 to 240 oz. silver per ton, with small gold values.

**ALTA-SUPERIOR MINING CO.**

UTAH.

Mine office: Alta, Salt Lake Co., Utah. Has a 300' tunnel, and at last accounts was in litigation with the South Columbus and Columbus Consolidated over the projected 4,000' drainage tunnel started on the Snow Bird claim of the Alta-Superior.

**ALTATA MINING CO.**

ARIZONA.

Office: 145 La Salle St., Chicago, Ills. Mine office: Chloride, Mohave Co., Ariz. J. F. McBride, president and general manager; L. L. Funk, vice-president; W. A. Barr, secretary and treasurer; C. H. Dryden, superintendent. Bonds, \$25,000 authorized; \$12,000 issued. Mine has a 200' shaft, showing silver-lead and auriferous copper ore. Has steam power.

**ALTA-ZOANNI MINING CO.**

NEVADA.

Mine office: Hamilton, White Pine Co., Nev. Roy W. Schenk, president and general manager; M. T. Collins, vice-president; G. A. McElery, secretary and treasurer. Lands are near the peak of White Pine Mountain.

**KÖNIGLICHES HÜTTENAMT ALTENAU.**

GERMANY.

Office and works: Altenau im Harz, Germany. Is a custom smelting plant, treating ore of copper and other metals from the mines of the Hartz. Has an electrolytic refinery, with daily capacity of 1,600 to 2,000 lbs. of cathodes.

**ALTENS KOBBERGRUBER.**

NORWAY.

Office: care of Sulitjelma Aktiebolag, Helsingborg, Sweden. Mine office: Kifjord, Finmarken, Norway. Lord-Lieutenant G. Tornerhjem, chairman; Consul N. Persson, vice-chairman; C. Ingesson, secretary; A. Quale, general manager; B. G. G. Tiberg, mine superintendent; Ch. Rosenquist, smelter superintendent; Sverre Falch, mill superintendent and chemist. Lands, 339 claims, also a 60-acre millsite and circa 2,000 acres miscellaneous lands. This is the northernmost copper mine in the world, lying near North Cape, in 70° north latitude. Post-silurian schists and slates have been penetrated by dioritic greenstone, showing about 75 ore bodies in diorite and also as impregnations in dolomitic strata. The veins have a generally NNW. strike, fissures in diorite dipping at about 30° and dolomitic layers at about 60°. About 20 strong veins and many small ones are under development, former ranging 1 to 3 metres in average width, and traceable 50 to 2,000 metres. The various veins average about 1.25% copper, the metal occurring as chalcocite, bornite and chalcopyrite disseminated in pyrite.

Development is by numerous tunnels, of which the Sture is 650 metres and the Jernmalm 415 metres in length, and by 6 shafts, deepest 100 metres. The mine has several miles of workings, exposing fully 600,000 tons of ore, with circa 100,000 tons blocked out for stoping. Mine, opened 1825 and closed 1878, was reopened, 1895, by present owner.

Equipment includes 120 hydraulic h.p., 100 electric h.p., 25 steam h.p. and 15 gasoline h.p. There are 4 small hoists, 2 Sullivan diamond drills and an electric light plant. Buildings include a machine shop of 220 square metres area, a 40-metre carpenter shop and 170 buildings of all classes, including dwellings.

The 100-ton concentrator, of 1,716 square metres area, has 2 Blake crushers, 4 Humboldt centrifugal crushers, 2 rolls, 11 jigs, 16 Lüborg vanners and 4 large and 8 small spitzkasten. The smelter has a 20-ton water-jacket blast furnace, smelting to a 20% matte, which by a second fusion is brought up to 60% copper tenor and shipped to Helsingborg for refining.

The mine is 300 miles from a railroad, but only 300 feet from the sea. The company owns a steamer and a gasoline launch. A school is maintained. Production, 1907, was 25,000 metric tons of ore yielding 1,050 tons of matte.

and 600 tons of 48% sulphur ore, producing circa 625,000 lbs. fine copper. The property has a strong and progressive management.

#### **GEWERKSCHAFT ALTFALTER.**

**GERMANY.**

Mine office: Altwalnau, Hirschberg-Grosselmerode, Hessen-Nassau, Germany. Has copper-lead ores, with one shaft, employing circa 25 men.

#### **ALTO COPPER CO.**

**ARIZONA.**

Office: 43 Exchange Pl., New York. Mine office: Patagonia, Santa Cruz Co., Arizona. Geo. A. Beaton, president; Geo. O. Earhart, secretary; Geo. J. Lockley, treasurer; J. N. Curtis, general manager. Organized Apr. 4, 1905, under laws of Maine, with capitalization \$3,000,000, shares \$100 par. Bonds, \$750,000, at 7%. Annual meeting, first Tuesday in April. Lands, 21 claims, area 420 acres, 8 miles from Patagonia, in the Santa Rita Mountains, near the Mexican border, developed by tunnels of 187' and 400' and by about 50 antiqua shafts, of 30' to 70', and by 3 new shafts of 73', 100', and 150', with circa 3,000' of underground openings, estimated by the company to show 500,000 tons of ore blocked out for stoping, which is much too high. Ore is mainly chalcopyrite, associated with galena and sphalerite, giving assays of 8 to 12% copper, 10 to 20% lead, 10 to 30 oz. silver and \$3 to \$20 gold per ton. Has steam power with 3 hoists, good for 600' each, and an 8-drill Sullivan air-compressor. Has a 20x40' machine shop, smithy, and about 25 miscellaneous buildings, including dwellings. The ore, from its complicated nature, will prove refractory in reduction. Presumably idle.

#### **ALTO MINING CO.**

**ARIZONA.**

Dead. Lands sold, January, 1908, to Leontine Consolidated Mining Co. Formerly at Poland, Yavapai Co., Ariz.

#### **ALVERDSKI MINE.**

**RUSSIA.**

Owned by Compagnie Française des Mines de Cuivre d'Akhtala.

#### **ALYCE MINERAL CO.**

**GEORGIA.**

Office: care of E. C. Gothard, secretary and treasurer, Knoxville, Tenn. J. G. Sterchi, president; Joe P. Davis, vice-president; preceding officers, W. D. Haun, Gus N. Miller and N. S. King, directors. Lands are several thousand acres in Murray county, Georgia, about 30 miles east of the Ducktown mines of Tennessee, showing ores giving assay values in lead, copper, silver and gold.

#### **AMADOR CONSOLIDATED MINING & DEVELOPMENT CO. MONTANA.**

Office: 507-172 Washington St., Chicago, Ills. Mine office: Iron Mountain, Missoula Co., Mont. William Surman, president; Geo. Lill, vice-president; D. E. McKinnon, secretary and general manager; P. F. Smith, receiver. Organized March 16, 1903, under laws of Arizona, with capitalization \$10,000,000, shares \$5 par. Property is the entire stock issue of the Amador Copper & Gold Mining & Milling Co.

Mine is described under title of owner, the Amador Copper & Gold Mining & Milling Co., and smelter under name of owner, the Amador Smelting Co., the two latter named corporations being the underlying companies, while the Amador Consolidated was the stock jobbing corporation. McKinnon, who was practically the entire company, and has been accused of crookedness in other deals, is said to have sold about \$350,000 of stock of this company. Mrs. L. M. McKinnon, wife of the promoter, is endeavoring to secure \$25,000 from the wreck, on two promissory notes, which seems adding insult to injury. Principal production of the mine apparently was distributed as samples, some of which reached the Copper Handbook, but did not secure for the company the favorable rating that it implored and demanded, by turns. Property considered worthless, and present equipment valuable only for scrap.

#### **AMADOR COPPER & GOLD MINING & MILLING CO.**

**MONTANA.**

Office: 507-172 Washington St., Chicago, Ills. Mine office: Iron Mountain, Missoula Co., Mont. D. E. McKinnon, secretary and general manager. Organ-

ized under laws of Arizona, with capitalization \$2,000,000, shares \$1 par. Entire stock issue is held by Amador Consolidated Mining & Development Co., which is hopelessly bankrupt. Lands, 18 claims, area 355 acres, also 2 groups of patented placer gold claims, area 180 acres, and 450 acres miscellaneous lands, claimed to show 5 fissure veins in slate and quartzite. The alleged mine was described at length in Vol. VI, under title Amador Consolidated Mining & Development Co., with explanation that information as to large ore bodies rested solely on the statements of the company. Mine has a 600' vertical shaft, with about one mile of workings, and was claimed by McKinnon to have \$10,000,000 worth of ore blocked out, which was a lie. As a matter of fact, the mine shows a small chute of fair grade ore on the 200' level, ore occurring in small bunches, very irregularly, with calcite gangue, in black slate. Mine has a 2-mile flume and pipe-line, delivering water under a 310' head. Has steam power, with air-compressor, two hoists, sawmill, about 15 mine buildings and a 10-mile railroad, built at a cost of circa \$160,000. Production was five carloads of ore, which did not pay for treating charges.

**AMADOR SMELTING CO.****MONTANA.**

Office: 507-172 Washington St., Chicago, Ills. Mine office: Amador, Missoula Co., Mont. D. E. McKinnon, general manager. Is controlled, through stock ownership, by Amador Consolidated Mining & Development Co., which is bankrupt. Property is a 60-ton pyritic smelter, which treated, from the Amador mine, five carloads of ore that did not pay treatment charges. Smelter considered valuable mainly for junk.

**AMALGAMATED COPPER CO.****MONTANA.**

Office: 42 Broadway, New York. Henry H. Rogers, president; Benj. B. Thayer, assistant to the president; F. P. Addicks, vice-president; John D. Ryan, managing director; preceding officers, Albert C. Burrage, W. M. Rockefeller, H. H. Rogers, Jr., Fred P. Olcott, Anson R. Flower, John Bushnell and Geo. H. Church, directors; A. H. Melin, secretary and treasurer; John Gillie, general superintendent. Organized Apr. 27, 1899, under laws of New Jersey, with capitalization \$75,000,000, increased, 1901, to \$155,000,000, shares \$100 par. Central Trust Company of New York and National Shawmut Bank of Boston, registrars. National City Bank of New York, and Kidder, Peabody & Co., of Boston, transfer agents. Annual meeting, first Monday in June.

The Amalgamated is a securities holding corporation, not a mining company, with assets consisting mainly of share interests in sundry subsidiary companies. Stock of the following named corporations is entirely owned by the Amalgamated, with the exception of the few founders' shares, required to be in the names of directors: Washoe Copper Co., capitalization \$5,000,000; Colorado Smelting & Mining Co., capitalization \$2,500,000; Diamond Coal & Coke Co., capitalization \$1,500,000; Big Blackfoot Milling Co., capitalization \$700,000. In the following named corporations the Amalgamated holds from practically the entire issue, as in the case of the Boston & Montana, to a majority interest only, as in the Anaconda: Boston & Montana Consolidated Copper & Silver Mining Co., capitalization \$3,750,000; Parrot Silver & Copper Co., capitalization \$3,000,000; Butte & Boston Consolidated Mining Co., capitalization \$2,000,000; Anaconda Copper Mining Co., capitalization \$30,000,000. The Amalgamated also is credited with owning a controlling interest in the United Metals Selling Co., but in all likelihood the control is held by Amalgamated officers, rather than by the company. Miscellaneous holdings of the Amalgamated include 27,000 acres of timber lands; a large stock interest in the Butte, Anaconda & Pacific R. R. Co.; the Republic Sampling Works, at Butte; a sawmill at Ravalli, Hamilton county, Montana; hotels at Anaconda and Hamilton; business blocks in Butte and Anaconda, and several daily newspapers. The company has about 21,000 shareholders.

Of the total capitalization of \$155,000,000, the amount issued is \$153,887,900. Net income for fiscal year ending Apr. 30, 1907, was \$14,154,400, or 9.19% on the stock, and for year ending Apr. 30, 1908, was \$6,680,557, or 4.3%, at which time the surplus was \$12,008,823. The available resources of the company, however, are larger than shown by these figures, for the reason that the subsidiary corporations are exceptionally well fortified, both with cash reserves and quick assets. Among the assets of the company is a loan of \$7,200,000 made to the Washoe Copper Co., for building a smelter. Dividends have been as follows: 2% in 1899; 8% in 1900; 7½% in 1901; 2½% in 1902; 2% in 1903; 2% in 1904; 4½% in 1905; 6¾% in 1906; 7% in 1907; 2% in 1908, a total of 44½% for 10 years, an average of slightly under 4½% per annum.

The subsidiary mines and other enterprises of the Amalgamated employ about 13,000 men, mainly at Butte, Anaconda and Great Falls, Montana, with an annual payroll of approximately \$15,000,000. A 5-year contract with employes was made, early 1907, under which wages were automatically reduced at the time of the depression in the copper trade, but will be automatically raised when copper again reaches a high price. Labor conditions are harmonious and satisfactory to both employer and employees.

The Amalgamated was organized in 1899 with the intention of controlling the copper industry of the world, but the debacle of 1901 proved that the Amalgamated was a long ways from being in control of the copper industry of the world, or even of the United States, though much the largest single factor in that industry. The material progress made by the Amalgamated has been especially notable since 1904, when John D. Ryan became managing director. The production of copper by companies owned or controlled by the Amalgamated was about 252,000,000 lbs. in 1904; 268,000,000 lbs. in 1905, and circa 275,000,000 lbs. in 1906, the direct share of the Amalgamated in the production of 1906 being about 225,000,000 lbs., while for 1907 the Amalgamated share of copper output by companies owned or controlled was about 175,000,000 lbs., out of a total of about 215,000,000 lbs. produced. This copper was secured at an average cost of probably about 10.5 cents per pound, but somewhat cheaper copper should be made in the future, by reason of numerous economies and greatly improved conditions. The subsidiary corporations are in good condition financially, and their mines, with few exceptions, are in fine shape physically, the Anaconda and Boston & Montana being especially notable in the latter regard. The long and disastrous litigation with F. Augustus Heinze was settled in 1906, through the interposition of Mr. Ryan, by the formation of the Butte Coalition Mining Co., the organization of which brought relief from the intolerable conditions that had prevailed for years. The litigation in which the company was concerned has been cleared off the dockets of the courts, and the Amalgamated, instead of being engaged in more lawsuits than any other great company, now has fewer suits in the courts than almost any other large corporation of the United States. Mr. Ryan has proven himself an organizer and harmonizer of the highest ability, and in the course of a few years has secured the hearty good-will of almost everyone connected with the copper industry of Montana, either as an employe or competitor of the Amalgamated. The company again followed, in 1907, its mistaken policy of "holding the umbrella" over the copper market for the benefit of its competitors, thereby repeating, though on a less serious scale, the mistake of 1901. The financial position of the company is strong, the general management has learned a great deal about the copper industry in a decade, and the local management in Butte is as effective and as good as that enjoyed by any copper property of the world.

#### **AMALGAMATED COPPER MINING CO. UTAH.**

Office: care of Dr. C. E. Watkins, Boston, Mass. Letter returned unclaimed from former mine office, Tremonton, Box Elder Co., Utah.

**AMALGAMATED COPPER MINING & EXTRACTION CO. WYOMING.**

Office: 1515 Larimer St., Denver, Colo. Mine office: Hecla, Laramie Co., Wyo. Louis Williams, president; Alonzo Hastings, vice-president; Henry Schwartz, secretary and treasurer. Organized under laws of Wyoming, with capitalization \$1,000,000, shares 50 cents par. Lands, 11 claims, area 220 acres, in the Silver Crown district, 2 miles from the Union Pacific railway and 23 miles from Cheyenne, having about 700' of workings, showing ore giving fair assays in copper. Company is in debt and property idle.

**AMALGAMATED GOLD & COPPER CO. ARIZONA.**

Dead. A swindle, promoted by Douglas, Lacey & Co., of 66 Broadway, New York, N. Y. See Douglas, Lacey & Co. Formerly at Huron, Yavapai Co., Ariz. Fully described Vol. VI.

**AMALGAMATED GREENWATER COPPER CO. CALIFORNIA.**

Office: 501-1524 Chestnut St., Philadelphia, Pa. Letter returned unclaimed from former mine office, Greenwater, Inyo Co., Cal. Was promoted, April, 1907, by Edward H. Worne & Co., who were organizing a syndicate, with intention of incorporating later, on 4 claims, said to be in the Greenwater district. Apparently somewhat diaphanous.

**AMALGAMATED METAL & EXPLORATION CO. ARIZONA.**

Letter returned unclaimed from mine office, Jerome, Yavapai Co., Ariz. J. M. Layman, secretary and general manager; Rudolph Rothermel, superintendent. Lands are said to include coal and oil areas in Utah, metalliferous claims in northern California and Oregon, and the Hogback group of 8 claims, adjoining the Verde Queen on the southwest and touching the Florencia claim of the United Verde. The Hogback has a 300' tunnel and a 105' shaft, said to show a little high grade ore. Company said to plan sinking a two-compartment shaft.

**AMALGAMATED NEVADA MINES & POWER CO. NEVADA.**

Office: 1131-52 Broadway, New York, N. Y. Operating office: Salt Lake City, Utah. Mine office: Black Horse, White Pine Co., Ely, Nev. Wm. Johnson, president; John I. Mathias, vice-president; Merrill A. Smith, secretary; Chas. N. Prouty, treasurer; Grant Snyder, general manager. Capitalization \$10,000,000, shares \$5 par. International Trust Co., Boston, transfer agent. Lands, 56 claims, also 1,000 acres of placer ground, 5,000 acres of ranch lands and water rights for the district, circa 35 miles east of Ely. Assays show values mainly in gold and silver. Is said to plan a 20-stamp custom mill.

**GEWERKSCHAFT VEREIN AMALIA-UND KNOTTENBEG. GERMANY.**

Letter returned unclaimed from former mine office, Mornshausen an der Dautphe, Hessen-Nassau, Germany. Adolph Freund, president. Capitalization, 1,400,000 marks. Has eupriferous silver-lead ores, opened by one shaft.

**AMARILLO MINING CO. NEW MEXICO.**

Office: care of Guy W. Holbrook, president, Lowell, Mass. Mine office: Jarilla, Otero Co., N. M. Dr. Warren W. C. Spencer, secretary. Lands, 13 claims, having about 5,000' of openings.

**AMATOLA COPPER CO. TRANSVAAL.**

Mine office: Zoutpansberg, Transvaal. Has copper claims near the Messina Extension and Caledon mines, in the Zoutpansberg district.

**AMAZON-BUTTE COPPER CO. MONTANA.**

Office and mine: Forbis Blk., Butte, Silver Bow Co., Mont. A. H. Barrett, president; Jos. Lynch, vice-president; Chas. Mattison, secretary and treasurer; John Hewett, superintendent. Organized circa November, 1906, under laws of Montana, with capitalization \$2,500,000, shares \$5 par. Owners of lands took \$1,500,000 in stock in full payment for property, giving them control of company. Stock was made assessable later, and a small assessment was levied October, 1907. Lands, 9 claims, 7 fractional, area 128 acres,

patented, in 2 groups, lying circa 2 miles east of the center of Butte and separated by the Ida-Montana, Butte & Summit Valley and Calumet & Butte. Lands include the Amazon, Gaynor and West Altoona claims at the mouth of Horse Cañon, in the southeastern part of Butte, about a quarter mile south of the Bullwhacker and carrying more than 1,000' of the north and south fault veins of the latter. Lands also carry about 1,600' of the east and west vein of the Ida-Montana and 3 other veins, 2 veins being of fair promise, the Amazon and Altoona claims giving a good showing from slight development. Has a 436' two-compartment shaft, with crosscuts and drifts on the 400' level. In 1907 nine sets of leasers were working the Bullwhacker vein on the Amazon claim, and shipping about 50 tons of ore daily. Ore, as developed, is chalcopyrite, about 4' giving average assays of 7% copper. Equipment includes several permanent mine buildings, two 100-h. p. and one 250-h. p. boiler, 4-drill air compressor and hoist. Production was begun circa November, 1906, and shipments to end of July, 1907, were 1,835 tons of ore, giving average returns of 2.72% copper and 0.01% silver, without gold values.

**AMAZON COPPER MINING CO.****CALIFORNIA.**

Letters returned unclaimed from former office, 203 Fay Bldg., Los Angeles, Cal., and former mine office, Victorville, San Bernardino Co., Cal. C. H. Green, secretary. Capitalization, \$1,000,000. Lands, 12 claims, area 240 acres, 5 miles from Victorville, in the Copper Mountain district, showing low grade ore giving assays of 4.5 to 21.5% copper, with small gold and silver values.

**AMAZON GOLD CO.****MEXICO.**

Office: 107 Commercial Bldg., St. Louis, Mo. Mine office: Chacalá, Tamaulipas, Durango, Mex. Jas. T. Dugan, president; Edward B. Sowers, manager; J. S. Wilkinson, superintendent. Mine, known as the Candelaria, has auriferous, argentiferous and bismuthiferous copper ores. Equipment includes a Bryan mill, 6-ton chlorination plant and 100-ton smelter. Employed circa 100 men, at last accounts.

**AMAZON GOLD MINING CO.****MEXICO.**

Mine office: Culiacán, Sinaloa, Mex. Has gold, silver and copper ores, with steam power, employing circa 40 men, at last accounts.

**AMERICA-BRITANNIA MINING CO.****WASHINGTON.**

Dead. Formerly at Baring, King Co., Wash.

**AMERICAN & CANADIAN MINING CO.****BRITISH COLUMBIA.**

Office: care of M. G. Scribner, general manager, Oakland, Cal. Mine office: Tyee, Vancouver Island, B. C. Organized 1907.

**AMERICAN CONSOLIDATED COPPER CO.****MONTANA.**

Office: 60 State St., Boston, Mass. Mine office: Butte, Silver Bow Co., Mont. Larkin T. Trull, president; Hiram M. Burton, vice-president; Timothy E. Hopkins, treasurer; David W. Snow, secretary; Jos. A. Corm, manager. Organized Jan. 12, 1906, under laws of Maine, with capitalization \$65,000,000, later increased to \$150,000,000, shares \$100 par. Was organized to merge the copper lands of the Davis and Daly estates, later organized as the Davis-Daly Estates Copper Co., the Balaklala, and various other properties. Capitalization is ridiculously high and company apparently is abortive. Is regarded unfavorably.

**AMERICAN CONSOLIDATED COPPER CO.****NEW MEXICO.**

Dead. Formerly at Santa Fé, Santa Fé Co., N. M. Fully described Vol. V.

**AMERICAN CONSOLIDATED COPPER CO.****UTAH.**

Offices: First National Bank Bldg., Chicago, Ills., and McCornick Bank Bldg., Salt Lake City, Utah. Mine office: Brighton, Salt Lake Co., Utah. John C. Barnard, president; E. J. Darst, vice-president; Wm. Darst, secretary and treasurer; preceding officers, John Branborg and Jas. W. Sibley, directors.

Organized 1907, under laws of Utah, with capitalization \$500,000, shares \$1 par, to develop property in the Big Cottonwood district.

#### **AMERICAN CONSOLIDATED MINES CO.**

#### **NEW MEXICO.**

Office: 23 Postoffice Bldg., Colorado Springs, Colo. Mine office: Twinning, Taos Co., N. M. J. Shumaker, president; C. D. Weimer, secretary and treasurer; O. H. Stanley, general manager; E. H. Souther, superintendent. Organized November, 1901, under laws of New Mexico, with capitalization \$3,000,000, shares \$1 par. Lands, 19 claims, area 380 acres, also a 5-acre mill-site and a half interest in 380 acres of timber lands, in the Rio Hondo and Lake Fork districts. Has secured assays of 3% copper and \$16 gold per ton, from ores cut in 3 tunnels, longest 510'. Apparently has large ore bodies of low grade. Presumably idle.

#### **AMERICAN CONSOLIDATED MINING CO.**

Dead. A swindling concern of this title operated, in 1906, from Chicago, giving no street number. Ostensible sponsors were A. Batchelder and Dr. S. Blott. Company offered a guaranteed 10% investment and now is unfindable.

#### **AMERICAN COPPER CO.**

#### **ARIZONA.**

Mine office: Globe, Gila Co., Ariz. Samuel L. Gibson, president; J. F. Coughlin, vice-president; John L. Alexander, secretary; Wm. Ryan, treasurer. Organized 1905. Lands, circa 3 miles from the Gibson, have 2 shafts, deepest 165', showing chalcocite and argentiferous tetrahedrite, latter assaying up to 70 oz. silver per ton.

#### **AMERICAN COPPER CO.**

#### **ARIZONA.**

Dead. Succeeded, 1905, by American Copper & Gold Co. Formerly at Humboldt, Yavapai Co., Ariz. Fully described Vol. VI.

#### **AMERICAN COPPER CO.**

#### **WYOMING.**

Office: 327 Pine St., Williamsport, Pa. Mine office: Holmes, Albany Co., Wyo. Thos. M. B. Hicks, president and treasurer; Otto C. Clinger, secretary; LeRoy Scholl, consulting engineer; P. F. Kelly, superintendent. Organized Aug. 23, 1902, under laws of Wyoming, with capitalization \$1,000,000, shares \$1 par. Lands, 40 claims, area 800 acres, in the Douglas Creek division of the Encampment district, showing a fissure vein in granite, 20' wide at depth, and composed of three distinct layers, first being porphyritic, with width of 6' to 7' and carrying about 1.5% copper and \$7 gold per ton, with some covellite assaying 60% copper and \$20 gold per ton; second layer, of 6' to 7', is of jaspelite and diorite, carrying decomposed iron ore assaying \$20 to \$150 gold per ton; third layer, brecciated, carries oxide, carbonate and sulphide ores of copper, with quartz gangue. Has a 350' three-compartment main shaft, also shafts of 50', 60' and 160', with a total of about 1,800' of mine openings. Has a 100-h. p. steam plant with Norwalk air-compressor. Has about 15 mine buildings.

#### **AMERICAN COPPER & GOLD CO.**

#### **ARIZONA.**

Office: 73-99 Warren St., New York, N. Y. Mine office: Blanchard, Yavapai Co., Ariz. A. J. Runyan, president; N. C. Tabor, secretary and treasurer; J. J. Murray, manager. Is a reorganization of the American Copper Co. Lands, 20 claims, area 400 acres, including the Iron King mine, in the Big Bug district, having 7 shafts, 4 deepest 400', 410', 350' and 385', with about 1 mile of workings, claimed by old management to have blocked out for stopping 350,000 tons of \$10 ore, which estimate was excessive. Principal values are in gold and silver, with copper and lead as by-products. Has steam and electric power, a 12-stamp mill and 50-ton cyanide plant, with necessary mine buildings, dwellings, store and combination church and schoolhouse.

#### **AMERICAN COPPER MINING CO.**

#### **NEW JERSEY.**

Office: 20 Broad St., New York. Mine office: Somerville, Somerset Co., N. J. Col. Josiah C. Reiff, president; W. S. Chapman, secretary; Josiah Bond,

general manager. Organized 1885, under laws of New York, with capitalization \$500,000, shares \$1 par. Lands are mining rights to about 1,000 acres, and a 50-acre millsite owned in fee, on Watchung Mountain, circa 2½ miles from Somerville. Ore occurs as blanket veins between trap and shale, these having an average thickness of 2' and being traceable nearly 4 miles, carrying an estimated average of 2.3% copper, with small gold and silver values. The oxidized zone shows crysocalia nearest surface, succeeded by oxides and carbonates, with chalcocite at greater depth, succeeded at circa 700' depth by native copper that is both auriferous and argentiferous. The largest mass of native copper secured weighed about 100 lbs. Mine is opened by 3 inclines, of 155°, 450', and 1,300', and by a 500' crosscut drainage tunnel. Has steam power, with 30-h. p. hoist, 5-drill Rand air-compressor and drills, tramway and necessary mine buildings. The 50-ton concentrator, of wood and stone, has 2 rolls, screens, crushers and 2 Wilfley tables. Product, when mine is operated, is turned out as concentrates, shipped to smelters on New York harbor. Idle for some years.

#### **AMERICAN COPPER MINING CO.**

Dead. John Baker, former president and general manager, reports company dead. Location of property never learned.

#### **AMERICAN COPPER MINING CO.**

Dead. A stock-jobbing outfit, formerly at 40 Wall street, New York. Promoted, on wind, by Ralph M. Jacoby, and others of his ilk.

#### **AMERICAN COPPER & MINING CO.** NEW MEXICO.

Office: St. Joseph, Mo. Mine office: Brice, Otero Co., N. M. Jas. C. Sager, president; J. J. Metcalf, secretary. Capitalization \$1,000,000, shares \$1 par. Lands, 5 claims, area 100 acres, known as the Badger group, on Granite Mountain, 4 miles from Orogrande smelter, showing a 20' ore body and 4 smaller veins, opened by 5 shafts, deepest 140'. Has secured assays up to 12% copper and \$7.20 gold per ton.

#### **AMERICAN COPPER MINING & EXTRACTION CO.** COLORADO.

Letter returned unclaimed from former office, 623 St. James Bldg., New York, N. Y. Property was the Gardiner leaching process. Presumably dead.

#### **AMERICAN COPPER MINING & MILLING CO.** UTAH.

Dead. Formerly at Simpson Springs, Utah.

#### **AMERICAN COPPER MINING & SMELTING CO.** NEW MEXICO.

Dead. Was a swindle, promoted by J. R. Kerr & Co., formerly at 555-11 Broadway, New York.

#### **AMERICAN COPPER & SILVER CO.**

Office: 15 Exchange Place, Jersey City, N. J. Organized February, 1907, under laws of New Jersey, by Geo. Melville Boynton, John R. Turner and B. S. Mantz, with capitalization \$100,000. Location of lands, if any, unknown.

#### **AMERICAN DEVELOPMENT CO.** ARIZONA.

Dead. Merged, March, 1906, in American-Saginaw Development Co. Formerly at Bisbee, Cochise Co., Ariz.

#### **AMERICAN EAGLE COPPER MINING CO.** WYOMING.

Dead. Formerly at Encampment, Carbon Co., Wyo.

#### **AMERICAN EAGLE MINING CO.** CALIFORNIA.

Mine office: Needles, San Bernardino Co., Cal. H. H. Ahrens, superintendent. Lands are on Whipple Mountain, 10 miles west of the Colorado River and circa 40 miles south of Needles. Presumably idle.

#### **AMERICAN FLAG MINING CO.** UTAH.

Office: Salt Lake City, Utah. Mine office: Park City, Summit Co., Utah. Geo. H. Rotham, president; E. B. Palmer, secretary; John G. Rhodin, superintendent. Is said to plan a bond issue, not to exceed \$150,000, to raise funds for a mill. Mine is developed principally on the 400' to 1,100' levels, work

on the bottom levels, hampered by water, showing a considerable tonnage of \$15 to \$16 milling ore. Ores are said to carry an average of about 2% copper, 5% lead and up to 60 oz. silver and \$7.50 gold per ton. Has steam power. Unwatered mine, April, 1908.

**AMERICAN GOLD & COPPER CO.****ARIZONA.**

Office and mine: Globe, Gila Co., Ariz. O. W. Thompson, director. Organized June 20, 1907, under laws of Arizona, with capitalization \$500,000, shares \$1 par.

**AMERICAN GOLD & COPPER CO.****ARIZONA.**

Dead. Was merged, 1904, in the Poland-American Gold Mining & Milling Co. Formerly at Morristown, Maricopa Co., Ariz. Described Vol. VI.

**AMERICAN GOLD & COPPER CO.**

Office: 951 Tremont Bldg., Boston, Mass. Location of lands, if any, unknown.

**AMERICAN GOLD & COPPER CONSOLIDATED MINING CO. ARIZONA.**

A tentative reorganization, circa 1905, of the American Copper Co., of Yavapai county, Arizona. Apparently abortive.

**AMERICAN GOLD & COPPER MINING CO.****WYOMING.**

Dead. Formerly at Jelm, Albany Co., Wyo. Described Vol. VI.

**AMERICAN GOLD MINING CO.****COLORADO.**

Office: 304-411 Olive St., St. Louis, Mo. Mine office: Ouray, Ouray Co., Colo. Fully described Vol. VI.

**AMERICAN GOLD MINING COMPANY****NEW MEXICO.****OF NEW MEXICO.**

Letter returned unclaimed from former office, 312 Tacoma Bldg., Chicago, Ills. Mine office: Nogal, Lincoln Co., N. M. A. T. Anderson, president; John Monk, secretary; J. M. Rice, manager; M. D. Gaylord, superintendent. Lands include the American, Helen and Old Abe mines, carrying ores of copper, gold, silver and lead. Has steam and electric power, 50-stamp mill and 50-ton cyanide plant. In litigation several years. Planned resumption early 1908, but apparently remains idle.

**AMERICAN GULCH MINING CO.****UTAH.**

Office: 53 Tremont St., Boston, Mass. Mine office: Bingham Canyon, Salt Lake Co., Utah. Organized, 1906, by interests closely connected with the Utah-Apex, to build a 200-ton mill at Bingham. Control is owned jointly by the Utah-Apex Mining Co. and Utah Development Co., latter to furnish site and former the cash. Cannot be learned that any work has been done.

**AMERICAN METAL CO., LTD.****U. S. A. & MEXICO.**

Office: 52 Broadway, New York, N. Y. Mexican office: 3 Calle de San Augustin, Mexico, D. F. Also has branch offices in Denver and St. Louis. Company is American agent for Henry R. Merton & Co., Ltd., of London; Metallegesellschaft und Metallurgische Gesellschaft, of Frankfurt am Main; Societe le Nickel, of Paris, and Balbach Smelting & Refining Co., of Newark, N. J. Controls the Compania de Minerales y Metales, of Mexico. Is an extensive dealer in metals, largely copper.

**AMERICAN METALS CO.****NEW MEXICO.**

Letter returned unclaimed from former office, Las Cruces, N. M. Mine office: Organ, Donna Ana Co., N. M. Emil A. Franke, superintendent. Organized 1905, under laws of New Mexico, with capitalization \$1,000,000. Property is the Modoc mine, having a mill with 3 Wilfley tables and 2 vanners.

**AMERICAN-MEXICO MINING & DEVELOPING CO.****MEXICO.**

Office: Watertown, S. D. Mine office: Velardeña, Cuencamé, Durango, Mex. W. A. Merrifield, president; A. L. Selenberger, vice-president; John W. Martin, secretary; F. O. Smolt, general manager. Organized 1902, under laws of South

Dakota, with capitalization \$3,000,000, shares \$1 par. Company, in 1906, reported \$1,267,544 stock issued, and in 1908 reports \$857,550 stock issued. Has authorized \$50,000 bonds at 6%. Dividends paid, though unearned, circa \$387,500. Lands, 21 claims, area 110 hectares, with 49 hectares in millsites, and 800 hectares miscellaneous lands, including La Roca Negra, Tecolotes and Los Libres mines. La Roca Negra mine has a 400' shaft; Los Libres mine a 184' shaft and 34' tunnel, and the Tecolotes mine has a 160' shaft and 350' tunnel. La Roca Negra mine, sometimes called La Victoria, area 10 hectares, bought for \$60,000, is a good small mine, having 3 veins averaging 3" to 9" width only, and not 3 metres, as claimed by company. Equipment includes a 180-h. p. steam plant, with 3 hoists.

Smelter, at San Lorenzo, 4 to 8 miles from the mines, has 2 blast-furnaces, with 80 to 150 tons daily capacity. The company's claim of a production of 261,531 lbs. fine copper in 1904 was questioned by the Copper Handbook. The suspicions plainly stated in past editions have been verified by disclosures in 1908, leading to indictments against the former officers, including Dr. W. S. Phillips, who seems to have been the chief scoundrel. Property, under former management, was a deliberate swindle, but La Roca Negra mine, though small, has good ore, and possibly, under honest management, the shareholders may recover something from the wreck.

#### **AMERICAN MINES DEVELOPING ASSOCIATION. CALIFORNIA.**

Office: 610 South Spring St., Los Angeles, Cal. Letter returned unclaimed from former mine office, Needles, San Bernardino Co., Cal.

#### **AMERICAN MINES DEVELOPMENT CO., LTD. ARIZONA.**

Office: 506 Oneida Bidg., Minneapolis, Minn. P. R. Bailey, president; Jas. T. Manning, secretary and treasurer. Capitalization \$10,000,000, shares \$1 par. Lands are claimed to be zinc property in Searcy county, Arkansas; 14 copper claims 16 miles west of Globe, Gila county, Arizona; 2 miles of placer claims on the Snake River, Idaho; 2 gold quartz claims in eastern Oregon; 2 gold claims in the Cripple Creek district of Colorado and 5 sections of oil lands in California. Capitalization is excessive, plan of operations nonsensical, and company apparently was promoted to sell stock.

#### **AMERICAN MINES & EXPLORATION CO. ARIZONA.**

Mine office: Hillside, Yavapai Co., Ariz.

#### **AMERICAN MINING CO. ARIZONA.**

Mine office: Globe, Gila Co., Ariz. Mine, near the Gibson, has a 300' shaft. Lands said to have been leased, 1908, to Amos Green and John Ryerson.

#### **AMERICAN MINING CO. IDAHO.**

Office: Helena, Mont. Letter returned unclaimed from former mine office, Weiser, Washington Co., Idaho. Property was the Peacock mine, in the Seven Devils district.

#### **AMERICAN MINING CO. MEXICO.**

Dead. Lands sold, 1906, to Cananea Central Copper Co. Formerly at La Cananea, Arizpe, Sonora, Mex. Described Vol. VI.

#### **AMERICAN MINING CO. MICHIGAN.**

Office: care of John W. Kingston, receiver, Calumet, Mich. To Dec. 31, 1871, company had levied assessments of \$21,000. Company was formed originally by setting off 1,100 acres from the Cliff mine. Present lands are circa 500 acres, in Keweenaw county, Michigan. Company is being liquidated.

#### **AMERICAN MINING & DEVELOPMENT CO. CALIFORNIA.**

Letter returned unclaimed from former office, Omaha, Neb. Mine offices: French Corral, Nevada Co., Cal.; Kennett, Shasta Co., Cal., and Marysville, Yuba Co., Cal. T. F. Warden, general superintendent. Is supposed to be controlled by the American Smelting & Refining Co. The Red Ledge mine, in Nevada county, carries copper ore and has steam and water power. The

property in Yuba county, at Sweetland, 20 miles east of Marysville, shows a considerable body of auriferous copper ore.

**AMERICAN MINING & DEVELOPMENT CO.**

MEXICO.

Office: Bisbee, Ariz. Mine office: Naco, Arizpe, Sonora, Mex. Lands are a few miles south of Naco. Owing to quarrels among shareholders, attended by litigation, company is practically moribund.

**AMERICAN MINING, MILLING & SMELTING CO.**

Dead. Was a brazen swindle, owning no property whatever, with office at 10 Coleman St., London, E. C., England, and was fully exposed in Volumes V. and VI. As a result of the efforts of the Copper Handbook this gang of swindlers was brought to book in 1906, and, as surmised, company was found to possess no lands, no officers and no organization, hence it is unnecessary to repeat the names of the alleged officers in quotation marks, as was done in the last two editions of this work. It was stated in Vol. VI. of the Copper Handbook that every man connected with this company was either a fool or a rascal, and this statement was verified at the trial, when Henry Jonas, the fool, was given 18 months in prison, and Mark Anthony Youngs, the rascal, was given 10 years penal servitude.

Sir Harry Marks, owner of the London Financial News, who had puffed this rotten swindle extensively, was sufficiently alarmed, when requested by the Copper Handbook to explain his action in the premises, to engage the services, as solicitor, of Sir George Lewis, a lawyer noted in England for his ability to keep clients out of jail, and for his profound and intricate knowledge of the swindles and scandals of the past forty years. Sir Harry and Sir George jointly repelled, "with scorn," the idea that there was anything to explain in connection with the puffery by the Financial News of this deliberate swindle, and a satisfactory explanation of the attitude of the Financial News remains to be made—if such an explanation is possible.

Another party, the editor of a financial weekly in London, who had viciously attacked the Copper Handbook as a blackmailing enterprise, because of its exposure of the American Mining, Milling & Smelting Co., and who had strongly endorsed the latter, became so alarmed over the pointed questions of the Copper Handbook, after the conviction of Messrs. Jonas and Youngs, that he took refuge in nervous prostration and sold his newspaper, inducing the new proprietor to beg him off, thus saving his precious bacon. Readers of the London Financial News and other publications of like ilk should bear in mind that the reports on companies, printed in their columns, almost invariably are furnished by the companies themselves, or that the report is submitted to the companies before printed, for "editing," and that, in practically every case, the reports of company meetings and other matters of similar nature, are paid for, in hard cash, at tremendously high advertising rates. The true value of this sort of "news" is too obvious to require comment.

**AMERICAN PROSPECTING & DEVELOPMENT CO.**

ARIZONA.

Office: Bisbee, Ariz. Mine office: Jerome, Yavapai Co., Ariz. Lands are sundry claims adjoining the Equator mine, having a 43' shaft, with a 112' drift in ore. Presumably idle.

**AMERICAN-SAGINAW DEVELOPMENT CO.**

ARIZONA.

Office: 510 Lyceum Bldg., Duluth, Minn. Mine office: Bisbee, Cochise Co., Ariz. Thos. H. Collins, president; Chas. d'Autremont, Jr., vice-president; Frederick R. Kennedy, secretary; Wm. G. Haggart, treasurer; preceding officers, Henry B. Hovland, Wm. B. Mershon and Watts S. Humphrey, directors; L. W. Powell, general manager. Organized March 7, 1906, with capitalization \$1,000,000, shares \$10 par, \$6 paid in, as a merger of the American Development Co. and Saginaw Development Co. Lands are 26 claims, owned outright,

being the American group of 9 claims, lying next east of the Junction, the Saginaw group of 17 claims, area 297 acres, also favorably located, and the Muheim and World's Fair groups. Mine has an old 384' shaft, sunk at an angle of 70° with the horizon, showing 35' of leached ore on the 300' level, and a new 1,100' three-compartment shaft connected with the Denn-Arizona, which cut a 35' body of low-grade ore on the 350' level. A considerable body of leached ore was found on the 750' level of the Saginaw, with prospects of commercial ore at greater depth. The Saginaw shaft has a double-drum first-motion hoist, with capacity for raising 4-ton skips 1,400', and also has a good pumping equipment. Management is excellent and property is well located. Idle since September, 1907.

**AMERICAN SMELTERS EXPLORATION CO.**

U. S. A. &amp; MEXICO.

Dead. Organized 1905, title changed to American Smelters Securities Co.  
**AMERICAN SMELTERS SECURITIES CO.** U. S. A. & MEXICO.

Office: 71 Broadway, New York. Daniel Guggenheim, president; Barton Sewell, Silas W. Eccles, G. F. Hilton, Eugene B. Borden and Edward Brush, vice-presidents; W. E. Merriss, secretary; Morris Guggenheim, treasurer; W. S. Morse, assistant manager; W. C. Potter, Mexican manager; William R. Rust, business manager; Alfred von der Ropp, metallurgical superintendent. Organized March 25, 1905, under laws of New Jersey, as American Smelters Exploration Co.; name changed to present title May, 1905. Capitalization \$77,000,000, shares \$100 par, divided into \$17,000,000 Series A cumulative 6% preferred stock; \$30,000,000 Series B cumulative preferred stock at 5%, and \$30,000,000 common stock. Series A has preference as to dividends, and both preference series have equal rights as to assets, both having priority over common stock. The American Smelters Securities Co. is controlled by the American Smelting & Refining Co., through ownership of a majority of the issue of common stock, and the American Smelting & Refining Co. guarantees the Series B. preferred stock. First quarterly dividend was paid July, 1905, on Series A. Surplus, May 31, 1907, was \$1,016,744. Morton Trust Co., registrar. Annual meeting, first Wednesday in September.

The American Smelters Securities Co. is merely a subsidiary corporation of the American Smelting & Refining Co., and, in turn, is merely a securities holding company, controlling, through ownership of shares, or otherwise, a number of smaller corporations. It also is closely affiliated with the Guggenheim Exploration Co. The various corporations and the principal mines controlled are as follows:

- Balaklala Consolidated Copper Co., Coram, Cal.
- Dairy Farm Mining Co., Van Trent, Cal.
- Selby Smelting & Lead Co., Selby, Cal.
- A. Y. & Minnie Mining & Milling Co., Leadville, Colo.
- Silver Lake Mines, Silverton, Colo.
- United States Zinc Co., Pueblo, Colo.
- Western Mining Co., Leadville, Colo.
- Federal Mining & Smelting Co., Wallace, Idaho.
- Federal Lead Co., Federal, Ills.
- Central Lead Co., Flat River, Mo.
- Federal Lead Co., Flat River, Mo.
- Cumberland-Ely Copper Co., Ely, Nev.
- Nevada Consolidated Copper Co., Ely, Nev.
- Steptoe Valley Mining & Smelting Co., Ely, Nev.
- Garfield Smelting Co., Garfield, Utah.
- Utah Copper Co., Bingham, Utah.
- Puget Sound Reduction Works, Everett, Wash.
- Tacoma Smelting Co., Tacoma, Wash.

Monte Cristo Mining & Concentrating Co., Monte Cristo, Wash.  
 Bonanza Mines, Bonanza, Zacatecas, Mex.  
 Botello Mines, Parral, Chihuahua, Mex.  
 Dolores Mines, Matehuala, San Luis Potosí, Mex.  
 Jibosa Mines, Jiménez, Chihuahua, Mex.  
 Reforma Mines, Reforma, Coahuila, Mex.  
 Tecolotes Mines, Santa Barbara, Chihuahua, Mex.  
 Tepezalanes Mines, Tepezalá, Aguascalientes, Mex.  
 Velardeña Mining & Smelting Co., Velardeña, Durango, Mex.

**AMERICAN SMELTING & REFINING CO. U. S. A. & MEXICO.**

Office: 71 Broadway, New York, N. Y. Works offices: At numerous addresses, given hereinafter. Daniel Guggenheim, president; Barton Sewell, vice-president; Edw. Brush, vice-president and assistant to the president; Silas W. Eccles, vice-president in charge of mine and mills; W. E. Merriss, secretary; Isaac Guggenheim, treasurer; L. A. Chapin, assistant treasurer; F. W. Hills, comptroller; Judd Stewart, general auditor and general superintendent; J. K. MacGowan, purchasing agent; Wm. Sproule, traffic manager; Geo. C. Kaufman, manager mining department; Franklin Guiterman, general manager Colorado department; C. W. Whitley, general manager Utah department; W. C. Potter, general manager Mexican department; S. R. Guggenheim, chairman executive committee; Morris Guggenheim, chairman finance committee; Edw. Brush, Silas W. Eccles, Anton Eilers, Karl Eilers, Daniel Guggenheim, Isaac Guggenheim, Morris Guggenheim, M. R. Guggenheim, F. W. Hills, J. K. MacGowan, W. S. Morse, E. L. Newhouse, Grant B. Schley, Barton Sewell, Wm. Sproule, J. N. Steele, Judd Stewart, J. P. Grant, Franklin Guiterman, Dennis Sheehy, Jos. Clendenin, Solomon Guggenheim, W. S. McCornick and W. F. Thatcher, directors.

Organized Apr. 4, 1899, under laws of New Jersey, with capitalization \$54,600,000, later increased to \$100,000,000, shares \$100 par, in \$50,000,000 cumulative 7% preferred and \$50,000,000 common stock. Annual meeting, first Wednesday in September. Chase National Bank, New York, registrar; Chas. E. Beach, treasurer for agent. Dividends on common stock have been as follows: 5% in 1904; 5½% in 1905; 7% in 1906; 7½% in 1907; 2% January and 1% April and July each, 1908. Net earnings have been as follows: \$1,979,907.85 in 1900; \$3,828,441.27 in 1901; \$4,861,619.01 in 1902; \$7,576,785.57 in 1903; \$7,905,572.84 in 1904; \$8,898,811.36 in 1905; \$10,161,358.12 in 1906; \$11,509,669.20 in 1907. Company controls the American Smelters Securities Co., which is a subsidiary corporation, through ownership of \$17,751,000 of the common stock issue of \$30,000,000, and owns 25,000 shares, par value \$2,500,000, of Series B, preferred stock, of the same company, bought for \$2,302,270, and has guaranteed 5% dividends on the entire stock issue of Series B, preferred stock. Company's surplus, at end of fiscal year, Apr. 30, 1907, was \$13,397,028.12, not including \$17,751,000 of common stock of the American Smelters Securities Co.

Following is the list of operating plants of the company:

Perth Amboy plant, Maurer, N. J., copper and lead and lead smelting.

National plant, South Chicago, Ills., lead refinery.

Omaha plant, Omaha, Neb., lead refinery, copper smelting and converting.

Globe plant, Denver, Colo., lead smelting.

Pueblo plant, Pueblo, Colo., lead smelting.

Eilers plant, Pueblo, Colo., lead smelting.

Durango plant, Durango, Colo., lead smelting.

Arkansas Valley plant, Leadville, Colo., lead smelting.

Murray plant, Murray, Utah, lead smelting.

Garfield plant, Garfield, Utah, copper smelting.

Selby plant, Selby, Cal., lead smelting and lead refinery.  
 Tacoma plant, Tacoma, Wash., lead and copper smelting.  
 Everett plant, Everett, Wash., lead smelting and arsenic refinery.  
 Helena plant, East Helena, Mont., lead smelting.  
 El Paso plant, El Paso, Tex., lead and copper smelting.  
 Aguascalientes plant, Aguascalientes, Mex., lead and copper smelting.  
 Monterey plant, Monterey, Mex., lead smelting.  
 Velardeña plant, Velardeña, Mex., lead and copper smelting.  
 Chihuahua plant, Chihuahua, Mex., lead smelting.  
 Federal plant, Federal, Ills., lead smelting and refining.

In addition to the foregoing plants, the company has other extensive interests and is supposed to control the United States Zinc Co., of Pueblo, Colo., the Silver Lake Mine, Silverton & Western Mining Co., and Aspen Mining Co., of Silverton, Colo.; the Carbon Coal & Coke Co., of Trinidad, Colo.; the Cook's Peak Mines, of Cooks, N. M., and extensive mining interests in the leading mining states of Mexico. Unfortunately, the American Smelting & Refining Co., its subsidiary corporation, the American Smelters Securities Co., and its affiliated corporation, the Guggenheim Exploration Co., are so closely interlocked, and particulars furnished the public are so meagre, that it is almost impossible to state which properties are owned or controlled by any one of these three different dovetailing corporations.

In addition to the foregoing interests, the company owns the exclusive rights to the Huntington-Heberlein ore-roasting patents in the United States and Mexico, and maintains a profit-sharing fund for employes occupying positions of responsibility. The various smelting plants of the company and its affiliations have an annual capacity of probably about 6,000,000 tons of raw ore and concentrates. There also are various subsidiary corporations for ore purchasing and other purposes. Apparently the copper ores are handled mainly through the American Smelters Securities Co.

The Helena smelter, at East Helena, Mont., is of 600 tons daily capacity. Frank M. Smith, manager; C. C. Titus, assistant manager.

The Murray smelter, at Murray, Utah, is a very complete plant. A new feature at these works is a 100x216' baghouse, which has 4,200 cotton bags, each 30' long and 18" in diameter, the cloth required being sufficient to cover 16 acres. There has been much trouble in the past from smelter fumes, but the baghouse, in addition to saving considerable values heretofore lost, has greatly reduced the volume of fumes.

The Arkansas Valley plant, at Leadville, Colo., handles mainly lead ores,

The old Grant smelter, at Denver, has been dismantled, and it is planned some years.

with a little copper. The other plants at Leadville have been dismantled for to sell the ground.

The El Paso smelter, at El Paso, Tex., F. C. Earle, manager, has 8 furnaces, with a daily capacity of circa 1,200 tons.

The Playa Blanca smelter, at Antofagasta, Chile, has been idle for some years, and the American Smelting & Refining Co. is no longer a factor in the South American metal industry.

The Aguascalientes smelter, at Aguascalientes, Mexico, Wm. J. Hamilton, superintendent, is a large plant of about 2,000 tons daily capacity, having 2 lead furnaces, 8 copper furnaces and 4 copper converters.

The Chihuahua smelter, at Chihuahua, Mexico, Geo. B. Squires, superintendent, is a new plant, rated at 625 tons daily capacity, having blast furnaces with buildings of steel and a 370' brick stack, with inside diameter of 16', 8 miles of railroad track, a hotel and 192 dwellings for workmen.

The Monterey smelter, at Monterey, Nuevo León, Mexico, Edward C.

Knight, manager, is of 1,200 tons daily capacity, having 10 blast furnaces and 15 reverberatory furnaces.

The principal refinery is the Guggenheim Works, at Perth Amboy, Middlesex Co., N. J., built 1895, and since repeatedly enlarged. This plant, having the advantages of tidewater frontage and rail connections at the rear, has copper and lead furnaces and a large electrolytic plant, also a bluestone plant making large quantities of copper sulphate. The electrolytic lead and copper refineries are each of about 125 tons daily capacity.

The Keyser refinery, at Baltimore, Md., was bought in 1907.

Copper production is merely an incident with the American Smelting & Refining Co., which is much the largest general smelting and metallurgical enterprise of the world. Copper production, 1905, was 72,952,000 lbs. fine copper; in 1906 was 85,810,000 lbs. fine copper, and in 1907 was 94,600,000 lbs. fine copper. It seems probable that an annual output of at least 150,000,000 lbs. fine copper will be reached within a few years.

#### **AMERICAN VENTURE CO.**

#### **MEXICO.**

Office: care of Harry M. McIntosh, general manager, 77 Jackson Blvd., Chicago, Ills. Mine office: Ayutla, Autlán, Jalisco, Mex. Capitalization \$200,000. Lands, 18 hectares, in the Beutista district, also copper and silver claims in the Cuautla and Ayutla districts, and one property in the Mascota district.

#### **SOCIEDAD MINERA LA AMISTAD.**

#### **SPAIN.**

Office: San Antonio, 44, Granada, Spain. Mine office: Albuñuelas, Granada, Spain. Don Joaquin Marin Robles, president. Property is the Santa Ines mine, carrying copper and cobalt ores.

#### **AUSTRALIA.**

#### **& SMELTING WORKS.**

Dead. Property sold to Murrin Copper Mines, Ltd., and company liquidated.

#### **ANACONDA COPPER MINING CO.**

#### **MONTANA.**

Office: 42 Broadway, New York, N. Y. Mine office: Butte, Silver Bow Co., Mont. Works office: Anaconda, Deer Lodge Co., Mont. John D. Ryan, president; Henry H. Rogers, vice-president; preceding officers, Wm. Rockefeller, J. E. Judson, E. C. Bogert, Geo. H. Church and Urban H. Broughton, directors; F. P. Addicks, treasurer; C. F. Kelley, secretary; A. H. Melin, assistant secretary; John Gillie, general superintendent; E. F. Mathewson, mill and smelter superintendent; D. W. Brunton, consulting engineer; J. P. O'Neill and Jas. Higgins, mine superintendents.

Organized June 18, 1895, under laws of Montana, with capitalization \$30,000,000, shares \$25 par, as successor of Anaconda Mining Co. Is controlled, through ownership of about 75% of stock, by Amalgamated Copper Co. Annual meeting, in May. National City Bank, New York, transfer agent. Stock is listed on the New York, Boston and London stock exchanges, and on the New York Consolidated stock exchange. Dividend coupons are payable in England by the London Joint Stock Bank, Ltd., Prince St., E. C. Warrants

to bearer are issued, in England, in denominations of 5, 20 and 50 shares. Dividends have been as follows: \$4,800,000 in 1900; \$3,900,000 in 1901; \$1,200,000 in 1902; \$1,200,000 in 1903; \$1,200,000 in 1904; \$2,400,000 in 1905; \$5,850,000 in 1906; \$7,800,000 in 1907, and for 1908, quarterly dividends of 2% were paid, dividends for the year aggregating \$2,400,000. Net earnings for 1907 were \$3,378,220.42, including \$581,281.74 earned by various subsidiary corporations and departments outside of regular mining operations. Company's surplus, Dec. 31, 1907, was \$6,261,462.30. Assets include investments of \$534,113.32 in various subsidiary companies, and merchandise on hand, for sale, valued at \$631,860.14.

Lands, 572 acres, constituting much the largest property in the Butte camp, and including the heart of Butte Hill. A detailed description of the geology will be found in the article on Montana, in the chapter on American copper deposits. Miscellaneous real estate holdings include extensive timber lands and coal mines. The Anaconda is the largest copper producer of the world and employs about 5,000 men, under normal conditions.

The Anaconda was opened, 1880, as a silver mine, but at about 150' depth the silver values decreased, being succeeded, a little lower, by high-grade copper ores, mainly chalcocite and bornite, while at depth there is a large amount of enargite. Net earnings of the mine, during the 15 years, 1880-1894, are unknown, but may be estimated safely as not less than \$50,000,000. At a depth of about 1,600' the mines of the Anaconda showed impoverished values, there being considerable marcasite, but an improvement was noted at 1,800' and 2,000', and very rich ore has been found below 2,200', while high-grade chalcocite is being mined at a depth of 2,800' in the High Ore mine of the Anaconda, this being the deepest level now worked in the Butte camp. The various mines of the Anaconda have immense reserves of ore, of all grades from low to high, and a considerable number of stopes of high-grade ore remain untouched. The ores extracted from the various mines give an average return of about 65 lbs. of copper per short ton, or 3.25%; with about 2½ to 3 oz. silver and 35 cents gold per ton.

The Anaconda mine proper has a 3-compartment main shaft, 2,450' deep, timbered with 10x10" square sets, with about 30 exits, being connected underground with the Never Sweat, St. Lawrence, Bell, Wild Bill, East Grey Rock, Buffalo and Mountain Consolidated mines. Ventilation normally is good, but considerable trouble was had, 1908, with gases from the adjoining St. Lawrence mine, and it is probable that the fire has crept from the St. Lawrence into several of the upper levels of the Anaconda. The mine has electric lights and signals, and electric locomotives for tramping were installed, 1907, on several levels. Hoisting is by 8-ton skips, swung under double-deck cages and worked in counterbalance.

The Never Sweat mine has a 3-compartment 2,500' main shaft, re-timbered, 1905, with false sets, allowing an 18" play for squeeze. Square-set timbering is used, with back filling, and tramping is done by horses. The mine has electric lights and bells, and is connected underground with the Parrot, Colusa-Parrot and Moonlight mines. The surface plant includes a 3,000-h. p. hoist with 30x72" cylinders, raising 8-ton skips swung under double-deck cages. There are 5 Ingersoll-Sergeant air-compressors, 2 being electrically driven, with aggregate capacity of 32,000 cubic feet of free air per minute, capable of running 360 power drills.

The St. Lawrence mine has a 3-compartment 2,400' main shaft, with 22 exits, being connected underground with the Anaconda, Never Sweat, Mountain View and Pennsylvania mines. The mine has electric lights and bells, and a chain system of endless-haulage on the 14th level. The St. Lawrence has been on fire since 1889, in an extensive area above the 1,100' level.

The fire has been fought constantly, and walled off by bulkheads wherever possible, but cannot be extinguished, and must be allowed to burn itself out, though it is possible to control its progress to a considerable extent. A complete fire-fighting brigade is kept constantly on duty, working 8-hour shifts. While the fire is troublesome, it does not result in the loss of copper, as the cintered ore remaining after the burning of the sulphur can be mined later, and the mine waters are strongly charged, carrying 9 to 13 lbs. copper per ton, much of which is recovered by underground precipitation in concrete sumps, the water leaving these sumps carrying only 2 to 4 lbs. of copper per ton, and again being leached on surface. The hoist has 32x72" cylinders, raising 9-ton skips swung under double-deck cages.

The High Ore mine is the deepest in Butte, having a 3-compartment shaft of 2,900' depth, with the lowest level at 2,800', producing high-grade chalcocite. Being the deepest mine of the group, the High Ore does the pumping for a number of connecting mines of the Anaconda and Amalgamated groups, handling all water from the Anaconda, Washoe and Parrot properties. The mine has 7 powerful pumps, including 3 Dixon pumps on the 2,200' level, 2 pumps on the 1,600' level and 3 on the 1,000' level. The mine has electric lights and bells, and tramping is done mainly by horses. Hoisting is done with two 3-deck cages.

The Diamond mine has a 3-compartment 2,200' shaft, from which hoisting is done by a 32x72" Risdon engine, operating double-deck cages with 8-ton skips. The Diamond has a large compressor plant with 4 electric air-compressors fitted with auxiliary steam cylinders, having an aggregate capacity of 16,000 cubic feet of free air per minute.

The Mountain Consolidated mine has a 3-compartment 2,400' shaft, with a 28x72" Union Iron Works hoist operating two 4-deck cages.

The Green Mountain mine has a 3-compartment 2,200' shaft.

The Modoc mine has a 1,000' shaft. The Modoc vein is the largest in Butte, averaging about 100' in width, but is low in grade to the depth opened, ore ranging in tenor from 1.5 to 2% copper only, but should improve with depth, and is a property of much promise. A new gallows-frame and a 1,000-h. p. electric hoist were installed, 1908, when the mine was reopened.

The Bell mine has a 3-compartment 1,600' shaft, connected underground with the Anaconda mine. Ore is trammed by mules and a 28x40" hoist raises double-deck cages.

The Bell No. 4 mine, having a 365' shaft, is idle.

The Belmont mine has a 1,000' shaft, which was cut down, 1907, to 3-compartment size.

The Wild Bill mine, having a 2-compartment 400' shaft, is idle. The surface plant has been dismantled, and ore probably will be extracted through the shafts of adjoining mines.

The Ramsdell-Parrot mine has an 800' shaft, connected underground on the 400' and 500' levels with the Colusa mine, and is operated through the Never Sweat shaft.

The Gallatin mine has a 250' shaft.

The Monitor mine is connected underground with the J. I. C. and Ground Squirrel mines.

In addition to the foregoing mines, there are several smaller properties, mainly idle, having more or less development, among the more important being the Sunnyside, J. I. C., Wake-Up-Jim and Buffalo.

The mine waters from the various shafts being highly charged with copper, an extensive leaching plant is operated in the gulch just above Meader-ville, where a large amount of cement copper is secured by precipitation. Old scrap iron, tin-cans and wire rope are used as the precipitating agent,

these articles commanding a standard price of 1 cent per pound. The drop of the water in the precipitation tanks and launders is much more rapid than is the case in the large Spanish lixiviation plants.

Steam has been supplanted very largely by electric energy, which is brought from a generating plant at Canyon Ferry, 70 miles distant, and from adjoining hydro-electric installations in Broadwater county. The current is wired to the mine with a primary voltage of 50,000, reduced to 2,000 volts at a transformer station just outside of Butte, power being distributed to the various workings from a main station at the Never Sweat mine. A 3-phase dynamo furnishes motive power for a direct-current generator that replaced an extensive underground haulage system actuated by compressed air. Electric lights are used underground very extensively, being employed wherever possible, and a large number of minor motors at the various buildings of the surface plant are driven electrically by a 440-volt current. Electric power has been found considerably cheaper than steam, both at the mines and works.

The Washoe reduction works are described hereinafter, although standing in the name of the Washoe Copper Co., because treating mainly Anaconda ore, commonly known as the Anaconda smelter, and leased by the Anaconda Copper Mining Co. The site of about 240 acres, on Washoe Hill, is about 2 miles east of Anaconda and 28 miles by rail from Butte. The plant was designed by Frank Klepetko and built and equipped with the able assistance of Messrs. Mathewson, Repath and Gulberg, and the late R. C. Collins and Wm. F. Evans. Ground was broken May, 1900, and smelting was begun February, 1902, since which time numerous modifications and improvements have brought the works to a daily capacity of 11,000 tons of raw ore. In the construction of the plant there were required 20,000 tons of structural steel, 25,000,000' of lumber, 1,000 carloads of brick, 50,000 cubic yards of masonry and 300,000 cubic yards of excavation. The cost of the plant has been about \$9,500,000. The grounds are of exceptional neatness, and the plant, as a whole, is nearly ideal in design, construction and equipment. Being located upon the side of a hill, full advantage is taken of gravity in the handling of material.

The concentration plant, covering 7 acres, includes a number of buildings. The bins, of wood and steel, include 8 second-class ore storage bins of 1,250 tons capacity each, thirteen 200-ton sampling ore bins, and a 2,500-ton coal-storage bin.

The sampling mill, 40x60' in size and 6 stories high, is in 2 sections, each of 1,800 tons daily capacity. Ore to be sampled is taken from sampling bins by an electric locomotive and dumped into the mill bins, whence delivered to crushers, crushed material being raised to the top of the building by bucket elevators. The descending stream of ore is cut four times by Brunton automatic samplers, each taking 20%, giving a final sample of 3.2 lbs. per short ton of ore. Discard from the sampling mill is elevated and dumped into the concentrator ore-bins, or, in the case of smelting ore, is sent to the blast-furnace storage bins. The final sample is quartered by a Brunton quartering shovel, the resulting sample dried on a steel dryer, ground on an Engelhart sampling grinder, bucked to pass through a 100-mesh sieve, and divided into 3 sample packages, one going to the laboratory for analysis and one to the owner of the ore, while the third is filed as a control, in case of dispute.

The power-house of the concentrator, 136x150' in size, stands between and connects the two halves of the concentrator proper. The construction is of steel, with brick walls, and there are three 15-ton traveling cranes, of 44' span. Equipment includes two 4 cylinder triple-expansion condensing engines of 3,300 indicated h. p. at 200 lbs. steam pressure, but run at 150 lbs. pressure, developing 1,750 h. p. each, with a 4-cylinder triple-expansion 1,150-h. p. engine held in reserve as an auxiliary. There also is a complete electric plant, taking power

from an installation near Helena, and from Flint Creek Falls, 22 miles west of Anaconda, electric power being used in preference to steam, but with the steam plant remaining intact for emergencies. This plant operates the mill and furnishes power for lighting the works, lighting the city of Anaconda, operating the city street-car system, etc.

The concentrator boiler-house, of brick and steel, located behind the coal-bins, has ten 300-h. p. Stirling water-tube boilers, feed pumps, etc., with an independent steel stack, 160' high, of 14' diameter.

The concentrator plant proper consists of 2 steel and wood buildings, on stone foundations, each 255x350', each containing 4 complete sections, or 8 in all. Each section contains a 12x24" Blake crusher, two 7x10" Blake crushers, 6 Harz jigs for coarse concentrates, 1 set of 15x42" coarse rolls, 1 set of 15x42" fine rolls, 36 Evans jigs for fines, 1 set of 15x42" rolls for middlings, 18 Evans jigs for middlings, 3 six-foot Huntington mills, 18 Evans finishing jigs and 33 Wilfley tables, with a large number of classifiers, settling tanks, dewatering tanks, elevators and trommels. The first crusher reduces ore to 3" size, which passes over 2 sets of trommels for sizing, oversize material going thence to 2 smaller crushers, which reduce it to 1½" size. Two belt-elevators take this material to a series of trommels for coarse sizing, oversize going to coarse jigs which produce coarse concentrates for the blast-furnaces. The waste from the coarse jigs goes to 2 sets of 15x42" rolls for crushing, and is thence elevated and re jigged. In the jiggling department all undersize material from crushers is treated automatically. The jiggling sections have Evans jigs in 3 double rows, with Evans hydraulic classifiers making 3 sizes of concentrates, which go to the storage bins, while middlings go to the middling department, where 2 sets of 15x2" rolls crush the material to about 1¼" size, this going by belt-elevators to 4 sets of trommels, from which the undersize goes automatically to 4 hydraulic classifiers, which feed 18 double Evans jigs, set in a triple row. Concentrates from the middlings department are mixed with concentrates from the jiggling department, going thence to storage bins. Middlings are collected in launders, and taken by elevators to the regrinding department, where three 6' Huntington mills are fed from V-shaped tanks, the ground material passing through 1¼" screens to hydraulic classifiers, thence to the jigs, both concentrates and tailings being carried by water, in launders. The slimes department has 33 Wilfley tables, fed from the bottoms of V-shaped tanks, concentrates being washed in launders to the settling tanks, at the foot of the concentrator building.

The tankhouse, of wood, is 70x670', containing 9 settling tanks for each section, each tank being 19x19x15', with a capacity of 420 tons. Each section of 9 tanks is divided into 6 tanks for the first settlement of concentrates, and 3 for settling the overflow of the first settlement tanks, the overflow from the second settling tanks going to 3 large tanks, common to all 4 sections of that half of the mill, the overflow from the final settlement tanks going to a slum pond, together with slum-water from all the settling tanks and Wilfley tables. The product of the first settlement tanks is known as fine concentrates, that of the second tanks as second settlement concentrates, and that of the third series of tanks as tank-slum. The fine and second settlement concentrates are treated in the roaster building, and the tank-slum goes to the briqueting plant.

The slum-ponds, located in the valley below the works, are 6 in number, each of about 300x630' average size. As soon as one pond is filled the slum-water from the works is diverted to an empty pond, and as much water as possible is drained from the filled pond, slums being excavated by one of 2 Liederwood traveling cableways operating 5-ton buckets, the slums being piled in heaps on the edges of the pond, and allowed to drain. Dried slums are

removed by buckets, and loaded into hopper-cars, thence to railway cars conveying them to storage-bins feeding the briquetting plant. Slum-water containing the least values is used for condensing purposes and for sluicing slag at the reverberatory and blast-furnaces. Settling tanks containing fine and second settlement concentrates, after draining, are emptied from the bottom into cars and material taken to the charging floors of the calcining building, being weighed and sampled before dumping. Throughout the works material is weighed and sampled on entering and leaving each building, thus giving an accurate check on the work of each department.

The roaster building, 96x412', of steel frame on stone foundations, contains 64 McDougal calcining furnaces of the Evans-Klepetko type. Each furnace is 16' in diameter and 18' high, with 6 hearths having revolving water-cooled shafts and arms driven by top-gearing, rabbling arms being so set as to move material from circumference to center, and vice versa, on alternate hearths, until the material drops from the lower hearth into 2 calcine hoppers under each furnace, beneath which run the railroad tracks, hopper cars transporting calcines to the reverberatory building. No carbonaceous fuel is required, except occasional fine coal for charging a cold calciner. Gases are drawn through brick flues into 40x40x300' brick and steel dust-chambers having concrete inner walls, where much of the flue-dust settles. The bottom of the dust-chamber has a series of hoppers, underneath which are railroad tracks, flue-dust going direct to the reverberatory furnaces for smelting. The barrings adhering to the rabbling arms and shafts are removed and sent to the blast-furnaces. In charging the roasters, finely crushed limestone and screenings from first-class ore are admixed, in the feed-hoppers, for the purpose of producing a balanced charge for the reverberatories. The capacity of each calciner is 45 tons per day.

The reverberatory department consists of two 183x225' steel buildings, each containing 4 coal-fired furnaces with hearths 19' wide and from 102' to 116' in length, with grate area of 8x16', having a smelting capacity of 300 tons daily, on natural draft. Fuel is Wyoming coal, dumped into hoppers having 4 discharges directly above the fire-box. The flames, after leaving the furnaces, pass through two 375-h. p. Stirling boilers, in tandem, reducing the temperature of the gases to about 600° Fahrenheit when reaching the main flue, and securing about 600 h. p. from the waste gases. Ashes and partly burned coal drop from the fire-boxes into launders carrying them over a grizzly, the larger pieces of ash going to the slag-slue, while the smaller pieces, containing unburned coke and coal, are sluiced to the coal-washery. Slag is skimmed from the reverberatories, at 4-hour intervals, into a stream of slum-water, which granulates and sluices it, through a launder with cast-iron lining, to the slag-dump. By allowing slag to accumulate until 3" or 4" above the skimming-plate, it is possible to skim the furnace very rapidly, 60 tons of slag being skimmed in 20 minutes. Matte is kept some distance below the skimming-plate, rendering it impossible to pull out any of the matte, thus obviating explosions. Matte is tapped from the side of the furnace through copper tap-hole plates, and run through cast-iron launders, lined with silicious material, to 10-ton hot-metal ladies that go by tram to the converters. Fire-brick used in the reverberatories are made by the company's brick-plant, bricks being 3x6x15" in size. Bridge-walls and sides are luted with clay every 30 days, when necessary. Bridge-wall plates are kept cool by the circulation of air through pipe connecting with the main flue. Fumes from the reverberatories are taken through underground flues, 1 for each row of furnaces, to the main flue. Flue-dust is not briquetted, but is treated in reverberatories with fines. The reverberatory department has given exceptionally satisfactory results, effecting an increase of about one-third of the normal smelting capacity,

a reduction of about one-third in fuel charges, saving about 10% of unburned fuel in the coal washery, reducing labor costs and securing about 600 h. p. of energy from the waste gases.

The briquetting plant occupies a 55x192' frame building containing 4 Chambers end-cut auger-type briquetting machines, each of about 700 tons daily capacity, 2 machines being sufficient, as a rule, to handle all material. Briquettes are made of fine concentrates, fine first-class ore and pond-slums, mixed with crushed coke and coal from the coal-washery. Materials are brought from storage-bins by belt conveyors to a pug-mill, whence they are discharged into the briquetting machines, where further mixed and forced through a former in a continuous bar, which is cut into 10-pound briquettes by a revolving cutter. Briquettes are taken by a series of belt-conveyors to storage hoppers, whence loaded into charging-cars for the blast-furnaces.

The blast-furnace building, of steel frame, 82x269' in size, has 3 floors, the first carrying the railroad tracks, second being the main operating floor and third the charging floor. There formerly were numerous furnaces of 56x180" section at the tuyeres, and 40' high, of about 400 tons daily capacity each, but these have been made into 3 furnaces by building connections between, 2 of the 3 furnaces being 51' in length, while the third is 87' long, with a uniform width of 56" at the tuyeres. The two 51' furnaces have a maximum capacity of 1,800 tons each, and the 87' furnace has smelted 3,100 tons in 24 hours. It is possible to repair one end of any of these furnaces while frozen, with full smelting in progress at the other end. The large blast-furnaces of the Anaconda mark perhaps the most important step taken in copper smelting since the invention of the bessemer process of copper conversion. The bottom of the centre of each furnace is of silica brick, laid on water-cooled cast-iron plates mounted on cast-iron columns, with a gradual slope to each discharge spout. The 87' furnace has 3 discharge spouts and three 16' settlers, with 150 four-inch tuyeres, the 51' furnaces having 88 four-inch tuyeres and two 16' settlers each. The credit for these gigantic furnaces is due to Mr. Mathewson. Among the advantages are increased hearth area, with but two ends to hold crusts, while crusts forming on the sides can be disposed of by permitting the furnace to run down, in which case the crust will drop, or, if necessary, can be barred. The large furnace has a smaller radiating surface for the same hearth area, requires less fuel, and may be repaired rapidly while in blast. Leaking water-jackets may be replaced in 6 to 8 hours. Each 51' furnace has three 7° 45° unlined steel flues, with 5 similar flues on the 87' furnace. The charging floor has railroad tracks on either side of the furnaces, side-dumping hopper cars being handled by compressed-air locomotives. The charging-doors extend full length, and are opened and closed by compressed-air pistons, all charges being fed automatically. In front of each furnace is a 16' settler, receiving a continuous flow of molten matte and slag, matte being drawn from the bottom into 10-ton hot-metal ladles, going thence to the converters, while the slag skins into sluices and is granulated and washed to the slag-dumps by running water. Overhead sheet-iron flues carry fumes and smoke into a dust-chamber exactly duplicating that in the calcining department, and which connects with the main flue. The product of the first fusion is a 44% matte, with slags averaging about 0.2% copper only. A charge-train consists of 18 cars, receiving material by weight from the storage bins adjacent to the blast-furnace building. These bins, of wood, are in 3 rows, each row being 28' wide, 20' deep and 786' in length, divided into bins of various sizes, providing storage for first-class ore, coarse concentrates, limestone, coal, limestone, silica, etc. All bin gates are operated by compressed air. Two charge-cars carry a charge, this ranging from 8,400 to 11,000 lbs., according to composition.

The converter building, 176x416' in size, is of steel frame, except the crushing and mixing department of the lining plant, which is of wood. There are two 60-ton 60' span electric traveling cranes for handling converters and ladles, with two 15-ton auxiliary electric traveling cranes in the casting department for general use, one of the larger cranes handling copper and slag from the converters, and one handling converters for relining. Matte from both blast and reverberatory furnaces is brought to the charging-floor of the converter building, which is 23' above the operating floor, and is poured from ladles into a launder, the end section which is so pivoted that it can be turned out of the way when the converter shell is filled, the shell being filled while in a nearly vertical position, with air on. Charge per shell is 7 tons of matte, regardless of condition of lining, and charge is blown up to blister copper in the same converter. There are 11 stands, operated hydraulically, with shells of the horizontal barrel type, 8' in diameter and 12' 6" long. Converters blow off into hoods with flues leading to a dust-chamber similar to that of the calcining department. The matte is blown to low grade blister copper and poured into a sheet-steel clay-lined ladle, which is taken by crane to a hydraulic cradle, from which it is poured into the casting furnace. There are two 95-ton and one 110-ton casting furnaces, 2 being in continuous use. Copper is poured in at the side, and when charged to 50 or 60 tons, oxidation is begun by a 90-lb. air pressure. When the furnace is full, slag is removed and oxidation is complete, the charge then being poled to the desired pitch, and cast in a machine with a platform conveyor having moulds attached, operated hydraulically. Molten copper is run into a suspended ladle, from which it is poured by hydraulic power into moulds. When the mould is filled, the ladle is dropped to a horizontal position, and the next mould is brought into position, and the process repeated. Capacity of the casting machine is 25 tons hourly. The cast copper is chilled by a spray, and dumped from the moulds upon a platform conveyor running through a tank of water, then trucked to the scales, weighed, marked and shipped. Anodes assay about 97% copper and 80 oz. silver per ton.

The lining department, in the converter building, includes also a 40x62' building on the southwest corner of the converter building, where material is prepared. Lining material is highly silicious ore having gold and silver values, and slum is used for a binder. Material is reduced by a Blake crusher and fine rolls, and sized by trommels, which feed four 7' Carlin grinding and mixing pans, where it is ground and mixed with pond-slum to the proper consistency. Lining material is then transported to the converter shell and tamped around a steel form by a special Ingersoll-Sergeant tamping machine, of 5" diameter with a 20" stroke, supported by a revolving jib-crane with vertical motion controlled hydraulically. After lining, the shell is removed by crane to a drying stand, where it is dried by a fire of coal and scrap wood secured from the concentrator and sampling mill.

Coal ashes from the reverberatory department are sluiced to the coal-washery, which has a complete jigging equipment that saves about 35 tons daily of coal and coke, which is ground and sent to the briquetting department, where it is mixed with other material and bricked.

The 85x526' smelter power-house, of brick and steel, has a 15-ton electric traveling crane running the entire length of the building. There are 10 Connersville blowers, direct-connected to Corliss engines, each with a capacity of 300 cubic feet of free air per revolution, compressed to 40 oz.; six air-compressors with an aggregate capacity of about 2,500,000 cubic feet of free air per hour, compressed to 16 lbs. pressure; three 90-lb. air-compressors for general use, and four 900-lb. air-compressors furnishing air to the locomotives of the tram-line. Four hydraulic compressor pumps and accumulators raise

water to 360 lbs. pressure per square inch, for use in the hydraulic apparatus at the converter plant, and for various other purposes. Steam is supplied from the waste-heat boilers at the reverberatory building, and from twelve 300-h. p. Stirling water-tube boilers in a boiler room at one end of the power-house. The principal work is done, however, by electric energy, the steam plant being held merely as an auxiliary under normal circumstances.

The system of flues is most excellently planned and highly efficient. There are 3 principal flue-lines, from the roasting department, blast-furnaces and reverberatory furnaces, each being 20' wide and 15' high, built of brick and steel. The converter department has two 7'x7' flues. The blast, roaster and converter flues connect with their respective dust chambers, while the reverberatory flue leads direct from the furnaces. Lengths of the flues are as follows: blast flue, 1,653'; reverberatory flue, 842'; converter flue, 708'; roaster flue, 488'. These flues converge into one main flue, which, for the first 1,200' of length, is 60' wide, with side walls 20' in height, the bottom being excavated at an angle of 30° from horizontal. The roof is of "I" beam and brick arch construction. For the balance of distance to the stack, 1,122', the main flue is 120' wide, having a roof of No. 9 sheet steel. The main flue leads to a brick stack 300' high, with inside diameter of 33' 4" at the bottom and 30' at the top, with a thickness of 4' 6" at the bottom, requiring 3,000,000 brick in its construction, with the top of the stack 932' above the valley. Underneath the main flue is a tunnel 7' high and 55' wide. Flue-dust is drawn off through hoppers, placed at intervals of 10', into cars operated by gravity from a set of drums located at the stack. Loaded cars are taken from the end of the main flue and elevated to 2 sets of flue-dust bins adjacent, one set taking arsenical flue-dust while the other receives flue-dust that is to go direct to the reverberatories.

Much trouble was experienced in the past from damage suits arising from the fumes thrown off from the smelter, until the building of the new stack and the installation of an arsenic plant, which treats about 60 tons of dust daily. Arsenical flue-dust is taken from the bins by inclined revolving pipes, leading to the feed hoppers of 2 Brunton revolving-hearth roasting furnaces. Fumes from these are conducted through 240' of zigzag flue having about 40 cells, the cooling of the fumes subliming the arsenic on the walls. At intervals roasting is suspended, and the sublimated arsenic is scraped from the walls of the cells and taken to a small reverberatory furnace, fired by coke, and resublimed in a similar zigzag flue. The first product is a 90% arsenic sesquioxide, and the final product a 99.8% arsenic sesquioxide, which is ground, barreled and shipped.

The local transportation system of the Washoe works includes 48 miles of standard-gauge railroad tracks, equipped with 17 Porter air-locomotives, of 12 to 22 tons weight each, and 240 cars. The air receivers of the locomotives are charged at 900 lbs. pressure, cut to 150 lbs. pressure at the cylinders by reducing valves. There are charging stations at frequent intervals, fed by an extensive system of high-pressure pipes. Locomotives are recharged about every 20 minutes, 2 minutes being required for the work. The tram system handles about 13,000 tons of material daily.

The electrolytic refinery of the Anaconda was closed August, 1903, blister copper being sent east for refining. The refinery is a portion of the old reduction plant, about 2 miles from the Washoe works and on the opposite side of the valley.

In addition to the various milling and smelting departments previously described, there are large and well equipped shops, including a smithy, boiler-shop, machine-shop, carpenter-shop and electric repair shop. There also is a large foundry and machine shop at Anaconda, about 2 miles from the smelter,

doing new work and heavy repairing, in addition to a general custom business.

The laboratory sampling mill, of brick, 29x63' in size, cares for all metallurgical samples taken throughout the works, there being about 9,000 samples of different kinds of material monthly.

The laboratory, of brick and stone, 2 stories high, is one of the most thoroughly equipped at any metallurgical plant. All samples taken in the works and at the sampling mill are sent to this department, and there analyzed, there being about 15,000 actual determinations monthly, for copper, gold, silver, iron, zinc, sulphur, alumina, silica, etc. There are testing and photographic departments in the basement of this building.

The general office building, of brick, contains offices for the manager, assistant superintendents, accounting department, engineering department, etc., also a large telephone exchange, there being a private system connecting all departments of the works, with long distance connections for Butte, Helena, Great Falls and other Montana points. There also are private telegraph wires connecting with the Western Union and Postal companies at Anaconda.

The amount of water required by the Washoe works, when in full operation, is about 35,000 gallons per minute. Water is stored in Storm Lake and Silver Lake, about 15 miles west of Anaconda, water from both creeks and lakes being gathered by a dam about 4 miles west of Anaconda, and diverted in a 5x7' flume, 7 miles long, that brings the water to the works.

The Washoe works treat, in addition to Anaconda ores, the production of the Butte & Boston, Washoe, Trenton and Parrot companies of the Amalgamated Copper Co., and the ores of the North Butte Mining Co. as well, having a capacity of about 11,000 tons of raw ore daily, and of about 150,000,000 lbs. of fine copper yearly. The Anaconda concentrating ore carries an average of about 3 to 4% copper, 1 to 6 oz. silver, 0.01 to 0.02 oz. gold, 16% iron oxide, 17% sulphur and 55% silica. The tailings carry an average of about 0.7% copper and 90% silica.

In concluding a description of this wonderful metallurgical plant, which is the largest in the world, it is but simple justice to give credit to Mr. Mathewson and his corps of able assistants for the great technical skill and executive ability that are manifested in a remarkably high degree in every department. An inspection of the plant is a genuine pleasure. The Washoe works employ about 2,000 men directly and 500 men indirectly.

Miscellaneous enterprises of the Anaconda Copper Mining Co. include a brick plant at Anaconda, manufacturing mainly silica brick from local material, the refractory products of this plant ranking among the best. The company has sawmills at Hamilton, Montana, which, in 1907 cut 24,275,111' of lumber, board measure, of which the company used 5,463,000', the balance being sold. The company's coal mines at Belt, Montana, in 1907 produced 233,298 tons of coal, of which 16,111 tons were used at the mines, 106,594 tons were shipped to other departments of the company, and the balance was sold.

The Anaconda owns a controlling interest in the Butte, Anaconda & Pacific Railway Co., which, in 1907, transported 4,258,370 tons of ore and freight and 205,862 passengers. Gross earnings were \$1,434,767.32, with net earnings of \$160,786.04, on which a 6% dividend of \$60,000 was paid on the capitalization of \$1,000,000.

Early in 1907 the Anaconda made a 5-year contract with its mine workmen, under which wages were reduced October, 1907, when the price of copper fell, the men submitting to the reduction, in accordance with their contract, without a murmur. The relations of the company with its employes are exceptionally harmonious and satisfactory.

For 1907 the production of ore was 1,110,203 tons, yielding 63,055,661 lbs. fine copper, 2,001,351 oz. fine silver and 8,290 oz. fine gold, the average extrac-

tion being 2.85% copper, 1.73 oz. silver and 0.007 oz. gold per ton. For 1905 the copper production was 95,443,780 lbs., and for 1906 was 94,963,000 lbs., the falling off in 1907 being due to suspension of operations during the latter part of the year.

The Anaconda has immense ore reserves, and is capable of making considerably more copper than the average production of slightly under 100,000,000 lbs. yearly. The management throughout is of a high order of ability, and the property, which seemed, only a few years ago, to be on a downward grade, again ranks among the most vigorous, profitable and promising mines of the globe.

#### **ANACONDA MINE.**

#### **NEW MEXICO.**

Mine office: San Pedro, Santa Fe Co., N. M. Carruthers & Field, owners and managers. Ores carry gold, silver, lead, copper and zinc. Has steam power and is said to have a small smelter. Idle.

#### **ANACONDA MINE.**

#### **WESTERN AUSTRALIA.**

Mine office: Mount Morgans, Margaret Goldfield, Western Australia. Was a considerable producer of copper ore in 1906, the district shipping 4,316 long tons of copper ore, mainly from this property.

#### **ANACONDA MINING CO.**

#### **MONTANA.**

Office: 42 Broadway, New York, N. Y. Mine office: Butte, Silver Bow Co., Mont. Was the parent of the Anaconda Copper Mining Co., and still in existence at last accounts.

#### **ANACONDA MIZPAH COPPER CO.**

#### **NEVADA.**

Dead. Was merged, circa June, 1907, in the Ely-National Copper Co. Formerly at Ely, White Pine Co., Nev.

#### **ANACONDA PROPRIETARY COPPER, GOLD & SILVER MINE.**

#### **AUSTRALIA.**

Dead. Was liquidated and succeeded by Melrose Copper Mines.

#### **ANACONDA-SONORA COPPER CO.**

#### **MEXICO.**

Office: 95 East Fifth St., St. Paul, Minn. Letter returned unclaimed from former mine office, Sahuaripa, Sonora, Mex. J. W. Shepard, president and treasurer; Herbert W. Merrill, vice-president; J. F. Hibcher, secretary. Organized March 17, 1906, under laws of South Dakota, with capitalization \$3,000,000, shares \$10 par. Annual meeting, first Tuesday in June. Is said to be free of debt. Lands, 400 hectares and a 40 hectare millsite, with 23,000 acres miscellaneous lands, fairly timbered, with water rights. Property carries about 3½ miles of the strike of a porphyry and limestone contact deposit of 10' to 100' width, showing oxidized and sulphide ores. Old management claimed ore averaged 17.5% copper, 19 oz. silver and \$3.20 gold per ton, which was entirely too high, and apparently a deliberate misstatement. Mine has several tunnels, with about a quarter-mile of workings. The 120-ton smelter that the old management claimed to be building, 1906, seems to have become merely a smelter-site, on the Yaqui river, 9 miles west of the mine. Apparently present management is not responsible for the lies and stock-jobbery of the original directorate. Idle.

#### **ANCHORIA COPPER MINING CO.**

#### **WYOMING.**

Office: 365 Tenth St., Oshkosh, Wis. Mine office: Copperton, Carbon Co., Wyo. D. H. Craig, president; H. O. Granberg, secretary-treasurer; E. M. Sanders, superintendent; Frank Earle, consulting engineer. Organized April, 1901, under laws of Wyoming, with capitalization \$1,000,000, shares \$1 par. Lands, 4 claims, area 82 acres, patented, in the Battle Lake district, developed by a 200' shaft and tunnels of 45' and 60', showing an ore body estimated at 45' width, giving average assays of 17% copper and from a trace to \$5 gold per ton. Has a 40-h. p. steam plant, with hoist good for 500', 3 power drills and 4 substantial mine buildings, of logs.

**ANCHOR MINING CO.****UTAH.**

Office: Hancock, Mich. Operating office: Salt Lake City, Utah. Chas. A. Wright, Henry L. Baer and John D. Cuddihy, directors. Organized June, 1908, with capitalization \$150,000, shares \$25 par. Lands are in Wasatch county, Utah.

**COMPAÑIA MINERA DE ANDACOLLO.****CHILE.**

Office: Santiago de Chile. Mine office: Andacollo, Coquimbo, Chile. Organized July 4, 1906, under the laws of Chile, with capitalization 1,125,000 pesos, shares 15 pesos par.

**ANDERSON-APACHE COPPER CO.****NEW MEXICO.**

Office: Douglas, Ariz. Mine office: Hatchita, Grant Co., N. M. Employs circa 35 men. Geo. H. Neil, president; Harry Duey, vice-president; Chas. H. Howe, secretary & treasurer; Arthur Honle, general manager; L. H. Houlton, mine superintendent. Organized June 1, 1907, under laws of Arizona, with capitalization \$500,000, shares \$1 par; issued, \$160,925. Lands, 5 claims, area 100 acres, circa 6 miles from Hatchita, known as the Apache mine, held under a \$100,000 bond and lease. Property, opened 1883, was worked continuously, until 1907, by chloriders, producing approximately \$200,000. Lands show contact deposits between porphyry and Carboniferous limestone, carrying euprite, malachite, chalcocite, chalcopyrite and chrysocolla, ores being mainly oxidized to present depth, and estimated by company to average about 10% copper and 20 oz. silver per ton. Mine has a 2-compartment 300' shaft, with about 3,500' of workings, estimated to show about 250,000 tons of ore, with about 40,000 tons blocked out for stoping, which estimates seem high. Equipment includes a 25-h. p. Fairbanks & Morse gasoline hoist. Property is shipping about 120 tons of ore weekly, averaging about \$17 in value, to the Copper Queen smelter, and is considered promising.

**ANDERSON MINING CO.****BRITISH COLUMBIA.**

Dead. Formerly at Alberni, Vancouver Island, B. C.

**ANDES COPPER MINING & EXPLORATION CO., LTD.****CHILE.**

Office: 18 Bishopsgate St., London, E. C., Eng. Wm. B. Broderick, chairman; A. M. Harris, secretary. Organized July 29, 1897, under laws of Great Britain, with capitalization £100,000, shares, £1 par; issued, £6,707, one-half paid. Lands are in the province of Tarapacá, Chile. Idle some years and apparently moribund.

**SOCIEDAD BENEFICIADORA DE MINERALES ANDINA.****PERÚ.**

Mine office: Chico, Yauli, Junín, Perú. Has argentiferous copper ore. Idle.

**SOCIÉTÉ DES MINES DE CUIVRE ANDREA.****SPAIN.**

Office: Brussels, Belgium. Mine office: Andrea, Badajoz, Spain. Organized Sept. 27, 1907, under laws of Belgium, with capitalization f1,000,000, in 10,000 shares of f100 par, with 10,000 shares without assigned value. Lands include the Andrea, Esperanza and Neustra Señora del Carmen mines, in the district of Llorefia.

**ANGANG COPPER CO.****MEXICO.**

Office: Coliseo Nuevo, 4, Mexico, D. F. Mine office: Chirangangueo, Zitácuaro, Michoacán, Mexico. Arthur Chippendale, superintendent. Stock issue supposedly owned by Arimex Copper Co., a short-winded promotion by Thomas W. Lawson. Has a considerable body of low to medium-grade chalcopyrite, with a limited amount of development. Idle practically since birth.

**COMPAÑIA METALURGICA DE ANGANGUEO.****MEXICO.**

Mine office: Angangueo, Zitácuaro, Michoacán, Mex. Property was leased from the Michoacán Railway & Mining Co., Ltd., and the smelter was

practically rebuilt. Owing to excessive royalties, high cost of coke and insufficient development of mines, property was closed down, and company apparently is a failure.

**ANGEL MINING CO.**

Dead. Property passed to Arizona Gold & Copper Mines Co. Formerly at Wickenburg, Maricopa Co., Ariz.

**ANGLO-AMERICAN COPPER CO., LTD.**

Office: 21 Ironmonger Lane, London, E. C., Eng. Mine office: Kelvin, Pinal Co., Ariz. Jos. H. Gordan, J. P., managing director; C. M. Gordan, general manager; W. R. Feldtman, consulting engineer; C. E. L. Norris, secretary. Organized Jan. 21, 1905, under laws of Great Britain, with capitalization £100, shares £1 par. Debentures, £12,000 authorized; 22,000 issued. Lands include the old Ray mine, which has a concentrator that was overhauled 1908, and some diamond drill boring done. Property presumably sold.

**ANGLO-AMERICAN COPPER MINING COMPANY****ARIZONA.****ONTARIO.****OF PARRY SOUND, LTD.**

Letter returned unclaimed from former office, 211 State St., Chicago, Ills. Mine office: Parry Sound, Parry Sound district, Ont. Isaac Block, president; Jacob Newman, Jr., secretary and treasurer. Organized 1900, under laws of Ontario, with capitalization \$3,000,000, shares \$1 par. Lands are on Wilcox Island, near Parry Sound, showing veins carrying copper, silver, gold, cobalt and zinc, rendering the ore exceedingly refractory. Company estimates average ore values at 20% copper and 10 oz. gold per ton, which, of course, is untrue. Has one shaft, 125' deep. Mine could be operated opencast. Idle for some years and company apparently moribund.

**ANGLO-AMERICAN DEVELOPMENT CO.****MEXICO.**

Office: El Paso, Texas. Mine office: Barranca de Cobre, San Andres del Rio, Chihuahua, Mex. H. T. E. Cowell, president. Was said, 1908, to plan taking over property of the Barranca Copper Co.

**ANGLO-AMERICAN GOLD & COPPER CO.****MEXICO.**

Dead. Lost its lands. Formerly at La Cananea, Arizpe, Sonora, Mex. Fully described Vol. IV.

**ANGLO-BUTTE COPPER, LTD.****MONTANA.**

Office: 564 Salisbury House, London, E. C., Eng. Mine office: Butte, Silver Bow Co., Mont. Organized Apr. 11, 1907, under laws of Great Britain, with capitalization £6,030, in 6,000 ordinary shares of £1 par and 600 deferred shares of 1s. par, to carry on the business of copper mining.

**COMPANIA ANGLO-CHILENA DE COLLahuasi.****CHILE.**

Office: Valparaiso, Chile. Mine office: Collahuasi, Tarapacá, Chile. Organized May 17, 1906, under laws of Chile, with capitalization £200,000, shares £1 par.

**ANGLO-CHILIAN EXPLORATION CO., LTD.****CHILE.**

Dead. Was liquidated 1906. Formerly at Canutillo, Huasco, Chile.

**ANGLO-CHILIAN NITRATE & RAILWAY CO., LTD.****CHILE.**

Mine office: Tocopilla, Antofagasta, Chile. Property includes the San Juan, Altamira, San Carlos, Feliciana, Colorado and Bella Vista mines. Production, 1904, was 3,150 metric tons of ore ranging 14 to 19% in average copper tenor, the largest production being 2,400 tons or ore from the Mina Feliciana, averaging 15%.

**ANGLO-CHILI CONCESSIONS, LTD.****CHILE.**

Office: Broad Street House, London, E. C., Eng. W. S. Miln, managing director; C. B. Parry, secretary. Organized Apr. 12, 1907, with capitalization £15,000, shares £1 par; issued, £5,250, fully paid. No trace of operations discovered in Chile.

**ANGLO-MEXICAN MINING & EXPLORATION CO.****MEXICO.**

Office: St. Louis, Mo. Mine office: Guachinango, Mascota, Jalisco, Mex. Geo. B. Clark, president; Thos. B. Rowe, general manager; John Broderick, vice-president; Chas. L. Rucker, secretary; E. W. Farnham, treasurer. Was organized with capitalization \$650,000, as a holding company. Lands, 9 groups, including the Santa Laura group, area 67 hectares, south of Ajuchitlán de las Cañas, Tepic; mineral lands in Durango and the Jalisco group of 42 hectares, circa 42 miles from Guachinango, latter carrying several small veins of auriferous and argentiferous copper sulphides, and one gold vein, apparently an antigua, said to be 15' in width and to carry 20 grams gold per metric ton. Company plans a 50-ton mill and plant to treat gold ores by direct cyanidation.

**ANGLO-ROUMANIAN FINANCE & TRADING CO., LTD.** **ROUMANIA.**

Dead. Dissolved, August, 1904. Formerly at Baia Arama, Mehedințe district, Roumania. Described Vol. V.

**ANGLO-SPANISH COPPER CO., LTD.****SPAIN.**

Office: 4 Broad Street Place, London, E. C., Eng. Mine office: Alosno, Huelva, Spain. C. F. Lupson, secretary. Organized Jan. 9, 1907, under laws of Great Britain, with capitalization £300,000, shares £1 par. Lands include perpetual leases of the San Vicente, Fronteriza, Valrubio, Carolina and Infanta groups of copper mines, area 180 hectares, between the Rio Tinto and Tharsis mines, said to carry upwards of 3 miles of the strike of the San Vicente vein, giving average assays of 2.71% copper, 28.1% sulphur, 1 dwt. 6 grains gold and 2 oz. 18 dwts. silver per long ton. La Carolina and La Infanta mines are undeveloped, but have good ores, La Carolina giving assays up to 30% copper and La Infanta giving average assays of 4% copper and 12 oz. silver per metric ton. The Valrubio group carries the extension of the San Vicente vein, and the Fronteriza is considered a promising property. Principal development is on the San Vicente, which has an 1,800' tunnel with about 1 mile of workings. Company planned, for 1909, an ore production of about 75,000 tons, but at last accounts vendors, who control company, were in litigation with cash purchasers of shares over value of company's lands.

**ANGLO-WESTPHALIAN COPPER CO., LTD.****GERMANY.**

Office: 9 St. Mildred's Ct., London, E. C., Eng. A. W. Johanning, secretary. Organized Aug. 29, 1904, under laws of Great Britain, with capitalization £1,000,000, shares £1 par. Property includes the Kampf mine, area 84.7 hectares, also the Gottesegen and Gottesgabe concessions, area 874 hectares, in Rhenish Prussia.

**ANGUS COPPER MINING & MILLING CO.**

Office: 10 North Eighth St., St. Louis, Mo. Location of property, if any, unknown.

**ANIMAS MINING & SMELTING CO.****MEXICO.**

Office: care of P. Sandoval y Ca., Nogales, Mex. Letter returned unclaimed from former mine office, Llano, Magdalena, Sonora, Mex. Ores carry gold, silver, copper and lead. Main shaft, 400'. Has steam power and a 40-ton smelter, employing about 30 men, at last accounts.

**ANI MINE.****JAPAN.**

Owned by Furukawa Mining Co

**ANITA CONSOLIDATED COPPER CO.****ARIZONA.**

Dead. Reorganized, 1903, as Anita Copper Co. Formerly at Williams, Coconino Co., Ariz.

**ANITA COPPER CO.****ARIZONA.**

Dead. Property sold, under foreclosure, and company practically succeeded by Titanic Copper Co. Formerly at Williams, Coconino Co., Ariz. Fully described Vol. VI.

**ANITA COPPER MINES CO., S. A.****MEXICO.**

Is the Mexican incorporation of the Douglas Copper Co.

**ANITA MINING CO.****MEXICO.**

Dead. Formerly at Colotlán, Jalisco, Mex. Described Vol. VI.

**SOCIEDAD ESPAÑOLA DE FUNDICION DE LOS ANGELES.****CHILE.**

Office: Valpariso, Chile. Mine office: La Ligua, Aconcagua, Chile. Organized March 21, 1900, under laws of Chile, with capitalization 60,000 pesos, shares 100 pesos par. Property is Los Angeles mine and San José smelter, latter having a matting furnace, property formerly making circa 650,000 lbs. fine copper yearly. Idle at last accounts.

**ANNA MINE.****ARIZONA.**

Office: care of Fairbanks, Morse & Co., owners, Chicago, Ills. Letter returned unclaimed from former mine office, Providence, Yavapai Co., Ariz. Has copper-gold ores, opened by shaft, with a 15-stamp mill. Idle for some years.

**ANNANDALE COPPER MINES & SMELTERS, LTD.****AUSTRALIA.**

Office: 4 Broad Street Place, London, E. C., Eng. Mine office: Blayney, N. S. W., Australia. C. H. Pinkey, chairman. Organized July 2, 1905, under laws of Great Britain, with capitalization £200,000, shares £1 par.

**ANNANDALE MINE.****AUSTRALIA.**

Owned by New South Wales Mines &amp; Smelters, Ltd.

**ANNIE MINING CO.****WYOMING.**

Office: Laramie, Wyo. Mine office: Jelm, Albany Co., Wyo. J. F. Johnson, treasurer; Louis Miller, president and general manager; L. A. Hancock, secretary. Organized 1903, under laws of Wyoming, with capitalization \$250,000, shares \$1 par. Lands, 100 acres, 32 miles southwest of Jelm, said to show two 4' contact veins between granite and schist, opened by a 140' shaft and a 138' tunnel, showing azurite and bornite, assaying up to 20% copper and \$10 gold per ton. Idle since 1904.

**ANTELOPE GOLD & COPPER CO.****CALIFORNIA.**

Mine office: Loyalton, Sierra Co., Cal. In 1907 was sinking on a quartz vein of fair size.

**ANTELOPE MINING & MILLING CO.****CALIFORNIA.**

Office: 704 Columbia Bank Bldg., Pittsburg, Pa. Mine office: Clio, Plumas Co., Cal. C. E. Christman, president; Henry Rosser, treasurer; Robt. Dilworth, secretary. Organized under laws of Arizona, with capitalization \$1,000,000, shares \$1 par. Lands, 6 claims, in 2 groups, carrying considerable timber and having a vein of 2' to 4' width giving assay values of \$15 to \$22 per ton, mainly in gold and silver.

**ANTIGUA COPPER CO.****MEXICO.**

Office: 201 Ward Bldg., Battle Creek, Mich. Mine office: Alamos, Sonora, Mex. H. A. Clapp, general manager; D. H. Livingston, superintendent; A. W. Davis, treasurer. Organized 1906, as successor of Sonora Mining Co. Lands, 261 acres, showing contact fissures between granite-porphry and limestone, carrying copper, lead, silver and gold values, mainly in sulphide ores. Has 5 shafts, deepest 105', and about 700' of tunnels, longest being the Margarita, 340', showing 4 veins, having claimed average widths of 3', 10', 12' and 15', said to give average assays of 6.8% lead, 17 to 30 oz. silver and \$1 to \$2 gold per ton from oxidized ore. Company claims that its gold, silver and lead will leave the copper without cost, as a by-product, which claim is not warranted.

**ANTIGUA GOLD-COPPER CO.****HONDURAS.**

Office: 224 St. Charles St., New Orleans, La. Mine office: Minas de Oro, Honduras. W. W. Duson, president; Jas. L. Wright, vice-president; L. S. Scott, secretary and treasurer; preceding officers, Sylvan Levy, Lionel L. Lyons and E. L. Chappuis, directors; A. Neustadter, superintendent; E. B. Thompson,

mine superintendent. Organized March 26, 1907, under laws of Arizona, with capitalization \$2,000,000, shares \$5 par. Annual meeting, first Tuesday in September. Lands, 531 acres, near the Honduras Rosario, circa 100 miles southeast of Puerto Cortez, carrying considerable timber, in both hard and soft woods. Property shows Antigua workings, with about 1,500' of new workings, developing argentiferous and auriferous copper ores in limestone. Improvements include 4 buildings and a 48x80' frame stamp-mill, of 30 tons estimated daily capacity, having 5 Allis-Chalmers stamps and 3 Huntington mills. Ore has given assays of 2 to 3% copper, 2 to 4 oz. silver and \$2 to \$4 gold per ton.

**MINA ANTIGUA PILAR.****SPAIN.**

Mine office: Colmenarejo, Madrid, Spain. Property is an old mine, reopened 1906, which was producing small quantities of cupriferous pyrite at last accounts.

**COMPAÑIA DE COBRES DE ANTOFAGASTA.****CHILE.**

Office: Blanco No. 144, Valparaiso, Chile. Mine office: Chuquicamata, Antofagasta, Chile. Federico Lesser, chairman; Edourado I. I. Sandiford, vice-chairman; Carlos R. Harrison, secretary; Alejandro Muirhead, general manager. Organized Oct. 5, 1900, under laws of Chile, with capitalization £65,000, shares £10 par. Lands, 30 claims, area 100 hectares, also 2 kilometeras of river frontage for water power. Property is served by a branch of the Bolivian Railway. Property considered well located.

**COMPAÑIA INDUSTRIAL DE COBRE DE ANTOFAGASTA.****CHILE.**

Office: Santiago de Chile. Mine office: Antofagasta, Antofagasta, Chile. Organized Nov. 23, 1905, under laws of Chile, with capitalization 500,000 pesos, shares 10 pesos par.

**APACHE CHIEF MINING CO.****ARIZONA.**

Dead. Lands sold, circa 1907, to Arizona Success Mining Co. Formerly at Salome, Yuma Co., Ariz.

**APACHE CONSOLIDATED COPPER CO.****ARIZONA.**

Office: P. O. Box 101, Denver, Colo. Mine office: Globe, Gila Co., Ariz. Employs 10 men. Hon. John I. Mullins, president; F. S. Pfister, vice-president and general manager; Chas. T. Martin, secretary; E. M. Hurd, treasurer; preceding officers and Joseph Pfister, directors; Frank Pfister, mine superintendent. Organized May, 1906, under laws of Arizona, with capitalization \$2,000,000, shares \$1 par; issued, \$1,200,000. Lands, 15 claims, unpatented, area 300 acres, in the Richmond district, showing fissure veins and contact deposits between limestone and quartzite, of which 1 vein, of about 5' width, is traceable about 1,200'. Mine has shafts of 65', 45' and 20', with 6 tunnels, longest 335', giving 719' of workings, showing about 400 tons of ore averaging about 3.5% copper, up to 15 oz. silver, and from a trace to \$2.50 gold per ton. In 1907 produced 148 tons of ore returning 3.84% copper. Company plans continuing tunnel, deepening shaft and installing a hoist.

**APACHE COPPER CO.****ARIZONA.**

Office: 72 Trinity Place, New York, N. Y. Meyer Zulick, president. Capitalization \$2,500,000. Lands are in Yuma county, circa 25 miles east of the Colorado river and 100 miles west of Congress Junction, Ariz. Mine is developed by shafts and tunnels, showing ore with good gold and silver values. Considerable ore has been mined and is on the dumps. Property is considered valuable, if given adequate transportation facilities, or a near-by smelter. Idle.

**APACHE DEVELOPMENT CO.****NEW MEXICO.**

Dead. Lands sold, 1907, to Anderson-Apache Copper Co. Formerly at Hatchita, Grant Co., N. M. Described Vol. VI.

**APEX COPPER CO.**

Office: 304 Colorado Bldg., Colorado Springs, Colo. Mine office: Hayman, Park Co., Colo. Officers: John K. Vanatta, president; J. J. O'Driscoll, vice-president and general manager; C. W. Dolf, secretary. Organized March, 1903, under laws of Arizona, with capitalization \$2,000,000, shares \$1 par. Lands, 9 claims, area circa 90 acres, on Apex Hill, in the Lower Tarryall district, showing 2 nearly vertical contact veins, of 3' average width, between spar and limestone, carrying chalcopyrite and bornite assaying 2 to 30% copper, 7 oz. silver and \$1.20 gold per ton, opened by shafts of 50', 120' and 250', and by 4 tunnels of 250' aggregate length. Has a 10-h. p. steam plant, with hoists, and a 7-drill Leyner air-compressor. Management is regarded favorably.

**APOLLO COPPER MINING & MILLING CO.****UTAH.**

Dead. Formerly at Frisco, Beaver Co., Utah.

**APOLLO GOLD MINING CO.****WASHINGTON.**

Office: New Haven, Conn. Mine office: Republic, Ferry Co., Wash. W. A. Case, superintendent. Property is the California mine, carrying auriferous and argentiferous copper and lead ores. Has steam power.

**APPLE TREE COPPER CO., N. L.****AUSTRALIA.**

Office: 371 Queen St., Brisbane, Queensland, Australia. Mine office: Mount Cannindah, Queensland, Australia. Wm. Hasley, secretary; T. J. B. Howard, mine manager. Organized 1906, under laws of Queensland, with capitalization £1,200, shares £6 par. Lands, 4 leases, area 45 acres, 1½ miles from Mount Cannindah, having old workings consisting mainly of a 20' trench 500' long, showing a 6' vein with pay streaks of 2' to 4' width carrying 10 to 47% copper and up to 5 oz. silver and 3½ dwts. gold per long ton. Mine is said to show about 2,000 tons of ore.

**ARAGON COPPER MINES, LTD.****SPAIN.**

Office: 12 Lime St., London, E. C., Eng. Mine office: Tobed, Zaragoza, Spain. Employs 10 men. Gaston de Fontenilliat, chairman; Aimé Bonnia, vice chairman; preceding officers and J. D. O'Brien, directors; A. L. Lanseigne, secretary and treasurer. Organized Oct. 29, 1903, under laws of Great Britain, with capitalization £100,000, shares £5 par; issued, £5,000. Title changed January, 1907, from Rio Grío District Copper Co. (Tobed & Codos Exploration), Ltd. Lands, 14 claims, area reported by company as 1,100 acres. Ore is reported to average about 7% copper. Company has been handicapped by lack of capital, but hopes to secure additional funds shortly.

**AKAKAWA MINE.****JAPAN.**

Owned by Mitsu Bishi Goshi-Kwaisha.

**ARAMO COPPER MINES, LTD.****SPAIN.**

Office: 2 Metal Exchange Bldgs., London, E. C., Eng. Mine office: Pola de Lena, Asturias, Spain. C. W. Aston Key, secretary. Organized, July 3, 1897, under laws of Great Britain, with capitalization £40,000, shares £1 par. Property is the Aramo copper and cobalt mines. Idle for some years; no accounts made public, and apparently moribund.

**ARAPAHOE GOLD & COPPER MINING CO.****COLORADO.**

Mine office: Sunset, Boulder Co., Colo. Organized, circa 1899, under laws of Colorado. L. D. Longhi, president and treasurer; J. S. Riggs, secretary. Lands, 4 claims and a tunnel-site, in the Sugar Loaf district of Boulder county, Colorado. Idle since 1902 except for annual assessment work, done at the personal expense of the president.

**ARCADIAN COPPER CO.****MICHIGAN.**

Office and mine: 205 Montezuma St., Houghton, Houghton Co., Mich. Robert H. Shields, president and general manager; Sylvester T. Everett, vice president; William F. Miller, secretary and treasurer; preceding officers, John

**C. Shields, James W. Shields, Wm. B. Anderson, Lucius J. Kilmer and Simon J. Beahan, directors.** Organized Mar. 31, 1899, under laws of New Jersey, with capitalization \$3,500,000, shares \$5 par.

Lands, circa 3,200 acres, including 5 old mines, worked in a small way at various periods in the past. Present company operated vigorously, 1898-1901, and equipped the property with magnificent buildings and machinery, including a 3-stamp mill at Grosse Pointe. Operations proving unsatisfactory, all work was suspended June 15, 1903, hoists, machinery and shafthouses were sold to the Trimountain Mining Co., stampmill was sold to the Centennial Copper Co., and mine buildings disposed of, property being almost completely dismantled. Exploratory work was resumed October, 1905, on an amygdaloidal bed about one-fourth mile east of the Isle Royale lode, previously worked, and crosscutting from the 200' level of the new shaft disclosed 5 copper bearing beds in a distance of about 110'. Work was suspended March, 1908, but the company plans diamond drilling from the bottom of the exploratory shaft, as there remains about a quarter mile of undrilled territory on the eastern boundary, which may carry the southern extension of the Kearsarge lode and the northern extension of the Baltic bed. Equipment includes a new air-compressor. The old workings and equipment are fully described in Volumes I and II.

The floating debt, Oct. 11, 1906, was upwards of \$714,000, but the company sold 800 acres of land to the Quincy Mining Co. for \$750,000, liquidating the large floating indebtedness. At the annual meeting in January, 1908, cash, supplies and bills receivable aggregated \$42,449. The property is large and should contain workable copper deposits at some point. The quarter mile of undrilled territory is, without question, the most promising part of the company's lands, especially in view of recent important developments on the Kearsarge lode to the north and the Baltic lode to the south.

#### **ARC GROUP MINING CO.**

**WASHINGTON.**

Mine office: Kettle Falls, Stevens Co., Wash. Mine has a 70' shaft, on the Queen claim, showing an 8' vein carrying gray copper ore. Planned smelter shipments, 1908.

#### **ARCTIC CHIEF COPPER MINES CO.**

**YUKON.**

Office: Spokane, Wash. Mine office: White Horse, Yukon. T. B. Garrison, president; W. J. C. Wakefield, secretary; W. J. Elmendorf, consulting engineer. Lands, 6 miles west of White Horse, with good wagon road connecting, include the Arctic Chief and White Horse mines, with sundry other claims. Principal development is on the Arctic Chief, developed mainly open-cast, with tunnels and 820' of underground workings, showing argentiferous bornite and chalcopyrite, disseminated in massive magnetite, in a vein of 50' estimated average width, also a west ore body, discovered 1907, showing ore said to average 8% copper and \$5 per ton in combined gold and silver values. The Best Chance mine, held under bond, shows an outcrop of cupriferous magnetite, 25' to 60' high, 60' wide and 400' in length, carrying bornite and chalcopyrite, with some oxidized ores, and several seams of chalcocite, opened by sundry cuts, two 15' pits and a 35' shaft, showing ore assaying about 25% copper and 3 oz. silver per ton. Production, to end of 1907, was 707 tons, shipped to coast smelters, returning an average of 4.45% copper, 1.49 oz. silver and 0.194 oz. gold per ton, equivalent to circa 63,000 lbs. fine copper.

#### **AEDILLA COPPER MINES, LTD.**

**PORUGAL.**

Dead. Property seized, 1905, by debenture-holders. Formerly at Barraços, Alemtejo, Portugal.

#### **AREACHAP COPPER MINES, LTD.**

**CAPE COLONY.**

Office: P. O. Box 5754, Johannesburg, Transvaal. Mine office: Upington, Gordonia, Cape Colony. Francis Oats, chairman; Jas. M. Calderwood,

**M. I. M. M.**, consulting engineer. Organized under laws of Cape Colony, with capitalization £20,000, shares £1 par; working capital, £4,000. Lands, circa 44,000 acres, 16 miles from Upington, held under 2-year lease, at royalty of 3s. per long ton on ore shipped, with right to purchase base minerals only for £25,000 cash and £23,000 in shares. Mine has several shallow shafts and an opencut known as Bezuidenhout's quarry. Surface trenching at intervals, for 750', shows a cupriferous zone about 200' wide, with strike NNW., between granite and schist, with a gossan capping carrying considerable ore assaying 25 to 60% copper. Company plans smelting with a 20-ton reverberatory furnace, and made several small shipments, 1908, of ore returning 30 to 60% copper. Property considered promising.

**ARENILLAS COPPER MINES, LTD.** SPAIN.

Dead. Voluntarily wound up, May, 1904.

**ARGENTA COPPER CO.** UTAH.

Letter returned unclaimed from former mine office, Robinson, Juab Co., Utah. Idle for several years.

**ARGENTA MINES CO.** BRITISH COLUMBIA.

Office: 622-50 Congress St., Boston, Mass. Mine office: Ainsworth, Kootenay, B. C. Wm. F. Almy, president and general manager; Geo. R. Angus, secretary and treasurer; L. Hanna, superintendent; Alfred C. Garde, engineer. Organized April, 1902, under laws of Maine, with capitalization \$2,000,000, shares \$1 par. Lands, 17 claims, are 550 acres, showing limestone, schist, and black slate, traversed by porphyry and trap dykes, a fissure in the schist, ranging 7' to 30' in width, showing chalcocite and chalcopyrite assaying 3 to 20% copper, up to 16% lead and 7 to 46 oz. silver per ton, with a trace of gold. Has tunnels of 98', 572', 644' and 1,288'; with a total of 9,051' of openings, estimated to show 150,000 tons of ore. Company has developed 300 h. p. from a waterfall of several thousand horse power available. Has a 10-drill air-compressor and 5 power drills, with necessary mine buildings; is served by the Canadian Pacific Railway, and is 5 miles from Ainsworth, connected therewith by wagon road, built by the government. Officials and promoters sued January, 1908, for an accounting.

**ARGENTINA-TIERRA DEL FUEGO EXPLORATION CO.** ARGENTINA.

Office: care of Banco de Italia, Buenos Ayres, Argentina. Organized 1905, with capitalization £1,000,000.

**ARGENTINE COPPER MINING CO.** UTAH.

Mine office: Bingham Canyon, Salt Lake Co., Utah. Lands, sundry claims adjoining holdings of the Utah Consolidated. Idle.

**ARGENTINE & GENERAL EXPLORATION CO., LTD.** ARGENTINA.

Office: 35 Queen Victoria St., London, E. C.; Eng. Organized March 23, 1908, under laws of Great Britain, with capitalization £50,000, shares £1 par, to buy, of Señor Don Justo Pastor Fonseca, mines known as Las Animas, Deengatio and Restauradora, in Argentina.

**ARGENTINE MINERALS, LTD.** ARGENTINA.

Office: 62 London Wall, London, E. C.; Eng. Seymour Caldwell, chairman; Henry Bacon, secretary. Organized January 4, 1904, under laws of Great Britain with capitalization £11,000, in 10,000 shares of £1 par and 20,000 deferred shares of 1s. par. Property is a mine known as San Antonio de los Cobres, in the province of Los Andes, Argentina. Company also has a smelting concession for the province of Salta, Argentina. Presumably idle.

**ARGHANA MAADEN MINES.** TURKEY.

Office: care of Imperial Minister of Forests & Mines, Constantinople, Turkey. Mine office: Arghana Maaden, Turkey. Is owned and operated by the Turkish crown. Mine was opened circa A. D. 1600, and has been operated vigorously for about 3 centuries. Development is mainly by adits. The ore,

averaging about 12% copper, is smelted with charcoal to a matte of 50 to 60% copper tenor, which is shipped by camel to Tokat, for export. The workmen are paid in food, clothing and tobacco, and mining processes are archaic in all respects. Production, which is hampered by lack of adequate transportation facilities and by scarcity of fuel, is about 5,000,000 lbs. fine copper yearly.

**AEGO COPPER MINING CO.****MONTANA.**

Dead. Merged, March 7, 1904, in Eclipse-Argo Mining Co. Formerly at Canyon Ferry, Broadwater Co., Mont.

**ARGOLIS COPPER MINING SYNDICATE, LTD.****GREECE.**

Office: 19 Eastcheap, London, E. C., Eng. Mine office: Nauplia, Epidaurus, Greece. H. H. Waller, secretary. Organized March 1, 1904, with capitalization £5,000, shares £1 par; issued, £2,025. Property is a 25-year lease, expiring December, 1929, of 854.4 hectares, at a rental royalty of 4s. per ton on ore produced. Idle.

**ARGO MINING, DRAINAGE, TRANSPORTATION****COLORADO.****& TUNNEL CO.**

Mine office: Idaho Springs, Clear Creek Co., Colo. Chas. C. Parsons, president; H. W. Robinson, secretary; Samuel Newhouse, managing director. Capitalization, \$100,000. Entire stock issue is owned by Argo Transportation & Tunnel Co., Ltd., property being the Newhouse tunnel.

**ARGO TRANSPORTATION & TUNNEL CO., LTD.****COLORADO.**

Office: 3 Great Winchester St., London, E. C., Eng. Mine office: Idaho Springs, Clear Creek Co., Colo. F. Hargreaves, chairman; Jos. C. E. Gillham, secretary. Organized Nov. 29, 1905, under laws of Great Britain, with capitalization £150,000, shares 10s. par; issued, 269,883 shares, fully paid. Was a reconstruction of the Argo Tunnel & Mining Co., which, in turn, was a reconstruction of the Newhouse Tunnel Co., and property is the stock of the Argo Mining, Drainage & Tunnel Co. Property, better known as the Newhouse tunnel, 17,740' in length, and of 21,300' projected length, probably the longest mining tunnel in existence, has double tracks laid with 30-pound rails of 18" gauge. For the first 12,000' the tunnel is 9' high and 10' wide, the remainder being 8' high and 6' wide. The tunnel was begun January, 1894, and has a grade of 5" per 100'.

The mines under which this tunnel passes have produced about \$70,000,000 in metallic values, and the tunnel has cut sundry veins of ore carrying gold, silver, lead and copper, and several laterals have been driven, opening various ore bodies, of more or less promise. The Eureka shaft, sunk to depth of several hundred feet, is planned to connect with the tunnel at a depth of 1,600'. Plant is equipped with steam and electric power.

**ARGO TUNNEL & MINING CO., LTD.****COLORADO.**

Dead. Reorganized Nov. 29, 1905, as Argo Transportation & Tunnel Co., Ltd.

**ARGYLE MINING CO., LTD.****ARIZONA.**

Office: 194 St. Vincent St., Glasgow, Scotland. Letter returned unclaimed from former mine office, Prescott, Yavapai Co., Ariz. A. Mitchell, secretary. Organized Dec. 29, 1900, under laws of Great Britain, with capitalization £100,000, shares £1 par; issued, £66,000. Lands, 2 claims, area 40 acres, known as the Examiner and Mineral Hill, near Huron, Yavapai county, Arizona. Idle for some years.

**ARICHISE COPPER CO.****ARIZONA.**

Mine office: Safford, Graham Co., Ariz. J. E. Carpantar, president. Organized February, 1907, under laws of Colorado, with capitalization \$2,500,000. Lands are the Buena Vista group, north of Safford, said to have been bought for \$40,000 and said to show a 6' vein of low grade copper ore carrying silver

and gold values, opened by a 100' shaft and a 580' tunnel. Shipped a little ore, late 1907.

#### **ARIMEX CONSOLIDATED COPPER CO.**

**ARIZONA & MEXICO.**  
Office: 85 Ames Bldg., Boston, Mass. Chas. H. Dickey, president; C. D. Burrage, secretary. Organized under laws of New Jersey, with capitalization \$5,000,000, shares \$25 par. Property includes the Copper Prince group of 30 claims, in the Silver Bell district, Pima county, Arizona, held through Oxide Copper Co.; seven-eighths of the stock of the Table Mountain Copper Co., which has 27 claims in the Bunker Hill Mining district of Pinal county, Arizona, and nine-tenths of the stock issue of the Angang Copper Co., which holds about 400 hectares, known as the Chiranganguero mines, near Zitácuaro, Michoacán, Mexico. Neither of the Arizona properties is of apparent promise, but the Mexican claims might be of some value if properly developed. Company was promoted by Thomas W. Lawson, and, like his other copper mining companies, apparently is merely a stock-jobbing scheme.

#### **ARIO COPPER CO.**

**MEXICO.**  
Office: 1525-25 Broad St., New York, N. Y. Mine office: Ario de Rosales, Ario, Michoacán, Mex. Geo. H. Walsh, Jr., treasurer. Lands include La Roma, Bohemia and Flora mines, on the projected line of the Morelia & Tacambaro railroad, which was under construction at last accounts, and the San Antonio and San Valentín mines, old properties carrying silver and copper ores.

#### **ARISPE MINING & DEVELOPMENT CO.**

**MEXICO.**  
Office: Chicago, Ills. Capitalization \$10,000,000, shares \$1 par. Supposed to have lands located somewhere in the district of Arizpe, Sonora, Mexico.

#### **ARIZONA AMALGAMATED COPPER CO.**

**ARIZONA.**  
Dead. Was organized, circa 1907, under laws of Maine, with capitalization \$15,000,000, shares \$5 par; name changed, circa November, 1907, to Copper Company of Arizona. Formerly at Clifton, Graham Co., Ariz.

#### **ARIZONA-APACHE MINING CO.**

**ARIZONA.**  
Office: care of W. J. Guthrie, president, Pasadena, Cal. Mine office: Tucson, Pima Co., Ariz. A. G. Pohndorf, vice-president; Thos. Stafford, superintendent. Organized March, 1907, with capitalization \$2,500,000, shares \$5 par. Lands, known as the Feran group, are circa 32 miles from Tucson, in the Santa Catalina Mountains. Company plans sinking a double compartment shaft and adding gas power. In December, 1907, Frank Foran, original owner of the ground, took forcible possession. Company dispossessed and practically out of business.

#### **ARIZONA & ARKANSAS LEAD, ZINC & COPPER MINING CO.**

#### **ARIZONA BELLE MINING CO.**

#### **ARIZONA.**

Dead. Formerly at Vail, Pima Co., Ariz.

#### **ARIZONA BLUE BELL COPPER CO.**

#### **ARIZONA.**

Dead. Was successor of Butte & Arizona Copper Co., and was succeeded by Arizona Exploration Co. Formerly at Mayer, Yavapai Co., Ariz. Fully described Vol. V.

#### **ARIZONA-BOSTON COPPER CO.**

#### **ARIZONA.**

Letter returned unclaimed from former mine office, Globe, Gila Co., Ariz. O. S. Paul, president; J. W. Hawes, treasurer and clerk. Organized May 8, 1907, under laws of Maine, with capitalization \$1,500,000, shares \$1 par. Lands, 28 claims, in 3 groups, area circa 500 acres, one adjoining the McMillen-Stonewall Mining Co., circa 18 miles northeast of Globe.

**ARIZONA CENTRAL COPPER CO.**

Office: 1304 Keystone Bldg., Pittsburg, Pa. Mine office: Dewey, Yavapai Co., Ariz. Hon. J. F. Wilson, president; J. R. Cleveland, vice-president and manager; J. M. Elder, secretary; J. W. Norton, treasurer; preceding officers and J. S. Carmichael, directors. Capitalization \$2,000,000. Lands, 18 claims, area 368 acres, in one group, on the western slope of the Black Hills, 6 miles northeast of Dewey, the nearest railroad station, and 2 miles south of the Yaeger Cañon mine. Property has a contact mineral zone of 800' to 1,200' claimed width, showing a gossan carrying quartz veins, up to 16' in width, giving good assay values in copper, gold and silver. Mine has about 15 openings, including the 485' Shylock incline shaft, said to show, at depth of 230', a 4' paystreak of black copper sulphide ore, with 7 additional ore bodies of 3' to 8' width, to depth of 340', giving good assays in copper, lead, silver and gold. Has gasoline power. Property considered promising.

**ARIZONA-COLORADO COPPER BELT & GOLD MINING & MILLING CO.**

Office: 305 State Life Bldg., Indianapolis, Ind. Mine office: Globe, Gila Co., Ariz. Hon. Robt. N. Force, president and general manager; Chas. H. Jollner, vice-president; Chas. Trotter, secretary; C. Fenger, Sr., treasurer; Jos. W. Bandhauer, superintendent. Organized September, 1901, under laws of Arizona, with capitalization \$2,500,000, shares \$1 par. Lands, 21 claims, area 400 acres, 3 miles northeast of Globe, showing veins of 3' to 100' estimated width, carrying auriferous and argentiferous copper oxides and carbonates, giving assays of 8 to 30% copper, 20 to 50% lead, 1 to 200 oz. silver and \$3 to \$30 gold per ton. Has 7 pits and shafts, deepest 800', cutting several small veins and one vein of 40' estimated width, latter cut at depth of 150'. Has a 100-h. p. boiler, 1,000' hoist and 10-drill air-compressor. Has shipped a little ore of fair grade.

**ARIZONA COMMERCIAL CO.**

Dead. Succeeded, 1904, by Arizona Commercial Copper Co. Formerly at Globe, Gila Co., Ariz.

**ARIZONA COMMERCIAL COPPER CO.**

Office: 82 Devonshire St., Boston, Mass. Mine office: Globe, Gila Co., Ariz. Nathan L. Amster, president; W. M. Bradley, secretary; R. Townsend McKeever, treasurer; C. R. Jeffers, assistant secretary and treasurer; preceding officers, William A. Paine, Charles H. Paine and A. B. Clough, directors; J. W. Bennie, general manager; H. A. Collins, superintendent; Patrick C. O'Neil, mine superintendent.

Organized January, 1905, under laws of Maine, with capitalization \$2,500,000, increased, 1908, to \$3,000,000, shares \$25 par. Has authorized an issue of \$500,000 of 6% bonds, convertible into stock at \$20. It is planned to devote \$300,000 from the bond issue to the erection of a smelter, balance of proceeds going to working capital. Annual meeting, second Wednesday in January. Shares are listed on the Boston stock exchange. American Loan & Trust Co., Boston, transfer agent. Federal Trust Co., Boston, registrar.

Lands, 11 claims, 3 fractional, in 2 groups, known as the Black Hawk and Copper Hill mines, separated by the Iron Cap mine of the National Mining Exploration Co., in Copper Gulch, circa 2 miles from Globe, lying just north of the Old Dominion and adjoining the United Globe and Superior & Boston mines. The property has large bodies of low grade carbonate ore, but principal values, as developed, are in sulphide ores of medium and high grades.

The Copper Hill mine has an 800' shaft showing a vein up to about 20' in width, with a 5' paystreak assaying about 4% copper, and is connected underground with the Gray mine of the Old Dominion. There are several

**ARIZONA.****ARIZONA.****ARIZONA.****ARIZONA.**

openings on silicious surface ores, and about 15,000 tons of such ores have been shipped.

Principal developments are on the Black Hawk mine, where there are 2 shafts, one being a 3-compartment 500' shaft. The Black Hawk has a surface capping of low-grade iron ore, above a 45' vein of silicious ore estimated to average about 4% copper, with excess of iron. There also is a hematite vein of 3' to 4' width, giving assays of 4.5% copper, with small silver values. At depth the vein is larger, being up to 60' in width on the 400' level, and carrying sulphide ore of 6 to 7% copper tenor.

Railroad connections were secured March, 1907, when active shipments were begun, and in six months the company shipped about 25,000 tons of ore returning about \$7.50 per ton, after deducting freight and smelting charges. Production was suspended September, 1907, on account of the drop in the price of copper. The Black Hawk mine shipped about 500 tons of high grade ore for test purposes in 1907. Mr. Amster estimates an average extraction of about 7% copper from Black Hawk ores, at a cost of 6.5 cents per pound. Cash on hand, Dec. 31, 1907, was \$51,106.61; supplies, \$22,440.17; accounts receivable, \$5,900.38, as against about \$6,000 actual liabilities. Production, 1906, was 939,102 lbs. fine copper, and for 1907 was 1,638,610 lbs. fine copper and 1,644 oz. fine silver.

The company plans erecting a reduction plant of about 300 tons daily capacity, and estimates that \$3.50 per ton can be saved by doing its own smelting. The company has a strong management financially, and is being developed vigorously.

#### **ARIZONA CONSOLIDATED COPPER MINES, LTD.**

**ARIZONA.**

Office: Throgmorton House, Copthall Ave., London, E. C., Eng. Mine office: Clifton, Graham Co., Ariz. Hon. H. A. Stanthorpe, director; W. Fairhall, secretary. Organized June 17, 1899, under laws of Great Britain, with capitalization £150,000, shares £1 par. Lands include claims in the Copper Mountain district, also a millsite on the San Francisco River, former said to show veins of 5' to 10' width carrying a considerable variety of copper ores of different grades. Idle at last accounts, except for endeavors to raise money for a 50-ton smelter.

#### **ARIZONA CONSOLIDATED GOLD & COPPER CO.**

**ARIZONA.**

Office: Phoenix, Ariz. Mine office: Winkelman, Gila Co., Ariz. Employes 4 men. H. B. St. Claire, president; J. S. Miller, vice-president; H. H. McNeil, secretary and treasurer; S. G. Gardom, superintendent. Organized June 12, 1907, under laws of Arizona, with capitalization \$5,000,000, shares \$1 par. Lands, 19 claims, area 380 acres, held by location, also a 20-acre millsite, showing numerous fissure veins, of which 4, under development, are said to average 30" width. Property has several pits of 10' to 15', shafts of 70', 32', 50', 40', and a 40' tunnel.

#### **ARIZONA CONSOLIDATED MINING CO.**

**ARIZONA.**

Office: 1420 Chestnut St., Philadelphia, Pa. Mine office: Johnson, Cochise Co., Ariz. Alfred S. Miller, president; Jas. W. Stetson, secretary and treasurer; Samuel J. Entrikin, general manager; Hale McCormick, mine superintendent. Organized July 21, 1904, under laws of Delaware, with capitalization \$1,000,000, shares \$1 par, in \$300,000 of 6% preferred stock and \$700,000 of common stock. Is operated as a close corporation.

Lands, 12 claims, area 240 acres, 7 miles northwest of Cochise, formerly owned by Russell Consolidated Copper Co., showing 5 ore bodies, of which 3, under development, range 4' to 6' in average width, carrying carbonate and sulphide ores, estimated by company to average 8% copper and 1.2 oz. silver per ton. Sulphide ore was encountered at depth of 671'. Property is opened by 6 shafts. Lands include the Mammoth and New Republic groups, latter

opened to depth of about 700', with circa one mile of workings. The Mammoth mine is about 350' deep. Both properties are equipped with power hoists. The Russell Consolidated shipped, 1880-1882, considerable quantities of rich carbonate ores, of about 30% average copper tenor. Production, 1907, was 245,040 lbs. fine copper, and 3,122 oz. fine silver, valued at \$51,057.08.

#### ARIZONA COPPER CO., LTD.

#### ARIZONA.

Office: 29 St. Andrews Square, Edinburgh, Scotland. Mine office, Clifton, Graham Co., Ariz. Employs circa 2,000 men. John Gill, chairman; John G. Hopkins, managing director; preceding officers, Col. J. Bald Harvey, P. Dickson, J. P., Lord Salvesens, G. Readman, Alex McNab, J. P., and J. Wilson, directors; Norman C. Carmichael, assistant general manager; Wm. Exley Miller, secretary; Robert Addie, consulting engineer; Geo. Fraser, smelter superintendent; Archibald Morrison, mill superintendent; C. D. Clark, mechanical engineer.

Organized Aug. 5, 1884, under laws of Great Britain, with capitalization £755,000, of which £736,504 is issued, as follows: £40,000 in 160,000 A preference shares, 5s. par, upon which no calls have been made, but £7,840, 10a. is paid in advance; £316,530 (part of £320,000) in full paid preference stock; £316,530 (part of £320,000) in 1,266,120 shares of fully paid preferred stock, shares 5s. par; and £63,440 (part of £75,000) in 253,776 shares of fully paid deferred stock, shares 5s. par. Profits are divided as follows: 10% cumulative dividend on A preference shares, 7% cumulative dividends on preference shares, 10% non-cumulative dividends on preferred ordinary shares, 10% non-cumulative dividends on deferred shares; balance, if any, to be divided pro rata between preferred ordinary and deferred ordinary shares. Debentures, £175,210 terminable 5% bonds outstanding. Fiscal year ends Sept. 30. For fiscal year ending Sept. 30, 1907, mining profits were £351,650 and railroad profits were £129,070, dividends being £24,581 on preferred shares and £284,900 on ordinary shares, with £108,000 credited to reserve capital outlay and £36,950 credited to surplus. About 20% of the stock issue is held in the United States.

Lands are circa 4,000 acres, including 8 producing mines, at Morenci, Metcalf, Longfellow, Garfield and Coronado, in Graham county, Arizona. Ores, as produced, give average returns of about 3.5% copper, production being about 10% smelting ore and 90% concentrating ore. Mines, except the Coronado, are developed to a depth of about 500' only, being opened mainly by tunnels, giving cheap extraction. Notwithstanding the comparatively shallow zone of development a tremendous amount of ore is in sight, ore reserves, March, 1905, being estimated at 10,870,600 tons practically in sight.

The Humboldt mine, which is the largest producer, shows a large body of low grade disseminated chalcocite. Extraction from this property is partly open-cast, but mainly through tunnels equipped with electric lights and electric traction. The haulage system uses the overhead trolley, power being furnished by a 150-h. p. Crossley gas-engine, driving a 100-h. p. generator that furnishes a 225-volt current. Electric locomotives of 10-h. p. haul 40-ton loads, the line having a single track laid with 10-lb. rails, running 600' directly through the mountain, with a loop reaching all workings of the Humboldt mine, the tunnel running through International Hill direct to the new concentrator.

The Longfellow mine is the oldest important copper producer of Arizona, having been opened circa 1877. A 1,300' tunnel driven from Chase creek connects with a 600' blind shaft, obviating about 3 miles of railroad haulage over bad grades. The Longfellow Extension mine is developing satisfactorily.

The Metcalf group, 7 miles from Clifton, is worked open-cast, and is an extensive producer of low grade oxidized ores, which are concentrated with the sulphide ores from the Humboldt and Yavapai groups.

The Coronado group, 9 miles from Clifton, has 3 shafts, deepest 700', the

latter having found, at a depth of 700', in the granite, an ore body of about 5.5% copper tenor, apparently disproving the claim that all ore values are cut off at about 500' depth. The Coronado group shows considerable high grade ore.

The Clay mine, which was but a small producer in the past, has been developed to important dimensions, and shows a large tonnage of low and medium grade ore.

Ore is taken from the different mines by 6 gravity tram-lines to storage bins on the Coronado railroad, whence hauled to the reduction plant at Clifton. The Coronado railroad is of standard gauge for 4 miles, from Clifton to Longfellow, and is of 36" gauge for 3.2 miles, from Longfellow to Metcalf, the road having 30-ton ore cars. The company also operates the Arizona & New Mexico railroad, a highly profitable standard-gauge line of 107 miles, running from Clifton to Hatchita, N. M., where connection is had with the El Paso & Southwestern.

The mines and works use about 3,000 h. p., supplied in about equal portions from steam, gas and distillate engines. The gas-engine plant is exceptionally complete and effective. It has been planned to develop hydro-electric power and transmit same from a dam about 50 miles distant.

The works at Clifton, Morenci, Longfellow and Metcalf, being somewhat scattered, were remodeled and enlarged 1902, 1904 and 1905, now including 6 concentrators, a smelter, leaching plant and acid plant. The concentrators, having about 2,400 tons combined daily capacity, are operated by gas and electric power, putting 6.6 tons of crude ore into one ton of concentrates. No. 6 concentrator, put into commission July, 1906, is the largest, having about 900 tons daily capacity. The building, of steel, is equipped with two 600-ton crushers and a 250-h. p. Nördberg engine direct-connected to a 125-h. p. dynamo, steam being furnished by three 400-h. p. Stirling boilers. No. 6 mill has a large settling basin, from which tailings are removed and filled into the mine. Chase creek was dammed to prevent tailings going into the Frisco river, and thence into the Gila river, as they caused considerable damage to farmers and ranchers, but the damming of Chase creek brought about floods that have caused great damage to the company and to the village of Clifton, hence, in 1908, a pipe-line was built to carry the tailings and discharge same on the flat, several miles down stream. Milling equipment at the various concentrators includes 2 Hancock jigs, installed 1905, handling 600 tons daily; which replace 35 Frue Vanners, 2 Wilfley tables and 8 other machines. The Hancock jigs are highly economical of floor space and require little water. There also are Allis-Chalmers high-speed rolls for crushing and Huntington mills for re-grinding.

The smelter is of steel frame with slate roof and floor of iron plates laid in cement. There are six 300-ton water-jacket blast-furnaces, each 39x240' at the tuyeres, with blast supplied by Nos. 7, 9 and 10 Connerville blowers, operated by a 275-h. p. engine. Gases from the blast-furnaces pass through a 480' tunnel and 300' stack. Slag settlers are 7x14x3', with a 6" fire-brick lining. Matte of 50 to 55% copper tenor is charged into the converters by a 10-ton ladle, handled by a 30-ton electric crane. The conversion plant has 3 stands and six 7-ton shells, with a daily capacity of 50 tons of 99.5% blister copper. Disintegration of slag by running water has been discontinued, and molten slag again is handled in ladle cars, by a steam locomotive. A 25-ton briquetting plant was built, 1905, using coal breeze for a binder, under 2,000 lbs. pressure per square inch. Plant is entirely automatic, fines going in at one end and briquettes being loaded upon cars at the other.

The acid plant makes about 3,000 tons of sulphuric acid yearly from the fumes of the roasters, the entire product being used in the leaching plant,

which treats an average of about 250 tons of low grade oxidized ores daily. In connection with the leachery there is a 125-ton bluestone plant, turning out bluestone equivalent to about 3,000,000 lbs. fine copper yearly. This is perhaps the most successful leaching plant in the United States, and the management is entitled to credit therefor.

Miscellaneous enterprises include a well equipped foundry, machine shop, sawmill, planing mill and 20-ton ice plant, all built of brick. The company also has general merchandise stores at Clifton, Longfellow and Metcalf, and a good library and reading room are maintained for employes.

High water mark in production was reached in 1904, with an output of 32,197,760 lbs. of fine copper; output of 1907 amounting to 30,794,092 lbs. fine copper, valued at \$6,150,050. A recent change in management, by which Mr. Hopkins was put in charge of the property, is expected to result, eventually, in increased production. The management has been criticized freely for alleged shortcomings, but some of these criticisms seem to have been founded more upon prejudice against the British management than upon reasonable grounds. While there are doubtless opportunities for improvements in various directions, it should be borne in mind that the Arizona has been a large and highly profitable producer of copper for many years, and that its ore bodies, while extensive, are low in average tenor. Under these circumstances the management has made a decidedly creditable record.

#### **ARIZONA COPPER BELT MINING CO.**

**ARIZONA.**

Office: 612-25 Broad St., New York, N. Y. Mine office: Constellation, Yavapai Co., Ariz. Wm. J. Dilthey, president; Alex. McNear, vice-president and secretary; Chas. H. Peckworth, treasurer; E. G. Straub, general manager; preceding officers, J. P. Rappold and Wm. A. Garrison, directors; Harry E. Jones, superintendent. Organized February, 1906, under laws of Arizona, with capitalization \$1,000,000, shares \$1 par. Lands, 11 claims, area 220 acres, including the Wren and Texas groups, in the Black Rock district, said to show a 4' to 22' fissure in granite-porphyr, traceable 2,000', each claim having shallow shafts, 2 deepest circa 115' each. Eight claims carry mainly gold values, up to \$48 per ton, and 3 claims carry principally ore assaying 8 to 17% copper, 0.83 oz. silver and circa \$10 gold per ton. Has gasoline power. Apparently more attention has been devoted to company's financing than to developing ore.

#### **ARIZONA COPPER CHIEF SMELTING CO.**

**ARIZONA.**

Office: 714 Hartford Bldg., Chicago, Ills. Claimed July, 1906, to have hundreds of tons of copper glance in sight. Location of lands unknown.

#### **ARIZONA COPPER-GOLD MINES CO.**

**ARIZONA.**

Office: 1011 Pabst Bldg., Milwaukee, Wis. Mine office: Prescott, Yavapai Co., Ariz. Employs 12 men. R. H. Burmister, president and general manager; Chas. McKenney, vice-president; F. E. Wildish, secretary; F. L. Wright, treasurer; preceding officers, C. N. Smith, W. V. Jones, A. S. Duffles, J. W. Howell and T. S. Norris, directors; J. S. Sheehan, superintendent. Organized Oct. 12, 1903, under laws of Arizona, with capitalization \$1,000,000, as Arizona Gold-Lode Mines Co., and reorganized Apr. 10, 1906, under present title, with capitalization \$1,500,000, shares \$1 par.

Lands, 17 claims, area 340 acres, in the Cherry Creek district, circa 15 miles northeast of Humboldt. Development is by several shallow shafts and short tunnels with circa 3,500' of workings, on a 2' fissure vein, reported by company's engineer to give 17,329 tons of ore in sight. Ore apparently averages about 2% copper, with gold values. Has a 40-h. p. steam hoist, good for 1,000' depth, with 4 mine buildings, including a 10-stamp mill. Management plans sinking shafts to 1,000' depth. Company was promoted by Pierce Underwood, and advertised extensively, some very wild statements being made in

the advertisements. At last accounts company was indebted to its general manager and superintendent.

**ARIZONA COPPER & GOLD MINING CO.**

**ARIZONA.**

Letter returned unclaimed from former office, Phoenix, Ariz. Mine office: Salome, Yuma Co., Ariz. Company owns a 20% stock interest in the Savage Gold & Copper Mining Co. Lands, 5 claims, unpatented, in the Harcuvar Mountains, having a 55' tunnel showing a 5' vein of auriferous copper ore, and a 320' shaft bottomed in a vein of circa 20' width carrying malachite and chalcopyrite. Is claimed to have about 1,000 tons of smelting ore on the dump.

**ARIZONA COPPER HILL MINING CO.**

**ARIZONA.**

Dead. Property sold under foreclosure. Formerly at Oracle, Pinal Co., Ariz. Described Vol. VI.

**ARIZONA COPPER MINING CO.**

**ARIZONA.**

Office: care of Geo. H. Parker, secretary and treasurer, Los Angeles, Cal. Mine office: Tucson, Pima Co., Ariz. E. C. Griffith, president; Louis F. Fletcher, vice-president; preceding officers and P. G. Turner, directors; B. C. Brechta, superintendent. Lands, 20 claims, in the Tucson Mountains, having a 400' tunnel, said to show an 8' vein carrying ore of good grade. Presumably idle.

**ARIZONA COPPER MOUNTAIN MINING CO.**

**ARIZONA.**

Office: care of B. T. MacMasters, secretary and treasurer, First National Bank Bldg., Chicago, Ills. Organized Jan. 25, 1901, under laws of Utah, with capitalization \$1,000,000, shares \$1 par. Lands, 6 claims, area 120 acres, in process of patenting, 25 miles from a railroad, in the Copper Mountain district of Mohave county, Arizona, developed by 4 shafts, deepest 200', and a tunnel of 183', with a total circa 1,500' of underground openings, showing 5 veins of 3" to 30" width, carrying oxide and carbonate ores, with a little chalcocite, giving good assays in copper, with gold values of \$1.20 to \$8.90 per ton. Presumably idle.

**ARIZONA COPPER MOUNTAIN MINING CO.**

**ARIZONA.**

Dead. Title changed, 1904, to Copper Butte Mines. Formerly at Phoenix, Maricopa Co., Ariz.

**ARIZONA COPPER PLACE MINING & MILLING CO.**

**ARIZONA.**

Mine office: Quartzsite, Yuma Co., Ariz.

**ARIZONA COPPER QUEEN MINING CO.**

**ARIZONA.**

Office: New York Life Bldg., Kansas City, Mo. Mine office: Mayer, Yavapai Co., Ariz. Shannon C. Douglas, president; Edwin Herrider, secretary; Ernest J. White, treasurer; Wm. Burr Douglass, general manager; preceding officers and H. C. Crowell, directors; John McIlwhee, superintendent. Organized July 24, 1907, under laws of Arizona, with capitalization \$5,000,000, shares \$1 par. Lands, 6 claims, on Copper Creek, circa 25 miles southeast of Mayer, claimed to show 10 practically parallel veins, carrying ore assaying 6 to 84% copper, 2 to 57 oz. silver and \$10 to \$100 gold per ton. Development is by various trenches and by shafts of 30', 30', 35', 40', 60' and 90'. Has a power plant with air-compressor. Suspended operations circa November, 1907, but planned resumption 1908.

**ARIZONA COPPER SMELTING CO.**

**ARIZONA.**

Office: care of L. C. Miller, vice-president, Los Angeles, Cal. Letter returned unclaimed from former mine office, Kelvin, Pinal Co., Ariz. Dr. O. B. Bachman, president; Chas. H. Peck, secretary and treasurer; preceding officers and Edw. A. Gill, directors. Dr. O. B. Bachman, the president, cannot be located at former addresses in Los Angeles or New York; H. M. Sorrick, understood to be a director, says that he is not, and Chas. H. Peck, formerly secretary and treasurer, says he has resigned. William R. de Grouchy & Co., of Boston, the fiscal agents, have disappeared. Organized under laws of Arizona, with capitaliza-

tion of \$1,000,000, shares \$10 par. Lands, said to be 20 claims, area circa 400 acres, on the western slope of the Pinal Mountains, 12 miles northeast of Kelvin, including the Bobtail, Black Jack and Brooklyn groups, having a 215' shaft, said to be bottomed in a 9' vein and claimed to have 1,800' of workings, with alleged ore blocked out valued at \$1,120,000, which is more than doubtful. The Bobtail mines are considered valuable, and some of the officers enjoy good local standing, but the company apparently is merely a bit of stock-jobbery.

**ARIZONA COPPER SYNDICATE.**

Dead. Succeeded, Dec. 29, 1903, by Clifton Copper Mines, Ltd. Formerly at Clifton, Graham Co., Ariz.

**ARIZONA COPPER SYNDICATE, LTD.**

Dead. An English twin of the Arizona Copper Syndicate. Formerly at Clifton, Graham Co., Ariz.

**ARIZONA COPPER SYNDICATE OF PROVIDENCE.**

Office: 171 Westminster St., Providence, R. I. Mine office: Pearce, Chilchase Co., Ariz. T. F. Gilbane, trustee and manager. Organized February, 1907, by a pool of old shareholders of the Copper King of Arizona, a concern of evil reputation and frequent reconstructions, which lost its property, under foreclosure, Aug. 28, 1905. Lands, 28 claims, 17 patented, and 2 millsites. Mine has a 225' incline shaft, with about 350' of tunnels, showing some ore of good tenor. Smelter, having a 30-ton water-jacket blast-furnace, has been idle since 1902. Property is idle and company is desirous of selling out.

**ARIZONA DIAMOND DRILL MINING DEVELOPMENT CO.** **ARIZONA.**

Office: 313 West Second St., Los Angeles, Cal. Hon. Owen McAleer, president; Dr. Wm. Dodge, first vice-president; A. W. Bruner, second vice-president; J. S. Van Doren, secretary; Edwin F. Hill, treasurer; Oscar Reinholt, general superintendent. Organized under laws of Arizona. Owns a controlling interest in the Cashier Copper Mining Co., and is said to have an option on the McClure North Extension property, in the Bully Hill district of Shasta county, California. Is well equipped with diamond drills, and does a general drilling business, under the management of Mr. Reinholt, a practical man of experience.

**ARIZONA & EASTERN MINES & POWER CO.**

Office: 6-135 Grand Ave., Milwaukee, Wis. J. O. Buckley, president and treasurer; Henry R. Buckley, vice-president; Thos. T. Somers, secretary; Donald Ferguson, general manager and consulting engineer. Capitalization \$7,500,000, shares \$100 par. Company advertises that it wishes to purchase mining properties in Arizona or Sonora. No trace of operations.

**ARIZONA & EASTERN MINING CO.**

Office: 637 Endicott Bldg., St. Paul, Minn. Mine office: Globe, Gila Co., Ariz. W. H. Sisson, president; T. W. Teasdale, vice-president; Maj. E. L. DeLestry, secretary and general manager; preceding officers, A. C. Osborne, W. H. Ulmer, Otto Bremmer and M. P. Ryan, directors. Organized December, 1905, under laws of District of Columbia, with capitalization \$1,500,000, shares \$1 par. Lands, 19 claims, area 380 acres, with a 20-acre millsite and 60 acres miscellaneous lands, in the Globe and Kelvin districts, including the Patterson group of 6 claims in the Mineral Creek district, some miles west of Globe. Properties are said to show 3 veins, of which one, under development, is reported as of 7' average width, traceable 3,900', ore being reported to carry an average of 2% copper, up to 50 oz. silver and \$2.25 gold per ton, in covellite, bornite and chalcopyrite. Development is by a 181' tunnel and by shafts of 120', 165' and 114', with a total of 613' of workings, estimated by company to put 116,000 tons of ore in sight, which estimate is excessive. Equipment includes a 500' hoist and 5 buildings.

**ARIZONA, EASTERN & MONTANA SMELTING & ORE PURCHASING CO.** MONTANA.

Dead. A swindle, promoted by the notorious person-swindler, Dr. R. C. Flower.

**ARIZONA-ECHO COPPER MINING CO.** ARIZONA.

Office: Pasadena, Cal. Mine office: Planet, Yuma Co., Ariz. Organized 1906, under laws of Arizona, with capitalization \$1,000,000, shares \$1 par. Lands are sundry claims near the Signal mine, on the Bill Williams Fork River.

**ARIZONA & ELY COPPER CO.** ARIZONA.

Office: 704 Citizens National Bank Bldg., Los Angeles, Cal. Mine office: Wickenburg, Maricopa Co., Ariz. Frank Newnham, president; L. M. Lyle, secretary; M. A. Proper, treasurer. Organized 1906 with capitalization \$3,000,000, shares \$1 par. Lands, 3 claims, unpatented, 12 miles northeast of Wickenburg, said to carry 2 veins showing oxidized and sulphide copper ore, opened by 150' of tunnels and drifts, also 2 claims near Ely. At last accounts company was offering stock at one cent per share. Idle. Is not regarded favorably.

**ARIZONA EXPLORATION CO.** ARIZONA.

Mine office: Mayer, Yavapai Co., Ariz. R. D. F. Johnson, superintendent. Company is composed mainly of shareholders of the Arizona Smelting Co. and also is closely connected with the De Soto Mining Co. Property is the Blue Bell group, connected with the Prescott & Eastern Railway by aerial tram. The group of 3 claims has 3 fissure veins in Algonkian slates, with quartzite footwall and grano-diorite hanging, developed by 6 shafts, deepest 300', and by tunnels of 70' and 75', showing cuprite, malachite and chalcopyrite, all slightly argentiferous and auriferous, with a large ore body opened on the 300' level. Machinery is actuated by electric power, carried by a 10-mile transmission line.

**ARIZONA EXPLORATION & DEVELOPMENT CO.** ARIZONA.

Letter returned unclaimed from former office and mine, Globe, Gila Co., Ariz. S. L. Gibson, president; G. S. Van Wagener, vice-president. Organized under laws of Arizona, with capitalization \$1,000,000, shares 10 cents par. Lands, 5 groups, area 850 acres.

**ARIZONA GIANT COPPER CO.** ARIZONA.

Office: 229 Byrne Bldg., Los Angeles, Cal. Letter returned unclaimed from former mine office, Ehrenburg, Yuma Co., Ariz. R. M. Furlong, president; H. Franklyn Hiller, secretary and treasurer. Capitalization \$3,000,000, shares \$1 par. Lands, 320 acres. Old management, which sold considerable stock, at fancy prices, was ousted, September, 1903. Moribund.

**ARIZONA GOLD & COPPER CO.** ARIZONA.

Mine office: Winkelman, Gila Co., Ariz. Organized circa January, 1908, under laws of Arizona, with capitalization \$500,000, by Chas. Bauer and C. A. Bauer—presumably the right and left. Lands are 6 miles northeast of Winkelman, near the Saddle Mountain mine. Presumably idle.

**ARIZONA GOLD & COPPER CO.** ARIZONA.

Dead. Lands sold, January, 1907, to Trenton Mining Co. Formerly at Patagonia, Santa Cruz Co., Ariz. Fully described Vol. VI.

**ARIZONA GOLD & COPPER MINES CO.** ARIZONA.

Dead. Formerly at Wickenburg, Maricopa Co., Ariz.

**ARIZONA GOLD & COPPER MINING CO.** ARIZONA.

Dead. Formerly at Prescott, Yavapai Co., Ariz.

**ARIZONA GOLD & COPPER REDUCTION CO.** ARIZONA.

Dead. A swindle, perpetrated by the notorious Theodore Stegner. Lands were claimed to be in Yuma and Mohave counties, Arizona.

**ARIZONA GOLD LODE MINING CO.**

Dead. Reorganized, circa 1906, as Arizona Copper-Gold Mines Co. Formerly at Humboldt, Yavapai Co., Ariz.

**ARIZONA.****ARIZONA GOLD MINING CO.**

Mine office: Clifton, Graham Co., Ariz. Wood Poland, superintendent. Has gold and copper ores, with steam power.

**ARIZONA.****ARIZONA GOLD MINING CO.**

Dead. Formerly at Wickenburg, Maricopa Co., Ariz.

**ARIZONA.****ARIZONA GOLD MINING & DEVELOPING CO.**

Office: 706-140 Dearborn St., Chicago, Ills. Mine office: P. O. Box 1300, Bisbee, Cochise Co., Ariz. E. C. Reichwald, president. John M. Dunphy, vice-president; Wm. E. Blakemore, treasurer; Geo. A. Smith, secretary; S. Mercer, superintendent. Capitalization \$2,500,000. Lands, in Tombstone Cañon, near the divide, are slightly developed by tunnel.

**ARIZONA.****ARIZONA GOLD MINING & MILLING CO.**

Dead. Formerly at Briggs, Yavapai Co., Ariz.

**ARIZONA.****ARIZONA-HANCOCK CONSOLIDATED MINING CO.**

Office: Hancock, Mich. Mine office: Florence, Pinal Co., Ariz. John D. Cuddihy, president; Alfred C. Sieboth, vice-president and superintendent; Henry L. Baer, secretary and treasurer. Organized Mar. 26, 1903, under laws of Arizona, as successor to the Arizona & Hancock Mining Co., with capitalization \$500,000, shares \$10 par. Annual meeting, first Tuesday after first Monday in March. Lands, 4 claims, patented, 2 miles south of Superior, showing a vein traversing two claims parallel to the vein of the Lake Superior & Arizona, with diabase footwall and limestone hanging, opened by a short tunnel and a winze of 55', with drifts on two levels, showing lead above and copper below. Idle for some years.

**ARIZONA.****ARIZONA & HANCOCK MINING CO.**

Dead. Succeeded, March 26, 1903, by Arizona-Hancock Consolidated Mining Co. Formerly at Florence, Pinal Co., Ariz.

**ARIZONA.****ARIZONA HERCULES COPPER MINING CO.****ARIZONA.**

Office: 386 Pacific Electric Bldg., Los Angeles, Cal. Mine office: Kelvin, Pinal Co., Ariz. W. T. Dunham, president; Wm. Bayly, vice-president; E. G. Thomas, secretary and treasurer; preceding officers, R. H. Reid and Clarence K. McCornick, directors. Organized September, 1906, under laws of Arizona, with capitalization \$10,000,000, shares \$10 par. Lands, on Mineral creek, near the Ray and Silver King mines, about 7 miles from Kelvin, are slightly developed by shaft and diamond drill borings.

**ARIZONA LE ROI COPPER MINING CO.****ARIZONA.**

Office and mine: Kingman, Mohave Co., Ariz. J. N. Turrentine, president; W. H. Bradley, vice-president; preceding officers, W. S. Shafer, Geo. H. Craig, Francis M. Townsend and J. H. Sampson, directors; Maj. W. A. Mensch, secretary and treasurer. Organized Nov. 17, 1906, with capitalization \$1,000,000, shares \$1 par. Lands, 6 claims, well watered and timbered, adjoining the Enterprise mine, circa 18 miles from Kingman, with good wagon road to within 1 mile. Has about 400' of openings, showing carbonate ores.

**ARIZONA MERCANTILE, TRANSPORTATION & SMELTING CO. ARIZONA.**

Office: Leavenworth, Kans. Mine office: Casa Grande, Pinal Co., Ariz. Capitalization 1,000,000 shares, presumably \$1 par. Lands, 5 claims and a millsite, near Casa Grande, with a 20-stamp mill and a 50-ton smelter. Is not regarded favorably.

**ARIZONA-MEXICAN COPPER CO.****MEXICO.**

Office: Phoenix, Ariz. Mine office: Caborca, Altar, Sonora, Mex. J. E. Hubinger, president; W. E. Defty, vice-president and consulting engineer; W. C. Foster, treasurer; C. T. Vincent, superintendent. Organized Feb. 14,

1902, under laws of Arizona, with capitalization \$3,000,000, shares \$10 par. Lands, 79 pertenencias, known as La Gran Provedora de Cobre, 75 miles from the Sonora Railway. Country rock is granite, ores carrying an iron and spar gangue, giving a self-fluxing ore. Vein is up to 228' wide, giving average assays of 6.7% copper, 12 oz. silver and \$2 gold per ton, and is opened by shafts of 102' and 200', and by tunnels of 209' and 228', with a total of about one-half mile of openings. From the 400' level down some ore bodies assayed 22% to 30% copper and as high as 131 oz. silver per ton. Management is good and property is considered promising.

**ARIZONA-MEXICAN MINING & SMELTING CO. ARIZONA & MEXICO.**

Office: Allentown, Pa. Works office: Needles, San Bernardino Co., Cal. Dr. H. K. Hartzell, president; H. H. Godshall, secretary and treasurer; Dr. L. D. Godshall, general manager and resident director; Saml. Fields, mine superintendent. Organized Dec. 6, 1904, under laws of Arizona, with capitalization \$2,500,000, shares \$10 par.

Lands include property formerly held by the W. S. Fletcher Mining & Smelting Co., holdings including mining properties at Siam, California; Cerbat and Kingman, Arizona, and 16 idle claims near Florence, Pinal County, Arizona. The Valley Wells mine produced a little copper ore in 1906. The Stockton Hill or Banner mine, 12 miles north of Kingman, opened by a tunnel of circa 1,300' length, has silver-lead ore, slightly auriferous, of good average tenor. The Infallible mine is said to show a 20' vein of high grade ore.

The smelter, remodeled and slightly enlarged to about 125 tons daily capacity, is well designed and equipped, though small, having both lead and copper stacks, with a six-hearth McDougal calciner and a 100' steel smoke-stack. The lead furnace is 46x120", with No. 6 Connerville blower and 65-h. p. engine. Works include a small but complete sampling mill, 35x37' in size, and are well located to serve a district having numerous small mines with rich ores, in which there is no smelter. Lead mines were idle at last accounts, but planned early resumption.

**ARIZONA & MICHIGAN DEVELOPMENT CO. ARIZONA.**

Office: Benson, Ariz. Mine office: Johnson, Cochise Co., Ariz. A. J. Pidgeon, president and general manager; Hon. Stephen Roemer, secretary and treasurer; Mortimer Wien, superintendent. Organized 1904, under laws of Arizona, with capitalization \$2,500,000, shares \$5 par. Lands, 7 claims, patented, area 140 acres, showing porphyry and limestone carrying 4 ore bodies, 1 under development by vertical and incline shafts and by tunnels, showing a 5' vein with poorly defined walls and impregnations in the limestone hanging and porphyry footwall. Has a 150' two-compartment main shaft. Ores are cuprite, malachite and copper sulphides giving average assays up to 12% copper, 18 oz. silver and \$1 gold per ton. Has a 60-h. p. gasoline engine with double-drum hoist, and has shipped a little good ore to El Paso smelter.

**ARIZONA MINE.**

Office and mine: care of Horace E. Adams, owner, Hecla, Laramie Co., Wyo. Lands, 4 claims, area 80 acres, in the Silver Crown district, opened by a 160' shaft and tunnels of 100', 100', and 120', showing native copper, oxides, carbonates, chalcocite and chalcopyrite. Has gasoline power and a small leaching plant.

**ARIZONA MINES CO.**

Mine office: Casa Grande, Pinal Co., Arizona. C. L. Shaw, superintendent, at last accounts. Idle.

**ARIZONA MINING CO.**

Office: 311 Pozzoni Bldg., St. Louis, Mo. Letter returned unclaimed from former mine office, Pinos Altos, Grant Co., N. M. Apparently moribund.

**ARIZONA MINING & TRADING CO.****MEXICO**

Office: care of C. A. Overlock, general manager, Douglas, Ariz. Letter returned unclaimed from former mine office, Nacoziari, Moctezuma, Sonora, Mex. C. W. Crawford, assistant general manager; H. C. Holbrook, mine superintendent. Organized 1906. Lands are in 2 groups, 8 miles and 16 miles southeast of Nacoziari, former, known as Los Angeles mine, having a 75' shaft showing chalcopyrite of good grade. A carload of ore shipped, 1907, to the Copper Queen smelter, gave returns of 12.5% copper and 46 oz. silver per ton. Has a concentrator and employed about 30 men at last accounts. Property considered promising.

**ARIZONA MINING & MILLING CO.****ARIZONA.**

Mine office: Poland, Yavapai Co., Ariz. Property, immediately south of the Poland Mining Co., was held formerly by Poland Extension Gold Mining & Milling Co. Mine is being developed by a blind shaft from the 170' Fitz-hugh Lee tunnel, latter, run jointly with the Cardinal Mining Co., showing copper, lead and zinc sulphides. Has a hoist and air-compressor.

**ARIZONA NATIONAL COPPER CO.****ARIZONA.**

Office: 327 Pine St., Williamsport, Pa. Mine office: Globe, Gila Co., Ariz. Thos. M. B. Hicks, president and treasurer; C. S. Messerly, secretary; LeRoy Scholl, general superintendent; Thos. Kelley, mine foreman. Organized Feb. 1, 1906, under laws of Arizona, with capitalization \$3,000,000, shares \$10 par. Bonds, \$300,000, at 5%. Lands, 14 claims, also a 15-acre millsite and 100 acres timber lands, formerly known as the McNelly-Crowley property, on Pinto Creek, carrying contact veins between schist and granite, said to average 14' in width and traced 785', showing considerable high-grade oxidized ores, including chrysocolla and native copper, with some chalcopyrite and occasional bornite. The 80' ledge of decomposed schist is impregnated with copper sulphides, and perhaps could be concentrated. Development is by shafts of 50' and 85', and by tunnels of 195', 250' and 300', with a total of circa 2,000' of workings. Has steam power. President Hicks has disclaimed responsibility for statements emanating from other officers claiming 18,840,000 tons of concentrating ore, and 3,297,000 tons of smelting ore in sight, with 1,000,000 tons blocked out for stoping.

**ARIZONA-NEVADA CONSOLIDATED GOLDFIELD****ARIZONA.****MINING CO.**

Mine office: Bisbee, Cochise Co., Ariz. Clarence H. Woodcock, manager. Presumably idle.

**ARIZONA & NEW SOUTH MINING CO.****ARIZONA.**

Letter returned unclaimed from former office, 501 Delta Bldg., Los Angeles, Cal. Mine office: Oracle, Pinal Co., Ariz. Chas. W. Pressley, president; Jas. H. Bennett, treasurer and general manager. Lands, 7 claims, in the Cañada del Oro district, fairly watered and timbered, showing ore carrying copper, silver and gold values. Has a gasoline hoist.

**ARIZONA & OHIO MINING CO.****ARIZONA.**

Dead. Formerly had an office at 409 Republic Bldg., Cleveland, Ohio.

**ARIZONA-PACIFIC COPPER CO.****ARIZONA.**

Office: 705 State Life Bldg., Indianapolis, Ind. Mine office: Florence, Pinal Co., Ariz. F. P. Jeffries, president; John W. Sharpe, vice-president and general manager; Henry Severin, treasurer; Murat W. Hopkins, secretary. Organized March 30, 1903, under laws of Arizona, with capitalization \$5,000,000, shares \$1 par. Lands, 16 claims, area 320 acres, also an 80-acre smelter site and 160 acres of possible oil lands, lying at Wooley, about 7 miles south of Kelvin, connected by 4-mile wagon-road with the Phoenix & Eastern railway. Property shows sundry minor veins, assaying 3 to 20% copper and \$5 to \$20 gold per ton. A much shattered quartz-porphyrity dike, 1,200' long

and about 500' in extreme width, with axes east and west, is cemented by veins carrying cuprite, melaconite and chalcocite, having estimated average values of 3% copper, 1 oz. silver and \$2 gold per ton. Has shafts of 80' and 350', also tunnels of 260' and 342'. Has 2 gasoline hoists, air-compressor, power drills, and necessary mine buildings. Officers of company are men of good standing and property is regarded as promising, owing to great size of the ore body, though the ore is low in tenor, but well adapted to close and economical concentration.

**ARIZONA-PITTSBURG MINING & SMELTING CO.****ARIZONA.**

Mine office: Patagonia, Santa Cruz Co., Ariz. T. A. Cox, general manager. Lands, 3 miles east of Patagonia, have a 240' shaft showing mainly galena, with small silver and copper values.

**ARIZONA SMELTING CO.****ARIZONA.**

Office: 71 Broadway, New York, N. Y. Works office: Humboldt, Yavapai Co., Ariz. J. Kearney Rice, receiver; T. H. Oxnam, general manager. Is supposedly controlled by Thomas W. Lawson, of Boston. Most of the old officers resigned, very wisely, as soon as Lawson secured control, this being followed promptly by a receivership. Organized February, 1905, under laws of New Jersey, with capitalization \$150,000, shares \$1 par, which capitalization probably has been increased. Is controlled, through ownership of entire stock issue, by Consolidated Arizona Smelting Co., and is closely connected with De Soto Mining Company. Bonds were \$180,000, issued at 5%. Annual meeting, first Monday in December.

The concentrator, size 180x200', known as the De Soto mill, of 400 tons daily capacity, in two 200-ton units, is equipped with 2 Blake crushers, 2 centrifugal crushers, 4 trains of rolls, 2 Hancock jigs, 16 Overstrom tables, 16 vanners and 8 sizers. The sampling mill, fully equipped, is rated at 1,000 tons daily capacity. The yard had 4 miles of 65-lb. railroad tracks, and there is a complete water system for fire protection. All buildings are of structural steel frame, with brick walls or corrugated iron sheathing, floored with cement. Miscellaneous buildings include a well-equipped machine shop, smithy, laboratory, offices, etc., and the works are lighted by electricity. The entire plant was designed and constructed under the supervision of Cyrus Robinson and Charles E. Finney.

The smelter, of 1,100 tons daily capacity, is so planned that it can be increased to 1,500 tons when desired. The works have both lead and copper stacks, the 200-ton lead furnace being 48x60", and there are four 250-ton copper blast-furnaces. The works have three 100' Edwards mechanical roasters, with a daily capacity of 350 tons, burning petroleum. There are three 100' reverberatory furnaces, of the Anaconda type, rated at 400 tons daily capacity, which burn petroleum. The converter department has 2 stands, with shells of barrel type, rotated electrically. Slags are granulated. The power plant has four 345-h. p. Stirling water-tube boilers, burning waste gases from the reverberatories, with 3 cross-compound Nordberg engines of 1,600 h. p. aggregate capacity, 2 Connersville blowers and electrically driven turbine pumps. Fuel is California petroleum and water is secured from the underflow of a nearby river. The smelter has a 40-ton Whiting electric crane and a 15-ton auxiliary crane. The works include an electric light and power plant, which also furnishes power for operation of the Blue Bell mine, 18 miles distant, transmitting current at a voltage 15,000, stepped down to 440 volts at the Blue Bell transforming station, before delivery to the motors. The smelter is well located for a general custom business, and apparently was doing well before the break in the metal market of July, 1907, but a receiver was appointed, November, 1907. The works employed nearly 300 men when running with full forces.

**ARIZONA & SONORA COPPER INVESTMENT CO.****MEXICO.**

Dead. Dissolved, 1901. Formerly in Sonora, Mexico.

**ARIZONA-SOUTHWESTERN COPPER CO.****ARIZONA.**

Office: 10 Board of Trade, Pueblo, Colo. Mine office: Cedar, Mohave Co., Ariz. P. C. Schramm, president; L. Hoffman, vice-president and manager; J. H. Hoffman, secretary and treasurer; preceding officers, W. G. Laideley, R. H. Weber, P. T. Ward and E. T. Mischeler, directors. Organized 1907, under laws of Arizona, with capitalization \$3,000,000, shares \$1 par. Lands, 9 claims, area 180 acres, in the Hualapai Mountains, slightly developed by shaft showing veins reported as 4' to 60' wide, giving assays up to 4% copper, 8% lead, 4% zinc and 12 oz. silver per ton.

**ARIZONA SUCCESS MINING CO.****ARIZONA.**

Mine office: Salome, Yuma Co., Ariz. B. T. Hickman, president; Austin E. Park, vice-president; Adolph Moltzen, secretary. Organized under laws of Arizona with capitalization \$1,000,000, shares \$1 par. Lands include 2 claims near Goldfield, Esmeralda county, Nevada, 8 claims southeast of Quartzsite, formerly held by Apache Chief Mining Co., having circa 800' of workings, and a group of 6 claims in the Plomosa district, Arizona, latter said to show 5 contact veins, 2 of which, of 21' average width, are said to carry oxidized ores giving average assays of 15% copper, 40 oz. silver and \$1 gold per ton, which figures seem high. Property has shafts of 50', 75', 110' and 250', and is said to have circa 1,700' of workings. The equipment includes a 16-h.p. hoist and several mine buildings, and company is said to plan a concentrator. A 15-ton ore shipment to the Humboldt smelter is claimed to have netted \$1,087. Company claims to guarantee a dividend of 1½ cents per share on all stock placed at 5 cents per share, and is regarded with suspicion. Employed circa 10 men at last accounts.

**ARIZONA SYNDICATE.****ARIZONA.**

Dead. Formerly at Kelvin, Pinal Co., Ariz. Described Vol. VI.

**ARIZONA UNION CONSOLIDATED GOLD &****ARIZONA.****COPPER MINES CO.**

Office: care of J. B. Hall, president, Cincinnati Bldg., Cincinnati, Ohio. Jos. H. Mageer, secretary. Lands are said to be 54 claims in northern Arizona, circa 150 miles from Fairfield, Utah, the nearest railroad station. Company's literature deals liberally in glittering generalities. Property idle at last accounts, with every likelihood of remaining so.

**ARIZONA UNITED COPPER CO.****ARIZONA.**

Dead. Formerly at Clifton, Graham Co., Ariz.

**ARIZONA UNITED COPPER MINING CO.****ARIZONA.**

Dead. Formerly had an office in St. Louis.

**ARIZONA-UTAH COPPER CO.****ARIZONA.**

Office: care of H. C. Weaver, secretary and treasurer, Salt Lake City, Utah. Mine office: Jerome, Yavapai Co., Ariz. W. H. Jones, president; S. S. Pond, vice-president; preceding officers, Geo. B. Weaver, J. F. Harding and H. H. Cornforth, directors. Organized 1906, with capitalization \$1,000,000, shares \$1 par. Lands, 5 claims, known as the Exchange group.

**ARIZONA & WEST LAKE COPPER CO.****ARIZONA.**

Dead. Formerly at Bisbee, Cochise Co., Ariz. Described Vol. V.

**ARIZPE GOLD & COPPER CO.****MEXICO.**

Dead. Demise occurred 1905, under suspicious circumstances. Formerly at Arizpe, Sonora, Mex.

**ARIZPE MINING CO.****MEXICO.**

Office and mine: Ap. 130, La Cananea, Arizpe, Sonora, Mex. Jas. H. Kirk, president; J. P. Hallihan, vice-president; Frank S. Wilhelm, second vice-president and general manager; Guy Hurlbut, third vice-president; Geo. Young,

secretary; M. H. C. Vedder, assistant secretary. Organized Nov. 20, 1903, under laws of Arizona, with capitalization \$1,000,000, shares \$5 par. Direct title to lands is held through the Moctezuma-Arizpe Development Co., S. A., organized under laws of Mexico. Chicago Title & Trust Co., registrar and transfer agent. Annual meeting, last Monday in January.

Lands, 6 groups, area circa 27,000 hectares, in the Manzanal Mountains, 15 miles southeast to 17 miles northeast of La Cananea, the nearest railroad point, and about 2½ miles from the Sonora River, with a good wagon road from the mine to the river. Lands have been divided by the company into 25 full blocks of 1 square kilometer each, and 5 fractional blocks.

Principal property is the Alacran mine, area 75 hectares, showing ore at the contact of quartz-porphyry with andesite, in a vein of 3' to 4' width, carrying mainly gold and silver values, with lead and some copper, having produced ore assaying up to \$270 per ton in values.

The Rey del Cobre mine, area 125 hectares on Block 21, shows low-grade copper ore.

The Palo Seco mine, area 86 hectares, on Block 11, has a tunnel said to show a ledge of about 200' width, carrying some high-grade silver, lead and copper ore, and second-class argentiferous ore of about 4% copper tenor.

The Manhattan mine, area 2,274 hectares, on Blocks 15 and 16, shows native copper.

Miscellaneous holdings include La Victoria mine and La Sevilla mines, area 24 hectares each, and La Princessa mine, area 15 hectares.

The property is one of considerable promise.

#### ARKANSAS & ARIZONA COPPER CO.

#### ARIZONA.

Office and mine: Jerome, Yavapai Co., Ariz. J. T. Robertson, president; Chas. T. Lynch, vice-president; Walter C. Miller, treasurer; Ralph A. Smith, secretary; J. E. Leeper, general manager; preceding officers, W. M. Kavanaugh and S. P. Part, directors. Organized June 25, 1906, under laws of Arizona, with capitalization \$1,500,000, shares \$1 par. Lands, 14 claims, area 280 acres, known as the Royal Irish group, in the Verde district, having a 552' shaft, sunk through alluvium, carrying a little gold, shaft evidently being sunk in a deep basin. Has a 50-h. p. Leyner hoist, good for 1,500' depth, and an 8-drill Rand air-compressor, with 30x40' power-house and 7 miscellaneous buildings. Officers stand well locally.

#### ARKANSAS MINING CO.

#### MONTANA.

Letter returned unclaimed from former mine office, Helena, Lewis and Clark Co., Mont. Lands, 2 miles west of the summit of Mount Helena, show a vein traceable 800', assaying well in copper, with small gold and silver values.

#### ARKANSAS VALLEY SMELTING & REFINING CO.

#### COLORADO.

Works office: Leadville, Lake Co., Colo. Is controlled by the American Smelting & Refining Co.

#### ARLINGTON-BURNS COPPER-GOLD CO., LTD.

#### BRITISH COLUMBIA.

Dead. Formerly at Greenwood, Boundary district, B. C. Described Vol. VI.

#### ARLINGTON COPPER CO.

#### NEW JERSEY.

Dead. Lands, at Arlington, Hudson Co., New Jersey, sold Sept. 30, 1903, for debt. Described Vol. II.

#### ARLINGTON MINING CO.

#### MONTANA.

Office and mine: Muller, Shoshone Co., Idaho. Organized under laws of Idaho. Lands, 30 claims, in the Mountain House unorganized mining district of Sanders County, Montana, showing ores said to give good average assays in copper, and to carry up to 6% lead.

#### ARLINGTON MINING CORPORATION.

#### WASHINGTON.

Letter returned unclaimed from former mine office, Conconully, Okanogan Co., Wash. Mine has a shaft, and an old crosscut tunnel nearly 1,000' in length,

planned to give a 400' back, showing auriferous and argentiferous copper ore, with some native silver, copper being in small percentages, but increasing with depth. Has gasoline power and an air-compressor. Idle and presumably moribund.

#### **FRANCISCO ARMENDAIZ SUCEORES.**

**MEXICO.**

Office: Apartado 37, Monterey, N. L., Mex. Mine office: Cerralvo, Nuevo León, Mex. Don Francisco Armendaiz, manager; Don José Armendaiz, assistant manager. Property includes the Refugio and Barredon mines, carrying slightly argentiferous lead ores, which are properties of merit, and the Colorado mine, carrying ore up to 3% in copper tenor. Employs circa 60 men.

#### **ARM EXPLOREATION CO.**

**CALIFORNIA.**

Office: Kennett, Cal. Mine office: Raymond, Madera Co., Cal. Is said to have a fair sized ore body, carrying high grade melaconite.

#### **COMPANIA LA MINA ARMONIA.**

**CHILE.**

Mine office: Carrizal Alto, Freirina, Atacama, Chile. Property is an old mine, opened to depth of 414 metres, which has been a considerable producer in the past, but output, according to last official returns available, is now insignificant.

#### **ARNOLD MINING CO.**

**MICHIGAN.**

Office: 64-50 State St., Boston, Mass. Mine office: Copper Falls, Keweenaw Co., Mich. C. Howard Weston, president; John Brooks, secretary and treasurer; Wesley Clark, superintendent. Annual meeting, second Tuesday in May. Organized 1864, under laws of Michigan, with capitalization \$2,500,000, shares \$25 par; issued, \$1,550,000. Lands, 3,323 acres, in T. 58 N., R. 31 W., in two tracts, including the Old Copper Falls mine and the Arnold mine proper, with frontage of about 3 miles on Lake Superior. The Copper Falls mine, worked, circa 1850 until August, 1893, made 12,843 tons, 429 lbs. fine copper, mainly from the Owl Creek fissure, and paid dividends of \$100,000. The Arnold mine proper, developed on the Arnold ashbed, was opened 1863, reopened 1897, closed 1901, rock stamped averaging under 0.8% copper. Has a stamp-mill and 2½ mile narrow-gauge railroad, known as Arnold & Eagle Harbor, rolling stock of which has been sold. No. 1 shaft of the Arnold is about 1,000' deep, sunk at an angle of 26° with the horizon. Employs 4 men on exploratory work and found a considerable mass of native copper, June, 1907.

#### **ARRINO PROPRIETARY COPPER MINING CO.**

**AUSTRALIA.**

Office: 17 Queen St., Melbourne, Australia. David Blair, manager. Property, in Western Australia, shows sandstone beds of Permian age, ore occurring as bunches and thin veins following the joints and fissures of the sandstone. Ores are mainly oxides and carbonates, with a little sulphide ore exposed recently. Sandstone formation, occupying a basin with gneiss walls, is about 300' wide by one mile long. Bulk parcels of ores shipped have given returns of 3.75% to 25% copper. Property has rail connections, but the process best adapted to treating ores of such unusual nature and occurrence had not been decided upon, at last accounts. Idle.

#### **ARTOLA HERMANOS.**

**CHILE.**

Dead. Sold their property at Cobija, Tocepilla, Antofagasta, Chile, to the Compania de Minas i Fundiciones de Gatico.

#### **AREZARD MINING CO.**

**WASHINGTON.**

Mine office: Chewelah, Stevens Co., Wash. L. Bryant, manager. Lands, 160 acres, patented, on Round Mountain, 5 miles south of Chewelah, opened by an 80' tunnel, said to show a 30' vein of medium grade copper ore.

**ERZBERGWERKE ASBECK BRÜGGEN-  
UND BEÜGER-ROBERT.**

**GERMANY.**

Mine office: Rönsahl, Westfalen, Germany. Idle for several years.

**ASHBED MINING CO.**

**MICHIGAN.**

Office: 64-50 State St., Boston, Mass. Mine office: Copper Falls, Keweenaw Co., Mich. C. Howard Weston, president; John Brooks, secretary and treasurer; Wesley Clark, superintendent; preceding officers, T. P. Farmer and W. C. Fiske, directors. Organized, 1880, under laws of Michigan, with capitalization \$1,000,000, shares \$25 par. Annual meeting, second Tuesday in March. Lands, 1,143 acres, in vicinity of Copper Falls, adjoining the Arnold mine. Was known originally as the Petherick. Did some exploratory work 1905-1906; since idle. Very fully described Vol. II.

**ASHEBORO COPPER MINING CO.**

**NORTH CAROLINA.**

Mine office: Asheboro, Randolph Co., N. C. H. D. Landers, president; D. M. Holliday, vice-president; W. C. Hammond, treasurer; M. W. Parrish, secretary; W. L. Thurber, manager. Organized under laws of North Dakota, with capitalization \$100,000, shares \$1 par. Lands 98 acres, on which a little mining was done in the Nineteenth Century. A carload of ore gave returns of \$16.85 per ton, with 8.6% copper and small gold values. Also had an option on 400 acres of gold-bearing lands at last accounts.

**ASHIO MINES.**

**JAPAN.**

Owned by Furukawa Mining Co.

**ASHLAND MINING CO.**

**COLORADO.**

Mine office: Ohio, Gunnison Co., Colo. Carroll M. Carter, superintendent, at last accounts. Property is the Carter group, carrying gold, silver, lead, copper and zinc ores. Has steam power.

**ASH PRAK MINING CO.**

**ARIZONA.**

Mine office: Duncan, Graham Co., Ariz. Arthur J. Murphy, Jr., manager. Has secured assays giving high values in copper, silver and gold. Has power equipment and ore-bins.

**COMPÀNIA MINERA DE ASIENTOS.**

**MEXICO.**

Mine office: Asientos, Ocampo, Aguascalientes, Mex. Harry Rab, superintendent. Lands include the Nopensada and Alta Palmira mines, antiguas, and the Veta Grande and Refugio mines. The Nopensada, said to have been a considerable producer in early days, carries mainly slightly argentiferous copper ore. The Alta Palmira, having a 200' shaft, produces mainly silver ore, with small copper values in the upper workings. The Refugio is said to show ore carrying up to 13% copper, with 1,100 grams silver per metric ton, and small gold values. Mines are not developed extensively. Equipment includes a steam and electric plant at the Nopensada and 2 electric hoists at the Alta Palmira. Property was leased to Asientos Copper Co., but latter said, June, 1908, to plan relinquishing the lease. Considerable ore was shipped, 1907.

**ASIENTOS COPPER CO.**

**MEXICO.**

Mine office: Asientos, Ocampo, Aguascalientes, Mex. J. F. Foster, superintendent. Company is said to plan relinquishing the property, which is held under lease from the Compañia Minera de Asientos.

**WALTER ASKEW.**

**MEXICO.**

Office and mine: Guachinago, Jalisco, Mexico. Property is known as the Ocate, showing a large vein giving good assay values in copper, silver and gold.

**ASMUS BOYSEN MINING CO.**

**WYOMING.**

Office: 226 South Clark St., Chicago, Ills. Mine office: Thermopolis, Fremont Co., Wyo. Asmus Boysen, president; N. C. Brorson, secretary and

treasurer. Organized under laws of Wyoming, with capitalization \$25,000,000, shares \$100 par. Boysen claimed the right to locate 180,000 acres on the Shoshone Indian reservation, in consideration of relinquishing a contract with the Shoshone and Arapahoe Indians, but fell afoul of the United States government, and finally compromised on 640 acres. Company claims to own silver, oil and coal lands. Several long tunnels have been driven, and a tram built, but whether ore has been found or not is known only to the management. Company is building a light and power plant.

#### SOCIÉTÉ CIVILE DES MINES DE CUIVRE D'ASPEICH.

FRANCE.

Office: 3, Rue de Milan, Paris, France. G. Caton, manager, at last accounts. Lands are in the Basses Pyrenees, France. Idle for some time.

#### ASTOR MINING CO.

COLORADO.

Mine office: Eureka, San Juan Co., Colo. E. G. Condit, superintendent. Property includes the Surprise, Mogul and other claims, carrying ores of gold, silver, lead and copper. Has steam, water and electric power.

#### ASTROLABE MINING SYNDICATE.

NEW GUINEA.

Mine office: Port Moresby, British New Guinea. Lands, 150 acres, near Sapphire Creek, circa 16 miles from Port Moresby, main tract of 120 acres being a reward claim for discovery. The main tract has a 50' shaft, said to show a 6' vein carrying cupriferous and arsenical pyrite, giving assays of 3% copper, with traces of gold and silver, but the surface ores, in alluvium, are mainly malachite, giving returns, 1906, from shipment of 17 tons, of 26.8 to 32% copper, with traces of gold. Apparently this ore was secured from detrital material, deposited by the Laloki river. A 30-acre tract lying one mile east of the main workings shows a goasan carrying green carbonate stains assaying 3 to 4% copper, and a short tunnel shows a little malachite and cuprite. Was making, early 1908, bi-monthly shipments to Newcastle, of 40 tons of ore, ranging 20 to 40% in copper tenor.

#### SOCIEDAD INDUSTRIAL ASTURIANA.

SPAIN.

Dead. Formerly at Torres, Teruel, Spain.

#### SOCIEDAD INDUSTRIAL DE ATACAMA.

CHILE.

Office: Copiapó, Atacama, Chile. Works office: Tierra Amarilla, Copiapó, Atacama, Chile. Mine office: Almolanos, Copiapó, Atacama, Chile. Principal mine is the Lautaro, in the San Antonio district, carrying an abundance of chalcopyrite of 5 to 7% copper tenor, with limestone gangue, in a porphyry dyke. A modern concentrator was built, 1904, at Lautaro, and a large hydroelectric installation, to utilize the power of a nearby river and distribute same for some distance, was under construction at last accounts. The Descubridora mine, at Puquios, also has been rehabilitated with a new plant, including steam and electric power.

The smelter, on the line of the Copiapó & Interior railway, does a custom business also, treating silver-lead ores as well as copper. The Tierra Amarilla plant includes 6 reverberatory furnaces turning out Chile bars, two 3-deck calcining furnaces, 2 reverberatory furnaces for bars and two 54x54" blast-furnaces. The power plant includes four 110-h. p. boilers and 3 small electric motors. Fuel is local coal and imported coke, latter used in charges of 1 ton to 6 tons of ore. Product is auriferous and argentiferous Chile bars and ejec. ores treated, 1903, averaging 11.74 to 12.42% copper. Smelter employs 150 men, at average wages of 2.25 pesos daily.

Company also owns a smelter at Caldera with a 120-ton rectangular blast furnace and converter. This has gas engines, run by producer-gas, which shows a great economy over the old steam plant, works also having electric power, with independent motors for each department. Production of the company, 1903, was 2,396,252 lbs. fine copper.

**ATACAMA MINERAL CO., LTD.**

CHILE

Dead. Voluntarily liquidated, July, 1902. Formerly at Taltal, Atacama, Chile.

**ATBASAR COPPER FIELDS, LTD.**

SIBERIA

Office: care Speyer & Sons, 65 London Wall, London, E. C., Eng. Organized Nov. 28, 1907, under laws of Great Britain, with capitalization £350,000, shares £1 par, to acquire copper properties in Siberia.

**ATE MINE.**

JAPAN

Mine office: Komatsu, Kaga, Japan. The mine has two main veins, in liparite and brecciated tuff, one being a fissure and one a contact vein. These veins cross, the intersection giving the richest ore, while at a little distance from the point of intersection the veins thin out and become of poor quality. Ore is mainly chalcopyrite, with iron pyrites, showing some bornite and tenorite, and averages about 10% copper in the upper portions. Production, 1900, was 231,484 lbs. fine copper; and in 1907 was only 194,305 lbs. fine copper.

**ATHELSTAN GOLD MINING CO., LTD.**

BRITISH COLUMBIA

Dead. Absorbed, 1907, by Dominion Copper Co., Ltd.

**ATHERLSTON & JACKPOT MINING CO.**

BRITISH COLUMBIA

Dead. Absorbed, 1904, by Montreal & Boston Cons. Mining & Smelting Co.

**ATLANTIC MINING CO.**

MICHIGAN

Office: 15 William St., New York, N. Y. Mine office: Atlantic Mine, Houghton Co., Mich. Joseph E. Gay, president; John R. Stanton, secretary and treasurer; preceding officers, J. Wheeler Hardley, William A. Paine and Samuel L. Smith, directors; F. McM. Stanton, agent; Theodore Dengler, superintendent; F. G. Coggin, mill superintendent; John Stratton, mining captain; Hon. A. D. Edwards, clerk; John Grigg, master mechanic.

Organized December, 1872, under laws of Michigan, reincorporated, 1901, for term of 30 years, and capitalization increased, 1902, to \$2,500,000, shares \$25 par; \$9.80 paid in. Annual meeting, second Tuesday in March. American Loan & Trust Co., Boston, transfer agent. Boston Safe Deposit & Trust Co., registrar. Has paid dividends of \$990,000, last dividend being \$50,000, in 1905.

The old Atlantic mine lies about 2 miles south of Portage Lake, and 4 miles southwest of Houghton, on a 640-acre tract, including the mines known before 1872 as the South Pewabic and Adams. The Atlantic lands, all on the mineral belt, are the South  $\frac{1}{4}$  of Section 4, except the Southeast  $\frac{1}{4}$  of the Southeast  $\frac{1}{4}$ ; North  $\frac{1}{4}$  of Section 9; Northwest  $\frac{1}{4}$  of Section 10, and Section 16, all in town 54 North, Range 34 West; also several thousand acres of timber lands, a millsite on Lake Superior and valuable frontage on Portage Lake. The old mine, fully described in Vol. V., was opened on an amygdaloidal bed of about 15' width, the lode being the most westerly worked in Houghton county, and known locally as an ashbed. This bed returned an average of about 14 lbs. fine copper per ton. There are 6 shafts, lettered in order from north to south as A to F. C shaft was abandoned after the fire of 1908; E shaft was used for a manway only and F shaft was put out of commission in 1902. Beginning 1904, serious trouble was experienced from caving ground and air-blasts, the latter being merely artificial earthquakes caused by subsidence of the hanging wall. The old stopes average about 15' width for nearly a mile in length and for nearly a half mile in depth. Air-blasts continued with increased severity, finally ruining the shafts and putting the mine out of commission May, 1906. Efforts were made previously to work on a modification of the caving system, but were too late, and the mine was lost. It may be reopened at some future time, by sinking new incline shafts on the footwall. Probably 2 new shafts of large capacity would be sufficient to operate the entire mine, which is estimated to contain about 6,000,000 tons of stamp.

rock, which, though low in grade, should be worked at a fair profit, as the Atlantic was noted, for two decades, as the lowest grade profitable mine in the world, the management performing wonders in the way of economical extraction of values that, under ordinary circumstances, would have been hopelessly unpayable.

At the old mine there is an unusually well-built mining town of 3,000 population, having about 500 buildings, half owned by the company, with several churches and one of the best graded schools in the state. Mining equipment included a number of shops, engine-houses and shafthouses, with powerful and effective hoists, air-compressors and general mining machinery.

The lands of the old Atlantic mine should carry the southern extension of the Pewabic lode, worked by the Quincy Mining Co., though this never has been located. Sections 4, 9 and 10 were tested, 1907, by trenching and diamond-drill bores, and a shallow shaft was sunk on the so-called Calico lode, which parallels the Atlantic ashbed about one-half mile to the eastward, but nothing of especial promise was developed.

The future of the Atlantic apparently lies in the new mine now being opened on Section 16, between the rich Baltic mine and the highly promising Superior mine. An exchange of 39 acres, made 1905, between the Atlantic and Baltic corporations, corrected lines for both, and obviated pocketing the northernmost shaft of the Baltic and the southernmost shaft of the Atlantic, while the Atlantic also secured the hinterland of the Baltic lode, necessary for engine-houses, shafthouses, power plants and general shops, and giving the Atlantic sufficient outcrop of the Baltic bed to sink 2 shafts. Exploratory work, 1897-1903, failed to locate the extension of the Baltic lode, owing to a marked flexure, accompanied by faulting. The Section 16 mine is opened on the Baltic by a single 3-compartment shaft having 2 skipways, though a second shaft is planned, tentatively. The Baltic bed, as developed on Section 16, is wide and strong, but disturbed to great depth, the first ground to carry good copper values having been opened on the 12th level. The mine was opened to the 16th level, September, 1908, the bottom showing more regular ground with considerable good stamprock. In crosscutting west from the shaft on the 13th level, an unidentified lode carrying a little copper was discovered July, 1908. Equipment at Section 16 includes 4 boilers and 3 air-compressors, one of 15 drills capacity. The old mine has ample machinery to equip 2 shafts on the Baltic lode with an efficient plant, while leaving sufficient machinery to operate 2 new shafts at the old mine, if reopened.

The Atlantic railroad, owned by the company, connects mine and mill with 9 miles of main line, and a 3-mile branch line runs from the mine to the old millsite on Portage Lake, where there are coal and merchandise wharves for receipt of fuel and supplies. The railroad has 4 Baldwin and 1 Brooks locomotives, 130 hopper cars for rock and coal, and 60 flat cars for wood and general freight. The mine, also, is on the main line of the Copper Range railroad.

The stampmill, built 1895, at Redridge, Lake Superior, on a site having nearly 2 miles of water frontage, is 151x234', of wood, on stone foundations. Water is furnished from a dam, described in the article on Baltic. The mill has 6 stamps with 18" cylinders, of about 400 tons daily capacity each. Chilean regrinding mills are used for raggings, and round tables have been displaced by Overstroms. Power is supplied by a 14x42" Reynolds engine of Corliss pattern. There are 7x14x12" Gardner fire pumps in the mill and boiler-house adjoining. A machine shop in the mill is supplied with all tools required for repair work and fitting. Adjoining the mill is the 71x101' boiler-house, of wood, on stone foundations. A Green fuel economizer saves about 12% in coal bills.

There also are a number of comfortable dwellings for workmen, a 30x36' frame warehouse, store building and smithy. The mill treats the rock of the Michigan mine.

Trouble at the old mine, which begun in 1904, was reflected by decreased production, output being 5,505,598 lbs. fine copper in 1903; 4,049,731 lbs. fine copper in 1905, and only 1,539,082 lbs. fine copper in 1906, with no production in 1907.

The Atlantic enjoys the inestimable advantage of a management that is highly experienced, economical and efficient, and while the developments at the new mine on Section 16 are not yet sufficient to warrant an absolute prediction of success, the results secured, though slow in coming, are decidedly promising.

#### **ATLAS COPPER MINING CO., LTD.**

**IDAHO.**

Office: care of Lyman Wood, Wallace, Idaho. Property is in Shoshone county, Idaho.

#### **ATLAS COPPER SYNDICATE, LTD.**

Dead. Compulsorily wound up, July, 1901. Was an English corporation.

#### **ATLAS CORPORATION.**

**CALIFORNIA & WASHINGTON.**

Mine office: Granite Falls, Snohomish Co., Wash. Jos. Weissbein, president; Karl A. A. Stahlgren, vice-president; H. S. McCartney, secretary and treasurer. Property includes the Gold Flat gold mine, at Nevada City, Cal., and the Wayside mine, near Granite Falls, latter showing sulphide copper ore. Company in hands of receiver June, 1908, and former office at 71 Broadway, New York, closed.

#### **ATLAS EXPLORATION & MINING CO.**

**ARIZONA & MEXICO.**

Office: Douglas, Ariz. E. O. Johnson, president; N. W. Chase, treasurer; D. T. Dunlap, secretary; James Bay, superintendent. Organized June 14, 1902, under laws of Arizona, with capitalization \$5,000,000, shares \$1 par. Annual meeting, first Tuesday in January. Has undeveloped mineral lands, known as the Atlas group, in the Warren district of Cochise county, Arizona, and a fair prospect about 15 miles south of Douglas, in the northern part of the Arizpe district of Sonora, Mexico, latter showing auriferous copper ore. Idle for several years.

#### **ATTUNGA MINE.**

**AUSTRALIA.**

Mine office: Attunga, N. S. W., Australia. W. H. Edwards, superintendent. Property, in the Tamworth division of the Peel and Uralla mining district, has a main shaft of 280'. Was developing, in search of sulphides, expected with greater depth, at last accounts.

#### **AKTIEBOLAGET ATVIDABERGS KOPPARVERK.**

**SWEDEN.**

Office: Atvidaberg, Sweden. Mine and works office: Bersbo, Ostergotland, Sweden. Baron Th. Adelsward, president and general manager; Axel Nygren, superintendent; C. A. Rudelius, smelter superintendent. Organized 1900, under laws of Sweden, with capitalization 900,000 kroner, shares 1,000 kroner par, fully paid. Ore is slightly argentiferous chalcopyrite, averaging 2% copper. Mine has 8 shafts, of 300' to 1,400' depth, with about 4,000' of workings. Water power generates electricity that operates the mines and works. Has a smelter, at Bersbo, 9 kilometers from mine, with rail connection, with 3 roasting furnaces, 3 reverberatory furnaces, and settling tanks for cementation, which was partly burned, 1905. Has been developing, without production, since 1902, when output was 163,270 lbs. fine copper.

#### **GEWERKSCHAFT AUGUSTE I.**

**GERMANY.**

Dead. Formerly at Herscheid bei Bärenstein, Westfalen, Germany.

#### **KUPFERERZBERGWERK AURORA.**

**GERMANY.**

Mine office: Huckelheim, Bavaria, Germany. Idle.

**AURORA CONSOLIDATED MINING CO.****MEXICO.**

Mine office: Mulegé, Sur, Baja California, Mex. G. W. Russell, manager. Property includes the Aurora and Princesa mines, carrying auriferous copper ores. Has steam power, 5-ton mill and 50-ton smelter, employing about 40 men, at last accounts.

**AURORA MINES CO.****NEW MEXICO.**

Office: care of Robt. F. Fitz, Elgin, Ills. Mine office: Lordsburg, Grant Co., N. M. D. H. Kedzie, local agent. Organized under laws of Arizona. Company fell into debt and closed down, but obligations were paid. Presumably idle.

**AURORA MINING CO.****MEXICO.**

Dead. Formerly at La Cananea, Arizpe, Sonora, Mex.

**AUSTRALIAN COPPER SYNDICATE, LTD.****AUSTRALIA.**

Dead. Voluntarily wound up, February, 1903. Was an English corporation.

**AUSTRALIAN MINING CO., LTD.****AUSTRALIA.**

Office; 63 Queen Victoria St., London, E. C., Eng. Colonial office: Burnside, Adelaide, South Australia. Mine office: Reedy Creek, Robe Co., South Australia. Walter J. C. Cutbill, chairman; Sir Samuel Davyport, K. C. M. G., colonial agent; Edgar Collier, secretary. Organized Feb. 22, 1902, under laws of Great Britain, with capitalization £40,000, shares £2 par, as reconstruction of a company of same name, chartered 1863. Paid a 2s. dividend September, 1905. Lands, circa 20,000 acres, formerly included the Tungkillo mine, sold, 1906, to Port Lincoln Copper Co., Ltd.

**AVALANCHE COPPER MINING CO.****MONTANA.**

Office: care of J. W. Beckett, secretary, Spokane, Wash. Mine office: Calfion Ferry, Broadwater Co., Mont. W. H. Hill, president and general manager; A. M. Baldwin, vice-president; C. E. Russell, superintendent; R. C. Vanderford, engineer. Lands, 10 claims, area 200 acres, circa 25 miles northeast of Helena, having several shallow shafts and short tunnels, showing an ore body assaying up to 20% copper, and a 300' crosscut tunnel, latter cutting a 20' vein carrying a 3' paystreak of smelting ore said to carry high copper values, 1 oz. silver and \$12.40 gold per ton. Is said to plan a concentrator or small smelter.

**MINA AVENTURERA.****MEXICO.**

Mine office: Sabiaal, Chihuahua, Mex. D. C. Sutton, general manager. Ore bodies occur irregularly in slate dikes, and carry silver, lead and copper. Mine is opened by shafts, and equipped with steam power. Employs about 100 men.

**AVINO MINES OF MEXICO, LTD.****MEXICO.**

Office: 138 Salisbury House, London, E. C., Eng. Mine office: Avino, Gabriel, San Juan del Rio, Durango, Mex. James B. Palmer, chairman; Ralph Nichols, resident manager and consulting engineer; F. F. Fuller, secretary. Organized Feb. 24, 1905, under laws of Great Britain, with capitalization £1,000,000, shares £1 par; issued, £978,429. Debentures, £18,000. Operations to June 30, 1906, showed net expenditures of £6,899 above receipts. Lands, 250 acres and a 302-acre damsite, 10 miles from a railroad. Mine has an 800' shaft and 800' tunnel, with several large pits, one being nearly 400' in width and of considerably greater length. Property is said to show about 2,000,000 metric tons of low grade silicious argentiferous copper ore, average value of one produced, July and August, 1907, being reported at 36s. per ton. Mine is claimed to have produced about \$60,000,000 in the past, mainly in silver, but presumably this should be 60,000,000 pesos, equal to about \$30,000,000. Property produces a little smelting ore, but is mainly of concentrating grade.

Property has steam, gas and electric power, with a 300-h. p. electric plant operated by a Crocker-Wheeler gas engine. A large concentrator was found unsuitable and was replaced by a hyposulphite lixiviation plant, which was claimed to save 85% of the silver and 30% of the gold values. Property has been poorly handled, former management spending too much money on surface and not enough in the mine, in addition to making a serious mistake in the plan of ore treatment. The mine has an immense amount of ore of dangerously low average tenor, but there have been too many changes in local management and processes, by reason of which no management or process has been given a fair test. Company is in such a financial position that either reconstruction or liquidation seems imperative.

**AWAYA-IKEDA CO., LTD.****BRITISH COLUMBIA.**

Office: 46 Davis Chambers, Vancouver, B. C. Mine office: Ikeda Bay, Morseby Island, Queen Charlotte group, B. C. Employs 92 men. Shinazo Awaya, president; Arichika Ikeda, vice-president and general manager; K. Hidano, secretary and treasurer; Joseph Marco, mine superintendent; S. Harada, engineer. Organized 1907, under laws of British Columbia, with capitalization \$100,000, shares \$100 par.

Lands, 42 claims, area 2,100 acres, on Ikeda Bay, at the southern end of Morseby Island, in several groups, including the Lilly group of 8 claims, area 400 acres, on the southwest side of Ikeda Bay, which shows numerous ore bodies in contact deposits between diorite and limestone, of which one, under development, is of 5' average width, proven for 1,000' in length and about 300' in depth. The 20' ore-chute carries lenses of ore with gangue of silicious country rock, and occasional stringers of quartz and limestone. Development is by tunnels of 110', 220', 170', and 330', the upper tunnel carrying about 11' of low grade ore and the lower tunnel having about 5' of high grade chalcopyrite, ranging 8 to 12% in average copper tenor, 3 to 5 oz. silver and about \$5 gold per ton.

The mine, about 6,000' from tidewater, is connected by a 36" gauge horse-tram with a 150' wharf having a 110' ell. The inlet is charted and admits steamers of fair size at flood tide, shipments being made from ore-bunkers on the wharf. The company's office, hospital and sleeping quarters were in an old stern-wheel steamer, beached for the purpose, but this has been succeeded by 12 buildings, including 2 shops, hospital, store, boarding-house, superintendent's house, etc. Equipment includes an Ingersoll-Sergeant air-compressor. Fuel is wood. Production, 1907, was 500 tons of ore; in 1908 about 4,500 tons, and should be about 10,000 tons in 1909. Ore shipped, 1907, to Ladysmith smelter, gave average returns of about 9% copper, 3.5 oz. silver and \$5 gold per ton, and production, 1907, is estimated at 125,000 lbs. fine copper. The company was organized for fishing purposes, but, on the discovery of copper, interested the Furukawa Mining Co., of Japan, which is said to have set aside a capital of 500,000 yen for development purposes. The property is exceptionally promising and has an excellent management.

**AXIS COPPER MINING CO.****WYOMING.**

Mine office: Rambler, Carbon Co., Wyo. Lands lie between the Doane mine and holdings of the Dill Gold & Copper Mining Co.

**NICOLÁS AZALIA.****PERÚ.**

Office and mine: Morococha Junín, Perú. Lands, 2 pertenencias, including the Alicia mine, yielding ore averaging about 10% copper. Production, 1904, was 115,609 lbs. fine copper.

**COMPAÑIA MINERA LA AZTECA y ANEXAS.****MEXICO.**

Letter returned unclaimed from former mine office, Ensenada, Norte, Baja California, Mex. Property has silver-copper ores.

**AZTEC-ALGOMAH DEVELOPMENT CO.****MICHIGAN.**

Dead. Formerly at Greenland, Ontonagon Co., Mich. Described Vol. VI.  
**AZTEC COPPER CO.**

**ARIZONA.**

Letter returned unclaimed from former office, 136 Hartford Bldg., Chicago, Ills. Mine office: Prescott, Yavapai Co., Ariz. E. M. Sanford, attorney. Lands, 20 claims, showing copper ores. Idle.

**AZTEC COPPER CO.****MICHIGAN.**

Office: care of John C. Watson, president, 68 Devonshire St., Boston, Mass. Mine office: Greenland, Ontonagon Co., Mich. F. W. Morandi, secretary and treasurer. Organized August, 1863, under laws of Michigan, and reorganized, 1880, under laws of Michigan, with capitalization \$1,000,000, shares \$25 par. Lands, 320 acres, being W.  $\frac{1}{2}$  of Section 31, T. 51 N., R. 37 W., also 1,214 acres of agricultural and timber lands in Sections 10, 12 and 14, T. 50 N., R. 38 W. Work was begun 1862, and property had a stampmill in early days, producing 353 tons, 863 lbs. fine copper, of which 100 tons were secured in a single mass. Exploratory work was done, 1905-1906, on the Knowlton lode, by the Aztec-Algomah Development Co. Property should carry the amygdaloid bed now being opened by the Lake Copper Co. Idle.

**AZTEC COPPER MINING & SMELTING CO.****MEXICO.**

Dead. Succeeded by Aztec Copper Smelting Co. Formerly at Guachinango, Mascota, Jalisco, Mex.

**AZTEC COPPER SMELTING CO.****MEXICO.**

Office: 1309 Stephen Girard Bldg., Philadelphia, Pa. Mexican general office: Alcalde, 29 $\frac{1}{4}$ , Guadalajara, Mex. Mine office: Guachinango, Mascota, Jalisco, Mex. Dr. Pemberton Dudley, president; J. W. Tyrell, vice-president; Geo. J. Graham, manager; preceding officers, Perry H. Dudley, G. H. D. Martin, F. B. Graham, Wm. A. Young and E. J. Fifthian, directors; J. F. Graham, secretary. Organized June, 1901, under laws of New Jersey, as successor of the Aztec Copper Mining & Smelting Co., with capitalization \$300,000, shares \$1 par. Lands claimed are circa 10,000 acres, of which 8,000 acres are said to be well timbered with oak and pine, and to be well watered, with an available water power on the Rio Ameca. Lands include 2 mines, known as La Concha and La Perla, opened by shafts and tunnels, and claimed by company to show ore averaging about \$30 per ton in values. Has an 80-ton concentrator with 2 Elspass mills and 6 tables. Present officers apparently are not responsible for the atrocious lies of a former management, which promised speedy dividends, which of course have not materialized.

**AZTEC GOLD & COPPER MINING CO.****COLORADO.**

Office: 18 Tremont St., Boston, Mass. Mine office: Needleton, La Plata Co., Colo. David W. Williams, president; Chas. A. Howland, vice-president; Geo. F. Bradstreet, secretary and treasurer; Josiah Moore, general manager; W. C. Kinney, engineer. Organized Nov. 10, 1899, under laws of Maine, with capitalization \$2,000,000, shares \$1 par; issued, \$1,619,260. Lands, 19 claims, in 5 groups, lying in the Needle Mountains, circa 16 miles south of Silverton, showing 2 fissure veins in granite and porphyry, these averaging about 2' width, one, opened by a 1,500' tunnel, showing argentiferous galena above and copper sulphides below, ores giving assays of \$30 to \$65 per ton. Equipment includes a 25-h. p. electric motor and 25-h. p. gasoline engine, with a 3,000-h. p. waterfall available for development. Has 7 buildings, and plans extending main tunnel and constructing an aerial tram to the concentrator.

**AZURE MINING CO.****NEW MEXICO.**

Office: 170 Broadway, New York, N. Y. Mine office: Leopold, Grant Co., N. M. Louis Kahn, president; M. D. Rothschild, secretary and treasurer; M. Kahn, manager; Wm. R. Wade, superintendent. Lands, near the Burro Chief group of the Chemung, have a 415' shaft, showing a little ore on the 250'

level, and the Emerald claim shows oxide ore in a 140' diamond drill hole, bored 1907. Lands show gossans carrying no copper, but with copper values at depth below, as proven by churn and diamond drill borings. Mine formerly was a considerable producer of turquoise, and is said to have been the largest turquoise mine in the United States, but such production has practically ceased, and present developments are for copper. The turquoise mine has an open cut and two tunnels. Holes bored, 1905, by churn drills, are said to have shown sulphide ores of 2.5% average copper tenor.

**AZURITE COPPER CO.****ARIZONA.**

Dead. Formerly at Williams, Coconino Co., Ariz. Described Vol VI.

**AZURITE COPPER & GOLD CO.****ARIZONA.**

Dead. Lands sold to Mineral Hill Consolidated Copper Co. Formerly at Tucson, Pima Co., Ariz.

**AZURITE COPPER MINING CO.****ARIZONA.**

Letter returned unclaimed from former office and mine, Globe, Gila Co., Ariz. Organized 1907, under laws of Arizona, with capitalization \$1,000,000, shares \$1 par, by Carl Eder, H. Sidow, Jacob Suter, C. W. Clement and C. W. Parsons.

**AZURITE MINING CO.****WYOMING.**

Office: 365 Tenth St., Oshkosh, Wis. Mine office: Dillon, Carbon Co., Wyo. Henry L. Larsen, president; Arthur Bishop, vice-president; H. O. Granberg, secretary, treasurer and general manager; E. N. Sanders, superintendent; Frank Earle, consulting engineer. Organized Dec. 17, 1904, under laws of Wyoming, with capitalization \$1,000,000, shares \$1 par; issued, \$635,000. Lands, 5 claims, area 100 acres, in the Battle Lake district, showing 3 fissure veins in gabbro, of 15' to 20' estimated width, opened by a 65' shaft and 70' tunnel, showing ore giving assays of 18% copper.

**BABY MCKEE GOLD MINING CO.****OREGON.**

Mine office: Sumter, Baker Co., Ore. Ores carry gold, silver, lead and copper. Has steam power. Presumably idle.

**BACHELOR GOLD MINING CO.****COLORADO.**

Mine office: Lake City, Hinsdale Co., Colo. C. F. Meek, superintendent, at last accounts. Ores carry gold, silver, lead and copper. Has water power.

**BACKUS & JOHNSTON.****PERÚ.**

Office: 74 Calle San Pedro, Lima, Peru. Works office: Casapalca, Oroya, Junín, Perú. The Natividad mine, employing circa 200 men, in 1907 produced 2,507 metric tons of ore averaging 14% copper and 14 to 70 oz. silver per ton. The smelter, known as the Fundición Casapalca, is a small but well-equipped matting furnace, on the Oroya railroad, 88 miles from Lima, at an altitude of 3,606', having two 75-ton water-jacket blast-furnaces. Water power is used, and ores under 12% in tenor are not treated. Fuel is mainly German and English coke, costing 25 pesos delivered, though Peruvian coke is used at times, from necessity. Product is exported as a matte of 50 to 55% average copper tenor. Wages are 50 cents to \$2 per 12-hour shift. Production, 1907, is estimated at 750,000 lbs. fine copper.

**BADAJOZ COPPER MINES, LTD.****SPAIN.**

Office: 14 Bishopgate St. Without, London, E. C., Eng. Mine office: Puebla, Badajoz, Spain. Lord Armstrong, chairman; J. W. Chalkley, secretary. Organized July 25, 1906, under laws of Great Britain, with capitalization £10,000, shares £1 par; issued, 8,000 shares, 1s. called up. Lands, 320 hectares, including the Suerte and Extramena copper mines. Presumably idle.

**BÄDEN-BÄDEN GOLD MINING CO.****COLORADO.**

Dead. Formerly at Black Hawk, Gilpin Co., Colo.

**BADGER COPPER CO.****WYOMING.**

Letter returned unclaimed from former office, Laramie, Wyo. Organized, 1902, to operate in Albany county, Wyoming, and in 1906 was driving a tunnel.

**BADGER COPPER MINING CO.****WISCONSIN.**

Office: care of B. J. Van Vleck, president, West Superior, Wis. Organized circa 1898, with capitalization \$2,500,000, shares \$1 par. Lands, 210 acres, in Section 8, Town 27, Range 12, Douglas county, Wisconsin, lying next west of the North Wisconsin mine. Idle since circa 1900.

**BADGER-HALL MINING CO.****ARIZONA.**

Office: Douglas, Ariz. Mine office: Paradise, Cochise Co., Ariz. Organized 1907, under laws of Arizona, with capitalization \$1,000,000, shares \$2 par. Is controlled, through ownership of entire stock issue, by Bisbee-Sonora Development Co. Lands, 30 claims, area 545 acres, said to show an ore body 62' wide at surface and 50' wide at depth of 200', opened by tunnel. Is said to plan a smelter, but should develop a mine first.

**BADGER MOUNTAIN MINING & MILLING CO.****COLORADO.**

Dead. Was organized under laws of Wyoming, with capitalization \$150,000, shares 10 cents par. Lands were 6 claims. Formerly at Florissant, Teller Co., Colo.

**BADGER STATE MINING & MILLING CO.****WYOMING.**

Office and mine: Saratoga, Carbon Co., Wyo. Gustav Jensen, president and manager; John H. Davis, vice-president and superintendent; C. E. Jensen, treasurer; A. H. McDougal, secretary. Organized Dec. 26, 1901, under laws of Wyoming, with capitalization \$1,000,000, shares \$1 par. Lands, 8 claims, area 140 acres, on Jack Creek, showing 3 fissure veins, averaging 4' width, claimed to give average assays of 50% copper, 50% lead and from a trace up to 400 oz. silver per ton, opened by shafts of 60' and 105', and by a 90' tunnel. Presumably idle.

**BAGDAD GOLD & COPPER CO.****CALIFORNIA.**

Office: care of Gordon & Co., 254 Wilcox Bldg., Los Angeles, Cal. Mine office: Bagdad, San Bernardino Co., Cal. Sherman Washburn, president; V. L. Carroll, secretary. Is a prospect only, with about 250 feet of openings. Idle for several years.

**BAHIA EXPLORATION CO.****BRAZIL.**

Mine office: Jaguarary, Pará, Brazil. Lands, sundry claims about 50 miles west of Jaguarary, giving ore assaying 2 to 4% copper.

**BAILEY'S COPPER, LTD.****TRANSVAAL.**

Office: P. O. Box 3170, Johannesburg, Transvaal. Mine office: Barberton, Middelburg, Transvaal. A. Y. Niven, chairman; L. K. Jacobs, secretary. Organized circa May, 1907, under laws of Transvaal, with capitalization £15,000, shares £1 par. Lands, 96 base metal claims, in the De Kaap Valley, near the Barberton Copper Syndicate, on which work was begun circa July, 1907. Property has a 5' vein, traceable a quarter mile, opened by 2 shafts, A shaft being 85' deep.

**BAKER CONSOLIDATED COPPER MINING CO.**

Office: 4 Campau Bldg., Detroit, Mich. John Baker, general manager. Organized under laws of District of Columbia, with capitalization \$2,500,000. Location of property, if any, unknown. Is regarded with suspicion.

**BAKER MILLING, SMELTING & REFINING CO.**

Office: 4 Campau Bldg., Detroit, Mich. John Baker, president; John E. Rolland, secretary and treasurer. Organized under laws of Oklahoma, with capitalization \$10,000,000. President claimed to be putting a plant in Detroit, to be in operation during 1906, but no such plant materialized. Is regarded with suspicion

**BALADE MINE.**

Mine office: Ouegoa, Diahot, New Caledonia. Mine, opened to depth of 150 metres, produced ore which was concentrated to average tenor of 17 to 20% copper, and exported to Australia for smelting. Idle since circa 1885.

**BALAKLALA CONSOLIDATED COPPER CO.**

CALIFORNIA.

Office: 60 State St., Boston, Mass. Mine office: Kennett, Shasta Co., Cal. Works office: Coram, Shasta Co., Cal. W. H. Brevoort, president; Thos. A. Barbour, vice-president; Roy N. Bishop, secretary and mine manager; T. M. T. Baborg, treasurer; Duncan McVichie, manager director; Bobeman T. White, smelter manager. Organized under laws of Nevada, with capitalization \$10,000,000, shares \$25 par. Bonds, \$750,000, at 6%, balance of bond issue of 4 series, being "C" series, \$375,000, maturing July 1, 1909, and "D" series, \$375,000, maturing July 1, 1910. Present company was a reorganization of the Balaklala Mining Co., control of which was sold simultaneously to two parties, requiring reconstruction to untangle matters. Windsor Trust Co., New York, and Federal Trust Co., Boston, transfer agents. Trust Company of America, New York, and First National Bank, Boston, registrars. Entire stock issue was owned by the Balaklala Copper Co., which has been reorganized as the First National Copper Co. An issue of \$2,000,000 of convertible collateral bonds, at 10%, was authorized, but the public wisely was suspicious of bonds bearing such high interest, and issue was not floated, vote authorizing these bonds being rescinded at annual meeting, January, 1908.

Lands, variously reported as 64 claims, 72 claims and 80 claims, patented, area circa 1,200 acres, also about 300 acres of mill and smelter sites, and miscellaneous lands giving total holdings of 1,600 acres, well timbered, in the Flat Creek district, adjoining the Trinity. Company platted the townsite of Coram, and sold every lot therein. Lands, December, 1906, were 72 claims, area 1,149 acres, carrying 3,040' of the strike of an ore body developed for 1,100', showing an ore lense of 20' to 60' width and about 900' length. In 1907 the Sheridan group of 40 acres was bought for \$20,000, and the Stowell group of claims has been added. Company reports 12 ore bodies, of which 3 are under development, these being reported as having average dimensions of 312' width, which obviously is an error, one ore body being 900' long and one being 1,100' long. The company reports that ore averages about 3% copper, 1 oz. silver and 0.03 oz. gold per ton.

Mine development is by tunnels, with upraises, providing for open-cast mining, which should give very cheap extraction. There are about 20 tunnels, the Weil tunnel being about 600' in length. Surface above the main lense has been stripped, preparatory to open-cast operations. Development shows 3 distinct lenses, all more or less displaced by a series of step-faults from south to north. Ore is pyritic and must be smelted direct, without concentration. It has been claimed that average assays of the ore show 2.7% copper, and at an earlier date it was claimed, in the press, that one ore body averaged 11%, but in actual practice it is probable that extraction will not exceed 2.25%, or 45 lbs. per ton, and possibly may not be more than 2%, or 40 lbs. fine copper per ton. Assays show 75 cents to \$1 per short ton in combined gold and silver values. The main ore body, according to the company's figures of December, 1906, carried 2.462% copper, or 49 1/4 lbs. per ton, 0.846 oz. silver, equal to about 50 cents, and 0.025 oz. gold, equal to 50 cents. The report of Duncan McVichie, early 1907, gave 540,142 tons of ore in sight, with 342,307 tons reasonably safe to infer. Company's direct report of Aug. 11, 1908, claims 2,000,000 tons of ore in sight, with 1,000,000 tons blocked out for stoping, which figures seem unduly high, though there is no question that there are large ore bodies proven and blocked out.

The machinery plant of the mine includes installations of about 1,000 h.p.,

including a number of hoists, 5 compound air-compressors, and about 40 rock-drills. There also are a sawmill, store, school, hospital and about 75 dwellings. Company has a 5-mile private railroad of 4' 8" and 36" gauges, with 5 locomotives. The mine and smelter are connected by a Bleichert aerial tram of 16,130' length, having 62 wooden towers, height 35'. The smelter, being lower than the mine, tram is operated automatically, by gravity, having an estimated hourly capacity of 75 tons.

The smelter, begun May, 1906, and practically completed, except converter plant, July, 1908, at a cost of approximately \$2,000,000, is near the mouth of Cottonwood Creek, which flows into the Sacramento river at a point 4 miles south of Kennett and 13 miles north of Redding. The smelter building is of steel frame with roof and siding of galvanized iron, no wood being used. There may be trouble with the roof on account of sulphur fumes, but the smelter is well designed, though lacking a converter plant, which obviously will be necessary later. The smelter nominally is of 1,200 tons daily capacity, having three 400-ton blast-furnaces and an 18x96' reverberatory furnace. Dust chamber is 120x180', being much wider than ordinary. The stack is 250' high, of 18' inside diameter. The smelter has bunkers for 750 tons of ore, and steam is furnished by two 250-h. p. Stirling boilers, fired with petroleum, in addition to the boilers fired by waste gases from the reverberatory furnace. Electric power will be used exclusively, except for running 8 blowers for the blast-furnaces. Installation includes various motors of 5 to 150-h. p. each. The smelting plant includes a machine-shop, smithy, carpenter-shop, bunk-house and 24 dwellings for workmen.

The American Smelters Securities Co. had a contract for treating the ores of the Trinity Copper Co., which was turned over to the Balaklala. It has been stated that this contract allowed an estimated profit of \$2 per ton on treatment of Trinity ores, but this estimate is excessive. The Balaklala also had a contract with the American Smelters Securities Co. providing for the treatment of matte, but the latter company does not seem to be in a position to carry out this contract advantageously.

There have been many wild assertions made regarding the prospective profits of the Balaklala. Interested parties have put forth estimates of 15,000,000 lbs. fine copper production yearly, at a cost of 9 cents per pound, and estimates as low as 8 to 8½ cents per pound have been made. It is unlikely that the ore in considerable quantities will average better than 2.25% copper, and may be less. Figured on a fair basis, costs should be about 75 cents to \$1 per ton for mining, 25 cents for transportation, \$2.50 to \$3.50 for smelting, and 50 cents to \$1 for incidentals, giving totals of \$4.50 to \$5.75 per ton for a product brought to matte. Allowing 45 lbs. fine copper per ton recovery, the cost would be 10 cents per pound for fine copper in the form of matte, if average costs were as low as \$4.50 per ton of ore, or 18½ cents per pound if ore costs were \$5.75. An estimate of 10 cents per pound for copper brought to matte would seem to be as low as can be made with safety. The cost of conversion, if done at the Balaklala smelter, as it should be, would be about 1½ cents per pound, in all likelihood, and freight and refining would cost about 2 cents per pound additional, a total of 3½ cents added to previous cost, giving a minimum cost of 13½ cents per pound; or a maximum cost of 18½ cents per pound, from which should be deducted about 2 cents per pound for included gold and silver values saved by electrolytic refining, this offsetting costs of freight and refining. Allowing for deduction of gold and silver values from gross cost, the Balaklala copper should cost a minimum of 11½ cents, or a maximum of 14½ cents per pound, when placed on the market. There is some possibility that the minimum figure may be slightly reduced, also a possibility that the maximum may be exceeded slightly, but the figures given may

be accepted as conservative estimates, although they differ very much from those of 8 or 9 cents, given out by interested parties.

The work at the mine and smelter has been good, with the exception of the omission of a converter plant, but the company has been poorly financed, and apparently was injured by its affiliations both with the Guggenheim and Lawson interests. The Guggenheims were said to own 30,000 shares. The plan of an operating company and holding company is one that seems in high favor with many financiers, but about the only excuse for such a bifurcated corporation is that somebody is to be kept in the dark, this somebody usually being the innocent investor. The excuses of delayed shipments, etc., given out for non-completion of the smelter, seem to have been a euphemistic method of accounting for delays due to shortage of cash.

The company being practically bankrupt at the close of 1907, and 10% bonds being absolutely unsalable, reorganization was necessary, and the holding company, known as the Balaklala Copper Co., has been reorganized under the name of the First National Copper Co., as set forth in the description of the latter-named corporation. While the Balaklala Consolidated Copper Co. has been poorly financed, and many exaggerations have been made public regarding the richness of the mine, and its possible earnings, the property is valuable beyond doubt, and with sufficient capital, and under good management, the mine, though low in grade, should be operated at a profit.

**BALAKLALA COPPER CO.****CALIFORNIA.**

Office: 60 State St., Boston, Mass. Mine office: Coram, Shasta Co., Cal. Clarence K. McCornick, president; N. Adams Egbert, vice-president and secretary; T. M. T. Haborg, treasurer; preceding officers, Edgar L. Newhouse and Geo. A. Baird, directors. Organized Feb. 24, 1906, under the laws of Maine, with capitalization \$10,000,000, shares \$25 par; capitalization reduced, March, 1907, to \$4,000,000, and increased immediately thereafter to \$6,000,000, shares \$10 par. The only property of the company is the entire stock issue of the Balaklala Consolidated Copper Co. Company, becoming bankrupt at the end of 1907, has been practically reorganized through the formation of the First National Copper Co., which, March, 1908, loaned \$450,000 to the Balaklala Copper Co., taking as security therefor the entire stock issue of the Balaklala Consolidated. About 98% of the shareholders of the Balaklala Copper Co. have deposited their stock, for new stock of the First National. This leaves the Balaklala Copper Co. a mere shell, and, to all practical intents and purposes, it is out of business.

**BALAKLALA MINING CO.****CALIFORNIA.**

Dead. Succeeded, circa 1904, by Balaklala Consolidated Copper Co. Formerly at Coram, Shasta Co., Cal.

**BALACLAVA COPPER MINING CO.****AUSTRALIA.**

Mine office: Broken Hill, N. S. W., Australia. W. O. H. Simons, superintendent, at last accounts. Has auriferous copper ores. Presumably idle.

**BALBACH SMELTING & REFINING CO.****NEW JERSEY.**

Office and works: Newark, Essex Co., N. J. Edw. Balbach, Jr., general manager. Property is an electrolytic refinery, having in connection a small smelting plant. Refinery has 430 tanks, operated on the multiple system, with one 300-kw. generator and two 125-kw. generators. Capacity of plant is circa 2,750,000 pounds electrolytic copper monthly. The metallurgical practice of the works ranks deservedly high. Employs circa 250 men.

**BALD MOUNTAIN MINING CO.****WASHINGTON.**

Mine office: Clear Lake, Skagit Co., Wash. A. H. Rogers, superintendent, at last accounts. In March, 1907, was said to have secured ore assaying 15 to 25% copper.

**BALD MOUNTAIN MINING & SMELTING CO.****MONTANA.**

Mine office: Saltese, Missoula Co., Mont. E. W. Conrad, superintendent. Was developing, with a small force, in 1907.

**BALHANNAH COPPER & GOLD MINE, LTD.****AUSTRALIA.**

Dead. Formerly at Onkaparinga, South Australia.

**BALHANNAH MINE.****AUSTRALIA.**

Mine office: Onkaparinga, South Australia. Property is an old mine, with 8 shafts, deepest 300', 14 miles southeast of Adelaide. Ores include copper, zinc, lead, silver and gold. Idle many years.

**BALKAN COPPER CORPORATION, LTD.****TURKEY.**

Office: 6 Great St. Helen's, London, E. C., Eng. Mine office: Yardimli, Turkey. Sir Owen R. Slack, chairman; Ernest A. Foster, secretary; Mario Krieger, managing director in London. Organized Sept. 5, 1899, under laws of Great Britain, with capitalization £250,000, shares £1 par; issued, £220,000. Lands include the Yardimli mine, area 7,900 acres, and the Chapzi-Hani mine, area nearly 2,500 acres, in the Rhodope Mountains, northwest of Constantinople, held on a 99-year lease by firman from the Turkish crown at annual royalty of £300. Property also includes a small undeveloped mine at Shab-Khaneh, in the district of Xanthi, held under annual royalty of £100. Idle for some years.

**BALLA BALLA COPPER MINES, LTD.****AUSTRALIA.**

Dead. Reorganized, Apr. 16, 1901, as New Balla Balla Copper Mines, Ltd.

**WASHINGTON.****BALLARAT COPPER MINING CO.**

Mine office: Newport, Stevens Co., Wash. Ores carrying copper, gold and silver, have been opened by a crosscut tunnel. Idle for some years.

**BALL COPPER CO.****ARIZONA.**

Office: 526 Security Bldg., Los Angeles, Cal. Mine office: Winkelman, Gila Co., Ariz. Chas. E. Finney, president; Paul Burkes, vice-president; E. J. Mitchell, secretary; N. A. Vyne, treasurer; preceding officers, W. H. M. Drescher, Chas. P. Joslin and John M. Ross, directors; Edw. V. Brooks, engineer. Organized Feb. 1, 1908, under laws of Arizona, with capitalization \$3,000,000, shares \$10 par. Has authorized a \$50,000 bond issue, at 6%. Company plans sinking a 3-compartment 800' shaft, at a cost of about \$150,000.

**BALTIC MINING CO.****MICHIGAN.**

Office: 82 Devonshire St., Boston, Mass. Mine office: Baltic, Houghton Co., Mich. Employs about 1,000 men. Wm. A. Paine, president; Frederic Stanwood, secretary and treasurer; preceding officers, Samuel L. Smith, Cameron Currie, J. Henry Brooks and E. Townsend McKeever, directors; Fred W. Denton, general manager; Clarence G. Mason, engineer; F. G. Coggins, mill superintendent; John Jolly, superintendent; Wm. C. Cole, clerk; W. J. Richards, master mechanic.

Organized December, 1897, under laws of Michigan, with capitalization \$2,500,000, shares \$25 par; \$18 paid in. American Trust Co., Boston, transfer agent. Old Colony Trust Co., Boston, registrar. Annual meeting, first Monday in March. Owns \$80,000 stock of Michigan Smelting Co. Practically entire stock issue is owned by Copper Range Consolidated Co. Dividends have been \$1,250,000 in 1905; \$1,400,000 in 1906, and \$1,000,000 in 1907.

Assets, Jan. 1, 1908, were \$1,261,862.41, with liabilities of \$649,115.23, giving an excess of assets of \$612,747.18. For 1907 the mining profit was \$1,477,650.25, with construction account of \$265,782.48, leaving net earnings for the year of \$1,157,971.57, with a surplus of \$454,775.61.

Lands, 800 acres, near the Eastern Sandstone of the Keweenawan copper belt, about 75 acres being on the sandstone and non-mineralized. Holdings comprise all of Section 21 except the southeast quarter, and the west half of Section 20, Town 54 North, Range 34 West. Lands are bounded on the north

by the Wheal Kate and Section Sixteen of the Atlantic; on the east by St. Mary's Mineral Land Co.; on the south by St. Mary's lands, lands of Hussey, Howe & Co. and the Trimountain mine; on the west by the Trimountain. In 1905 exchanged 39 acres with the Atlantic mine, which will enable the Baltic to sink No. 5 shaft to much greater depth than otherwise possible. To the southward the Trimountain and Champion mines are opened on the same lode, which has a strike of N. 63° E., from Baltic shafts 2 to 5, and to the northward is the Superior mine, on the same bed. The dip of the lode averages about 73°, being the sharpest of any developed cupriferous bed in the Lake district.

The shafts are numbered from south to north, with a distance of 3,025' between the extreme shafts, there being room for one additional shaft at the southern end.

No. 1, the discovery shaft, located between Nos. 2 and 3, was sunk at a wrong angle, and was abandoned at a depth of 219'.

No. 2, the southernmost shaft, on Jan. 1, 1908, was 1,150' deep, and began production 1906. The surface plant at No. 2 includes a boiler-house with two 250-h. p. Stirling boilers; compressor-house with Nordberg air-compressor reducing 4,000' of free air per minute to a pressure of 70 lbs. per square inch, and a Nordberg hoist with double-conical drum. The shaft-rockhouse has a crusher operated electrically, and the shaft has concrete stringers.

No. 3 shaft, 1,170' northeast of No. 2 and 1,500' deep, has a steel shaft-rockhouse, built 1908 by the Wisconsin Bridge & Iron Co. This is of the circular type, with 1,200-ton bins, equipment including a 16x18" engine, two 18x24" Blake crushers and a large crusher operated electrically.

No. 4 shaft, 900' northeast of No. 3 and 1,475' deep, has a frame shaft-rockhouse sheathed with steel, 36x71' with 17x31' wing, 88' high, with 1,400-ton rock-bin and two 18x24" Blake crushers.

No. 5 shaft, the northernmost, 855' northeast of No. 4 and 1,125' deep, has a shaft-rockhouse duplicating that at No. 4. Stoping is in progress on the 9th to 14th levels, inclusive, and drifts have been run to the Atlantic boundary. The ground was considerably disturbed in the upper levels, but is growing more settled at the bottom. Hoist is a duplex Nordberg, good for 1,500' depth.

Hand-power cranes for handling mass copper have been installed at all shafts, and the mine has electric pumps.

The Baltic amygdaloid, taking its name from its first mine, was opened in 1882, but abandoned at 90' depth, because a wrongly pitched drill hole ran into the hanging-wall. The Baltic is an exceptionally strong lode, ranging 15' to 60' in width, so well mineralized that at most point it must be more or less thoroughly beaten away from wall to wall. The great width of the stopes has brought about the use of a walling system, by which waste rock is built into dry-walls along the drifts, thus saving timbering, while giving stronger walls than any timber could supply, and saving the cost of hoisting lean rock. The walling system of the Baltic has proven a success under actual test, and is now in general use in the Lake district, the credit being due Mr. Denton. A little melaconite is found in narrow fissures crossing the lode, these being too small to follow, but the black oxide ore mined in the stopes is saved in the milling, carrying 35% to 40% copper as dressed, and smelts readily with the native copper mineral. The native copper of the Baltic is arsenical, and it is probable that some copper arsenides are mined and milled, as narrow arsenical fissure veins occur occasionally in the district south of Portage Lake. While the finished copper is arsenical, it makes wire of great tensile strength.

The compressor-house, between shafts 3 and 4, is 36x58' in size, with concrete foundations, stone walls and steel roof, housing a compressor with

capacity to reduce 4,000 cubic feet of free air per minute to a pressure of 70 lbs. per inch. Adjoining is a boiler-house of similar material, 49x76', with wing 12x62', having four 250-h. p. Stirling boilers and a 140' self-supported steel smokestack. This boiler plant supplies steam for shafts 3 and 4. Adjoining the boiler-house is a 360' coal trestle, of 5,000 tons capacity, underneath being a 5x8' concrete tunnel, through which coal is hauled in tram-cars, on a down grade, by endless cable. There also is a coal trestle at No. 2 shaft. There is a 50x132' combination machine shop and smithy, with stone walls and steel roof; a 42x72' carpenter shop; a 30x90' miners' changing house, supplied with hot and cold water, bath-tubs and lockers; a good office building and upwards of 100 well-built dwellings for employees. The mine has a complete electric light plant. A considerable town has grown up about the mine, on lands owned by the company, mine and town being served by the Painesdale branch of the Copper Range railroad, and also by a branch of the Atlantic railway.

The stampmill, at Redridge, on Lake Superior, one-half mile west of the Atlantic mill, went into commission December, 1901, and was enlarged 1907. Building is of structural steel, on stone foundation, equipped with 4 Allis simple heads of 560 to 625 tons daily capacity each, and 2 Nordberg compound heads of about 800 tons daily capacity each, the second head having been completed June, 1908, giving the mill a capacity of about 4,000 tons daily. Stamp foundations are massive, with 90-pound anvil-plates set beneath the mortars. Finisher-jigs and slime-tables were displaced by Wilfley tables, and Woodbury jigs have been added, also Deister concentrating tables for treating the finer slimes, both giving good results. The mill has crushing rolls and a Huntington mill for regrinding, and a settling tank for slimes. Mineral returns about 72% fine copper, and tailings, '907, carried 0.24% copper, but are expected to be reduced, by the settling tank, to about 0.20% copper. The discharge at the mill is about 25' above mean water datum, and with a drop of 1 in 10 provides for the wasting of many million tons of tailings by gravity alone. The mill is heated by the Coogan & Strothenke system, air being delivered from 4 blowers after previous heating by passing over steam-coils, radiation in the coils being insured by a vacuum system. Power is furnished by a 500-h. p. Nordberg cross-compound engine, and a 180-h. p. auxiliary engine.

Adjoining the mill is a 55x90' boiler-house, of steel frame on stone foundations, housing five 250-h. p. Stirling boilers and a Green fuel economizer. Draft is secured by a set of duplex fans, driven by the mill engine. Behind the boiler-house is a 25,000-ton coal-storage yard, for the joint use of the Baltic and Atlantic mills, coal being brought to the boilers, through tunnels, by gravity.

Water for both the Baltic and Atlantic mills is furnished by a \$150,000 gravity dam across the mouth of Salmon Trout river, built jointly by the Atlantic and Baltic mines. This structure is built of steel and anchored by its own weight, irrespective of the holding power of the rock. The plan was suggested by J. F. Jackson, of the Wisconsin Bridge & Iron Co., and the details were inspected and approved by Foster Crowell. The work required about 1,000,000 pounds of steel and 8,000 cubic yards of concrete. The dam impounds about 1,250,000,000 gallons of water, and at the river's lowest stage can furnish water to wash 5,000 tons of rock daily, 300 days yearly, effecting a saving over pumping of about 2 cents per ton of rock stamped. The dam is anchored in a cement foundation of great strength, and is in 5 sections, with a total length of 475', the central or deepest section being 74' high, with wings of 200' on the west and 350' on the east, in comparatively shallow water, made with cement cores built up from excavations in bed-rock, buttressed

by earth embankments. All 5 sections of the dam proper are of the same general design, the central section being highest, as it is bottomed in the bed of the river, with a wider and heavier concrete base and stronger steel bracing. The dam is of steel throughout, anchored in a concrete base, with braces between the crest of the dam and the extreme foot of the cement base. The following description of the central section will give an idea of the general construction of all 5 parts; the concrete base is 62' wide, built up from rock excavations. The resultant of all pressures gives a pressure of 2,626,000 lbs. for each steel section of 8' width and 74' height. The upper 50' of the dam in this central section of 100' is inclined from the water at 45°, throwing the point of overturning within the central third of the concrete base, thus allowing an ample margin of safety. The dam is made of plates of best boiler steel, concave on the water side, 8x10" in size and 8-8" thick, riveted and caulked water-tight and supported by parallel inclined "I" beams 24" thick, for the full depth of 50' below the crest of the dam. On the lower section the steel plates are each 8x10' and 8-10" thick, concave, riveted and caulked, but resting directly against the concrete base. The "I" beams of the upper or main section are supported by heavy triangular frameworks of inclined steel columns and struts. The entire steel structure is anchored to a 2" steel base-plate, at the bottom of the concrete, by a large number of 1½", 2" and 2½" steel rods, of 15' to 30' length. Water is taken from the dam about 20' below the crest by three 38" riveted steel pipes, one pipe being on the Atlantic and two on the Baltic side. There is a system of valves and waste weirs, but the structure is of such a nature that it could not be injured were water to flow continuously over its crest for an indefinite period. Surmounting this structure is a trestle of the Copper Range railroad, built at the same time, but in nowise a portion of the dam. The center of the railroad track is 7' above the crest of the dam, 10' down-stream. In the central sections the foundations for the feet of the trestle are all in the concrete work, elsewhere the northern piers for the trestle are separately built.

The Baltic began production with a leased stamp, August, 1899, starting one stamp in its own mill December, 1901. Production was 2,641,432 lbs. in 1901; 12,177,729 lbs. in 1903; 16,708,868 lbs. fine copper in 1907. The ultimate productive capacity of the mine cannot be predicted with safety, but the present milling capacity is equal to making about 25,000,000 lbs. fine copper yearly, and it is but a question of time when an output of this size will be made, and, ultimately, an even larger production may be secured. The management is in all respects equal to the mine, both being of the best.

**BALTIMORE & ARIZONA COPPER CO.**

ARIZONA.

Letter returned unclaimed from former mine office, Turkey, Yavapai Co., Ariz. Lands, known as the Rainbow group, in the Turkey Creek district, are opened by a 75' shaft, claimed to show a large body of sulphide ore of 2.5 to 5% copper tenor. Presumably idle.

**BALTIMORE COPPER CO.**

ARIZONA.

Mine office: Prescott, Yavapai Co., Ariz. Organized 1907 as successor of Chronicle Mining Co. Lands, 6 claims, circa 4 miles east of Prescott, having several shallow shafts.

**BALTIMORE COPPER-GOLD MINING CO.**

Office: London, Ontario. Location of lands, if any, unknown.

**BALTIMORE COPPER & SILVER MINING CO.**

MONTANA.

Letter returned unclaimed from former office, Butte, Mont. Organized circa May, 1907, with capitalization \$100,000, shares \$5 par.

**BALTIMORE COPPER SMELTING & ROLLING CO.**

MARYLAND.

Office and works: Keyser Bldg., Baltimore, Baltimore Co., Md. R. Brent

**Keyser**, president; **Jos. Clendenin** and **Wm. H. Pierce**, vice-presidents; **Albert H. Weld**, treasurer. Succeeded the Baltimore & Cuba Smelting & Refining Co., which built the first American copper smelter, 1845. Supposedly is controlled by the American Smelting & Refining Co. Plant is located on one of the best harbors of the Atlantic coast and having direct rail connections, is very advantageously located for both domestic and foreign business. Plant is large and modern, including electrolytic works, bullion refinery, sheet copper rolling mill and a bluestone plant. The 100-ton electrolytic refinery has eleven 80-kw. generators and 540 tanks, with anodes arranged on both the series and multiple plans. Material treated is mainly auriferous and argentiferous copper matte from Arizona, Montana and various foreign countries. Employs circa 400 men.

**BALTIMORE MINING & DEVELOPMENT CO.****MONTANA.**

Mine office: **Comet**, Jefferson Co., Mont. Lands, 15 claims, in the Boulder district. Made, 1907, several small smelter shipments.

**BALTIMORE & SONORA GOLD & COPPER CO.****MEXICO.**

Letter returned unclaimed from former office, 909 Maryland Trust Bldg., Baltimore, Md. Mine office: **La Cananea**, Arizpe, Sonora, Mex. **J. O. Johnston**, president; **Chester F. Johnston**, secretary. Capitalization \$5,000,000, shares \$10 par. Lands, 387 acres, on the western slope of the Cananea Mountains, showing good outcrops of auriferous copper, carbonates and silicates. Idle.

**BALVANERA MINING CO.****MEXICO.**

Office: 1202-24 Broad St., New York, N. Y. Mine office: **Conchelio**, Bayón, Chihuahua, Mex. **Herbert T. Beatty**, president; **Chas. W. White**, secretary and treasurer. Is controlled, through ownership of majority of stock, by Greene Gold-Silver Co. Lands, circa 46,000 acres, in the Ocampo and Conchelio districts.

**BAMBERGER-PIOCHE MINING CO.****NEVADA.**

Office: care of **Simon Bamberger**, president, Salt Lake City, Utah. Mine office: **Pioche**, Lincoln Co., Nev. **Edward Cutts**, superintendent, at last accounts. Lands, 12 claims, lying to the westward of the Nevada-Utah. Presumably idle.

**BANKER'S MINING & DEVELOPMENT CO.****MEXICO.**

Office: care of **E. R. Chapman & Co.**, New York, N. Y. Mine office: **Zautla**, San Juan de los Llanos, Puebla, Mex. **Chas. Q. Davis**, president; **W. L. Wilkins**, general manager. Is said to plan a 250-ton smelter.

**BANNACK CONSOLIDATED MINING CO.****MONTANA.**

Office: care of **Carlton H. Hand**, president, Butte, Silver Bow Co., Mont. Letter returned unclaimed from former mine office, **Bannack**, Beaverhead Co., Mont. Organized 1906, with capitalization \$1,250,000, shares \$5 par. Lands, 312 acres, covered with alluvium of 25' to 75' depth, opened by 2 shallow shafts, showing ores assaying up to 5% copper and \$2.40 gold per ton.

**BANNER GOLD & COPPER MINING CO.****WASHINGTON.**

Mine office: **Chelan**, Chelan Co., Wash. **Dr. J. L. Jacobs**, president; **R. W. Eager**, secretary. Main tunnel, 101', shows ores assaying up to 18% copper and \$15 to \$33 gold per ton. Idle.

**BARABA MINING CO.****WISCONSIN.**

Office and mine: **Mellen**, Ashland Co., Wis. **Nelson Baraba, Sr.**, president; **Nelson Baraba, Jr.**, secretary. Organized 1906, with capitalization \$1,000,000, shares \$1 par. Has a shallow shaft showing ore assaying 2.8% copper, with traces of gold and silver.

**BARAGUNDA MINES.****INDIA.**

Mine office: **Baragunda**, Hazaribagh, Bengal, India. Were operated, 1887

to 1891, turning out about 1,000 tons of copper in five years. Ore occurs as chalcopyrite, running only 1 to 3% copper, in a gangue of micaceous schist. All ore treated was carted 24 miles to the smelter, at Giridhi. These are perhaps the most promising copper properties now known in India, despite the low grade of the ore, and might be worked successfully, if given rail facilities, adequate capital and good management. Idle.

**SUCESIÓN DE BAAZARTE.****CHILE.**

Mine office: Paposo, Taltal, Antofagasta, Chile. Property includes the Reventon mine, 400' deep, and the Abundancia mine, 380' deep, both opened in 1830, also La Unión mine. Has steam power. Idle.

**BARBERTON COPPER CO., LTD.****TRANSVAAL.**

Office: High Court Bldgs., Johannesburg, Transvaal. Mine office: Barberton, Middelburg, Transvaal. T. F. Allen, chairman. Organized July 25, 1907, under laws of Transvaal, as successor of the Barberton Copper Syndicate. Lands, 144 claims, near Noord Kaap. Manager states that he is opening the biggest mining and smelting proposition in South Africa, which seems a rather ambitious statement, in view of the small amount of work accomplished.

**BARBERTON COPPER SYNDICATE, LTD.****TRANSVAAL.**

Dead. Reorganized July 25, 1907, as Barberton Copper Co., Ltd. Formerly at Barberton, Middelburg, Transvaal.

**BARE HILL MINE.****MARYLAND.**

Office: care of F. R. Van Antwerp, owner, Hornell, N. Y. Letter returned unclaimed from former mine office, Mt. Washington, Baltimore Co., Md. Is an old but slightly developed mine, showing auriferous and argentiferous chalcopyrite and bornite. In 1907 owner planned installing a mine equipment. Idle some years.

**BARISTE COPPER CO.****MEXICO.**

Office: 84 Adams St., Chicago, Ills. Mine office: Aguacaliente de Baca, Fuerte, Sinaloa, Mex. John E. Richardson, president; Harry Austin Clapp, vice-president and general manager; Paul H. Seymour, secretary; Edw. R. Austin, treasurer; Daniel H. Livingston, superintendent; preceding officers, Wm. Walden Shaw and Herbert F. Spellman, directors. Organized Feb. 23, 1906, under laws of Arizona, with capitalization \$2,000,000, shares \$1 par. Lands, 104 hectares, in the Fuerte and Alamos districts, said to show 8 veins, of which 2, under development, of 24' estimated average width, said to be traceable 1 mile, are slightly developed by tunnel, shafts and trenches, with about 800' of workings, showing oxidized ores said to average 16% copper and 25 oz. silver per ton.

**BARNES COPPER CO.****MONTANA.**

Office: 810-184 La Salle St., Chicago, Ills. F. E. Barnes, superintendent. Capitalization \$1,500,000, shares \$1 par. Lands are sundry unpatented claims in Granite county, Montana, said to show 2 veins of 4' width, between diorite and slate, one carrying copper ore and one, of about 6' width, between quartzite and sandstone, carrying silver-lead ores. Has a 120' tunnel and several shallow shafts.

**BABOTSE COPPER CO., LTD.****RHODESIA.**

Dead. Merged, 1902, in Rhodesia Copper Co., Ltd.

**BARRANCA COPPER CO.****MEXICO.**

Office: 170 Broadway, New York, N. Y. Mine office: Barranca del Cobre, San Andres del Rio, Chihuahua, Mex. H. T. R. Cowell, manager. Lands, 25 miles east of a railroad, include La Purisima mine, having argentiferous and auriferous copper ores, opened by a 750' shaft and a 2,100' tunnel. Has shipped circa 2,000 metric tons of high grade ore, in concentrates, and is said to have large reserves of low grade copper ore. Has a 20-stamp mill with

two 4' Huntington mills, a 100-ton concentrator and a 60-ton smelter. Negotiations said to be under way for transfer of property to Anglo-American Development Co.

**BARTSTOW MINING & MILLING CO.**

**COLORADO.**

Office: Titusville, Pa. Mine office: Ironton, Ouray Co., Colo. John J. Carter, general manager; John Geisel, superintendent. Property is the Bobtail group, producing mainly gold, with silver, copper and lead as by-products. Has a 40-stamp mill with steam and electric power, employing about 60 men.

**GEWERKSCHAFT BARTHOLOMÄUS.**

**GERMANY.**

Dead. Formerly at Menden bei Olpe, Westfalen, Germany. Described Vol. VI.

**BASEL MINING CO.**

**NEVADA.**

Dead. Formerly at Tonopah, Nye Co., Nev. In 1907 was opening a mine in the Lone Mountain district, circa 16 miles west of Tonopah, on a 7' vein showing auriferous and argentiferous copper ore.

**BASIN & BAY STATE MINING CO.**

**MONTANA.**

Dead. Property sold July 30, 1907, for \$302,865 to the Basin Reduction Co. Formerly at Basin, Jefferson Co., Mont.

**BASIN-COMSTOCK CO.**

**MONTANA.**

Dead. Formerly at Catacaet, Jefferson Co., Mont.

**BASIN GOLD & COPPER MINING CO.**

**MONTANA.**

Office: care of E. R. Holden & Co., 20 Broad St., New York. Mine office: Basin, Jefferson Co., Mont. Hon. Robt. B. Smith, president; Marcus L. Hewett, vice-president and general manager; B. Lowinson, secretary and treasurer. Lands, 280 acres, patented, known as the Hope mine, on which considerable development has been secured. Company is entangled in litigation and apparently hopelessly involved.

**BASIN REDUCTION CO.**

**MONTANA.**

Works office: Basin, Jefferson Co., Mont. W. A. Kidney, superintendent. Is controlled by La France Copper Co., which is dominated by United Copper Co. In August, 1907, bought the mill and smelter of the Basin & Bay State Mining Co. and the Katie mine, at sheriff's sale, for \$302,865. Mill is of about 1,200 tons daily capacity. Has had some trouble with the county authorities because of polluting streams with tailings, but has built large dams to hold the slimes.

**BASLER MINING & DEVELOPMENT CO.**

**CALIFORNIA.**

Office: 904 J St., Sacramento, Cal. Mine office: Lowry, Tehama Co., Cal. Dr. D. L. McLean, president; W. L. Rennie, secretary and treasurer; C. M. Basler, general manager. Organized under laws of California, with capitalization \$200,000, shares \$1 par. Lands, 14 claims, partly patented, also a 5-acre millsite and 320 acres miscellaneous lands, opened by a 1,200' tunnel, with 3,000' of underground openings, showing 3 ore bodies, one of 2' to 75' width, giving average assays of 2% copper, 2% lead, and \$1 to \$3 gold per ton, from malachite, bornite and chalcopyrite.

**JOHN BATES.**

**BOLIVIA.**

Office and mine: Coro Coro, La Paz, Bolivia. Property is the Santo Tomás mine, carrying native copper in conglomerate. Has steam power and is a small producer of barrillas de cobre.

**BATES MINING & SMELTING CO.**

**MASSACHUSETTS.**

Dead. Formerly at Charlemont, Franklin Co., Mass. Described Vol. IV.

**BATTLE COPPER MINING CO.**

**WYOMING.**

Succeeded circa 1907 by Portland Copper Mining Co. Formerly at Battle, Carbon Co., Wyo. Described Vol. VI.

**BATTLE LAKE & BATTLE CREEK MINING CO.** WYOMING.

Office: care of N. B. Noble, Rice Lake, Wis. Mine office: Battle, Carbon Co., Wyo. Idle.

**BATTLE LAKE TUNNEL SITE MINING CO.** WYOMING.

Office: 731 Monadnock Block, Chicago, Illa. Mine office: Rudefeha, Carbon Co., Wyo. E. M. Cobb, president. Organized 1900, under laws of Wyoming, with capitalization \$2,500,000, shares \$1 par. Is controlled, through stock ownership, by Penn-Wyoming Copper Co. Lands, 30 claims, area 600 acres, also 80 acres miscellaneous lands.

**BATTLE MOUNTAIN COPPER MINING CO.** WYOMING.

Dead. Formerly at Encampment, Carbon Co., Wyo.

**BATTLESHIP MINING & MILLING CO.** NEW MEXICO.

Office: 412 Mack Bldg., Denver, Colo. Letter returned unclaimed from former mine office, Lordsburg, Grant Co., N. M. Dr. O. L. Blachly, president; O. B. Crum, secretary and treasurer. Capitalization \$100,000, shares \$1 par. Lands, 2 groups of 2 claims each, area 79 acres, in the Virginia district, three to four miles from Lordsburg, connected therewith by a good wagon road. Property has no surface improvement, but is opened by 478' of shafts, crosscuts, and opencuts, showing ores that are said to have given average returns, from smelter shipments to El Paso, of 8 to 14% copper, 1 to 20% lead, 22 oz. silver, and \$10 to \$20 gold per ton. Idle and apparently moribund.

**BAUMANN COPPER CO.** ARIZONA.

Office: 407 Keystone Bldg., Pittsburgh, Pa. Mine office: Humboldt, Yavapai Co., Ariz. Thos. G. McClure, president; H. L. Dooley, vice-president; W. H. McClelland, secretary; R. Johnston, treasurer; J. M. McNeal, managing director. Organized Aug. 3, 1901, under laws of Arizona, with capitalization \$600,000, increased, 1907, to \$1,500,000, shares \$1 par. Has an issue of 5-year 6% convertible bonds. Was practically reorganized, 1907. Annual meeting, first Monday in November.

Lands, 25 claims, area 500 acres, unpatented, in the Agua Fría district, including the Swiss Girl mine. Country rocks are quartz-porphyry and slate, principal veins occurring as fissures in quartz-porphyry, with heavy gouge on footwall. Ores are cuprite, malachite and azurite above, with chalcopyrite below, giving assays of 14 to 42% copper, from a trace to 312 oz. silver, and from a trace to \$38.50 gold per ton. Development is by 11 shafts, three of 208', 214' and 690', with 8 under 200' depth, and by tunnels of 50', 150', 200', and 305', with a total of 2,650' of underground openings. Equipment includes a 25-h. p. hoist, good for 1,500', an 80-h. p. boiler, 2-drill Sullivan air-compressor, 2 power drills and several small mine buildings. Property considered promising. Idle at last accounts, but resumption planned.

**SOCIEDAD MINERA y FUNDICIÓN DE RAUSCH y TIANI.** ARGENTINA.

Office, mine and works: Chilecito, Rioja, Argentina. Property includes the Compañía and Mercedes mines. Has steam and water power and a smelter, known as the San Miguel, built 1876, for lead ores, at a cost of \$120,000, and altered, 1893, to treat copper ores of the Mexicana district.

**BAY COPPER MINES, LTD.**

Office: 142 Palmerston House, London, E. C., Eng. John Robertson, managing director; W. R. Caldwell-Moore, secretary. Organized Jan. 24, 1902, with capitalization £35,000, shares £1 par; issued, £15,007. Claims to own an idle copper mine, but location unknown.

**BAY HORSE COPPER MINING CO.**

Dead. Formerly at Riverside, Carbon Co., Wyo.

WYOMING.

**BEACON CONSOLIDATED MINES CO.****COLORADO & MEXICO.**

Office: 609 Mack Bldg., Denver, Colo. Letter returned unclaimed from former mine office, La Cananea, Arizpe, Sonora, Mex. Lloyd Kenyon Jones, secretary, treasurer and promoter. Has two gold claims, on Beacon Hill, Cripple Creek, Teller county, Colorado, and in June, 1907, claimed to be acquiring 40 to 50 pertenencias of copper ground at La Cananea.

**BEAD LAKE GOLD-COPPER MINING & MILLING CO. WASHINGTON.**

Office: care of W. E. Allen, secretary, Spokane, Wash. Mine office: Newport, Stevens Co., Wash. B. F. Seeley, president; O. L. Smith, superintendent. Organized, 1901, under laws of Washington, with capitalization \$3,000,000, shares \$1 par. Lands, 13 claims, area 267 acres, developed by a 2,065' tunnel, showing sulphide ore. Has steam power and air-compressor. Was exploring by diamond drill at last accounts.

**BEAN AMALGAMATED COPPER CO.****NEW MEXICO.**

Letter returned unclaimed from former mine office, Lordsburg, Grant Co., N. M. Organized 1907, under laws of Arizona, with capitalization \$6,000,000. Lands, 600 acres, formerly known as the Bean & Good claims, in the Shakespeare district, shortly south of Lordsburg.

**BEAN COPPER CO.****ARIZONA.**

Dead. Formerly at Gila Bend, Maricopa Co., Ariz.

**BEAR GULCH MINING CO.****MONTANA.**

Office and mine: Twin Bridges, Madison Co., Mont. Alex. Johnson, manager; Edson C. Baxter, superintendent. Property is the Mountain View group, carrying auriferous and argentiferous copper ores, opened by tunnel. Has steam power.

**BEAR MOUNTAIN MINING & DEVELOPMENT CO. WASHINGTON.**

Mine office: Colville, Stevens Co., Wash. C. G. Carruthers, superintendent, at last accounts. Has argentiferous and auriferous copper ore, opened by tunnel.

**BEAR MOUNTAIN TUNNEL & MINING CO.****COLORADO.**

Mine office: Crystal, Gunnison Co., Colo. H. H. Williams, superintendent, at last accounts. Has argentiferous and slightly auriferous copper ores, opened by tunnel, with water power.

**BEAR TOOTH GOLD & COPPER MINES CO.****CALIFORNIA.**

Letter returned unclaimed from former office, Redding, Cal. Organized October, 1907, under laws of California, with capitalization \$900,000, by F. P. Burrie, Robt. Duffy, W. A. Courey, W. A. Bender and H. W. Leach. Lands, 14 claims, in Trinity county, California, said to have 14 parallel veins carrying auriferous and argentiferous copper ore, these ranging from a few inches to several feet width, and said to give average assays of 4% copper, 5 oz. silver and \$15 gold per ton. Has a shallow shaft and a 500' tunnel, with considerable trenching.

**BEATRICE MINING & MILLING CO.****MONTANA.**

Mine office: Elliston, Powell Co., Mont. D. G. Barringer, president; A. McNaughton, secretary and general manager; Abner Knapp, superintendent. Has ores of gold, silver, lead and copper, opened by tunnel. Has steam power and a 10-stamp mill.

**A. K. BEATSON.****ALASKA.**

Business of Bonanza mine is done in name of A. K. Beatson.

**BEAUPARK COPPER MINES CO., LTD.****IRELAND.**

Office: 36 College Green, Dublin, Ireland. W. Hume and D. Frame, directors. Organized Feb. 12, 1908, under laws of Great Britain, with capitalization £1,000, shares £1 par, to acquire mineral lands in County Meath, Ireland.

**BEAVER CANON GOLD & COPPER MINING CO.** WASHINGTON.

Mine office: Loomis, Okanogan Co., Wash. E. P. Gaillac, manager. Lands, sundry claims, circa 8 miles south of Loomis.

**BEAVER CARBONATE MINING CO.** UTAH.

Office: Salt Lake City, Utah. Mine office: Frisco, Beaver Co., Utah. Lands, 2 miles north of Frisco, have a 553' shaft.

**BEAVER CONSOLIDATED MINING CO.** UTAH.

Dead. Merged, 1904, in Beaver-Harrison Mining Co. Formerly at Milford, Beaver Co., Utah.

**BEAVER COPPER CO.** UTAH.

Office: 222 D. F. Walker Bldg., Salt Lake City, Utah. Maj. Henry Catrow, president and general manager; A. J. Bettles, first vice-president; A. J. McMullen, second vice-president; A. D. McMullen, secretary; H. P. Clark, treasurer; preceding officers, Jos. H. Patterson, A. D. Moffat and Paul E. Banker, directors; D. P. Rohlfing, consulting engineer. Organized 1906. Lands, 14 claims, in the Beaver Lake district, showing a strong vein traceable about 1 mile, giving assays of 4 to 25% copper and up to 70 oz. silver, opened by a 100' shaft showing 10% chalcopyrite at bottom. Under former ownership desultory mining operations produced a little high-grade ore.

**BEAVER COPPER MINING CO.** WYOMING.

Dead. Wound up. Formerly at Downington, Carbon Co., Wyo. Described Vol. V.

**BEAVER-HARRISON MINING CO.** UTAH.

Office: 23 Eagle Block, Salt Lake City, Utah. Mine office: Milford, Beaver Co., Utah. J. J. Trenam, president and manager; E. H. Jacobs, treasurer; B. L. Corum, secretary. Organized 1904, with capitalization \$75,000, shares 5 cents par, as a merger of Beaver Consolidated Mining Co. and Ben Harrison Gold & Copper Mining & Milling Co. Lands, 21 claims, area 385 acres, in the Beaver Lake district, one group being near the O. K. mine of the Majestic company, showing sundry fissure veins, opened by 2 shafts of 300' and 534', with about 2,000' of workings, showing a 10' ore body assaying 5 to 50% copper, and up to 10 oz. silver and \$7 gold per ton. Has steam power and an air-compressor, with necessary mine buildings. Presumably idle.

**BEAVER LAKE COPPER CO.** PENNSYLVANIA.

Mine office: Bloomsburg, Columbia Co., Pa. Has secured ores assaying 17% copper. Idle.

**BEAVER MOUNTAIN MINING CO.** ALASKA.

Mine office: Sulzer, Prince of Wales Island, Alaska. Henry Miller, president; George Comer, manager. Lands, sundry claims on the south side of Beaver Mountain, Hetta Inlet. Development is by tunnels, showing ore carrying copper, nickel and cobalt. Idle.

**BEAVER VALLEY MINING & LAND CO.** COLORADO.

Office: care of E. P. Castor, secretary and treasurer, Boulder, Colo. Letter returned unclaimed from former mine office, Rosemont, Teller Co., Colo. J. F. Peck, president; Jas. F. Smith, consulting engineer. Lands include sundry mining claims, water rights and a dam. Has 2 shallow shafts and a short tunnel, showing a quartz vein giving fair assays in copper, silver and gold. Was developing with a small force at last accounts.

**BECKER COPPER CO.** ARIZONA.

Mine office: Clifton, Graham Co., Ariz. Said to have been absorbed, 1907, by Copper Company of Arizona.

**BECKMANN COPPER MINING & DEVELOPMENT CO., LTD.** TRANSVAAL.

Office: Johannesburg, Transvaal. Capitalization £6,000, shares £1 par;

working capital, £2,000. Lands, 192 base metal claims, in the Zoutpansberg district, northern Transvaal, slightly prospected.

#### **BEDE METAL & CHEMICAL CO., LTD.**

#### **NORWAY & SPAIN.**

Office: Hebburn-on-Tyne, England. General Spanish office: Manriques 9, Córdoba, Spain. Mine office: Puebla de Guzmán, Huelva, Spain. Sir Andrew Noble, Bart., K. C. B., chairman; preceding officer, W. D. Cruddas, Sir Walter Scott, Bart., Alfred M. Palmer and Mason T. Scott, directors; W. W. Brown, secretary; Richard Eshott Carr, general manager; Chas. S. Sams, superintendent. Organized 1870, under laws of Great Britain, with capitalization £288,400, shares £25 par, since reduced to £115,360, shares £10 par, and, in 1908, reissued in 115,360 shares, £1 par. Dividends, 1879-1907, were £108,464. Dividends 1906 were £14,320, and 1907 were £20,048. Statement, as of Jan. 1, 1908, gave assets of £114,427, liabilities £135,763; cash on hand, £49,005. Is primarily a manufacturer of acid and chemical products, but is a considerable producer of copper, from Spanish and Norwegian cupriferous pyrite.

Spanish lands, 71 hectares, leasehold, expiring 1942, include Las Herrerías mine, which has 7 workings in 2 groups. Main ore body is a large, irregular mass of solid cupriferous pyrite, in schist, with dip from vertical to 40° N., there being 7 ore bodies, of which 6, under development, range 1 to 40 meters in width, with extreme length of 400 meters, ore averaging about 1.75% copper and 47% sulphur. Mine is opened by shafts of 246', 185' and 186', with about 200,000 tons of ore blocked out. The western portion of the mine is worked open-cast, while in underground workings all ore is removed and openings filled with waste.

Mining equipment includes a locomotive, 2 hoists, machine-shop, smithy, carpenter-shop, office building, warehouses, 4 engine-houses and 25 dwellings. Ore as mined is piled on large flat-topped heaps, which are irrigated regularly, the resulting liquors being passed over iron for precipitation. There are 2 fresh-water dams and 4 leaching dams, of masonry. Precipitate ranges 70 to 80% copper, and is shipped to company's smelters at Hebburn-on-Tyne for reduction. Cost of copper, in precipitate, on board steamer, averages about £50 per long ton, including royalties, development charges and general expenses. Ore in leach-heaps is charged to general production, company's balance sheet concealing rather than padding actual assets. Production of Spanish mines, 1907, was 1,276,800 lbs. fine copper, secured with a force of circa 300 men.

The Killingdal mine, north of Röros, Norway, is operated under lease from Norwegian owners. Ore is cupriferous pyrite, averaging about 1.5% copper and 45% sulphur. Production, 1905, with an average force of 100 men, was 11,600 tons of ore, yielding 512,960 lbs. fine copper. A continuation of the main lode, discovered 1905, materially improves the prospects of the mine. Company is conservatively and successfully managed.

#### **BEECHWORTH GOLD MINING SYNDICATE.**

#### **AUSTRALIA.**

Mine office: Cobar, Robinson Co., N. S. W., Australia. Lands, sundry claims 6 miles north of the Queen Bee mine, carrying a promising gossan containing gold, silver and copper values, opened by a 200' shaft showing auriferous and argentiferous copper and lead ores.

#### **BELCHER MINING CO.**

#### **WASHINGTON.**

Office: Spokane, Wash. Mine office: Republic, Ferry Co., Wash. Jas. A. Anderson, president. Mine is opened by three tunnels, of which No. 3, the 1,000' main tunnel, shows a large body of medium-grade ore carrying a 2' footwall paystreak of high-grade chalcopyrite. Has a 1,000' aerial tram connecting 3 main adits with railroad bins. Water, brought 2,000' from Lambert Creek, through a steel pipe, generates electric power, and gasoline power is used also. Has 8 power drills. Property is considered promising.

**BELCHER MOUNTAIN GOLD & COPPER CO.****MONTANA.**

Mine office: Republic, Ferry Co., Wash. Is said to plan building a 500-ton smelter.

**BELENE COPPER CO.****MEXICO.**

Office: 733-145 South Spring St., Los Angeles, Cal. Mine office: El Copete, Carbó, Ures, Sonora, Mex. J. J. Hardwick, president and general manager; S. E. Hostetter, vice-president; Harry R. Hay, secretary and treasurer; preceding officers, W. L. Hardwick and G. A. Willcox, directors. Organized Nov. 25, 1901, under laws of Arizona, with capitalization \$5,000,000, shares \$5 par. Registered and protocolized Jan. 1902, under laws of Mexico.

Lands, 162 hectares, circa 24 miles from Carbó, the nearest railroad station, lying west and north of the Copete mine and near the Sultan mine of the Giroux Consolidated. Mine has shaft of 310', 256', 185', 90', and several tunnels, with circa one-half mile of workings, on 2 large sulphide ore bodies, claimed to give average assays of 12% copper, 8 oz. silver and \$10 gold per ton. Has steam and electric power. Idle since circa 1903, except for shipment, May, 1907, of 70 tons of ore to El Paso smelter, which returned nearly \$2,250.

**BELHN MINING CO.****MEXICO.**

Office: 12 Chamber of Commerce Bldg., Minneapolis, Minn. Mine office: Cumpas, Moctezuma, Sonora, Mex. Chas. E. Wenzel, president; John E. Stair, vice-president; Ace P. Abell, secretary and treasurer; preceding officers, Chas. W. Sexton and Lyman W. Dickerson, directors; R. L. Van Dusen, superintendent; T. F. Janes, mine superintendent. Organized May 20, 1901, under laws of South Dakota, with capitalization \$1,200,000, shares \$10 par.

Lands, 190 hectares, also 14,000 acres of ranch and timber lands. Property shows 8 ore bodies, of which 5 have been more or less developed by 5 shafts and 3 tunnels, showing a vein of about 90' width, with a 2' pay streak of high grade ore averaging circa 8% copper, 20 to 30 oz. silver and 0.09 to 0.5 oz. gold per ton, from chalcocite, bornite, chalcopyrite and tetrahedrite, ores being bismuthiferous.

Equipment includes a steam and electric power plant, with 2 electric hoists and electric lights. There are about 10 buildings, including necessary shops. Transportation is by wagon road from Dos Cabezos mine to Cumpas, via the Transvaal mine.

Smelter has a rotary calciner and 30-ton Medberry revolving reverberatory furnace, but this plant, blown in 1908, did not give satisfactory results, for some reason, and was closed down after a short run. Some copper ore has been shipped to the Copper Queen and El Paso smelters, and 8 carloads of bismuthiferous ore have been shipped to England.

**SOCIÉTÉ ANONYME BELGE POUR LA RECHERCHE****ITALY.****ET L'EXPLORATION DES MINERAIS.**

Mine office: Massa Marittima, Grosseto, Tuscany, Italy. Is a Belgian company, operating a mine of slightly cupriferous iron pyrites.

**COMPAGNIE DES OUVRIES DE BELGIQUE.****BELGIUM.**

Office: 17 Quay Napoleon, Antwerp, Belgium. Works office: Duffel, Belgium. Employs circa 60 men. Marquis de St. Seine, chairman; Louis J. Burkard, commercial director; H. de Montagu, metallurgical director; Herman G. C. Thöfehrn, consulting engineer. Organized April, 1905, under laws of Belgium, with capitalization 500,000 francs, shares 500 f. par. The smelter, at Duffel, a suburb of Antwerp, and connected therewith by water, has a 250-ton blast furnace and five 100-ton reverberatory furnaces.

**BELLA COOLA COPPER CO.****BRITISH COLUMBIA.**

Office: 606 First Ave., Spokane, Wash. Provincial office: Bella Coola,

Cassiar district, B. C. V. M. Scribner, president; S. S. West, vice-president; R. B. Swim, treasurer. Organized August, 1906, under laws of Washington, with capitalization \$2,000,000, shares \$1 par, and registered, 1907, under laws of British Columbia, as an extra-provincial company. Lands, 9 claims, area 450 acres, at tidewater, on the Burke channel, on Bella Coola Mountain, circa 400 miles north of Vancouver. The Burke mine has been developed slightly by trenching.

**MINA BELLAVISTA.****MEXICO.**

Office: care of Henry L. Chostry, owner, Guadalajara, Jal., Mex. Mine office: Etzatlán, Jalisco, Mex. Lands, 14 pertenencias, just east of Etzatlán, showing 7 veins, two averaging 1 metre in width, slightly developed by about 95 metres of workings, showing argentiferous and auriferous copper ores. Property is an antigua, formerly known as the Picachos. Idle.

**BELL-DOMINION COPPER MINING CO.****ARIZONA.**

Office and mine: Globe, Gila Co., Ariz. Organized August, 1904, with capitalization \$250,000. Lands, 10 claims, known as the Scotch group, west of Final Creek. Had a 70' shaft at last accounts. Presumably idle.

**BELLE OF GRANITE MINE.****COLORADO.**

Mine office: Granite, Chaffee Co., Colo. B. H. Pelton, superintendent, at last accounts. Lands, sundry claims, developed by a 475' shaft, bottomed in a very narrow but rich vein, claimed to average about 32% copper, 28 oz. silver and \$120 gold per ton.

**BELL MARE COPPER MINING & SMELTING CO.****NEVADA.**

Dead. Merged, 1902, in the Nevada Bell Copper Mining & Reduction Co. Formerly at Lovelock, Humboldt Co., Nev.

**MINA BELL.****MEXICO.**

Office: care of Robert Tate, manager, Bisbee, Ariz. Mine office: Fronteras, Arizpe, Sonora, Mex. Lands, sundry claims, circa 18 miles west of Fronteras, showing rich auriferous and argentiferous copper ore. Presumably idle.

**BELL MINE.****MONTANA.**

Owned by Anaconda Copper Mining Co.

**BELMONT MINE.****MONTANA.**

Owned by Butte Coalition Mining Co.

**BELLONA MINE.****MONTANA.**

Owned by Parrot Silver & Copper Co.

**BELMONT-CHEMUNG MINING CO.****COLORADO.**

Mine office: Black Hawk, Gilpin Co., Colo. Ores carry gold, silver and copper. Has steam power. Presumably idle.

**BELMONT MINING CO.****COLORADO.**

Mine office: Winfield, Chaffee Co., Colo. Has gold-silver-copper ores, opened by tunnel. Presumably idle.

**BELMONT MINING CO.****MONTANA.**

Dead. Property sold, 1906, to Butte Coalition Mining Co. Formerly at Butte, Silver Bow Co., Mont.

**BEN BUTLER MINING & MILLING CO.****UTAH.**

Dead. Was merged, 1903, in the Butler-Liberal Consolidated Mining Co. Formerly at Bingham Canyon, Salt Lake Co., Utah.

**BENEDICTINE MINING CO.****ARIZONA.**

Letter returned unclaimed from former mine office, Cedar, Mohave Co., Ariz. Lands are known as the Cedar group. Suspended operations circa July, 1907, but is said to have been practically reorganized, and to plan resumption.

**COMPANIA BENEFICIADORA DE MINERALES, S. A.****MEXICO.**

Is the Mexican incorporation of the National Smelting Co.

**BEN FRANKLIN GOLD MINING CO.****WASHINGTON.**

Mine office: Bossburg, Stevens Co., Wash. Property is a prospect, showing auriferous copper ores. Idle.

**BEN HARRISON GOLD & COPPER MINING CO.****WASHINGTON.**

Office: Jeffersonville, Ind. Mine office: Chesaw, Okanogan Co., Wash. Geo. H. Holzboy, president; Basil Doerhoefer, vice-president; C. J. Weivel, secretary; Geo. F. Edgington, treasurer and general manager; preceding officers, W. A. Robeson and John Sidler, directors; Jas. P. Blaine, superintendent. Organized April, 1903, under laws of Washington, with capitalization \$1,000,000, shares \$1 par. Lands, 6 claims, area 120 acres, in the Myers Creek district, opened by a 140' shaft and 1,100' tunnel, showing mainly auriferous silver-lead ore. Has a 12-h. p. gasoline hoist, 25-ton concentrator and several mine buildings.

**BEN HARRISON GOLD & COPPER MINING & MILLING CO.****UTAH.**

Dead. Merged, 1904, in Beaver-Harrison Mining Co. Formerly at Milford, Beaver Co., Utah.

**BEN HUR COPPER MINING CO.****WYOMING.**

Office: 710-34 South Clark St., Chicago, Ills. Letter returned unclaimed from former mine office, Encampment, Carbon Co., Wyo. Chas. G. Mason, president; R. B. Short, vice-president; Clifford M. Miller, secretary and treasurer. Organized November, 1902, under laws of Wyoming, with capitalization \$1,000,000, shares \$1 par. Lands, 4 claims, 3 patented, area 80 acres, in the Battle Lake district, opened by a 350' tunnel, planned to cut a sulphide ore vein outerropping on surface. Presumably idle.

**BEN HUR GOLD MINING CO.****WASHINGTON.**

Dead. Reorganized, 1906, to raise new capital, as Ben Hur Mining & Milling Co. Formerly at Republic, Ferry Co., Wash.

**BEN HUR MINING CO.****MONTANA.**

Mine office: Saltese, Missoula Co., Mont. Geo. H. Keep, president; Frank Bell, vice-president and general manager; F. H. Bell, secretary; Chas. Keating, treasurer; Richard Daxon, manager; preceding officers and Geo. Trask, directors. Property is said to have a 25' vein, in quartzite, carrying gray copper and lead ores containing fair gold values.

**BEN HUR MINING & MILLING CO.****WASHINGTON.**

Mine office: Republic, Ferry Co., Wash. S. P. Domer, manager. Organized 1906, with capitalization \$1,000,000, shares \$1 par, as a reconstruction of the Ben Hur Gold Mining Co. Mine, opened by shaft, shows ore values mainly in gold and silver, with a little copper. Has steam power. Late 1905 was shipping circa 25 tons of ore daily.

**COMPÀNIA MINERA BENITO JUÁREZ.****MEXICO.**

Mine office: Peñón Blanco, Cuencamé, Durango, Mex. Has argentiferous and auriferous copper ores, employing about 40 men at last accounts.

**CHARLES BENTON.****MEXICO.**

Mine office: Culiacán, Sinaloa, Mex. Has ores carrying gold, silver and copper, employing 20 men at last accounts.

**BEREHAVEN COPPER MINES, LTD.****IRELAND.**

Dead. Formerly at Allihies, County Cork, Ireland. Described Vol. VI.

**BERGBAU UND EISENHÜTTEN GEWERKSCHAFT.****AUSTRIA.**

Works office: Witkowitz, Austria. Has a small reduction plant, with electrolytic refinery having 72 tanks, with electrodes arranged on the multiple plan, with daily capacity of about 600 pounds of finished copper.

**BERKELEY MINE.****MONTANA.**

Owned by Butte & Boston Consolidated Mining Co.

**BERLIN MINE.****MONTANA.**

Owned by North Butte Mining Co.

**BERLIN MINING & DEVELOPMENT CO.****MONTANA.**

Mine office: Butte, Silver Bow Co., Mont. Wm. D. Thornton, Jas. D. Slemons and Jas. T. Steele, directors. Organized Apr. 10, 1905, under laws of Montana, with capitalization \$200,000, shares \$10 par. Out of business, and will be wound up as soon as money now in litigation, paid for Berlin claim by North Butte, can be distributed.

**JOSÉ BERNARDINO.****MEXICO.**

Office and mine: Nombre de Dios, Durango, Mex. Was a very small copper producer at last accounts.

**BERNICE & RED ROCK MINING CO.****MONTANA.**

Office: 15 Bee Hive Blk., Butte, Mont. Lands, 12 claims, a millsite and water right, on Red Rock Creek, circa 3 miles north of Bernice, Jefferson County, Montana, which is not a postoffice. Mine has several tunnels, of 400' aggregate length, showing a 15' vein with 4' paystreak, from which selected samples gave average assays of 4.4% copper, 21.2% lead, 9.8 oz. silver and 40 cents gold per ton. Leasers, circa 1902, shipped a little ore.

**BERNOUDY MINING & MILLING CO.****ARIZONA.**

Office and mine: Paradise, Cochise Co., Ariz. Wm. P. Wright, president; Fred G. Bernoudy, vice-president and general manager; Geo. A. Walker, secretary; Henry C. Chamberlain, treasurer; preceding officers are the directors. Organized 1906, under laws of Arizona, with capitalization \$1,000,000, shares \$1 par. Lands, 5 claims, one-half mile northeast of Paradise, opened by tunnel. A smelter shipment, 1906, gave returns of 4% copper, 151 oz. silver and 1.92 oz. gold per ton.

**BERSBO KOPPARVERK.****SWEDEN.**

In the smelting plant of the Aktiebolaget Atvidabergs Kopparverk.

**SUCESIÓN NOEL BERTHÍN.****BOLIVIA.**

Office: 74 Rue de Rennes, Paris, France. Mine office: Coro Coro, La Paz, Bolivia. Ange Berthín, agent. Employs circa 450 men. Property is the Guallateri mine, 2 kilometers from the city, having a separate mining location with about 2,000 population. Property carries cupriferous conglomerates, copper occurring native. Main shaft is 1,100' deep and mine has been opened for length of circa 1,300 meters, with machinery plant midway. Property has a reduction plant, known as the Accourni, near the mine, and is the second largest copper producer of Bolivia, the Bolivian government estimating the cost, per quintal of barilla de cobre, of 80% copper tenor, at 6.5 bolivars. Production, 1903, was 2,028,232 lbs. fine copper.

**BETTRAND COPPER CO.****ARIZONA.**

Mine office: Clifton, Graham Co., Ariz. Idle.

**BESA y CA.****CHILE.**

Dead. Property sold, November, 1906, to Société des Mines et Usines de Cuivre dé Chañaral. Described Vol. VI.

**BESSEMER COPPER MINES CO.****NEW MEXICO.**

Mine office: Fierro, Grant Co., N. M. Lands include the Continental, Iron Head and Anson S. mines, latter said to produce ore of 7% copper tenor, opened by a 200' shaft. Property was worked formerly for iron ore, having been leased by the Bessemer Iron Association and Colorado Fuel & Iron Co. Extraction of copper by latter was stopped, by injunction, lease calling for mining of iron ore only. Company is said to plan a 100-ton smelter.

**BESSEMER IRON ASSOCIATION.****NEW MEXICO.**

Office: Hanover, Grant Co., N. M. Mine office: Fierro, Grant Co., N. M. Copper properties are leased to the Bessemer Copper Mines Co.

**BESSHI MINE.**

JAPAN.

Owned by Sumitomo Copper Co.

**BETTS COVE SULPHUR, COPPER & IRON CO.**

NEWFOUNDLAND.

Office: 1702-43 Exchange Place, New York. Apparently company has lost or sold its mine at Betts Cove, Newfoundland.

**BETTS GAP MINE.**

NORTH CAROLINA.

Mine office: Care of Winfield Scott Adams, Savanna Creek, Jackson Co., N. C. Lands, 1,300 acres, in the Blue Ridge Mountains, carrying two veins, apparently averaging about 50' width and prospected for about 1,500' in length. Upper vein carries many disseminated chalcopyrite; lower vein mainly pyrrhotite, with prospect that these veins join at depth. Has 4 short tunnels, 2 shallow shafts and 20 drill-holes, with indications favoring possession of a large amount of low to medium grade ore. Assays average about 4.5% copper and \$1.60 gold per ton from chalcopyrite, the pyrrhotite showing nickel and traces of platinum. Presumably idle.

**BEULAH COPPER CO.**

WYOMING.

Dead. Supposedly absorbed by United Exploration Co. Formerly at Battle, Carbon Co., Wyo.

**MINA BIBLANA.**

MEXICO.

Office and mine: Charcas, Moctezuma, San Luis Potosí, Mex. Aurelio Hiriarts, owner and manager. Mine has silver-copper ores, employing about 35 men at last accounts.

**BICKERTON COPPER MINES SYNDICATE, LTD.**

ENGLAND.

Office: care of Allen, Edwards & Oldfield, 16 Eastcheap, London, E. C., Eng. Organized Oct. 9, 1907, under laws of Great Britain, with capitalization £750, shares £1 par, to acquire a lease on the Bickerton copper mines, in Cheshire, England.

**BIG BONANZA MINE.**

ALASKA.

Owned by Latouche Mining Co.

**BIG BUG GOLD & COPPER MINING CO.**

ARIZONA.

Dead. Succeeded, 1906, by Pocahontas Copper Queen Mining Co.

**BIG BUTTE COPPER CO.**

WYOMING.

Office: 95 Washington St., Chicago, Ills. Mine office: Rudefaha, Carbon Co., Wyo. C. B. Bergquist, president. Organized circa November, 1907. Presumably idle.

**BIG CHIEF COPPER CO.**

WYOMING.

Mine office: Encampment, Carbon Co., Wyo. T. L. Knudtson, general manager. Lands, west of Encampment, include the Silver Lake mine, developing by tunnel. Plans utilizing Cow Creek for hydro-electric power plant.

**BIG COLORADO MINING AND MILLING CO.**

COLORADO.

Mine office: Gladstone, San Juan Co., Colo. C. W. Bloodgood, manager, at last accounts. Ores carry gold, silver, copper and lead. Has electric and gasoline power. Idle.

**BIG COTTONWOOD COPPER & GOLD MINING CO.**

UTAH.

Office: 521 Atlas Block, Salt Lake City, Utah. Mine office: Brighton, Salt Lake Co., Utah. Nicholas Treweek, president and general manager; W. Mont. Ferry, vice-president; J. Leonard Burch, secretary and treasurer; preceding officers, J. E. Galligher and John S. Bransford, directors. Organized under laws of Utah, with capitalization \$1,500,000, increased, 1906, to \$3,750,000, shares \$5 par. Lands, circa 200 acres, opened by a 500' tunnel showing carbonate and sulphide ores assaying 4 to 10% copper and up to \$8 per ton in combined gold and silver values. Property considered promising.

**BIG CREEK COPPER CO.**

WYOMING.

Dead. Formerly at Encampment, Carbon Co., Wyo.

**BIGELOW GOLD & COPPER MINING CO.**

NEW MEXICO.

Dead. Was organized by same people as the Victoria Chief. Formerly at Hillsboro, Sierra Co., N. M.

**BIG HORN MINING CO.**

ARIZONA.

Letter returned unclaimed from former mine office, Wendendale, Yuma Co., Ariz. Was prospecting, late in 1907, and was said to have found some good ore at shallow depth.

**BIG HORN MINING CO.**

COLORADO.

Mine office: Pearl, Larimer Co., Colo. Has a 50' shaft, on the Copper Queen group, bottomed in a 5' vein claimed to assay 20% copper. Idle.

**BIG INDEX GOLD & COPPER MINING CO.**

WASHINGTON.

Office: 419 Pioneer Bldg., Seattle, Wash. Mine office: Index, Snohomish Co., Wash. Wm. Frankfurt, president; J. C. Rathbun, secretary; Ed. E. Aegeuter, superintendent. Organized 1902, under laws of Washington, with capitalization \$2,500,000, shares \$1 par. Lands, 15 claims, area 300 acres, 4 miles from a railroad, in the Washington district, opened by a 350' tunnel, showing ores giving average assay values of \$26 per ton, in copper and gold, principally latter. Idle.

**BIG INTERIOR MINE.**

BRITISH COLUMBIA.

Mine office: Alberni, Vancouver Isld., B. C. Lands, 7 claims, area 350 acres, at the head of Great Central Lake, 12 miles from Alberni, at an elevation of 5,000' above sea-level. Property shows a brecciated zone with considerable impregnation of copper carbonates, low in grade, but with ore in immense quantities, and apparently available for concentration, if given transportation facilities, mine being very difficult to reach by present trail. Only development is a 31' tunnel. Idle.

**BIG LEAD MINING & SMELTING CO.**

ARIZONA.

Dead. Merged, circa July, 1907, in Kelvin-Calumet Copper Mining Co. Formerly at Kelvin, Pinal Co., Ariz. Described Vol. VI.

**BIG SHOW SILVER & COPPER MINING CO.**

MONTANA.

Mine office: Twin Bridges, Madison Co., Mont. Organized under laws of Arizona, with capitalization \$1,500,000, shares \$1 par. Lands, 4 claims, showing auriferous and argentiferous copper ores. Presumably idle.

**BIG SPRINGS MINING CO.**

ARIZONA.

Mine office: Paradise, Cochise Co., Ariz. C. W. McCoy, manager. Organized 1907. Lands, variously reported as 7 or 11 claims, are known as the Claire group, near Wood Canyon. Shipped a little ore before present ownership. Vein has a 2' paystreak, carrying mainly silver-lead ore, with a little argentiferous copper ore, all more or less auriferous, opened by a 165' tunnel. Silver-lead ores are shipped to El Paso smelter, and copper ores to the Douglas smelter. Employs 10 men.

**BIG YANK MINING & MILLING CO.**

OREGON.

Office: 414 Abington Bldg., Portland, Ore. Mine office: Galice, Josephine Co., Ore. J. C. Mattison, superintendent, at last accounts. Has auriferous and argentiferous copper ores. Idle.

**MINAS BILBAINAS.**

SPAIN.

Office: care of Aznar y Ca., owners, Bilbao, Spain. Mine office: Paimogo, Huelva, Spain. Property is the eastward extension of La Romanera group, with a promising showing of ore. Presumably idle.

**COMPANIA MINERA BILBAINO ASTURIANO.**

SPAIN.

Office: Bilbao, Spain. Is controlled, through stock ownership, by Don Fulano Copper Mines, Ltd. Lands, 214 acres, in the province of Asturias, Spain, including 5 copper and 3 zinc properties.

**BILLION DOLLAR QUEEN MINING CO.**

Dead. A stock-jobbing scheme, promoted by a petticoat grafted called Mrs. Van Arsdale, née Estella Trunnel, alias Mrs. Estella True-Nell.

**BI-METALLIC GOLD & COPPER MINING CO. WASHINGTON.**

Letter returned unclaimed from former mine office, Loomis, Okanogan Co., Wash. Lands, sundry claims, slightly developed by tunnel.

**BINGHAM AMALGAMATED COPPER CO. UTAH.**

Mine office: Bingham Canyon, Salt Lake Co., Utah. Jos. Edmunds, general manager. Property includes the Illinois and Copper Glance groups, former having a vein of about 9' width, carrying a 2' pay streak of 5% copper ore, some ore assaying up to 40% copper. The average of 50 assays, for the entire vein, gave 2.8% copper, 6 oz. silver and \$2 gold per ton. The Copper Glance group has an 1,800' tunnel, in McGuire Gulch. The Amalgamated group is said to show, on the 300' level, an ore chute of 60' width, averaging 4.5% copper and \$1.20 gold per ton. Equipment includes an electric plant. Some ore has been shipped. Property considered promising.

**BINGHAM ARGENTINE COPPER CO. UTAH.**

Office: 1401-56 Broadway, New York, N. Y. Mine office: Bingham Canyon, Salt Lake Co., Utah. A. T. Wright, president; John Dern, vice-president; Wm. H. Igglehart, secretary; P. T. Farnsworth, treasurer. Organized 1907, under laws of Utah, with capitalization \$1,000,000, shares \$1 par. Lands, circa 150 acres, on Sheep Mountain, near the Utah Consolidated and Bingham-New Haven.

**BINGHAM-BAY STATE COPPER CO. UTAH.**

Office: 161 Devonshire St., Boston, Mass. Mine office: Bingham Canyon, Salt Lake Co., Utah. E. Harding Dickinson, president; W. G. Brown, secretary and treasurer; John E. Cotter, general manager; Jos. Kauffman, director; Fredk. G. Tibbitts, financial agent. Organized under laws of Utah, with capitalization \$1,000,000, shares \$1 par. Lands, 18 claims, at the head of Butterfield Cañon, formerly known as the Mt. Aetna group, adjoining the Last Chance mine of the Nevada-Utah. Mine has 3 tunnels, No. 1 being 600', No. 2 about 300' and No. 3 being 290' in length, latter planned to cut vein at depth of about 1,200'. No. 1 tunnel has a Fairbanks & Morse engine and air-compressor. Has secured ore assaying 15% lead, 3.4 oz. silver and \$10.40 gold per ton, with occasional copper values. Officers stand well and developments have been pushed systematically and vigorously.

**BINGHAM-BUTTE COPPER MINING CO. UTAH.**

Mine office: Bingham Canyon, Salt Lake Co., Utah. John T. Cowan, president and general manager; Geo. A. Bellinger, superintendent. Organized circa 1907, with capitalization \$5,000,000, shares \$5 par, as successor of Copper Hill Mining Co. Lands, 240 acres, including the Copper Hill group, opened by 2 tunnels, on the Caledonia fissure, upper tunnel giving ore assaying up to 25% copper, 35% lead, 26 oz. silver and \$5 to \$9 gold per ton. Also has a 2' vein of ore said to assay 5% lead, 55 oz. silver and \$11 gold per ton. Has shipping bins at mouth of lower tunnel, at the railroad track.

**BINGHAM CENTRAL MINING CO. UTAH.**

Mine office: Bingham Canyon, Salt Lake Co., Utah. Samuel Newhouse, president; H. P. Clark, treasurer; D. C. Jackling, managing director. Capitalization \$5,000,000, shares \$5 par. Has a bond issue of \$250,000, apparently convertible into stock at \$2 per share. Is controlled, through ownership of practically entire stock issue, by Bingham Central-Standard Copper Co.

Lands, 190 acres, patented, developed by 2 tunnels, these being known as the upper or Whiteley tunnel, of about 2,000' length, showing mainly silver-lead ore, and the lower or Jeff Davis tunnel, of circa 1,000' length, cutting a

large body of low grade sulphide ore. In 1908 opened 2 new ledges, one of 3' to 4' width giving assays of 12% copper, the other being a vein of silver-lead ore of good average tenor. Mine has about 9,000' of workings and is considered promising.

**BINGHAM CENTRAL-STANDARD COPPER CO.**

UTAH.

Mine office: Bingham Canyon, Salt Lake Co., Utah. Samuel Newhouse, president; D. C. Jackling, vice-president and general manager; Wm. M. Bradley, secretary; H. P. Clark, treasurer. Organized 1907, with capitalization \$5,000,000, shares \$5 par. Is a holding company, controlling, through ownership of practically entire stock issues, the Bingham Central Mining Co. and the Bingham Standard Copper Co., which are separately described.

**BINGHAM-COCHISE COPPER MINING CO.**

UTAH.

Office and mine: Bingham Canyon, Salt Lake Co., Utah. Elmer Hill, manager. Organized January, 1906, under laws of Utah, with capitalization \$500,000, shares \$1 par. Lands include the Cochise and Brooks claims, in the Bingham district. Apparently a stock-jobbing enterprise.

**BINGHAM CONSOLIDATED MINING & SMCETING CO.**

UTAH.

Office: 60 State St., Boston, Mass. Mine office: Bingham Canyon, Salt Lake Co., Utah. Edward L. White, president; W. S. McCormick, vice-president; C. E. Davis, secretary; H. N. Sweet, treasurer; Duncan McVichie, managing director; preceding officers, W. F. Hammond, J. A. Coram, W. J. Freeman, L. T. Trull and O. E. Weller, directors. Organized Apr. 24, 1901, under laws of Maine, as a reconstruction of the Bingham Copper & Gold Mining Co., with capitalization \$10,000,000, shares \$50 par. Bonds, \$1,000,000 authorized, at 6%; outstanding, \$903,000. Annual meeting, third Wednesday in April. Owns an interest of 190,000 shares out of capitalization of 250,000 of Eagle & Bluebell Mining Co., and 231,500 shares in the Tesora mine of the Tintic district.

Lands, circa 300 acres, in the Bingham or West Mountain district, including the Dalton & Lark, Antelope, Brooklyn, Commercial, Miner's Dream, Sampson, Old Hickory, Vernal, Bingham and sundry other mines and claims.

In 1907 the company lost, on operations, \$277,442.43, ending the year with quick assets of \$244,697.70 and direct liabilities of \$770,186.35, showing that operations were conducted at a loss for some time preceding the 1907 break in the copper market. An involuntary petition in bankruptcy was filed June, 1908. A reorganization is being effected, under the title of Bingham Mines Co., and the property formerly held by the Bingham Consolidated Mining & Smelting Co. will be found described under latter title. Production, 1906, was 11,475,863 lbs. fine copper, of which amount only 6,124,333 lbs. were produced from ore taken from the company's own mines.

**BINGHAM COPPER CO.**

UTAH.

Office: Salt Lake City, Utah. Mine office: Bingham Canyon, Salt Lake Co., Utah. Edw. Home, president; W. E. Hubbard, vice-president; F. E. McGurkin, treasurer; Edward McGurkin, secretary. Capitalization \$800,000, shares \$1 par. Lands, circa 120 acres, lying north of the Utah Apex and west of the Butler-Liberal, having 2 tunnels and 2 shafts on the Venice claim, at the head of Cottonwood Gulch, and produced a little high grade ore in early days.

**BINGHAM COPPER BOY MINING CO.**

UTAH.

Office: 14 West First South St., Salt Lake City, Utah. Mine office: Bingham Canyon, Salt Lake Co., Utah. Abram Hanauer, Jr., president; J. P. Spalding, vice-president; J. H. Hurd, secretary; J. A. Cook, treasurer and general manager; J. B. Taylor, superintendent. Organized Feb. 19, 1901, under laws of Utah, with capitalization \$1,500,000, shares \$1 par. Annual meeting, first Monday in March.

Lands, 12 claims, 11 patented, area 142 acres, also an 11-acre millsite, in

Carr Fork Cañon, in the western part of the Bingham camp, somewhat out of the developed district, lying west of the Highland Boy mine of the Utah Consolidated and apparently carrying a continuation of the Utah-Apex ore bodies. Property shows 3 veins, of 20' to 40' reported width, giving estimated average assays of 6% copper, 20% lead, 1.5% zinc, 18 oz. silver and \$2.50 gold per ton, these figures being in themselves evidence of gross exaggeration. Ore on the dump shows 2 to 4.5% copper. Mine has an 800' crosscut tunnel and a 2,000' lower tunnel, with circa 6,500' of workings, claimed by company to put 1,500,000 tons of ore in sight, which figures are excessive. Equipment includes an electric air-compressor. Company is out of funds and property idle, with poor prospects, though property is not devoid of promise.

**BINGHAM COPPER GLANCE MINING CO.**

UTAH.

Dead. Merged, 1907, in Bingham Amalgamated Copper Co. Was successor of the Copper Glance Mining Co. Formerly at Bingham Canyon, Salt Lake Co., Utah.

**BINGHAM COPPER & GOLD MINING CO.**

UTAH.

Offices: 60 State St., Boston, Mass., and 700 McCornick Bldg., Salt Lake City, Utah. Is the parent corporation of the Bingham Consolidated Mining & Smelting Co.

**BINGHAM-COPPER HILL MINING CO.**

UTAH.

Office: Salt Lake City, Utah. Letter returned unclaimed from former mine office, Bingham Canyon, Salt Lake Co., Utah. Henry P. Clark, president; Wm. M. Bradley, vice-president; Abram Hanauer, Jr., secretary and treasurer; preceding officers, C. E. Allen and A. P. Mayberry, directors; G. L. Bemis, general manager. Organized Dec. 18, 1905, under laws of Utah, with capitalization \$1,500,000, shares \$5 par. Lands, 5 claims, patented, area 100 acres, known as the Copper Hill group, adjoining the Conger and having a 500' tunnel, also a number of other short tunnels and shallow shafts.

**BINGHAM COPPER MINING CO.**

UTAH.

Dead. Succeeded, circa 1906, by Bingham Mary Copper Co. Formerly at Bingham Canyon, Salt Lake Co., Utah.

**BINGHAM & EASTERN COPPER MINING CO.**

UTAH.

Dead. Reorganized, 1903, as Bingham & Eastern Mines Co. Formerly at Bingham Canyon, Salt Lake Co., Utah.

**BINGHAM & EASTERN MINES CO.**

UTAH.

Dead. Formerly at Bingham Canyon, Salt Lake Co., Utah. Described Vol. IV.

**BINGHAM GREAT WESTERN MINING CO.**

UTAH.

Mine office: Bingham Canyon, Salt Lake Co., Utah. Organized 1908, to operate in the West Mountain district.

**BINGHAM GROUP MINING CO.**

UTAH.

Mine office: Bingham Canyon, Salt Lake Co., Utah. R. L. Boothe, superintendent. Lands include the Croesus claim and the Greeley-Sacred group, opened by tunnel. Idle.

**BINGHAM MARY COPPER CO.**

UTAH.

Office: care of Simon Bamberger, president, Salt Lake City, Utah. Mine office: Bingham Canyon, Salt Lake Co., Utah. W. H. Dickson, vice-president; W. F. Adams, treasurer; J. B. Bean, secretary; Jas. Start, superintendent. Organized 1905, under laws of Utah, with capitalization \$2,500,000, shares \$5 par. Register & Transfer Company of Jersey City, transfer agent. Lands, 2 claims, patented, area 40 acres, in Carr Fork, near the Utah Apex. Mine has a 571' shaft, showing ore assaying 4.7% copper, up to 12 oz. silver and \$1 to \$3 gold per ton. Has an electric hoist, good for 1,500'. Has sundry small but adequate mine buildings, and a tramway to the Rio Grande Western Railroad.

Has but little ore developed and probably will have to go to considerably greater depth to find commercial ore bodies.

**BINGHAM MARY MINING CO.**

UTAH.

Dead. Apparently succeeded, circa 1906, by Bingham Mary Copper Co. Formerly at Bingham Canyon, Salt Lake Co., Utah.

**BINGHAM METAL MINING CO.**

UTAH.

Offices: 161 Devonshire St., Boston, Mass., and 616 McCornick Bldg., Salt Lake City, Utah. Mine office: Tooele, Tooele Co., Utah. Clarence K. McCornick, president; Fred C. Smith, vice-president and general manager; Walter B. Farmer, treasurer; preceding officers, Cabot J. Morse and H. A. Smith, directors. Organized under laws of Maine. Capitalization, issued, \$3,380,000. Apparently was to have been succeeded, 1907, by Bingham Metals Co., but doubtful if change was made. Lands, circa 1,300 acres, in Middle Cañon, fairly timbered and having a sawmill. Mine has 5 tunnels, No. 1 being 1,400', No. 4 being 1,700', and No. 5 being 500' in length. It is thought that the auriferous porphyries of Bingham Canyon may extend to this company's property, development being from the Tooele side. Has water and electric power.

**BINGHAM METALS CO.**

UTAH.

Office: care of Clarence K. McCornick, president, Salt Lake City, Utah. Mine office: Bingham Canyon, Salt Lake Co., Utah. Fred C. Smith, vice-president and general manager. Organized 1907, under laws of Utah, with capitalization \$5,000,000, shares \$5 par. Apparently is related to Bingham Metal Mining Co.

**BINGHAM MINES CO.**

UTAH.

Office: Salt Lake City, Utah. Mine office: Bingham Canyon, Salt Lake Co., Utah. John Dern, president; C. W. Whiteley, vice-president; Frank Knox, treasurer; D. B. Locker, secretary; preceding officers, D. C. Jackling, Samuel Newhouse and H. C. Edwards, directors. Organized 1906, under laws of Utah, with capitalization \$650,000, shares \$1 par. Lands, 13 claims, area circa 250 acres, between the United States and Bingham Metals Mining Co., having a 130' tunnel. Has surface ores of low grade. Has no connection with other company of same name.

**BINGHAM MINES CO.**

UTAH.

Office: 60 State St., Boston, Mass. Mine office: Bingham Canyon, Salt Lake Co., Utah. Works office: Murray, Salt Lake Co., Utah. Jas. P. Graves, president. Organized 1908, under laws of Maine, with capitalization \$1,500,000, shares \$10 par, as a reconstruction of the Bingham Consolidated Mining & Smelting Co. Plans a \$600,000 second-mortgage collateral 5-year 6% trust bond issue, convertible into stock at par. Exchanged 1 share new stock for 1 share old stock of Bingham Consolidated, plus \$3.50 cash, payable in five 5% cent installments. Control of the Bingham Consolidated should carry control of the Eagle & Blue Bell Mining Co. at Eureka, Juab Co., Utah.

Lands are circa 500 acres, including the Dalton & Lark and Commercial mines, on the west side of Bingham Cañon, and the Mascotte mine, these being the principal properties, also the Antelope, Brooklyn, Miner's Dream, Sampson, Old Hickory, Bingham, Vernard and sundry other mines and claims. These properties have a considerable variety of ores, principally sulphides, carrying fair gold and silver-lead values at and near surface, changing at depth to auriferous and argentiferous chalcopyrite, of low average grade, estimated, probably too high, at 2.5% copper, with combined gold and silver values of about \$2 per ton. Some of the ores are high in iron, hence desirable for fluxing, as the ores of the district are highly siliceous, as a rule.

The Dalton & Lark mine, area 240 acres, has shafts of 850' and 1,150', with 4 tunnels, one having an electric haulage plant, extraction being exclusively by tunnel. The Dalton & Lark vein on the 11th level averages about 6'

width, carrying about 2% copper, 6 oz. silver and \$1.50 gold per ton. The Bingham vein, of about 8' width, is said to average 6% copper and \$2 to \$6 combined gold and silver values, which probably is too high. The lead ores of the Dalton & Lark are richer than the copper ores, as a rule. The mine is claimed to have about 250,000 tons of medium grade and 500,000 tons of low grade ore in sight.

The Commercial mine, area 26 acres, has 2 ore bodies and is perhaps the best mine of the company, being estimated to show reserves of about 500,000 tons of ore averaging about 2% copper and \$2.50 per ton in combined gold and silver values, ore having an excess of iron.

The Mascotte mine, area 160 acres, has the Mascotte tunnel of circa 7,000' length, which drains the Dalton & Lark, Brooklyn and Miner's Dream mines, providing extraction also. Cost of tunnel was about \$225,000, and it is planned to be driven, eventually, to the Ohio mine, with a total length of circa 8,000'. The Mascotte shows a fair vein of silver-lead ore, and the "Lead Mine vein," said to be circa 150' wide, carries an average of 1.25 to 1.50% copper and 6 to 9 oz. silver per ton, with small gold values.

The Brooklyn mine, 1,800' deep, has a 20' vein in the bottom levels, showing a large tonnage of low-grade ore.

The Miner's Dream mine has been drained by the Mascotte tunnel, and can be operated through that tunnel, which taps the ore bodies 600' below the old workings.

The Sampson mine carries auriferous and argentiferous chalcopyrite and auriferous galena.

The mine of the Fortune Mining & Milling Co. at Bingham is held under lease. The Tesora and Eagle & Blue Bell properties are described separately, under the names of the respective companies holding direct title.

The smelter, 13 miles from the mine, blown in 1901, is 150x400' in size, of steel frame on stone foundations, having steel and cement floors and iron sides and roof, the only wood in the structure being the ore-bin partitions. Plant is terraced throughout, permitting handling of material by gravity. Equipment includes five 200-ton water-jacket blast-furnaces, 42x72" at the tuyeres, calcining furnaces, a large reverberatory furnace, and a briquetting plant, capacity of the works being about 1,000 tons daily. Works have both steam and electric power, with a 1,000-h. p. Rarig blowing machine, Stirling boilers and automatic stokers. Smelter has a 375' dust-chamber and a 200' steel smokestack, of 12' diameter. The converter plant has 2 stands, with six 12-ton shells, each 24x126". Owing to trouble from smelter fumes, works were closed down, by injunction, late 1907, this proving the finishing stroke in bankrupting the Bingham Consolidated.

The Bingham Mines Co. has some serious financial and metallurgical problems to work out, but the mines, while low in grade, are by no means devoid of promise.

#### BINGHAM MONITOR MINING CO.

UTAH.

Office: care of E. J. Wilkinson, secretary, Salt Lake City, Utah. Mine office: Bingham Canyon, Salt Lake Co., Utah. G. R. Cleaveland, president; Robt. Palmer, vice-president. Organized 1906. Lands include the Ruth and Monitor groups. Presumably idle.

#### BINGHAM NEVADA MINING CO.

NEVADA.

Office: Bingham Canyon, Utah. Mine office: Goodsprings, Lincoln Co., Nev. R. D. Kennedy, secretary; W. T. Simons, treasurer; J. M. Richards, superintendent. Lands, 10 claims, including the Payday group of 3 claims, said to have a 2' vein of 40% zinc ore, and the Paymaster group of 3 claims.

#### BINGHAM-NEW HAVEN COPPER & GOLD MINING CO.

UTAH.

Office: P. O. Box 84, New Haven, Conn. Operating office: 508 McCor-

nick Bldg., Salt Lake City, Utah. Mine office: Bingham Canyon, Salt Lake City, Utah. L. E. Stoddard, president; E. B. Critchlow, vice-president; T. W. Farnam, secretary and treasurer; preceding officers, E. G. G. Stoddard and F. S. Brusler, directors; C. H. Doolittle, general manager; H. J. Turley, mine superintendent. Organized Oct. 12, 1902, under laws of Utah, with capitalization \$2,000,000, shares \$5 par; issued, \$1,150,000. Bonds, \$200,000 authorized, at 6%; \$78,250 issued and \$46,000 outstanding, due June 1, 1909. Paid a 20% dividend 1906, and 10% dividend 1907. Annual meeting, second Tuesday in October. Union Trust Co., New Haven, registrar.

Lands, 26 claims, area 500 acres, including the Zelnora mine, near the head of Carr Fork, above the Highland Boy mine of the Utah Consolidated, property showing 3 fault fissures in porphyry and a contact deposit between quartz-porphyry and limestone. The latter, of 3' to 8' width, carries 2 to 6% copper, 10 to 22% lead, 7 to 12% zinc, 2 to 8 oz. silver and 40 to 80 cents gold per ton, ores being chalcopyrite, galena and sphalerite. Mine is opened by tunnels, with a blind shaft starting 900' from the portal of the lowest tunnel, there being a vertical distance of 1,200' between the highest and lowest workings. The new lower tunnel, of 1,030' length, has cut a very wide fissure vein, giving assays of about 3% copper, 2.8 oz. silver and \$2.50 gold per ton. Terminal at the upper tunnel is to be moved to the lower tunnel, and mine operated through latter in the future. Mine has about 3 miles of workings, with an aerial tram connecting with loading bins on the Copper Belt railroad, tram having been removed to opposite side of the cañon. Equipment includes electric power and air-compressor. Property has produced about \$500,000 in ore to end of 1906, and is considered promising.

#### BINGHAM & SALT LAKE MINING CO.

**UTAH.**

Dead. Formerly at Bingham Canyon, Salt Lake Co., Utah.

#### BINGHAM STANDARD COPPER CO.

**UTAH.**

Office: Salt Lake City, Utah. Mine office: Bingham Canyon, Salt Lake Co., Utah. Organized 1906, with capitalization \$5,000,000, shares \$5 par, as successor of the Standard Copper Co. Is controlled, through stock ownership, by the Bingham Central-Standard Copper Co. Lands, 320 acres, partly patented, developed by the Saginaw tunnel. Mine is said to have produced \$600,000 worth of ore under former management. Property has a considerable number of buildings, and shipped some ore, 1907.

#### BINGHAM WEST DIP TUNNEL CO.

**UTAH.**

Office: 1505-277 Broadway, New York, N. Y. Mine office: Tooele, Tooele Co., Utah. F. M. Lyman, president; Milano Pratt, secretary; F. M. Bishop, treasurer. Capitalization \$100,000, shares 1 cent par. Lands, circa 520 acres, unpatented, developed by an 850' tunnel, planned to be driven 4 miles, from the Tooele side, through the Oquirrh range, to drain the entire West Mountain district, develop mineral bodies and provide water for the Tooele lands. Tunnel has cut several small ore bodies. Is not regarded favorably. Idle.

#### BIO-BIO (CHILE) COPPER SYNDICATE, LTD.

**CHILE.**

Office: 43 London Wall, London, E. C., Eng. J. Sargent, secretary. Organized July 27, 1906, under laws of Great Britain, with capitalization £30,000, shares £1 par, to acquire copper mines in Chile. Location of property, if any, unknown.

#### BISBEE-ARIZONA DEVELOPMENT CO.

**ARIZONA.**

Office and mine: Bisbee, Cochise Co., Ariz. Moribund. Described Vol. VI.

#### BISBEE-ARIZONA GOLD & COPPER MINING CO.

**ARIZONA.**

Dead. Supposedly succeeded, circa 1905, by Bisbee-Arizona Development Co. Described Vol. V.

**BISBEE BELLE COPPER CO.****ARIZONA.**

Dead. Formerly at Bisbee, Cochise Co., Ariz., and at Wickenburg, Maricopa Co., Ariz. Described Vol. V.

**BISBEE CONSOLIDATED COPPER CO.****ARIZONA.**

Office and mine: Bisbee, Cochise Co., Ariz. W. J. Lewis, president and general manager; Emil Marks, vice-president; F. A. Hess, secretary. Organized 1902, under laws of Arizona, with capitalization \$1,000,000, shares \$5 par. Lands, 21 claims, area circa 400 acres, northwest of the Copper Glance, showing a heavy conglomerate capping over limestone, opened by a 208' shaft. Has steam power and a 54-h. p. hoist, good for depth of 1,500'. Out of funds and idle some years.

**BISBEE COPPER CO.****ARIZONA.**

Letter returned unclaimed from former mine office, Bisbee, Cochise Co., Ariz. Organized under laws of Arizona, with capitalization \$1,500,000, shares \$5 par. Company endeavored, September, 1907, to place shares at par, in London, claiming lands were near the Copper Queen and Calumet & Arizona, but no such lands have been found. Company also claimed that the manager of the Copper Queen was president, but this was not true, and apparently none of the Copper Queen officials are connected with this company, which, on the face of matters, bears the appearance of a swindle.

**BISBEE COPPER DEVELOPMENT CO.****ARIZONA.**

Dead. Formerly at Bisbee, Cochise Co., Ariz. Described Vol. V.

**BISBEE-DULUTH COPPER CO.****ARIZONA.**

Office and mine: Drawer 1196, Bisbee, Cochise Co., Ariz. Christian T. Kolstad, president; Harris Bennett, vice-president; Walter W. Carley, treasurer; E. L. Williams, secretary; preceding officers, Raymond A. Sauer, Newton Trenham, Carl M. Kolstad and Walter H. Rankin, directors. Organized 1907, with capitalization \$900,000, shares \$10 par; \$4 paid in; issued, \$500,000. Lands, 27 claims, area 500 acres, including the Corning & Pinyan group of 8 claims, adjoining the Warren Realty & Development Co. Also holds the Copper Range group and Red Metal groups. A 70' shaft on the Little Squaw claim of the Corning & Pinyan group shows auriferous and argentiferous copper ore.

**BISBEE & DULUTH MINING & DEVELOPMENT CO.****ARIZONA.**

Mine office: Bisbee, Cochise Co., Ariz. Is controlled, through ownership of 60% of stock issue, by Bisbee-Sonora Development Co.

**BISBEE EXTENSION DEVELOPMENT CO.****ARIZONA.**

Office and mine: P. O. Box 829, Bisbee, Cochise Co., Ariz. F. L. Harrington, president; John B. Rice, vice-president; Wm. M. Clute, secretary and general manager; J. T. Hood, treasurer; preceding officers, R. C. Starford and Frank R. Harrington, directors. Organized March, 1907, under laws of Arizona, with capitalization \$400,000, shares \$5 par, as successor of the Great Eagle. Lands, 25 claims, area 500 acres, in Tombstone Cañon, 8 miles northwest of Bisbee, on the porphyry side, showing fissure veins in porphyry carrying cuprite, azurite and malachite. Has 5 shafts, deepest 385', latter said to be sunk in Carboniferous limestone. Equipment includes a 25-h. p. Fairbanks & Morse hoist, good for 800' depth, with 7 mine buildings. Idle since September, 1907, owing to lack of funds, but plans early resumption. Company hopes to cut ore bodies at depth of about 350', in the Esquibysa limestone, supposed to correspond with the horizon of the best ore bodies in Bisbee.

**BISBEE GOLD & COPPER MINING CO.****ARIZONA.**

Dead. Succeeded, Dec. 27, 1902, by Bisbee-Arizona Gold & Copper Mining Co. Formerly at Bisbee, Cochise Co., Ariz.

**BISBEE MINING CO.****ARIZONA.**

Dead. Dissolved, 1904, with all debts paid. Formerly at Bisbee, Cochise Co., Ariz.

**BISBEE QUEEN DEVELOPING CO.****ARIZONA.**

Office: care of E. E. Dennis, president, Grand Rapids, Mich. Mine office: care of Hoval A. Smith, managing director, Bisbee, Cochise Co., Ariz. Organized Apr. 20, 1903, under laws of Arizona, with capitalization \$1,000,000, shares \$1 par. Lands, 27 claims, lying between the Portage Lake & Bisbee and Pittsburg & Hecla. Was reorganized, 1905, through purchase, by Hoval A. Smith and associates, who are allowing the land to lie idle, pending developments on adjacent properties.

**BISBEE-QUINCY COPPER MINING CO.****ARIZONA.**

Dead. Formerly at Bisbee, Cochise Co., Ariz. Described Vol. VI.

**BISBEE-SONORA DEVELOPMENT CO.****MEXICO & ARIZONA.**

Office: Douglas, Ariz. Mine office: Paradise, Cochise Co., Ariz. B. J. Ames, president. Organized February, 1907, under laws of Arizona, with capitalization \$2,500,000, shares \$2 par, as successor of Paradise Development Co. Is a holding corporation, controlling, through ownership of 60% of stock issue each, 5 subsidiary companies, these being the Badger-Hall Mining Co. and Paradise Mining Co. near Paradise; Ohio Mining Co. and Bisbee & Duluth Mining & Development Co. near Bisbee, and the Dispatch Mining Co. in northern Sonora. Subsidiary corporations are separately described.

**BISBEE & SUPERIOR DEVELOPMENT CO.****ARIZONA.**

Dead. Dissolved, 1904, with all debts paid. Formerly at Bisbee, Cochise Co., Ariz.

**BISBEE-WEST COPPER MINING CO.****ARIZONA.**

Dead. Formerly at Bisbee, Cochise Co., Ariz. Described Vol. VI.

**KUPFERERZ GEWERKSCHAFT BISMARCK.****GERMANY.**

Office and mine: Hanover, Braunschweig, Germany. Organized Nov. 20, 1899. Property is various copper and iron mines, former including the Morganrothe in Brunswick, and the Rothbart in Prussia, carrying malachite and other copper ores, the iron ore mines being near Buhla, Saxe-Weimar.

**BISMARCK-NUGGET GULCH CONSOLIDATED MINING CO. MONTANA.**

Dead. Bankrupt and property sold by sheriff, 1905. Apparently was succeeded, 1907, by Bismark Copper Co., which in turn was succeeded by Montana-Illinois Copper Mining Co. Formerly at Brandon, Madison Co., Mont.

**BISMARCK COPPER CO.****MONTANA.**

Dead. Succeeded the Bismarck-Nugget Gulch Consolidated Mining Co., and was succeeded, circa 1907, by Montana-Illinois Copper Mining Co. Formerly at Brandon, Madison Co., Mont.

**BISMARCK COPPER MINING CO.**

Letter returned unclaimed from former office, Butte, Mont. Organized Oct. 24, 1905, under laws of South Dakota, with capitalization \$500,000, shares \$25 par, by J. R. Sievers, Alexander Mackey, J. W. Mahoney, B. W. Wilson, R. F. Kerr and Mathew W. Murphy. Location of lands, if any, unknown.

**BISON MOUNTAIN MINING CO.****MONTANA.**

Mine office: Elliston, Powell Co., Mont. Ores carry gold, silver, copper and lead. Has steam power. Idle.

**BITTER MOUNTAIN MINING CO.**

Dead. Started as a copper mining company, but found no copper.

**BITTER ROOT COPPER MINING CO.****MONTANA.**

Dead. Lost its lands, circa 1904, through inability to meet bond payments. Formerly at Saltese, Missoula Co., Mont.

**BLACK BAY MINING CO.**

Office: Willmar, Minn. G. P. Carwand, president; N. B. Carlson, secretary. Organized Nov. 5, 1901, under laws of Arizona, with capitalization \$1,000,000. Lands, 3 crown-granted claims, area 266 acres, also 13 acres miscellaneous lands, all heavily timbered, on Black Bay, in the Thunder Bay district of Ontario. Country rock is trap, showing 7 cupriferous amygdaloidal beds, claimed by company to average 2% native copper, 1.25 oz. silver and \$2 gold per ton. Idle for several years.

**BLACK BEAUTY COPPER CO.**

Office: Los Angeles, Cal. Mine office: Cima, San Bernardino Co., Cal. W. B. Chapman, superintendent. Lands, 19 claims, on the southern side of Black Mountain, circa 25 miles north of Cima, said to show a mineralized zone of 100' to 400' width, traceable 8,000', opened by 8 pits and shafts of 15' to 60' depth, on veins of 1' to 4' width, showing malacite and malachite.

**BLACKBIRD COPPER & GOLD MINING CO.****CALIFORNIA.**

Office: 745 Ellicott Sq., Buffalo, N. Y. Mine offices: Newhouse, Beaver Co., Utah, and Salmon, Lemhi Co., Idaho. John E. DuBois, president; Chas. J. North, vice-president; L. A. Amsden, secretary and treasurer; Dr. P. A. H. Franklin, manager; Geo. S. Fitzwater, superintendent in Idaho; Peter M. McCrea, superintendent in Utah. Capitalization, \$2,000,000; bonded debt, \$500,000; indebtedness, 1907, was \$745,379.

Lands are 33 patented claims, area 482 acres, in the Blackbird district of Lemhi county, Idaho, from which small smelter shipments have returned 17% copper and circa \$8 gold per ton.

Utah lands are 84 patented claims, area 1,437 acres, adjoining the Cactus mine of the Newhouse Mines & Smelters, on which a large shaft was started, some years ago. Considerable development has been secured, only compulsory assessment work has been done since 1903. Property is considered promising.

**BLACK BIRD MINING CO.****MONTANA.**

Office and mine: Butte, Silver Bow Co., Mont. Frank H. Cooney, manager. Is a leasing company, operating ground leased from the East Butte Extension Mining Co., and is composed mainly of officers of latter.

**BLACK BUTTE MINING & REDUCTION CO.****ARIZONA.**

Office: Phoenix, Ariz. Letter returned unclaimed from former mine office, Hot Springs, Yavapai Co., Ariz. T. Connell, president and treasurer; M. Thompson, secretary; J. C. Dobbins, general manager. Organized under laws of Arizona, with capitalization \$750,000, shares \$1 par. Lands, 5 claims, area 100 acres, in the Castle Creek district, 26 miles from Santa Fe, Prescott & Phoenix railway, showing 3 fissure veins in shale averaging 8' width, carrying cuprite, azurite, malachite, chalcocite and atacamite, opened by a 220' tunnel and 170' shaft. Has steam power and necessary mine buildings. Development as yet is within the leached zone, atacamite being the predominant ore, this occurring in a paystreak of 12" to 18" along the footwall and giving average assays of 34% copper. Idle.

**BLACK CANYON COPPER CO., LTD.****ARIZONA.**

Dead. Was a bad outfit. Lands sold to Copper Canyon Mining Co.

**BLACK COPPER CO.****NEW MEXICO.**

Mine office: Elizabethtown, Colfax Co., N. M. Is a gold producer only.

**BLACK DIAMOND COPPER MINING CO.****ARIZONA.**

Office: care of E. D. Kennedy, treasurer and general manager, Warren, Ohio. Mine office: Pearce, Cochise Co., Ariz. J. G. Hearne, president; H. C. Christie, vice-president; Dr. T. M. Sabin, secretary; W. G. Barney, superintendent; F. H. Mitchell, smelter superintendent. Organized 1898, under laws

of West Virginia, with capitalization \$2,000,000; shares \$5 par. Bonds, \$480,000.

Lands, 35 claims, area circa 500 acres, 6 miles from Pearce, in the Cochise Mountains. Ores occur as contact deposits between limestone and porphyry, with parallel dykes of sandstone and quartzite, having a heavy gossan capping, in places 150' wide. Ores are almost exclusively sulphide, being mainly chalcopyrite and bornite, with iron and silica gangue, estimated to average better than 6% copper, 10 oz. silver and \$1.40 gold per ton, with about 38% silica. Property was opened originally for silver. Development is by a 115' shaft and 4 tunnels, lowest 600' below crest of the hill, tunnels being connected by winzes. Mine is connected with smelter by a 1½-mile Leashen aerial tramway, having a drop of 800', with 600 tons daily capacity. Has a pumping plant with 4" pipeline, installed at Pearce, this having capacity to raise 100,000 gallons daily against a head of 804' in 6 miles, with a 350,000-gallon storage reservoir at the mine. Property has a good steam equipment, including 2 air-compressors with 15-drill capacity, petroleum being used for fuel. Miscellaneous improvements include a 20-room hotel, store, schoolhouse and a considerable number of dwellings.

A 200-ton smelter, built 1902, has a 44x120" Allis-Chalmers rectangular water-jacket blast-furnace, a 38" auxiliary cupola and a 24x36" circular roaster, and made a matte carrying about 65% copper, and 150 oz. to 800 oz. silver per ton, with small gold values. Ores are self-fluxing, and easily smelted, and furnace is claimed to have shown slag losses of only 0.3% copper. Company came to grief financially, and was practically reorganized and management changed. Work was resumed in fall of 1905. Smelter was blown in 1906 but was idle 1907. Apparently the large ore bodies claimed cannot feed a smelter.

**BLACK DIAMOND MINING & DEVELOPMENT CO. WYOMING.**

Dead. Said to have been liquidated circa 1905.

#### **BLACK DIAMOND TUNNEL CO.**

#### **BRITISH COLUMBIA.**

Office: 604 Land Title Bldg., Philadelphia, Pa. Mine office: Ainsworth, Kootenay district, B. C. Maxwell Stevenson, president; Henry M. Stevenson, secretary. The Highlander tunnel, having a total length of about 3,000', has cut three veins of 4' to 13' width, giving fair assays in silver, lead, copper and gold. Although the officers of the company were claimed to stand well locally, the company was a mere stock-jobbing scheme. Moribund.

#### **BLACK EAGLE MINING CO.**

#### **WASHINGTON.**

Mine office: Chewelah, Stevens Co., Wash. G. A. Mowatt, manager. Lands, 160 acres, 2 miles west of Chewelah, having a 300' tunnel showing copper ore and free gold.

#### **BLACK EAGLE MINING & MILLING CO.**

#### **OREGON.**

Office and mine: Gates, Marion Co., Ore. R. F. Shier, president and manager; H. F. Gerspach, vice-president; S. C. Sorensen, secretary, treasurer and superintendent; preceding officers, D. C. Smith and L. P. Larsen, directors; W. L. Shier, mine superintendent. Organized 1907, under laws of Oregon, with capitalization \$1,000,000, shares \$1 par. Annual meeting, first Monday in February. Lands, 8 claims, area 160 acres, also 40 acres miscellaneous lands, well watered and timbered, 14 miles from Gates, in the Gold Creek district, on Horn Creek, a tributary of the Little North Fork river, which is a tributary of the Santiam river. Property shows a wide contact vein between greenstone and dolomite, traceable circa 1 mile, opened by a 100' shaft and by several short tunnels, longest 250', with 500' of workings, showing oxidized ores, mainly malachite, averaging about 10% copper and 6 to 22 oz. silver per ton. Has a hoist and 4 mine buildings. Company plans continuing development and probably will plat a townsite.

**BLACKFOOT COPPER CO.****MONTANA.**

Dead. Succeeded, 1901, by Imperial Montana Copper Mining, Smelting & Water Power Co. Apparently should have been called the Blackleg instead of the Blackfoot. Formerly at Blackfoot, Teton Co., Mont.

**BLACKFOOT MINING & MILLING CO.****WYOMING.**

Dead. Formerly at Battle, Carbon Co., Wyo.

**BLACK HAWK MINE.****ARIZONA.**

Owned by Arizona Commercial Copper Co.

**BLACK HILLS CONSOLIDATED COPPER CO.****SOUTH DAKOTA.**

Mine office: Keystone, Pennington Co., S. D. Lands, in the Pactola district, have a 118' shaft.

**BLACK HILLS COPPER CO.****SOUTH DAKOTA.**

Office: Benton Harbor, Mich. Mine office: Rochford, Pennington Co., S. D. John E. Barnes, president; George M. Thresher, secretary; John Robinson, treasurer. Organized June 2, 1900, under laws of South Dakota, with capitalization \$2,000,000, shares \$1 par. Lands, 27 claims, area 510 acres, in the Hornblende district, showing fissure veins in slate, with heavy gossan capping, carrying carbonate and oxide ores. Ore body under development is said by company to average 20' width, and to be more than a mile in length, opened by incline shafts of 800', 40' and 75', with crosscut tunnels of 65' and 300', giving a total of about 1,200' of underground openings. Ores average 1.5 to 3% copper, with small values in gold, silver and nickel, and a carload shipment of carbonate ore gave smelter returns of 16.81% copper. Has steam power, with 60-h. p. hoist, good for 1,500', and 4 power drills. Idle several years.

**BLACK HILLS COPPER CO., LTD.****ARIZONA.**

Office: 232 Fifth Ave., Pittsburg, Pa. Mine office: Jerome, Yavapai Co., Ariz. R. A. Thomas, president; Peter Boyd, vice-president; F. J. LeMoyne, secretary and treasurer. Organized July, 1899, and reorganized May 20, 1901, under laws of Arizona, with capitalization \$3,000,000, shares \$1 par. Union Trust Co., Pittsburg, registrar; Colonial Trust Co., Pittsburg, transfer agent.

Lands, 15 claims, 6 patented, area 280 acres, in the Verde district, between the United Verde and Equator mines, opened by shafts of 212' and 550', with tunnels of 60' and 90', with about 2,500' of openings. Main shaft, at 382', cut a stringer of ore assaying up to 13% copper and 3 oz. silver. Has a 280-h. p. steam plant, with 125-h. p. tubular high-pressure boiler, duplex pump, hoist and power drills. Resumed work August, 1905; suspended 2 years later. Said to be in debt.

**BLACK HILLS & DULUTH COPPER MINING CO.****SOUTH DAKOTA.**

Mine office: Custer, Custer Co., S. D. F. A. Towner, president; M. J. Bailey, secretary; W. F. Hanley, treasurer; W. A. Nelson, superintendent. Capitalization \$3,000,000, shares \$1 par. Lands, 340 acres, 8 miles northwest of Custer, adjoining the Central Black Hills Copper Co., showing promising outcrops of argentiferous and auriferous copper ores assaying up to 20% copper, slightly developed by 2 shafts. Has water power. Idle for several years.

**BLACK HILLS GOLD & COPPER MINING CO.****ARIZONA.**

Office and mine: care of R. H. Burmister, general manager, Prescott, Yavapai Co., Ariz. Apparently moribund.

**BLACK JACK CONSOLIDATED MINING CO.****UTAH.**

Office: Provo, Utah. Letter returned unclaimed from former mine office, Park City, Summit Co., Utah. Jesse Knight, president; J. Wm. Knight, vice-president; R. E. Allen, secretary and treasurer; preceding officers, W. Lester Mangum and Amanda M. Knight, directors. Organized 1907, under laws of Utah, with capitalization \$100,000, shares 10 cents par, as a merger of the Black Jack Mining Co. and Star Consolidated Mining Co. Mine has consider-

able development, showing horn silver and ore up to 6% in copper tenor, values as developed being mainly in silver.

**BLACK JACK COPPER CO.**

CALIFORNIA.

Letter returned unclaimed from former mine office, Greenwater, Inyo Co., Cal. T. J. McDonald, superintendent. Was sinking two shafts, showing copper ore, with a force of 8 men in the spring of 1907. Idle.

**BLACK JACK COPPER MINING CO.**

MONTANA.

Office: care of Martin Mulvahill, Helena, Mont. Mine office: Clancey, Jefferson Co., Mont. Organized circa June, 1907, with capitalization \$400,000, to develop sundry copper claims in the Corbin district.

**BLACK JACK MINING CO.**

UTAH.

Dead. Merged, 1907, in Black Jack Consolidated Mining Co. Formerly at Park City, Summit Co., Utah.

**BLACK PEAK GOLD & COPPER MINING CO.**

NEW MEXICO.

Dead. Formerly at Engel, Sierra Co., N. M.

**BLACK PRINCE COPPER CO.**

ARIZONA.

Office: 635 Symes Bldg., Denver, Colo. Mine office: Johnson, Cochise Co., Ariz. Robt. N. Bell, president; Dr. John C. Thompson, vice-president and general manager; J. B. Wright, secretary and treasurer; preceding officers, Robt. Temple and Hon. D. S. Tullar, directors; Richard Harris, superintendent; N. E. Boggs, mine superintendent. Organized May 10, 1901, under laws of Arizona, with capitalization \$1,500,000, shares \$1 par; issued, \$1,046,000. Annual meeting, last Wednesday in May.

Lands, 8 claims, patented, area 147 acres, showing contact deposits in limestone, near a porphyry contact. Mine has a 233' shaft, with circa 2,000' of workings, showing oxides, carbonates, bornite and chalcopyrite. Four car-loads of ore shipped to El Paso smelter gave returns of 12% copper and 20 to 30 oz. silver per ton. Has a 15-h. p. hoist and 8 mine buildings. Company is free from debt and plans steady development.

**BLACK PRINCE COPPER MINING CO.**

IDAHO.

Office: Fairmont, West. Va. Mine office: Coeur d'Alene, Kootenai Co., Idaho. Capitalization \$3,000,000. Lands, 8 claims, circa 20 miles above head of navigation on the St. Joe river, showing auriferous copper ore.

**BLACK RANGE COPPER MINING CO.**

NEW MEXICO.

Office and mine: Fairview, Sierra Co., N. M. B. S. Phillips, general manager; preceding officer, F. E. Green, L. H. Armstrong, E. D. Thayer and Gladys Allen, directors. Organized January, 1906, with capitalization \$1,250,000, shares \$1 par. Idle and apparently has done no work.

**BLACK ROCK COPPER CO.**

UTAH.

Mine office: Frisco, Beaver Co., Utah. Lands are sundry claims in the Beaver Lake district of Beaver county, Utah, on which work, begun 1904, has shown ore assaying up to 36% copper, with small gold and silver values.

**BLACK ROCK GOLD & COPPER MINING CO.**

ARIZONA.

Dead. Formerly at Jerome, Yavapai Co., Ariz. Fully described Vol. VI.

**BLACK ROCK MINING CO.**

ARIZONA.

Office: care of R. C. Vinesnt, president and manager, Superior, Wis. Mine office: Wickenburg, Maricopa Co., Ariz. Lands, 9 claims, area 180 acres, in the Bradshaw Mountains, 17 miles from rail connection at Wickenburg. Country rocks are granite and syenite, showing 4 fissure veins, averaging about 30" width, carrying copper, lead, gold and silver, with quartz gangue, and also showing porphyritic dykes carrying low-grade ore. Development is by several shallow shafts and short tunnels. Has gasoline power. Idle and apparently moribund.

**BLACK ROCK MINE.**

MONTANA.

Owned by Butte & Superior Copper Co.

**BLACK BOCK MINING CO.****MONTANA.**

Dead. Lost leased lands. Formerly at Butte, Silver Bow Co., Mont.

**BLACK TIGER COPPER MINING CO.****WYOMING.**

Dead. Property lost Jan. 1, 1905. Formerly at Encampment, Carbon Co., Wyo.

**BLACK TRAVELER COPPER MINING CO.****MONTANA.**

Office: Mullan, Idaho. Mine office: Saltese, Missoula Co., Mont. Jas. Conners, manager. Lands, 6 claims, 7 miles northeast of Saltese, showing a vein of about 6' width, carrying 8% copper ore. Has a 560' tunnel, planned to be driven circa 1,400', on Black Traveler lands, to run into the property of the Marie Mining Co. Property shows some ore of 12 to 14% copper tenor in shallow workings.

**BLACK WARRIOR COPPER COMPANY, AMALGAMATED.** **ARIZONA.**

Dead. Reorganized, 1905, as Warrior Copper Co. Formerly at Black Warrior, Gila Co., Ariz.

**BLAKE MINING, MILLING & INVESTMENT CO.****NEW MEXICO.**

Office and mine: Las Vegas, Lincoln Co., N. M. Mill office: Chapelle, San Miguel Co., N. M. H. E. Blake, president and general manager; S. B. Davis, Jr., vice-president; B. C. Pittenger, secretary; C. P. Hammond, treasurer; preceding officers and Jos. L. Matt, directors. Capitalization \$200,000. Lands, 140 acres, in the Mineral Hill district, circa 12 miles from Las Vegas, slightly developed by shafts and tunnels. A 14-ton sample ore shipment yielded 2.1% copper. The reduction plant, 7 miles from the mine, doing a general custom business, includes a mill and 50-ton Gardiner process leaching plant.

**BLANCA COPPER MINING CO.****NEW MEXICO.**

Office: 514 Cooper Bldg., Denver, Colo. Letter returned unclaimed from former mine office, Silver City, Grant Co., N. M. Henry Izard, president; L. E. Hannen, vice-president; E. Sanders, secretary. Lands, 3 claims, area 60 acres, in the Bear Mountain district, 8 miles from Silver City, claimed to have old workings, and said to be reopening by a tunnel claimed to show auriferous and argentiferous copper ore of good assay value. This is one of the promotions of the Financial Security & Trust Co., of Denver, and probably is absolutely fraudulent, as this same company was the promoter of the Spanish Lost Bullion Mines, Geronimo Copper Mining Co. and Pizarro Copper Mining Co., all of which claimed to have old Spanish workings. The Spanish Lost Bullion was proven in court to be an outright swindle, and presumably other promotions of the company are no better.

**COMPÀNIA MINERA BLANCA TORRE DE COLLAHUASI.****CHILE.**

Office: Varparaiso, Chile. Mine office: Collahuasi, Tarapacá, Chile. Organized June 23, 1906, under laws of Chile, with capitalization £120,000, shares £1 par.

**BLANCHE COPPER MINING CO.****WYOMING.**

Office: 432 Omaha National Bank Bldg., Omaha, Neb. Mine office: Encampment, Carbon Co., Wyo. H. E. Owen, president; Jas. H. Kyner, secretary; Arthur H. Crow, general manager. Organized Apr. 2, 1902, under laws of Wyoming, with capitalization \$1,000,000, shares \$1 par. Lands, 5 claims, near the New Rambler, showing 2 veins, one of which, 3' to 5' wide, is claimed to show auriferous oxide, carbonate and sulphide ores in a 160' shaft. Idle several years.

**BLAND MINE.****ARIZONA.**

Office: Patagonia, Santa Cruz Co., Ariz. Wm. T. Powers, owner and manager. Mine has a 500' tunnel, with about 2,000' of workings, showing a main vein and 2 blind ledges, carrying mainly copper, with some silver-lead.

**BLAYNEY COPPER MINES & SMELTERS, LTD.****AUSTRALIA.**

Mine and works office: Blayney, Bathurst Co., N. S. W., Australia. S.

Remfry, manager. Organized 1906, under laws of New South Wales, with capitalization £25,000. Plans doubling capitalization to complete smelter. Lands, sundry freehold claims include the mine variously known as the Blayney, Great Blayney and Anandale, reopened 1897, having a 390' shaft developing a 40' vein carrying chalcopyrite disseminated in andesite. Has a 50-ton smelter with water-jacket blast furnace, large reverberatory furnace and Edwards calciner, doing a general custom business. Machinery and smelter were thoroughly overhauled and mine reopened, 1907, and smelter blown in, 1908. Production of mine, 1901, was 418 long tons of copper from 18,666 tons of ore smelted.

#### **BLAYNEY MINING & SMELTING CO.**

**AUSTRALIA.**

Dead. Succeeded, 1906, by Blayney Copper Mines & Smelters, Ltd. Formerly at Blayney, N. S. W., Australia. Described Vol. VI.

#### **BLEW BUR COPPER CO.**

**CALIFORNIA.**

Office: 25 Broad St., New York, N. Y. Andrew F. Burleigh, president and treasurer; Edw. Blewett, vice-president; M. E. Miles, secretary; Ralph E. Blewett, general manager. Organized October, 1906, under laws of Arizona, with capitalization \$30,000,000, shares \$100 par. Lands, 120 claims, area 2,400 acres, in the Ironwood district of Riverside county, California, on McCoy and Palen Mountains, circa 65 miles north of Salton. Company claims to have about 45 different veins on its lands, of which 1 is reported as 6' to 200' in width, opened by 4 shafts of 30' to 52' depth, carrying cuprite, azurite, malachite, chalcocite and chalcopyrite, estimated by company to average 20% copper, 7 oz. silver and \$18 gold per ton. Company estimates 1,000,000 tons of ore in sight, which is entirely too high. Transportation facilities are poor, but the Arizona & California railroad should reach vicinity of the mine in 1909. A sample carload of selected ore, weighing 29,000 lbs., shipped, 1907, to El Paso, netted \$1,382.

#### **BLINMAN COPPER MINING CO.**

**AUSTRALIA.**

Dead. Property sold, 1902, to Tasmanian Copper Co., Ltd.

#### **BLOODY ROSE COPPER CO.**

**ARIZONA.**

Mine office: Tucson, Pima Co., Ariz. Chas. F. Hoff, president and general manager. Capitalization \$3,000,000, shares \$1 par. Lands, 5 claims, area 100 acres, 3 miles west of Tucson, near the Old Pueblo mine, in the Amole district, practically undeveloped but showing good surface indications.

#### **BLUE ACRE COPPER CO.**

**UTAH.**

Office: 409 Dooly Blk., Salt Lake City, Utah. Letter returned unclaimed from former mine office, Blue Acre, Beaver Co., Utah. Henry M. Crowther, president and general manager; Wallace W. Wait, vice-president, secretary and treasurer. Capitalization \$600,000, shares \$1 par. Lands, 17 claims, area 320 acres, in the Beaver Lake district, showing 5 contact and fissure veins, of which three, of good average width, are being developed, these carrying values estimated by management at 6% copper, 5 oz. silver and \$4 gold per ton, from oxide, carbonate and sulphide ores, opened by 4 shallow shafts. Property regarded as promising, though but slightly developed, but company apparently very feeble.

#### **BLUE BELL-BELCHER MINING CO.**

**WASHINGTON.**

Office: care of C. E. Mitchell, Spokane, Wash. Mine office: Republic, Ferry Co., Wash. Wm. Woodward, superintendent. Organized 1906, under laws of Washington, with capitalization \$1,500,000, shares \$1 par. Lands, sundry claims, known as the Blue Bell group, carrying 3,000' of the northwest extension of the Belcher vein. Development is by tunnel, showing slightly cupriferous gold ore.

**BLUE BELL COPPER MINING CO.**

Office: 36 Swiss St., Cleveland, Ohio. West Virginia charter forfeited 1902. Moribund.

**BLUE BELL COPPER MINING SYNDICATE, LTD.** AUSTRALIA.

Office: Queen St., Brisbane, Australia. Mine office: Gympie, Queensland, Australia. Organized Sept. 18, 1906, under laws of Queensland, with capitalization £80,000, shares £1 par. In liquidation, early 1908. Lands are 13 miles south of Gympie, on the southern branch of Ammon creek. Property has a 60' shaft, opening a 2' vein with 2 parallel veins about 300' distant. Has shipped some ore returning 15 to 28% copper and 19 to 31 oz. silver per long ton.

**BLUE BELL MINING CO.**

CALIFORNIA.

Office and mine: care of J. J. Sullivan, superintendent, Quincy, Plumas Co., Cal. Lands, sundry claims near Hosslekuss's. Idle for several years.

**BLUE BIRD CO., LTD.**

MONTANA.

Letter returned unclaimed from former mine office, Butte, Silver Bow Co., Mont. Fred J. Rowlands, manager. Lands, sundry claims three miles west of Butte. Formerly was operated as a gold mine, and once had a 90-stamp mill. Main shaft 500'. Idle for some years.

**BLUE BIRD COPPER-GOLD MINING CO.**

UTAH.

Dead. Succeeded, circa 1907, by New York & Utah Gold & Copper Mining & Milling Co. Formerly at Milford, Beaver Co., Utah. Described Vol. VI.

**BLUE BIRD MINING & SMELTING CO.**

WASHINGTON.

Mine office: Darrington, Snohomish Co., Wash. Idle.

**BLUE CAP MINING & MILLING CO.**

WYOMING.

Office and mine: Casper, Natrona Co., Wyo. Theo. Becker, president; Donald Mitchie, vice-president; E. Percy Palmer, secretary and treasurer; Wm. S. Cook, superintendent. Capitalization \$5,000,000, shares \$1 par. Lands, in the Casper Mountains, are opened by a shaft, from which rich copper specimens have been secured.

**BLUE CREEK COPPER MINING CO.**

WASHINGTON.

Dead. Formerly in Stevens county, Washington. Described Vol. III.

**BLUE JACKET CONSOLIDATED COPPER CO.**

IDAHO.

Office: 20 Broad St., New York. Letter returned unclaimed from former mine office, Decorah, Washington Co., Idaho. Lands, 295 acres, opened by a 250' shaft. Is said to have produced \$200,000 in copper, with smelter returns up to 47% copper. Property was bonded to Col. Geo. W. E. Dorsey, who failed to pay his men, and came to grief. Idle.

**BLUE JACKET MINE.**

IDAHO.

Mine office: Grangeville, Idaho Co., Idaho. Lands, 4 unpatented claims, area 75 acres, showing 2 contact veins, of good width, assaying 4% copper, 7 oz. silver and \$4 gold per ton. Ores are oxides near surface and sulphides at depth. Shafts, 100' to 300' deep, with 1,000' of underground workings. Has gasoline power.

**BLUE JAY EXTENSION MINING CO.**

UTAH.

Office: 308 Templeton Bldg., Salt Lake City, Utah. R. E. Fowler, president; L. H. Gray, secretary and treasurer. Capitalization \$500,000, shares \$1 par. Lands, sundry claims in the Washington district of Beaver county, Utah, slightly developed. Presumably idle.

**BLUE JAY MINE.**

MONTANA.

Owned by Butte & Boston Consolidated Mining Co.

**BLUE JAY MINE.**

NEVADA.

Mine office: Yerington, Lyon Co., Nev. A. Pugh, superintendent, at last accounts. Is slightly developed by shaft and tunnel. Has steam power.

Google

**BLUE JAY MINING CO.****CALIFORNIA.**

Mine office: Letcher, Fresno Co., Cal. Idle for several years.

**BLUE JIM MINING CO.****WASHINGTON.**

Office: Spokane, Wash. Mine office: Ione, Stevens Co., Wash. Lands, on the Pend d'Oreille river, near Ione, are said to show a 10' copper vein.

**BLUE LAKE GOLD & COPPER MINING,****WASHINGTON.****SMEILING & POWEE CO.**

Office: 302-82 Wisconsin St., Milwaukee, Wis. Letter returned unclaimed from former mine office, Conconully, Okanogan Co., Wash. C. T. McElroy, secretary and general manager. Organized circa 1902, with capitalization \$3,000,000, shares \$1 par. Claims to have 6 veins, of 1' to 3' width, giving assays of 3 to 49% copper and \$3 to \$11 gold per ton. Died atrociously in its prospectus. Moribund.

**BLUE LEDGE COPPER CO.****CALIFORNIA.**

Dead. Succeeded, circa 1907, by Blue Ledge Mining Co. Formerly at Hutton, Siskiyou Co., Cal.

**BLUE LEDGE MINING CO.****CALIFORNIA.**

Office: 82 Beaver St., New York, N. Y. Mine office: Hutton, Siskiyou Co., Cal. Robert S. Towne, general manager; Frank H. Carnahan, general superintendent. Lands, 24 claims, area circa 440 acres, well timbered, at the head of Joe Creek, circa 4 miles south of the Oregon line; also a large smelter-site on Applegate River, at Seattle Bar.

Claims were located 1889, and more or less work of a desultory nature was done before coming under management of present owners. Mine has about one-half mile of workings, mainly tunnels, with a considerable amount of ore blocked out, and about 7,000' of diamond drilling, showing various ore bodies giving average assays of about 5% copper, 2.5 oz. silver and \$2.50 gold per ton. Country rock is mica-schist, showing a contact vein, between black and white schists, traceable circa 8,000' by a prominent outcrop of 5' to 50' width. Ore is mainly chalcopyrite, with a little native copper. Has a hydroelectric power plant, taking water from Elliot Creek with a head of about 150', and has a good machinery equipment. Has built a town, with waterworks, sewers and schoolhouse, and has constructed a good road between Hutton and Yreka. Property considered promising and management good.

**BLUE LIGHT MINING CO.****NEVADA.**

Office: 410 Traction Bldg., Indianapolis, Ind. Mine office: Mina, Esmeralda Co., Nev. Paul E. Stormes, president; David S. Swain, vice-president; A. C. Kynett, secretary; W. C. Osborne, treasurer. Capitalization 2,000,000 shares, presumably \$1 par. Has authorized a \$125,000 bond issue. Lands, 17 claims, 12 miles from Mina, in the Gold Mountain district, having a 300' two-compartment shaft showing a vein giving average assays of about 7% copper, with small gold and silver values, with an 18" paystreak assaying 12 to 42% copper. Claims to have 85,000 tons of ore developed. Has a 45-h. p. gasoline hoist. Five carloads of ore, shipped circa 1907, gave returns of 15 to 23.2% copper, with small gold and silver values.

**BLUE MOUNTAIN COPPER MINING CO.****COLORADO.**

Dead. Lands sold, circa 1906, to Michigan &amp; Colorado Mining &amp; Milling Co.

**BLUE POINT COPPER MINING & MILLING CO.****UTAH.**

Office: care of E. J. Raddatz, president, Salt Lake City, Utah. John Frazier, vice-president; F. M. Davis, secretary and treasurer; preceding officers, Fred Hodges, Wm. Hanson, W. R. Warren and R. C. Hill, directors. Organized August, 1906, under laws of Utah, with capitalization \$100,000, shares 10 cents par. Lands, 9 claims, in the Bradshaw district of Beaver county, Utah.

**BLUE RIDGE COPPER CO., INC.****VIRGINIA.**

Office: 613-145 La Salle St., Chicago, Ills. Mine office: Stanley, Madison Co., Va. Jacob Lauth, president; Frank L. Race, secretary and treasurer; Geo. F. Brigham, Jr., general manager. Organized Apr. 2, 1904, under laws of Virginia, with capitalization \$500,000, shares \$5 par. Lands, circa 100 acres, on the eastern slope of the Blue Ridge Mountains, opened by old pits and a 200' shaft, with about 500' of workings. Ore is variously reported as a contact vein between granite and metamorphosed slate, and as an 8' bed of green-stone, carrying native copper, cuprite, malachite and azurite. Has a 4' Pelton wheel, using water under a head of 500', generating circa 350 h. p. Has necessary mine buildings and a 50-ton Nissen mill.

**BLUE RIDGE COPPER MINING CO.****NORTH CAROLINA.**

Dead. Formerly at Gap Creek, Ashe Co., N. C.

**BLUE RIDGE REAL ESTATE & DEVELOPMENT CO.****MARYLAND.**

Office: care of I. N. Snively, president, Waynesboro, Pa. John C. Entrican, vice-president; Eric Krell, secretary and treasurer; preceding officers, Geo. P. School, Saml. Musser and Gideon Sibley, directors. Organized 1906, to develop a copper property on South Mountain, in Garrett county, Maryland.

**BLUE STAR MINING CO.****WASHINGTON.**

Mine office: Chewelah, Stevens Co., Wash. Mark Mitchell, manager. Lands, 6 claims, 3 miles from Chewelah, including the Eagle group of 4 claims, formerly owned by Eagle Consolidated Gold Mining & Milling Co. Development is by a 2-compartment 240' shaft, and an 800' tunnel, showing a 4' vein of silver-lead ore, said to parallel the copper vein of the United Copper Co. at distance of circa 400'. Idle for several years.

**BLUESTONE EXTENSION GOLD & COPPER MINING CO.****NEVADA.**

Mine office: Yerington, Lyon Co., Nev. Organized 1906, to develop copper property in the vicinity of Yerington. Presumably idle.

**BLUESTONE MINE.****NEVADA.**

Office: 43 Exchange Place, New York, N. Y. Mine office: Yerington, Lyon Co., Nev. Capt. J. R. De La Mar, owner; Chas. A. Week, superintendent. Lands, 20 claims, 3 miles south of Yerington. Mine has about 6,500' of workings, including a 1,200' main haulage tunnel cutting an ore chute about 300' wide and 500' long at a point 300' below the apex, carrying an 80' pay-streak of high grade sulphide ore said to range up to 20% in tenor, balance of ore being about 3% in copper tenor. Management estimates 1,600,000 tons of ore in sight, averaging 2.6% copper. Ore is mainly chalcopyrite, associated with considerable epidote, in a limestone gangue, there being practically no oxidized ores, even at the outcrop. Ore is garnetiferous, and uniform in character, and adapted to magnetic separation, the epidote gangue, which is nearly as heavy as chalcopyrite, causing difficulty in ordinary wet concentration. Equipment includes a 50-h. p. hoist and a 35-drill electric air-compressor.

The 100-ton mill pulverizes the ore in rolls to pass an 8-mesh screen, after which ore is slightly roasted in a tower-roaster, to magnetize the pyrite. The roasted ore is then passed through a Wetherill magnetic separator, which takes up the mineral and discharges the waste, giving a concentrate of about 15% estimated copper tenor. Magnetic separation is claimed to have given a 95% extraction, though 85% under working conditions should be satisfactory.

The smelter, installed 1901, has a 150-ton water-jacket blast-furnace, but is antiquated in design, and of small value. Mine employs circa 25 men. Management is thoroughly experienced and property is considered valuable.

**BLUE VEIN COPPER MINING CO.****MONTANA.**

Letter returned unclaimed from former office and mine, Butte, Silver Bow Co., Mont. Organized June 21, 1906, under laws of Montana, with capitaliza-

tion \$1,000,000, shares \$1 par, by F. L. Melcher, W. F. Noyes and others. Lands include the Soon placer claim, Valentine and Little Boulder lode claims and a half interest in the Columbia lode claim.

#### BLUE WING COPPER CO.

#### NORTH CAROLINA.

Dead. Was succeeded by Boston & Carolina Copper Mining Co. Formerly at Baker City, Granville Co., N. C.

#### BLUE WING MINE.

#### NORTH CAROLINA.

Mine office: Baker City, Granville Co., N. C. Was owned formerly by Blue Wing Copper Co., and later by Boston & Carolina Copper Co., but never successful, perhaps owing to poor management. Vein is narrow and ore chutes uncertain. Ore is highly silicious, and difficult of treatment without admixture of basic ceras, which apparently are unobtainable in the district. Mine has several shafts of 100' to 317' depth, with 4 levels opened, showing considerable bodies of disseminated bornite having quartz and calcite gangue. Idle some years.

#### BLUFFTON GOLD & COPPER MINING &

#### WASHINGTON.

#### SMEILING CO.

Mine office: Chesaw, Okanogan Co., Wash. Lands, at Bolster, 4 miles from Chesaw, are said to show ore assaying \$18 per ton in combined copper and gold values. Has a 218' tunnel, planned to be driven 1,200', and several shallow shafts.

#### GEWERKSCHAFT BOBERTHALER ERZBERGWERK.

#### GERMANY.

Mine office: Kupferberg, Schlesien, Germany. Max Arendt, chairman; Dr. Bernhard Kossman, general manager. Organized Apr. 20, 1902, under laws of Prussia, with capitalization 1,000 shares, of no stated value. Lands, 437 hectares, showing country rock of Archean schists, with about 20 ore bodies, including fissure veins in amphibolite and diorite, and contact deposits between dolomite and porphyritic rocks. Fourteen ore bodies under development range 0.6 to 1.8 meters in width, and are traceable circa 1,200 meters, showing a great variety of ore, including the principal oxides and carbonates, chalcopyrite and tetrabedrite in connection with sphalerite. Has shafts of 84 and 135 meters depth, with about 3,000 meters of workings, estimated to show 120,000 metric tons of ore, with about 60,000 tons blocked out for stoping. Mine was discovered A. D. 1270, and, after various vicissitudes, was reopened, 1898, by present management. Has steam power and employs 42 men. Company plans a central electric plant and concentrator with magnetic separation. Production, 1902, was 176,368 lbs. fine copper.

#### BOB EVANS COPPER MINING CO.

Dead. West Virginia charter forfeited 1902. Formerly had an office at Toledo, Ohio.

#### BOBTAIL MINES CO.

#### ARIZONA.

Dead. Lands now held by Big Lead Mining & Smelting Co. Formerly at Kelvin, Pinal Co., Ariz.

#### BOCA DEL COHÉ MINING CO.

#### MEXICO.

Office: 509-408 South Spring St., Los Angeles, Cal. Mine office: San Luis del Cordero, Nazas, Durango, Mex. Capt. C. Henry Thompson, president; J. D. Thompson, vice-president; Lane C. Gilliam, general manager; P. H. Mack, assistant manager; Pasadena National Bank, treasurer. Organized 1906. Property, said to have been bought for \$300,000, is circa 40 miles from Pedriceña, and includes El Rosario, San Nicholas, San Francisco and Santa Rita mines, all with considerable development, and said to have ore reserves valued at 12,000,000 pesos. The Santa Rita mine, 900' depth, has a 75-h. p. hoist. Machinery equipment includes 2 hoists, a 12-drill air-compressor and an electric plant. Company was said, July, 1908, to have ordered a 100-ton

water-jacket blast-furnace. During 1907 property shipped ore, of about 5% average copper tenor, with high silver values, said to have netted \$170,000. Management excellent and property considered valuable.

**BOCCHEGLIANO MINE.**

ITALY.

Owned by Societa Anonima delle Miniere di Montecatini.

**KÖNIGLICHE HÜTTENVERWALTUNG BODENMAIS.**

GERMANY.

Mine office: Bodenmais, Bavaria, Germany. Ores are iron and copper pyrites, and products are bluestone and coppersas. Employs circa 75 men.

**BOGAN RIVER COPPER MINING CO., N. L.**

AUSTRALIA.

Office: 10-114 Pitt St., Sydney, N. S. W., Australia. Mine office: Dandaloo, N. S. W., Australia. H. Ernest A. Miller, agent; Geo. Eason, C. Mooy, Jas. Wallace and A. H. Mellick, directors; Peter Neville, mine manager; J. M. Rees, legal manager. Organized January, 1906, under laws of New South Wales, with capitalization £6,250, shares 2s. 6d. par, in 25,000 fully paid shares and 25,000 contributing shares, latter 9d. paid. Property is 80 acres of crown lands, in the parish of Beaconsfield, Orange Plains district, 50 miles west of Dandalee and 40 miles west of Frangie railway station, on the Great Western line, held at annual rental of 5s. per acre. Lands, which are well timbered, show a vein outcropping for about 300'. Has shafts of 57', 66' and 145', in a vein of 30" to 3' width, showing exclusively oxidized ores, with considerable iron, about 2,000 tons of high grade ore being in sight. Returns from upwards of 100 tons shipped to the Waratah smelter were 35% copper, 2.5 oz. silver and 3 dwts. gold per long ton. Has a smelter with reverberatory furnace, completed 1907, and tanks for conservation of water. Production, 1906, was 124,440 lbs. fine copper. Employs 25 men.

**SOCIÉTÉ MINIERE DE BOGOSLOVSK.**

RUSSIA.

Office: 18 Theatre Place, St. Petersburg, Russia. Mine office: Bogoslovsk, Verkhotskorsky, Perm, Russia. Employs circa 1,000 men. A. Hitrovo, chairman; N. I. Vladikin, general manager. Company has a bond issue of 14,111,183 roubles. Becoming embarrassed, corporation was placed in the hands of trustees, Nov. 3, 1905, since when finanees have been greatly improved. A deficit of 2,309,820 roubles was shown Dec. 1, 1905. In 1906 the company made a profit of 226,980 roubles.

The principal business of the company is the manufacture of iron, of which about 75,000 tons of finished products are turned out annually. The property includes iron and steel foundries, a steel rolling mill, chemical works, quarries, coke-ovens, a flouring mill, a 180-verst railway and a fleet of steamers and barges, in addition to mines of copper, gold and iron.

The copper mines are in 4 groups, at a distance of 3 miles, lying on the Siberian side of the Urals, the copper deposits apparently running parallel with the mountains. The country rock adjoining the mine is limestone, of lower Devonian age, through which have erupted granite and porphyry, mingled with tuffa, these being overlaid by tentaculite slate, followed by an eruption of augite-garnet rock, the copper ores occurring along the contact of augite-garnet with other rock formations, lying mainly between the diorite and wollastonite and limestone, occurring in lenticular chutes. The ore is chiefly chalcopyrite, with occasional chalcocite, associated with pyrrhotite, having calcite, quartz and garnetiferous gangue. The rock in the mines is extremely hard. Mines include the Vasilevsky, 600' deep; Bashmakovsky, 450' deep; Frolovsky, 750' deep, and Bogoslovsk, 630' deep, these mines having been worked for upwards of a century. The Bogoslovsk ore body is about 650' long, and there is another lens of about 15x50x180'. The main ore body produces ore averaging 2.5 to 3%, which is hand-sorted to an average copper

tenor of 4.5%. The Vasilevsky was completely equipped with modern machinery, 1904, but proved an expensive failure.

Ore is hand-sorted at surface, and heap-roasted, after which it goes to the smelter, near the mine, having four 48" Pilz furnaces, of 28 tons capacity each; one 55-ton Raschette furnace, 42x144" at the tuyeres, and two 18-ton Raschette furnaces, 41x65" at the tuyeres, all furnaces being of brick, without water-jackets. Fuel is inferior charcoal, made from pine and fir. Product is a matte of 22 to 35% copper tenor, slags averaging 0.3%. Matte is bessemerized to 98% blister copper, and refined, in brick furnaces, to a tenor of 99.7%.

Costs of the Bogoslovsk average as follows, per ton of 2,000 lbs.: Mining, \$8.09; hand-sorting, 31 cents; roasting, 17 cents; matte smelting, \$2.12; bessemerizing, 89 cents; refining, 20 cents; management, 35 cents; administration and miscellaneous, 95 cents; total, per ton of ore, \$13.08, equivalent to 13.78 cents per pound fine copper.

In addition to mining and smelting, the management of the Bogoslovsk lays out money liberally in a variety of ways, and for a variety of purposes other than of a business nature, these including expenditures for roads, schools, a mining college, geological museum, old people's home, charity, free medicines, hospital, etc.

The Bogoslovsk, which is the largest copper property in the Urals, is endeavoring to increase production to about 12,000,000 lbs. fine copper yearly. Production, 1905, was 3,163,190 lbs. fine copper, or nearly 4 times as great as in 1902, and for 1908 is estimated at 10,500,000 lbs.

#### **BOHEMIAN RANGE COPPER CO.**

MICHIGAN.

Dead. Formerly at Mohawk, Keweenaw Co., Mich. Described Vol. VI.

#### **BOLAÑOS MINING CO.**

MEXICO.

Office: care of M. M. Stephens, president, St. Louis, Mo. Mine office: Bolaños, Colatlán, Jalisco, Mex. W. C. Stith, vice-president; C. W. Simmons, treasurer; Juan B. Yzabal, general manager; Walter R. Hazel, superintendent. Organized circa 1904 as successor of Bolaños Mining & Milling Co., bankrupt. Property includes sundry mines that were considerable producers in the past, and water rights along the Bolaños River. The Santa Fé mine carries highly argentiferous copper ore, with about 60 to 80 oz. silver per ton. Has a 50-ton stamp-mill and a concentrator, and plans a hydro-electric power installation. Employed circa 50 men at last accounts.

#### **BOLAÑOS MINING & MILLING CO.**

MEXICO.

Dead. Reorganized, circa 1904, as Bolaños Mining Co. Formerly at Bolaños, Colatlán, Jalisco, Mex.

#### **COMPAGNIE DU BOLEO.**

MEXICO.

Office: 56 Rue de Provence, Paris, France. American office: 614 Sansome St., San Francisco, Cal. Mine office: Santa Rosalia, Sur, Baja California, Mex. Paul Mirabaud, chairman; Ernest Michot, director general; M. Demorest, secretary; C. H. Mabant, smelter superintendent; H. Boisse, mining engineer; J. Thiere, railway superintendent; G. Boutillier, auditor; J. Jeffroy, mechanical engineer; A. Santillier, purchasing agent.

Organized May 16, 1885, under laws of France, with capitalization f12,000,000, shares f500 par; debentures, f1,782,000, in bonds of f500 at 4.5%. Dividends were f62, 50 centimes each, for 1901 and 1902; f104, 16 centimes, in 1903; f135, 4 centimes, in 1904; f200 in 1905; f212 in 1906; and f200 in 1907. Is supposed to be controlled by the French house of Rothschild. Owns a considerable share interest in the Compagnie d'Inguaran. Is exempt, until Dec. 17, 1912, from all federal and local taxes, except stamp taxes; is exempt from custom duties and local dues until 1942; is exempt until 1942 from export and

import duties on fuel consumed; employees are exempt from military and civil service.

Lands, 20,000 hectares, granted by the Mexican government, in 11 groups, also 11,920 hectares of grazing lands south of the mines. Principal groups are the Soledad, Providencia, Purgatorio and Bricas. Lands include 5 known copper deposits of importance, the copper-bearing formation covering 3,000 hectares, with possibilities of further extensions.

The ore occurs in a formation of Tertiary conglomerates, sandstones and tuffs, traversed at certain points by trachyte, the cupriferous tuffs overlying conglomerates of eruptive rock pebbles, and being surmounted by argillaceous tuffs, all traversed by fissures. The ores are of great variety, including caprite, melaconite, azurite, malachite, crednerite, chrysocolla, atacamite, covellite and chalcocite, chalcocite and covellite predominating. There are three cupriferous beds, the upper averaging about 3' in thickness, the middle 2' to 3', and the bottom 2' to 10'. The middle bed carries oxide and carbonate ores in oölithic concretions, known locally as boleos, hence the name of the mine. The lowest bed, partly below the water-line, carries sulphide ores, as well as oxides and carbonates. The ore is disseminated through the tuffs in thin, irregular veins, with clay gouge, and has a marked concentration toward the bottom of each bed, where the ore forms compact layers of 6" to 12". The main workings are 15 metres to 200 metres above sea-level, the mine being opened by numerous tunnels, and by 7 shafts of the following depths: Sombrero, 98 metres; Carmen, 53m.; Purgatorio, 55m.; Central, 156m.; Amefia, 48m.; Santa Rita, 86m.; San Juan, 86m. The mine is extensively developed, having about 125 kilometres of workings in 1906.

Owing to the peculiar nature of the mine all drilling is done by hand and the ore is so rich that no mechanical concentration is attempted. Ore is hand-sorted and machine-briquetted at a cost of only 1 franc per ton, the argillaceous gangue serving as a natural binder.

The mine has complete steam and electric plants, generating about 2,000 h. p. from steam-engines, of which 1,500 h. p. is transformed by two 3-phase 500-kw. current generators and two 250-kw. 3-phase generators. The electric plant, at Santa Rosalia, furnishes power for hoisting and traction engines, etc., and also current for 50 arc lights and a number of incandescent lamps. The company is courageous in utilizing new and untried machinery, and has a "boneyard" containing an immense amount of machinery that has been scrapped. The climate being tropical and the country extremely arid, there is a condensing plant, with 4 powerful pumps, for the distillation of sea-water, and, to obviate evaporation, water distilled is stored in underground wells. Potable water comes from a reservoir on the Yaqui plateau, through a 16,074-meter pipe-line, having pumps at Santa Agueda and Santa Rita.

The smelting plant, rebuilt 1901, had ten 150-ton water-jacketed blast-furnaces, but these were replaced, 1906, by 10 new furnaces of larger capacity, with 12 to 15 tuyeres each. The smelter has 4 large Connerville blowers, driven by two 175-h. p. compound engines. Sea-water for water-jackets is supplied by a duplex pump having a capacity of 2,400 cubic meters per hour, operated by a 250-h. p. engine. Electric locomotives on the slag-line dump molten slag into moulds in rough holes in the ground, and, after cooling, the masses of slag are dumped over the end of the breakwater, serving a useful purpose in its extension. The first-fusion product is a matte of 58 to 65% copper tenor, about one-third of which is refined to black copper of 89 to 94% tenor, both matte and bars being shipped to Falmouth, England, for refining. A converter plant should be added to the smelter. Fuel for smelting is imported German and English coal and coke, and coal briquettes are used for general fuel. Coke consumption, 1906, was 4,140 tons, imported from Cardiff.

## THE COPPER HANDBOOK.

The plant includes large and extensive machine-shops, capable of handling all classes of mining work, the property occupying a singularly isolated position. The town of Santa Rosalia, absolutely controlled by the company, has a population of 7,000, dependent solely on the mines and works. The village of Santa Rosalia is well laid out, including 4 general stores, warehouses, saw-mill, church, 4 schoolhouses, hospital, theatre, amphitheatre and market building.

The harbor of Santa Rosalia has breakwaters of 650' and 2,500', with a 340-meter jetty and 2 new wharves, the dock having an area of 15 hectares, the breakwaters being composed of large blocks of slag. The harbor works include a dredge and three 200-ton lighters used therewith. The port handles annually about 125,000 tons of freight, in addition to about 7,000,000' of lumber. The company owns a 350-ton sailing vessel and a steamer, latter plying between Santa Rosalia and European points. Copper is shipped to Europe on the steamers of the Compagnie Chargeurs Remis.

A 30-kilometer private railroad connects the mines with the smelters at Santa Rosalia, equipment including 9 locomotives and 120 cars.

The labor question has given considerable difficulty, owing to the scant population of Lower California, necessitating the importation of workmen. Wages are fairly high, for Mexico, averaging 2 pesos daily for miners, and all employees are given the benefit of free medical and surgical attendance, medicines and an excellent hospital service. The importation of 500 Japanese workmen, 1904, proved unprofitable, only 40 men remaining at the mine by the end of the year, and tropical labor from Tepic also proved a failure. A large number of Chinese coolies were hired, 1903-1904, but of the force of 3,440 men employed, January, 1908, only about 200 were Chinese.

The average net copper return from ore smelted was 4.29% in 1900; 4.38% in 1902, and 3.626% in 1906, when a somewhat lower average grade of ore was used, on account of the high price of copper. Production has been as follows, in 1902, from 249,895 metric tons of ore, 10,953 metric tons fine copper; in 1903, from 230,490 tons of ore, 10,480 tons fine copper; in 1905, from 260,694 tons of ore, 10,350 tons fine copper; in 1906, from 304,940 tons of ore, 22,817,610 lbs. fine copper, and in 1907, from 319,850 tons of ore, production was 24,530,000 lbs. fine copper. It will be noted that the company has steadily increased ore production, under rather trying circumstances. The property is one of great merit and ably managed.

### BOLINAS COPPER MINING CO.

### CALIFORNIA.

Office: 253 Spear St., San Francisco, Cal. Mine office: Bolinas, Marin Co., Cal. T. P. H. Whitelaw, president and manager. Lands, sundry claims 4 miles northeast of Bolinas, showing 9 veins, 6" to 2' wide, in serpentine, on which considerable development work has been done. Ore on the dumps is said to carry 5 to 10% copper. Has a good equipment, including a concentrator. Idle for several years, and company refuses to furnish any statement.

### BOLIVIAN CONSOLIDATED COPPER CO.

### BOLIVIA.

Office: 3102-1 Madison Ave., New York, N. Y.

### BOMPA SYNDICATE.

### AUSTRALIA.

Mine office: Glassford Creek, Gladstone district, Queensland, Australia. Presumably idle.

### BONANZA BELT COPPER CO.

### ARIZONA.

Office: 31 Nassau St., New York, N. Y. Mine office: Johnson, Cochise Co., Ariz. Robert Huntley, president; A. T. Wells, vice-president; H. L. Deeser, secretary and treasurer; Walter L. Ehrich, superintendent; Gustave N. Gouyard, consulting engineer. Organized Oct. 29, 1906, under laws of Arizona, with capitalization \$3,500,000, shares \$10 par. Trust Co. of America, New York, registrar. Lands, 12 claims, area circa 230 acres, including the Peabody

mine, adjoining the Arizona & Michigan, located 1879, which has a 6' vein giving assays up to 9% copper and 4 oz. silver, and is said to have 16,950' of workings. Mine is claimed to have produced, under former ownership, about \$1,000,000 worth of ore. Present company has shipped some ore running 11.5% copper and 51 oz. silver per ton. In August, 1907, property was attached by the Albert Frank Co. for \$40,823.20, for an unpaid advertising bill. Some of the officers are men of excellent standing, but advertising was misleading and mine is not in the same district as the Greene-Cananea, Copper Queen, Old Dominion and United Verde mines, as might be inferred from map printed in company's advertising, although the map carried, in very small letters, a note that it was not drawn to scale. Is not regarded favorably.

**BONANZA CIRCLE MINES.****ARIZONA.**

A nickname for the Calumet & Arizona, Superior & Pittsburg, American-Saginaw and Warren Realty & Development properties at Bisbee, Cochise Co., Ariz.

**BONANZA COPPER CO.****ARIZONA.**

Mine office: Clifton, Graham Co., Ariz. Said to have been absorbed, 1907, by Copper Company of Arizona.

**BONANZA COPPER CO.****MONTANA.**

Office: care of J. H. Tilsey, secretary, Spokane, Wash. Letter returned unclaimed from former mine office, Florence, Ravalli Co., Mont. Jos. Felton, president; A. J. Riese, vice-president; J. W. Doust, treasurer. Lands, 15 claims, known as the Whaley mine, in the Woodchuck district, said to have a 12' ore body of fair grade, slightly developed by tunnel.

**BONANZA COPPER CO.****NEVADA.**

Mine office: Manhattan, Nye Co., Nev. Lands, in East Moshulat, have a 131' shaft showing stringers of ore assaying about 4% copper, with gold values. Presumably idle.

**BONANZA COPPER CO.****NEW MEXICO.**

Mine office: Las Vegas, San Miguel Co., N. M. Chas. N. Petteys, president and manager; Geo. H. Hunter, secretary. Has steam power, a small concentrator and a 25-ton leaching plant.

**BONANZA DE COBRE MINING CO.****MEXICO.**

Dead. Succeeded, circa 1907, by Elenita Development Co. Formerly at La Cananea, Arizpe, Sonora, Mex.

**BONANZA DEVELOPMENT CO.****MEXICO.**

Dead. Sold lands, 1899, to Santa Rita Mining Co. Formerly at Santa Rita, Grant Co., N. M.

The Bonanza mine in the Copper River district, Alaska, is owned by the Kennicott Mines Co.

**BONANZA MINE.****ALASKA.**

The Bonanza mine, on Latouch Island, Alaska, is owned by A. K. Beaton, et al.

**BONANZA MINING CO.****BRITISH COLUMBIA.**

Dead. Formerly at Observatory Inlet, Cassiar district, B. C.

**BONANZA MINING CO.****IDAHO.**

Office and mine: Montpelier, Bear Lake Co., Idaho. M. L. de Julien, president and general manager; C. N. Sweet, vice-president; A. D. Young, secretary; F. C. Plummer, treasurer. Organized November, 1905, under laws of Idaho, with capitalization \$5,000,000, shares \$1 par, succeeding Montpelier Copper Mining & Smelting Co. Lands, 23 claims, unpatented, area 460 acres, circa 9 miles southwest of Montpelier, include the Duke, Emerald and other claims, showing auriferous and argentiferous copper ore in a vein of about

30' width with a 5' pay streak. Has a 200' two-compartment shaft, planned to be sunk to 600', on the Duke claim.

**BONANZA MINING CO.**

MEXICO.

Office: care of Chas. Sidlar, secretary, Sunbury, Pa. Mine office: Ameca, Jalisco, Mex. Hon. Thos. Savage, president; E. J. Callahan, general manager. Organized 1905, by shareholders of the Amparo Mining Co., to take over the Barranca mine, bought for \$30,000. Presumably idle.

**BONANZA MINING & SMELTING CO.**

WASHINGTON.

Office: 81 Sullivan Bldg., Seattle, Wash. Mine office: Index, Snohomish Co., Wash. Chas. Lovejoy, superintendent. Lands are the Edison group, 12 claims, in the Silver Creek district, opened by tunnels aggregating 2,100' length, showing auriferous copper ores. Has water power.

**BONANZA MOUNTAIN GOLD MINING CO., LTD.** BRITISH COLUMBIA.

Mine office: Grand Forks, Boundary district, B. C. Has low-grade auriferous and argentiferous copper ores. Idle for several years.

**BONANZA QUEEN MINING CO., LTD.**

WASHINGTON.

Office: Minneapolis, Minn. Mine office: Silverton, Snohomish Co., Wash. J. H. Eaton, superintendent. Lands, 8 claims, showing 4 veins, said to be proven by gorges for length of about 4,000'. Main vein is claimed to average 60' width, with extreme width of 134'. Has a 1,090' crosscut tunnel. Ten carloads of ore shipped to Tacoma smelter gave returns of \$14.50 per ton.

**BONITO COPPER CO.**

ARIZONA.

Mine office: Safford, Graham Co., Ariz. Planned installing a leaching plant. Idle.

**BONMAHON COPPER MINES DEVELOPMENT**

IRELAND.

**SYNDICATE, LTD.**

Office: Broad Street House, London, E. C., Eng. Mine office: Waterford, County Waterford, Ireland. Sir Jas. Aloysius Power, chairman; H. J. Dixon, secretary; Arthur Llewellyn Pearce, consulting engineer; Herbert T. Marks, mine manager. Organized Nov. 16, 1905, under laws of Great Britain, with capitalization £30,000, shares £1 par.

Lands, 190 acres, on Bonmahon Bay, 17 miles from Waterford, including the Knockmahon and Tankardstown mines, which, 1827-1865, under the ownership of the Mining Company of Ireland, had an authenticated production of £1,339,232, from which profits of £534,011 are said to have been made. Ore extracted during this period is said to have averaged 10%, but must have been secured by very careful hand-selection. After 1875, under a different management, mines are said to have produced about £900,000 worth of ore. The Bonmahon mines are very ancient, having been worked as early as the Sixteenth Century. Last mining work preceding present ownership was done 1878.

The Knockmahon ore body, said to be traceable 5 miles to Kilmackthomas, occurs in clay-slates. Annual production was about 1,000 tons fine copper, circa 1840. The Tankardstown mine, running under the sea for some distance, is said to show considerable bodies of ore of concentrating grade. The Bbnvy mine, 300' deep, has been unwatered. Property as a whole shows large reserves of low to medium grade ores, and is considered decidedly promising, but to be profitable must be operated on a good scale. At last accounts company planned reorganization, on basis of about £200,000 capitalization.

**BONNEY MINING CO.**

NEW MEXICO.

Dead. Formerly at Lordsburg, Grant Co., N. M. Described Vol. VI.

**BONNIE BELLE MINING & MILLING CO.**

WYOMING.

Dead. Formerly at Rudefeda, Carbon Co., Wyo.

**BONNIE DUNDEE MINING CO., N. L.****AUSTRALIA.**

Office: Cobar, N. S. W., Australia. Mine office: Hermidale, N. S. W., Australia. M. J. Corbett, chairman; preceding officer, J. A. Draper, A. J. L. Flashman, E. B. Treatt and B. A. Sorensen, directors. Property, carrying auriferous copper ore of some promise, is slightly developed.

**BOODLE MINING SYNDICATE, LTD.****COLORADO.**

Office: 46 St. Mary Axe, London, E. C., Eng. Letters returned unclaimed from former mine office, Central City, Gilpin Co., Colo. John Peter Reid, chairman; Chas. Pearson, secretary; W. J. Richards, superintendent. Capitalization, £15,000, shares £1 par; issued, 7,500 shares, 15s. called up. Ores carry gold, silver and copper. Idle for some years and apparently moribund.

**BOPPY BROKEN HILL COPPER MINE, N. L.****AUSTRALIA.**

Mine office: Cobar, Robinson Co., N. S. W., Australia. Organized circa December, 1907, under laws of New South Wales, with capitalization £22,500. shares £5 par. Mine has a 200' shaft, showing, at bottom, ore estimated to average 30% copper.

**BOPPY MOUNTAIN CO.****AUSTRALIA.**

Mine office: Cobar, Robinson Co., N. S. W., Australia. Organized 1906, with capitalization £3,000, shares £5 par. Lands, 28 claims, 2 miles north of Mount Boppy gold mine, adjoining the Boppy Blocks mine on the north, showing a strong gossan capping. Idle at last account.

**COMPAGNIE FRANCAISE DES MINES DE BOR.****SERVIA.**

Office: 60 Rue de la Victoire, Paris, France. Mine and works office: Bor, Zeyetchar, Timok, Servia. Original capitalization of £5,500,000 was increased, 1908, to £7,000,000.

Lands are a 50-year concession with privilege of renewal, known as the St. George, covering 2,400 hectares, and the lease of 6,500 hectares additional lands, in the communes of Bor, Krivelj and Ostrelj, lying circa 13 miles south of Majdenpek. Property shows prominent gossans carrying considerable limonite, ores occurring in a belt of 1 to 2 miles width by about 10 miles length, in fissure veins up to 50' and even 100' width, traversing andesite and volcanic tuffs and breccias. Ores include chalcocite, covellite, bornite, chalcopyrite and enargite, associated with galena, sphalerite and pyrite, all slightly auriferous and argentiferous. At Krivelj, a vein of about 40' width gives average ores of 5.5% copper. At Cuka-Dulkan, a vein of 27 meters extreme width has given average assays of 6% copper. At Crveno-Brdo there are 3 irregular chimneys, averaging 80' in width, giving average returns of 7% copper. A branch of the Budapest & Constantinople railway is being built to the Bor district. Smelter has 2 blast furnaces, 360-h. p. Babcock & Wilcox boilers and a converter with one stand and four shells.

**BOREN GULCH MINING CO.****COLORADO.**

Office: care of Henry C. Deeming, general manager, Harrisburg, Pa. Mine office: La Plata, La Plata Co., Colo. G. C. Cornell, superintendent. Ores are complex auriferous and argentiferous copper, lead and zinc sulphides. Has steam power.

**BORNITE COPPER CO.****MONTANA.**

Office: 150 Fifth Ave., New York, N. Y. Mine office: Blackfoot, Teton Co., Mont. Jas. B. Holmes, vice-president; Frank Meyer, secretary. Organized with capitalization \$5,000,000, shares \$5 par, as successor of Imperial Montana Copper Mining, Smelting & Water Power Co., which was successor of Blackfoot Copper Co. Lands are variously reported as 8 claims, area 160 acres, and as 19 claims, on the north side of Boulder Creek, in the ceded strip of the

Blackfoot Indian Reservation. Mine has 5 tunnels. Said to have lost lands, which were held under bond and lease, and is moribund.

**BORNITE COPPER & GOLD MINING CO.**

**ARIZONA.**

Dead. Formerly at Wickenburg, Maricopa Co., Ariz.

**BORNITE COPPER & GOLD MINING CO.**

**WASHINGTON.**

Office: care of C. W. Coffin, president, Bangor, Me. Mine office: Darlington, Snohomish Co., Wash. Wilbur E. Frank, secretary; C. G. Austin, general manager; Wm. Hancock, superintendent. Organized under laws of Washington, with capitalization \$2,500,000, shares \$1 par. Lands, 11 claims in the Stillaguamish district, showing strong outcrops of auriferous and argentiferous bornite and chalcopyrite. Development is by a 2,689' tunnel, and a deeper tunnel was planned. Has water power and is said to have an aerial tram. April, 1908, was offering 1-year 7% notes to shareholders in efforts to raise funds. Presumably idle.

**BORTLE COPPER-GOLD CO.**

**WASHINGTON.**

Office: 822 Penobscot Bldg., Detroit, Mich. Mine office: Republic, Ferry Co., Wash. C. Eugene Bortle, president; Chas. E. Murphy, vice-president; Chas. Kohn, secretary and treasurer; preceding officers, Ralston MacCaig and Chas. Storch, directors; E. J. Delbridge, general manager. Organized June 22, 1906, under laws of Washington, with capitalization \$1,200,000, shares \$1 par; issued, \$800,000.

Lands, 4 claims, area 80 acres, held under bond and lease, also an 80-acre millsite and 160 acres miscellaneous lands, in the Lambert Creek district, adjoining the Belcher mine on the south. Mine has a 357' tunnel and a 52' incline shaft, on the northern extension of the Belcher vein, showing auriferous sulphide ore giving average assays of about 3% copper. Company is said to have expended about \$65,000 on the property. There is a sawmill on the smeltersite, on Curlew Lake, where a matting furnace is planned, tentatively. Idle, but plans early resumption.

**BOSCASTWELL UNITED TIN & COPPER MINE, LTD.**

**ENGLAND.**

Mine office: St. Just, Cornwall, Eng. Organized circa June, 1908, under laws of Great Britain, with capitalization £200,000, shares £1 par, in half preferred ordinary and half deferred ordinary shares, latter allotted to vendor as purchase consideration. Lands, 7 setts, including the North Boscaswell Downs, Calarthra Common and Bortherras mines, about 2 miles from St. Just. Is not regarded favorably.

**BOSSMO KISGBUBER.**

**NORWAY.**

Mine office: Baasmoen, Ranen, Norway. Ore is slightly auriferous pyrite, assaying 0.5% and upwards in copper, and up to 50% sulphur, latter element furnishing the principal ore values. Yearly production is about 20,000 tons of pyrite, and circa 25,000 lbs. fine copper.

**BOSTON & ARIZONA CONSOLIDATED COPPER CO.**

**ARIZONA.**

Dead. Formerly had an office at 501-7 Water St., Boston, Mass.

**BOSTON-ARIZONA COPPER CO.**

**ARIZONA.**

Office: 1012-60 State St., Boston, Mass. Letter returned unclaimed from former mine office, Globe, Gila Co., Ariz. Hon. Chas. M. Bruce, president. Lands, 21 claims, near the McMillen, in the Richmond Basin, 20 miles from Globe.

**BOSTON & ARIZONA COPPER CO.**

**ARIZONA.**

Office: 131 State St., Boston, Mass. Apparently moribund.

**BOSTON-ARIZONA GOLD & COPPER MINES CO.**

**ARIZONA.**

Dead. Formerly had an office at 405-31 State St., Boston, Mass.

**BOSTON-ARIZONA MINING CO.**

**ARIZONA.**

Dead. Formerly at Wickenburg, Maricopa Co., Ariz. Described Vol. V.

**BOSTON & ARIZONA SMELTING CO.****ARIZONA.**

Letters returned unclaimed from former office, 302 Mills Bldg., San Francisco, Cal., and former works office, Benson, Cochise Co., Ariz. Eiley A. Boggess, manager. Organized 1907, under laws of Nevada, with capitalization \$2,500,000, shares \$100 par, as successor of the Southwestern Smelting & Refining Co., which succeeded the Empire Smelting Co. Lands, 60 acres, on the main line of the Southern Pacific. Has a 200-ton water-jacket blast-furnace, No. 7 Connerville blower, electric power plant, sampling plant with 500-ton Vein automatic sampler, and an artesian well. Smelter never was blown in. Has an old slag-dump, from a previous smelter, containing circa 100,000 tons of slags, assaying about \$5 per ton in values, which probably could be remelted. Moribund.

**BOSTON & BRITISH COLUMBIA COPPER****BRITISH COLUMBIA.****MINING & SMELTING CO.**

Dead. Lost property by attachment.

**BOSTON & BRITISH COLUMBIA MINING CO.****BRITISH COLUMBIA.**

Office: 39 Cortlandt St., New York. Mine office: Granite Creek, Yale district, B. C. Moribund.

**BOSTON & CAROLINA COPPER MINING CO.****NORTH CAROLINA.**

Dead. Formerly at Baker City, Granville Co., N. C.

**BOSTON CLIMAX GOLD-COPPER MINING****WASHINGTON.****& INVESTMENT CO.**

Office: Union Trust Bldg., Providence, R. I. Benj. F. Harrington, president. Lands, circa 240 acres, in Stevens county, Washington, on which about \$25,000 has been spent in development work. Idle for several years.

**BOSTON-COLEBY COPPER MINING CO.****MONTANA.**

Office and mine: Saltese, Missoula Co., Mont. John Bauer, president; Andrew Flraig, secretary, treasurer and general manager. Organized Sept. 16, 1903, under laws of Montana, with capitalization \$1,000,000, shares \$1 par. Lands, 7 claims, area 140 acres, also a 5-acre millsite, in the St. Regis district, near Saltese and rail connections. Has a shallow shaft and tunnels of 400' and 880', showing 5 ore bodies, claimed to have given average assays of 15% copper, 10 oz. silver and \$5 gold per ton. Presumably idle.

**BOSTON-COLORADO COPPER CO.****COLORADO.**

Dead. F. H. Colvin was president and general manager. Capitalization, \$1,000,000. Is said to have paid \$200 for the property. Company claimed a preposterous tonnage of 4% ore above water level. Claimed to have 4 tunnels, aggregating about 2,000' in length, and claimed an ore body showing an 85' outcrop, traceable 4,500'. Dennison, the former secretary, is in bankruptcy and gave a bill of sale on unpaid stock, apparently perjuring himself, and Colvin was arrested for taking the bill of sale. Both Colvin and Eckle were indicted, 1907, on complaint of the United States government, for using the mails with intent to defraud. The 100-ton mill and dividends promised, 1906, have not materialized. Was a swindle. Formerly at 124 F St., Salida, Chaffee Co., Colo.

**BOSTON-COLORADO COPPER MINING CO.****COLORADO.**

Letter returned unclaimed from former office, 50 White St., New York. Mine office: Fort Collins, Larimer Co., Colo. Edwin M. Keiser, president; Sanford Stark, vice-president and general manager; Roger C. Turner, secretary. Organized 1898, under laws of Arizona, with capitalization \$1,000,000, shares \$1 par. Lands, 7 patented claims, area 63 acres, in the Howes Gulch district, showing carbonate and sulphide ores, giving assays of 7 to 8% copper, 1 oz. silver and \$2.60 gold per ton, developed by shafts of 40' and 240'

and two 200' tunnels. Has steam power and necessary mine buildings. Idle some years and moribund.

**BOSTON & COLORADO SMELTING CO.**

**COLORADO.**

Office: Boston Bldg., Denver, Colo. Works office: Argo, Denver Co., Colo. C. C. Converse, president; Geo. D. Edmunds, secretary; Crawford Hill, managing director; Harold V. Pearce, general manager. Has a 250-ton smelting plant, with steam and electric power, doing a general custom smelting business. Employs about 200 men.

**BOSTON CONSOLIDATED COPPER & GOLD MINING CO., LTD.**

**UTAH.**

Office: 62 New Broad St., London, E. C., Eng. Mine office: Bingham Canyon, Salt Lake Co., Utah. John E. Dudley Ryder, chairman; Samuel Newhouse, general manager; preceding officers, Chas. S. Henry, M. I. Newhouse, Frank A. Schirmer, Eugene Meyer, Jr., and Capt. Stephen H. Pollen, directors; G. H. Johnson, secretary. Organized May 14, 1898, under laws of Great Britain; capitalization increased, August, 1905, to £725,000, shares £1 par; issued, £625,000. Has a first-mortgage debenture issue of £252,000, at 7%, convertible into shares at £3 or redeemable at £105 on 6 months notice. Property is held through an American corporation, the Boston Consolidated Mining Co., under which title the mine is described. Practically the entire stock issue of the American corporation is held by the British parent company, and funds of the latter are loaned to the American corporation. Shares are listed on the London and Boston stock exchanges.

**BOSTON CONSOLIDATED MINING CO.**

**UTAH.**

Office: 79 Milk St., Boston, Mass. Operating office: 608 Dooly Block, Salt Lake City, Utah. Mine office: Bingham Canyon, Salt Lake Co., Utah. Samuel Newhouse, president; Frank A. Schirmer, vice-president, secretary and treasurer; Lafayette Hanchett, general manager; Louis S. Cates, general superintendent; S. H. Horner, mine superintendent; A. J. Bettles, mill superintendent; Geo. G. Wald, engineer.

Organized under laws of New York, with capitalization \$1,000,000, shares \$100 par, entire capital stock, except founders shares, being owned by the Boston Consolidated Copper & Gold Mining Co., Ltd. Owns 20% of stock issue of Garfield Improvement Co., which holds the townsite of Garfield, Utah. A first-mortgage of \$1,500,000, Federal Trust Co., New York, trustee, was recorded circa February, 1908, to cover the convertible bond issue of December, 1907, by the English parent company. Pressing needs during the 1907 panic were met by the personal endorsements of directors Frank A. Schirmer and Samuel Newhouse, for which they deserve great credit, and the thanks of all shareholders. During 1907 the company expended, for mill construction, \$782,654, and spent upwards of \$900,000 for mine development, machinery and other construction account.

Lands, 51 claims, area 379 acres, patented, also the old 200-acre millsite, the Pelican Point millsite of 1,085 acres, the Garfield millsite of 910 acres, and 680 acres miscellaneous lands. Country rocks are limestone, porphyry and quartzite, and the ore is mainly chalcopyrite, with occasional bornite and disseminated chalcocite.

The Boston Consolidated really is two mines in one, the original mine having been opened on fissure veins in limestone and quartzite. Later, the work of the Utah Copper Co. led to the investigation of the monzonite ore bodies of the Boston Consolidated and a monstrous porphyry mine has been developed thereon. Company estimates that the ore of the Sulphide mine average 2.5% copper, 2 oz. silver and \$2 gold per ton, and that the porphyry ores average 1.6% copper, 0.25 oz. silver and 30 cents gold per ton.

The Sulphide property, which was the original mine, has an area of about

100 acres, containing 15 known ore bodies. Two veins are being developed, these having a generally east and west strike, with average dip of 28° N., ore chute being estimated at 160' width and 340' length. During 1907 a new and promising ore body was opened by Armstrong No. 1 tunnel. Some of the best ore of the Sulphide mine returns better than 10% copper, with corresponding increase in gold and silver values, but the average return of all sulphide ores, 1906, was 2.802% copper, with a 6% loss in smelting. During 1907 there were 7,799' of new openings made in the Sulphide mine, which has about 6 miles of workings. The Armstrong No. 1 tunnel, which is the main working artery, has an electric haulage system. The Peabody tunnel shows a body of sulphide ore 190' in width. Other principal tunnels of the Sulphide mine are: Armstrong No. 2, Work, Phoenix and Ingersoll.

The Porphyry mine is opened by 15 tunnels, with about 7 miles of workings, and consists, not of a vein or contact deposit, but of 110 acres of country rock, with values continuing to an undetermined depth. The porphyry is monzonite, a somewhat complex anhydrous silicate of aluminum, sodium, potassium, calcium, manganese and iron, the porphyry ore body being a continuation of the monzonite ore of the Utah Copper Co. The company estimates 52,000,000 tons of porphyry ore in sight. It is probable that, eventually, this ore body will be found to contain between 100,000,000 and 200,000,000 tons of ore, part of which probably will be unworkable, owing to its extremely low copper tenor. The porphyry ores, estimated by the company to average 1.6% copper, range down in tenor to 0.7% copper, which probably is unworkable, at present. The porphyritic ores are mined and overburden stripped by four 90-ton steam shovels, stripping being removed at a cost of 5 to 10 cents per ton, each shovel being capable of handling 2,000 to 3,000 tons daily of overburden or ore, which is broken by blasts, deep holes for charges being bored by Keystone drills.

Mine equipment includes a 700-h. p. steam plant, with 3 cross-compound air-compressors, of 60 drills aggregate capacity. Mine buildings include a 40x80' machine shop, 30x40' carpenter-shop, 3 smithies, etc.

There is a 2,000' incline tram, with double tracks, laid with 36-lb. rails, having 2 Stine drums at the top of the terminal, operating 13-ton skips, estimated capacity of line being 6,000 tons daily. There are 3,000-ton steel ore bins at the terminal, on Carr Fork, and a half-mile railway connecting with the Rio Grande and Copper Belt railways. The company has a 5-mile private narrow-gauge railway, equipped with 12 locomotives and 190 ore cars.

The 3,000-ton mill, at Garfield, costing upwards of \$1,500,000, is in 6 units of 500 tons each, with 13 operating units. The mill is 370x555' in size, built of steel and concrete. Equipment includes 18,000-ton main ore-bins, 4 Gates crushers, 312 Nissen individual stamps, 284 Wilfley tables, 256 Johnson tables and 312 Calow settling tanks. The mill has no elevators, all material being handled by gravity. Water is supplied partly from springs on the millsite, but mainly by the Garfield Water Co. The mill has a large reservoir.

Miscellaneous buildings at the millsite, all of steel and concrete, include a 50x180' machine-shop, 40x40' carpenter-shop, smithy, etc.

The porphyry ores have given decidedly disappointing results in initial production, but it is hoped that better returns can be secured. The top of the porphyry ore deposit shows a considerable excess of iron, and the mill has given an average extraction of about 70% only of the ore values. The porphyry ores can be concentrated about 20 into 1, though necessarily with heavy tailings loss. The porphyry ores, for the first half of 1908, gave smelter returns of only 19 to 22 lbs. fine copper per ton, concentrates averaging 14 to 19% copper and circa 25% iron. It is hoped that ore mined may be brought

to an average of about 1.5% copper, with an 80% extraction, which would give 24 lbs. fine copper per ton, less small smelter losses.

Production has been secured for several years from the sulphide zone, output, 1906, having been 3,565,483 lbs. fine copper, and 6,146,125 lbs. fine copper, 78,128 oz. silver and 12,446 oz. gold in 1907. The company plans an eventual production of about 30,000,000 lbs. fine copper yearly. Costs, 1907, were figured at 8.55 cents per pound, deducting gold and silver values, but not including construction of mill or sundry heavy expenses of mine development. It is hoped to have the property producing at full capacity during 1909. Notwithstanding the disappointing results given by the porphyry ores in 1908, the mine, by reason of its almost incomprehensible tonnage of porphyry ores, is one of great possibilities, and the management is vigorous and resourceful.

#### **BOSTON & CORBIN COPPER & SILVER MINING CO. MONTANA.**

Office: 82 Devonshire St., Boston, Mass. Mine office: Corbin, Jefferson Co., Mont. Nathan L. Amster, president; A. B. Clough, vice-president; C. R. Jeffers, secretary and treasurer; Homer E. Emerson, general manager; preceding officers, Jas. A. Houston and David A. Ellis, directors. Organized Aug. 30, 1906, under laws of Maine, with capitalization \$500,000, shares \$5 par; issued, \$400,000. Boston Safe Deposit & Trust Co., transfer agent. Federal Trust Co., Boston, registrar.

Lands, 9 claims, area circa 175 acres, 1 mile from Corbin and 43 miles from Butte, including the Bertha mine, with about 4,500' of strike of the Bertha vein. Country rock is granite with intrusive porphyritic rocks, vein system of the Berths consisting of a number of parallel fissures. Geological conditions are markedly similar to those at Butte, though ore is mainly chalcopyrite instead of chalcocite as at Butte, with some enargite, all argentiferous. The Bertha has 6 different veins, of about 2' average width, in addition to the main Bertha vein, which is a well defined fissure, in granite, of 6' to 18' width, carrying an 18" to 2" paystreak. Silver values increase with depth, ranging 6 to 9 oz. per ton in the upper workings, and 12 to 22 oz. per ton on the lower level. First class ore averages about 7.8% copper and second class ore 4.6% copper, average of all ore shipped from beginning of operations to Apr. 1, 1908, being 5.64% copper and 7.7 oz. silver per ton. Property adjoins the old Alta mine, claimed to have produced about \$20,000,000 worth of silver, and which supposedly was opened on a continuation of the Bertha vein.

The mine had about 3,500' of workings, when taken over by present company, development being by two 900' tunnels and a 200' shaft. New management has begun a third tunnel and deepened the 2-compartment Gregory shaft to 500', and plans sinking to 1,000'. Is crosscutting, on the 500' level, to cut the parallel veins.

Equipment includes a 500' hoist and 10-drill air-compressor, with necessary mine buildings and shops. Cost of wagon freight to railroad is \$2 per ton on ore, and an aerial tram is planned.

Company ended fiscal year, July 31, 1907, with cash and bills receivable of \$73,218.81, with liabilities of \$6,947.21. Small ore shipments have been made from development work, to the Butte Reduction Works, and production, 1907, was 157,000 lbs. fine copper.

The company is modestly capitalized and is being developed with vigor by experienced mining men who have proven successful in other fields. The Corbin district has been called, by its friends, another Butte, but has been given a black eye by reason of the failure of numerous small mining enterprises. These, however, were inadequately financed, and, as a rule, were poorly managed, hence the real value of the district remains to be demonstrated. The prospects of the Boston & Corbin seem good.

**BOSTON-ELY COPPER CO.****NEVADA.**

Office: 110 State St., Boston, Mass. Mine office: Ely, White Pine Co., Nev.  
**BOSTON-ELY DEVELOPMENT CO.** **NEVADA.**

Dead. Organized 1906, under laws of Maine, and reorganized, circa November, 1907, as Boston-Ely Mining Co. Formerly at Ely, White Pine Co., Nev.

**BOSTON ELY MINING CO.****NEVADA.**

Office: 84 State St., Boston, Mass. Mine office: Ely, White Pine Co., Nev. Employs 15 men. Arthur L. Robinson, president; Chas. H. Parshaworth, vice-president; Jerome C. Smith, secretary and treasurer; preceding officers, Geo. E. Keith, Jos. N. Smith, Wm. D. Biwell and S. Herbert Williams, directors; Ed. W. Ralph, superintendent. Organized November, 1907, under laws of Maine, with capitalization \$2,000,000, shares \$10 par; \$3.15 paid in; issued, \$1,700,000. Was a reconstruction of the Boston-Ely Development Co., giving new stock for development stock, stamping latter \$3 paid and levying a 15-cent assessment. Owns a two-thirds stock interest in the Ely Western Copper Co.

Lands, 92 claims, patented, area 300 acres, including the Colorado-Ely group, about one-half mile from the Cumberland-Ely and Giroax, and in the vicinity of the Rickard-Ely, opened by the 710' Emma shaft, showing low grade copper ore in drifts on the 710' level. Also has 2 fissure veins, said to carry high grade ore, from which small shipments have been made, but if a considerable ore body is developed by the Emma shaft, presumably it will be found quite deep. Has a 15-h. p. hoist and several camp buildings. Company plans deepening shaft and prospecting below the oxidized zone. Lands have been partially explored by churn drill. Management seems efficient, and property is considered as not devoid of promise.

**BOSTON EXPLORATION CO.****WASHINGTON.**

Office: Old South Bldg., Boston, Mass. F. E. Houghton, fiscal agent. Organized 1906, with capitalization \$5,000,000, shares \$5 par. Is a holding company, organized to control the Mineral Hill Tunnel Mining Co. and Mineral Hill Mining Co., both of Ferry county, Washington; the Triune Gold Mining Co. in the Wannicutt Lake district of Okanogan county, Washington, and the Providence Mining Co. in the Cedar Cañon district of Stevens county, Washington.

**BOSTON GOLD-COPPER CO.****ARIZONA.**

Dead. Reorganized as Growlet Copper Co. Formerly at Gila Bend, Maricopa Co., Ariz.

**BOSTON GOLD-COPPER SMELTING CO.****COLORADO.**

Office: 408 Cooper Bldg., Denver, Colo. Works at Leadville, Lake Co., Colo., were leased, 1902, for 10 years, to the Republic Smelting Co.

**BOSTON-GREENWATER COPPER CO.****CALIFORNIA.**

Office: Butte, Mont. Mine office: Greenwater, Inyo Co., Cal. W. A. Kidney, president; J. P. Nelson, vice-president and general manager; E. H. Lattimer, secretary; Hon. John MacGinnis, treasurer; Daniel P. Murphy, superintendent. Organized October, 1906, under laws of Arizona, with capitalization \$1,250,000, shares \$1 par. Lands, 11 claims, area 175 acres, lying about 1 mile east of the Furnace Creek Copper Co., instead of immediately adjoining, as claimed. Lands are claimed to show a wide vein, with numerous cross fissures, giving assays of 25 to 50% copper, but actually having an 8' vein giving average assays of about 5% copper. There were various charges of fraud in connection with sale of stock in this company by brokers, leading to the arrest of Secretary Lattimer, Miles Almy and Dr. Grant Lyman. Apparently Almy was innocent of intentional fraud, and Lyman, who was at the head of the Union Securities Co., managed to escape punishment, though undoubtedly

having sold an immense amount of stock through misrepresentation. Idle and presumably moribund.

#### BOSTON-IDAHO MINING CO.

IDAHO.

Offices: 306-147 Milk St., Boston, Mass., and 6 First Natl. Bank Bldg., Ogden, Utah. Letter returned unclaimed from former mine office, Nicholia, Lemhi Co., Idaho. R. P. Hunter, president and treasurer; Frank H. Clayton, vice-president and eastern manager; Ernest J. Waugh, secretary; W. N. Pierce, superintendent; Thos. Hampton, mine superintendent. Organized February, 1902, under laws of Utah, with capitalization \$200,000, shares \$1 par. Lands, 8 claims, area circa 100 acres, including the Ontario mine on Boyle Mountain, in the Spring Mountain district, having 8 tunnels, with about 1,500' of workings, claimed to have produced upwards of \$1,000,000 in the past. Has secured ores assaying up to 27.5% copper, 57% lead, 40 oz. silver and \$1.60 gold per ton. The L. Diamond Co., of Boston, advertised this stock, 1907, stating that 5% quarterly dividends would begin next month, and company is regarded with suspicion. Postmaster at Nicholia stated no such company there.

#### BOSTON-JARILLA COPPER CO.

NEW MEXICO.

Mine office: Orogande, Otero Co., N. M. Lands, 7 claims, adjoining the Molly Gibson, from which a little copper and silver ore of good grade has been shipped.

#### BOSTON & JEROME COPPER CO.

ARIZONA.

Office and mine: Jerome, Yavapai Co., Ariz. Jos. Larson, president; J. C. Scott, vice-president; A. A. Macpherson, secretary and treasurer. Organized April, 1908, under laws of Arizona, with capitalization \$1,500,000, shares \$1 par, increased, May, 1908, to \$2,500,000, shares \$5 par. Lands, 9 claims, area 146 acres, known as the Juniper group, circa 2 miles south of Jerome, having a 130' shaft sunk on a large porphyry and schist dyke, carrying carbonate copper stains. Also has tunnels of 50' and 60'. Suspended operations circa February, 1908, but plans resumption.

#### BOSTON-MEXICAN MINES CO.

ARIZONA & MEXICO.

Office: 141 Broadway, New York, N. Y. Mine offices: Twin Buttes, Pima Co., Ariz., and Hermosillo, Sonora, Mex. S. E. Otis, president; Fredk. Holder, vice-president; Augustus H. Vanderpool, secretary and treasurer; Chan. J. Eames, Jr., general manager. Organized under laws of Arizona, with capitalization \$4,000,000, shares \$5 par. American Loan & Trust Co., Boston, registrar; Federal Trust Co., Boston, transfer agent. Lands include sundry copper, silver and gold claims. The Copper Beauty group of 10 claims, in the Twin Buttes district, has a shallow shaft and is said to give average assays of 5 to 8.5% copper from surface ores. El Sol mine, 9 miles from Llano, has 2 shallow shafts in veins of 3' to 4' width, giving assay values in copper, gold and silver. The Carmen and Adriana mines are said to be near the Black Mountain, in Sonora, and to carry somewhat similar ore. The Caliche mine, in the Magdalena Mountains, supposedly has gold ores. The Concepción mine is a silver property, 20 miles west of Agua Zarca, northern Sonora. The Hada mine is a silver property near the Concepción. La Azurena mine is said to be 3½ miles from Cerro Azul, Sonora, which is not a postoffice, and to have shafts showing a vein of 5' to 25' width, giving assays of 35 to 290 oz. silver per ton. Company was said, April, 1907, to have secured circa 1,200 acres of copper lands in the Cananea district. Company is not regarded with especial favor.

**BOSTON & MONTANA CONSOLIDATED COPPER  
& SILVER MINING CO.**

**MONTANA.**

Office: 42 Broadway, New York, N. Y. Mine office: Butte, Silver Bow Co., Mont. Works office: Great Falls, Cascade Co., Mont. Sidney Chase, president; John D. Ryan, managing director; David B. Hennessy, secretary and treasurer; preceding officers, Andrew B. Graffius and Jas. Phillips, Jr., directors; Chas. W. Goodale, general manager; John C. Adams, general superintendent; A. E. Wheeler, smelter superintendent; Lee Hayes, engineer; Wallace Corbett, mine foreman.

Organized July 19, 1887, under laws of Montana, and reincorporated, July 19, 1907, with capitalization \$3,750,000, shares, \$25 par. Debentures, \$2,100,000 issued, at 7%; \$200,000 outstanding. Practically entire stock issue is owned by Amalgamated Copper Co. Dividends, to Dec. 31, 1907, were \$57,725,000. Dividend disbursements have been as follows: \$35 in 1901; \$6 in 1902; \$8 in 1903; \$68 in 1904; \$40 in 1905; \$48 in 1906; \$42 in 1907. Quarterly dividends, January, April and July, 1908, were \$3 each.

Lands, 483 acres, including working mines, idle properties partially developed, prospected claims and undeveloped mineral lands, also various part interests in sundry full and fractional claims in the Butte district. Miscellaneous lands include an extensive smelter-site, with valuable water rights, at Great Falls, and coal mines at Sand Coulee, 16 miles from Great Falls.

The ore bodies of the various mines are very extensive, and reserves of smelting grade ore alone were estimated, 1906, at about 3,000,000 tons, and probably were larger in 1908. The mine has some stopes of medium to high grade ore nearly 200' in width, and is opened several years ahead of any possible requirements. Production is approximately 15% smelting ore and 85% concentrating ore. The ores are notably rich in silver and gold; returning an average of 0.025 oz. silver, valued at 1½ cents, and ¼ cent in gold, for each pound of copper produced.

The Leonard, which is the principal mine of the Boston & Montana at present, has an old 1,129' shaft, which became badly drawn, circa 1905, and a new 4-compartment shaft of 1,400'. The Leonard has a very large vein, carrying exceptionally good gold values. Mine is timbered with 12x12" and 14x14" square sets, requiring monthly an average of about 1,000,000' of mine timber, board measure, as solid bulkheading is required in most stopes, owing to width of the vein. The mine has electric lights and bells, and steam and electric pumps. Some trouble was had on account of fire in 1907. Water from the Mountain View, East Colusa and West Colusa mines drains to the 1,200' level of the Leonard, and is forked thence by a Nordberg duplex station pump, with steam-end 20x40x42" and 42x7½" plungers; steam-end being fitted with Corliss valves and carrying a fly-wheel. The water-end was made by the company, and cast in the Silver Bow foundry, at Butte. Valves are of pot form, and the entire water-end is phosphor-bronze, columns being lined with wood, thoroughly soaked with oil and coated on the inside with hot tar, to withstand the corrosive action of the mine waters. There also are 2 Nordberg quintuplex pumps, of 600 gallons capacity each, on the 400' level. Surface plant at the Leonard is very complete, including a 152' steel headgear and 2,000-ton ore bins. The power plant has ten 250-h. p. boilers, and a 32x72" Nordberg hoist, good for 3,500' depth, hoisting cages with 10-ton skips swung under, with 1½" round cable. There also is a 12x14" Risdon sinking engine. Plant includes 3 air-compressors, of 3,000, 4,000 and 5,000 cubic feet capacity, respectively. The largest electrical transformer station in Montana is planned for the Leonard plant.

The Pennsylvania mine has a 400' shaft at the East Pennsylvania, and a

three-compartment 1,845' shaft at the West Pennsylvania. Some trouble was occasioned, 1907, at the West Pennsylvania, by gases coming from the St. Lawrence mine. The Pennsylvania is connected underground with the Mountain View, St. Lawrence and Silver Bow No. 1 mines. The property has extensive stopes above the 600' level, ore lying nearer surface than in most of the Butte mines. The Butte Coalition owns 38% and the Boston & Montana owns 62% of the Pennsylvania mine. Surface equipment includes 2,900-ton ore bins, a 19x48" Allis hoist, operating 2 double-deck cages, a 12x24" sinking engine and an Ingersoll-Sergeant air-compressor with 20x30" steam cylinders and 30x24 $\frac{1}{2}$ " air cylinders.

The Mountain View mine has a 1,851' three-compartment shaft, and a 1,000' air-shaft. There are 15 exits, mine being connected underground with the High Ore mine of the Anaconda, for drainage. The Mountain View shows 6 veins of 8' to 60' width, ore averaging about 5% in copper tenor, being second only to the North Butte in richness in the Butte camp. Equipment includes 4,500-ton ore bins, a hoist good for 3,000', a 12x14" Risdon sinking engine and an Allis air-compressor with 20x24" steam cylinders and 40x42" air cylinders.

The East Colusa mine has a 2-compartment 900' shaft, with 4 underground connections with other mines. It is planned deepening this shaft to 1,200'. Property shows a vein of about 65' width, assaying 3 to 4% copper, with streaks ranging up to 12% in copper tenor. Equipment includes a 16x32" Griffith & Wedge hoist.

The West Colusa mine has a 2-compartment 1,800' shaft. The West Colusa shows vein matter up to 400' in width, at one point, and is timbered with 10x10" and 12x12" square sets. Considerable trouble was had, 1908, by gases from the fire in the Minnie Healy mine. Surface equipment includes a 60' steel gallows-frame, a 20x60" Nordberg hoist operating 2 single-deck cages, and a 13x12" Iron Bay sinking engine.

The Badger State mine, lying northwest of and adjoining the North Butte, and carrying the extension of the Edith May vein, formerly produced a little good ore from shallow workings, and is opened by a 4-compartment 530' shaft, planned to be sunk 1,800'.

The Gambetta mine has 2 shafts, No. 1 being 300' and No. 2 being 200' in depth.

The Moose mine has a 400' shaft and is but slightly developed, having been idle for several years.

The Greenleaf mine has a 1,000' shaft, with hoist good for 2,500'. The property shows an 11' ore body, having a southerly dip, with several promising streaks of copper ore. Work was suspended circa July, 1908.

The Cimanche mine has been but slightly developed. There also are numerous other properties, on which more or less exploratory work has been done at various times.

The leaching plant, costing about \$20,000 and treating water from all the mines of the company, is much the largest and best planned in the district, including the usual launders and a building at the Leonhard mine for drying and shipping precipitates.

The works, at Great Falls, 171 miles from the mine, receive ore over the Great Northern railway, at a freight charge of \$1 per ton, high freights being offset by the advantage of water power obtainable at Great Falls. The works were opened 1891, with a capacity of 1,000 tons, increased, 1903 to 2,000 tons, and later to 4,000 tons. It is planned to increase the capacity to 5,000 tons daily.

The concentrator, second only in size to the monstrous Washoe plant of

the Anaconda, is in 6 sections, each a complete mill in itself, the 6 having a total capacity of 2,700 tons daily. The building, of wood, is equipped with six 10x20" and twelve 5x12" Blake crushers, 16 Huntington mills, 18 rolls, 317 sieves, 68 Harz jigs, 249 Evans jigs, 5 Overstrom tables, 42 Wilfley tables, 10 six-foot vanners and 50 four-foot vanners.

The smelter treats normally circa 400 tons daily of high grade ore, and the mill-product of 2,500 tons of concentrating ore. Equipment includes 22 McDougal calciners, five 500-ton water-jacket blast-furnaces, four 175-ton reverberatory furnaces, and a converter with 12 stands, having 84x170" shells, of the upright type. Product is blister copper of 99% tenor, including about 40 oz. silver and 0.25 oz. gold per ton.

A new smokestack, under construction, is the largest in the world, costing about \$200,000. The new stack is set on a foundation 38' deep and 97' in diameter, composed of 10,000 tons of concrete. The stack is of 500' height, 74' outside diameter at the base and 50' inside diameter at the top, weighing 16,600 tons. Material of stack is perforated segmental brick, slightly shaped to fit the curvature of the stack, equivalent in contents to 5,700,000 common brick. The stack has a sectional lining, and is capable of carrying about 4,000,000 cubic feet of gases per minute, its capacity being equal to any possible increase in the works. A new flue, connecting the smelter and stack, has a 175"x125" dust-chamber and a 1,450' flue-section 48' wide and 28' high.

The electrolytic plant has a capacity of 70 tons of refined copper cathodes daily, gold and silver slimes being redazed in a separate refinery. Equipment includes 3 furnaces for melting cathodes and for casting refined copper into wire-bars and cakes. A considerable portion of the blister copper from the smelter is sent for refining to the Baritea works, at Perth Amboy, N. J. Current for the electrolytic tanks is carried by solid overlapping slabs of copper.

Power for the concentrator, smelter and electrolytic works at Great Falls is taken from the Black Eagle Falls of the Missouri river, this having a 42' effective head and generating 8,700 h. p., except at the lowest stage of water. There also is a 3,000-h. p. auxiliary steam plant. The power plant was practically ruined, June, 1908, by floods that caused the failure of the north wall, and was put out of commission for some months, while rebuilding, closing down the entire works.

The extensive litigation, 1899-1906, between the Boston & Montana and the Heinze interests, was ended February, 1906, by the formation of the Butte Coalition Mining Co., and the slate has been wiped clear of litigation.

The Boston & Montana employs normally about 4,000 men, of whom approximately 2,500 are at the mines and 1,500 at the works.

Production of the Boston & Montana is approximately 90,000,000 lbs. fine copper yearly, though materially less in 1907, owing to suspension on account of the low price of copper in 1907. For the Montana tax year, ending June 1, 1907, production was 1,156,785 tons of ore, yielding gross proceeds of \$16,629,643, with net earnings of \$7,049,888, while for the tax year ending June 1, 1908, production was 967,685 tons of ore with gross proceeds of \$9,775,118 and net earnings of \$1,561,061. Average cost of Butte & Montana copper is 10 to 10.5 cents per pound, after deducting included gold and silver values. The ore mined gives average returns of a little better than 4% copper, and about \$1.60 per ton in combined gold and silver values. The property is one of the richest and largest copper mines in the world, and the management is excellent in all departments.

#### BOSTON-SIERRA MADRA MINE INDUSTRY CO.

WYOMING.

Office: 1118-59 Clark St., Chicago, Ills. Mine office: Slater, Routt Co., Google

**Colo. Amos Pettibone**, president; **Dr. Daniel Pease**, vice-president; **Lewis A. Pease**, secretary, treasurer and general manager. Organized December, 1900, under laws of Wyoming, with capitalization \$1,000,000, shares \$1 par. Annual meeting, second Wednesday in January. Lands, 2 claims, patented, area 40 acres, in the Three Forks district of Carbon county, Wyoming, carrying 2 fissure veins in andesite, opened by a 165' shaft and several pits of 10' to 25' and a 407' tunnel, with about 1,200' of workings, showing cuprite, chalcopyrite and argentiferous galena, in veins of 6" to 30' width, reported by company to carry small percentages in copper, about 15% lead, up to 60% zinc, 10 to 600 oz. silver, and from a trace to \$1,400 gold per ton. Has several buildings. Idle.

**BOSTON & TINTIC MINING CO.****UTAH.**

Office: Herald Bldg., Salt Lake City, Utah. Mine office: Mammoth, Juab Co., Utah. D. P. Rohlfing, chairman; C. E. Allen, vice president; Wm. H. Tibbals, Jr., secretary; Wm. H. Tibbals, treasurer. Organized 1899, under laws of Utah, with capitalization \$500,000, shares \$1 par; issued, \$472,000. Lands, 3 claims, patented, area 41 acres, in the Tintic district, showing 2 fissure veins in porphyry, of which 1, of 3' to 5' average width, traceable circa 2,000', has been opened by tunnels of 70', 120' and 40', and by a 240' shaft, showing ore assaying 1 to 3% copper, 20 to 55% lead, 45 to 255 oz. silver and 80 cents gold per ton. Idle since 1905.

**BRIDGE CREEK MINING CO.****WASHINGTON.**

Mine office: Keller, Ferry Co., Wash. E. H. Arthur, president; A. L. Braley, secretary and treasurer; B. H. Wells, superintendent. Lands, 100 acres, on Bridge Creek, near the Congress mine, 14 miles north of Keller, opened by a 240' tunnel, said to show ore assaying \$80 per ton in combined copper, gold and silver values.

**BOSTON & NEVADA COPPER CO.****NEVADA.**

Dead. Organized Aug. 15, 1904, under laws of Maine. Lands sold 1905, to Nevada Consolidated Copper Co. Formerly at Ely, White Pine Co., Nev.

**BOSTON & NEVADA MINING CO.****NEVADA.**

Dead. Property sold, 1906, to Nevada Copper Co. Formerly at Yerington, Lyon Co., Nev.

**BOSTON & NEW MEXICO COPPER CO.****NEW MEXICO.**

Office: 502 Colonial Bldg., Boston, Mass. John E. Kimball, president; Andrew Swanson, treasurer; C. J. Arthur, secretary and manager. Organized April, 1903, under laws of South Dakota with capitalization \$200,000. Lands, sundry mining claims in Socorro county, New Mexico. Is a mere stock-jobbing scheme.

**BOSTON & PIOCHE MINING & DEVELOPMENT CO.****NEVADA.**

Office: Boston, Mass. Mine office: Pioche, Lincoln Co., Nev. C. S. Miller, general manager. Land, 10 claims, lying to the eastward of the Nevada-Utah property, including the Fannie and Peavine mines, both small producers, in the past. Development is by shaft. Presumably idle.

**BOSTON & ST. MARY COPPER MINING CO.**

Dead. Formerly had an office at Great Falls, Mont.

**BOSTON-ST. PAUL CONSOLIDATED COPPER MINING CO.****WASHINGTON.**

Office: 712 St. Peter St., St. Paul, Minn. Letter returned unclaimed from former mine office, Index, Snohomish Co., Wash. Wm. M. Baker, president; Q. S. Derringer, secretary. Capitalization \$2,000,000, shares \$1 par. Lands, 8 claims, adjoining the Ethel. Idle for some years.

**BOSTON & SEATTLE MINING CO.****MONTANA.**

Office: care of C. R. Tuttle, secretary, Cleveland, Ohio. Mine office:

Elliston, Powell Co., Mont. A. J. Wheeler, president; Bobt. L. McKay, treasurer. Lands, 11 claims, 4 patented, circa 12 miles from Elliston; said to show large bodies of low-grade ore, which might be worked advantageously only with railroad facilities, now lacking. Idle.

**BOSTON & SEVEN DEVILS COPPER CO.**

IDAHO:

Dead. Formerly at Cuprum, Washington Co., Idaho. Described Vol. III.

**BOSTON & SILVERTON MINING & REDUCTION CO.**

COLORADO:

Office: 39 Court St., Boston, Mass. Mine office: Silverton, San Juan Co., Colo. A. A. Lamont, superintendent. Lands, in Illinois Gulch, shortly north of Silverton, show auriferous and argentiferous lead and copper ores. Has steam power and a 10-stamp mill. Claimed too much in its literature offering stock and presumably is idle.

**BOSTON TERRACE COPPER MINING CO.**

UTAH:

Office: 631-53 State St., Boston, Mass. H. T. Gerrish, treasurer. Organized under laws of Maine, with capitalization \$500,000, shares \$1 par, issued \$1,400,000. Lands, 11 claims, area 220 acres, in the Newfoundland district of Box Elder county, Utah; having about one-half mile of underground openings, including 10 shafts of 30' to 285' depth. Ores have assayed up to 27% copper, 18% lead, 86 oz. silver and \$1.20 gold per ton. Idle.

**BOSTON & TEXAS COPPER CO.**

TEXAS:

Office: 405 Tremont Bldg., Boston, Mass. Letter returned unclaimed from former mine office, Spalding, Archer Co., Texas. E. M. Low, president; Jas. M. Wheaton, secretary and treasurer. Organized 1898, under laws of Arizona, with capitalization \$2,500,000, shares \$10 par. Mortgaged for \$25,000 and desirous of selling lands. Long idle and apparently moribund.

**BOSTON & TEXAS COPPER MINING CO.**

TEXAS:

Dead. Was promoted, in 1898, by Chas. Demison, Hartford Trust Bldg., Hartford, Conn., who advertised it as another Calumet & Hecla.

**BOSTON & UTAH COPPER CO.**

UTAH:

Office: 508 Tremont Bldg., Boston, Mass. Mine office: Castleton, Grand Co., Utah. L. Auerbach, president. Lands, 40 claims, area circa 700 acres, in the La Sal district, showing a vein of 700' claimed width, traceable for more than 1 mile, claimed to have a 200' hanging-wall paystreak averaging 6 to 10% copper, with workable values in the balance of the ledge. These figures are gross overstatements. Mine has about a dozen openings, ranging from shallow pits to a 285' tunnel, all showing copper. A tunnel on the east side of the Copper Queen claim is said to show about 75' of ore of 3% copper tenor.

**BOSTON & WYOMING COPPER-GOLD CO.**

WYOMING:

Letter returned unclaimed from former office, Custer, S. D. Mine office: Wheatland, Laramie Co., Wyo. W. A. Nelson, president; John I. Hightower, vice-president and general manager; W. E. Benedict, secretary. Organized October, 1903, under laws of South Dakota, with capitalization \$2,000,000, shares \$1 par. Lands, 6 claims, area 120 acres, known as the Seldom Seen group, showing 3 fissure veins in granite-prophyry, giving assays of 5 to 7% copper, 6 oz. silver and \$3 gold per ton, from cuprite, chalcocite, bornite, and chalcopyrite, with sulphide ores predominating. Idle.

**BOSTON & WYOMING COPPER MINING CO.**

WYOMING:

Office: care of Col. Jas. A. Shinn, Leadville, Colo. Mine office: Tie Siding, Albany Co., Wyo. Organized January, 1903, with capitalization \$500,000. Has a 100' shaft, and at last accounts was developing in a small way, under bond and lease.

**BOULDER COPPER MINING CO.**

SOUTH DAKOTA:

Dead. Formerly at Custer, Custer Co., S. D. Described Vol. VII.

Digitized by Google

**BOULDER CREEK MINING CO.****IDAHO.**

Mine office: Mullan, Shoshone Co., Idaho. Lands are the Central group, about 1 mile from Mullan, having tunnels of 140' and 400', showing ore giving assays of 10 to 15% lead, with small copper and silver values. Property considered promising.

**BOULDER MINING CO.****BRITISH COLUMBIA.**

Office: Oshkosh, Wis. Lands are gold-copper claims in British Columbia. Presumably idle.

**BOUNDARY FALLS Smelter.****BRITISH COLUMBIA.**

Owned by Dominion Copper Co., Ltd.

**SOCIÉTÉ DES MINES DU BOU-THALEB.****ALGERIA.**

Office: 27 Rue Lafitte, Paris, France. Mine office: Bovigny, Alger, Algeria. Jules de Catelin, manager. Lands, 394 hectares, carrying copper, lead and zinc sulphides.

**BOX CANYON MINING CO.****ARIZONA.**

Dead. Organized, 1906, by John Fredericks and others, to develop a mine and build a 5-stamp mill on a property in Tombstone Cañon, near the Modern mine. Formerly at Bisbee, Cochise Co., Ariz.

**BOZEMAN COPPER CO.****MONTANA.**

Office: Bozeman, Mont. Organized August, 1904, with capitalization \$100,000. No traces of any operations.

**BRADEN COPPER CO.****CHILE.**

Office: 71 Broadway, New York, N. Y. Mine office: La Junta, Rancagua, O'Higgins, Chile. Barton Sewall, president; Wm. Braden, general manager; W. N. Burk, mine manager; E. K. McCann, superintendent; B. L. Lloyd, metallurgist. Organized June 24, 1904, under laws of Maine, with capitalization \$3,000,000, and name changed, August 9, 1904, to present title. Company is protocalized in Chile.

Lands, 15 claims, area 264 acres, located about 40 miles east of Rancagua, nearest seaport being Valparaiso, 200 miles distant by rail. Property includes El Teniente, an antigua, in the Cordillera de Graneras, also the extensions of El Teniente and the Capitana mines.

The ore body is unique, a volcanic vent of about 3 miles circumference being filled with tuff and surrounded by highly fractured diorite, the fracture being mineralized around the circumference. While the mineralization extends for a distance of about 1,000' around the 3-mile circle, the commercial ore bodies in diorite are found within about 100' of the contact, as a rule. The dioritic zone has been fractured by porphyry dykes, which occasionally cut into the tuff. The zone of oxidation is shallow, ranging from a few feet to 150' in depth. The fractures in the rock range from a mere film of sulphide up to 3" to 4" of mixed bornite and chalcopyrite, principally the latter.

The Teniente, which is the principal mine, as developed, was worked by the Spaniards before the independence of Chile, and is said to have produced about 50,000 tons of ore of 30 to 50% average copper tenor. El Teniente is developed at the point of contact of porphyry dykes and tuffs, having a gangue of tuff and porphyry breccia seamed with native copper, cuprite, azurite, malachite and tetrahedrite, latter predominating. The breccia of porphyry and tuff has been claimed to somewhat resemble the Calumet conglomerate of the Calumet & Hecla, and both porphyry and tuff are slightly mineralized for a considerable distance along the contact line.

The Fortuna mine was gophered extensively by former owners for high grade ore, which was followed and extracted wherever found. The ore averages lower in grade than in the Teniente, underground workings showing copper sulphides and occasional metallic copper throughout the seams in diorite

and brecciated contact material, for a depth of about 2,000'. No. 1 tunnel shows an extreme width of about 250' of ore, giving an average assay of 3.71% copper. No. 2 tunnel shows an even larger ore body, and No. 3 is estimated to show more ore than No. 2. The Fortuna mine also is estimated to have 4,000,000 tons of ore developed, ranging in copper tenor from 3 to 4%.

The Capitana mine, in the Cañon Diablo, on the opposite side of the mountain to the Fortuna, has been developed through the Fortuna tunnels, at considerable depth, and shows 15% ore in surface workings. El Soldado mine, practically undeveloped, has promising ore outcrops.

The plan of mining used calls for the extensive use of opencuts, ore being milled down to the tunnel level, this system of extraction requiring little timber.

A 1,000-h. p. hydro-electric plant is fed by water brought by a flume and pipe-line, and the cost of power for the first year of operation was under \$2 per h. p. year, not including interest and depreciation.

The property has a good equipment of mine buildings and necessary machinery, the plan of mining followed not requiring heavy hoists. A 30-mile wagon road, costing about \$175,000, was complete November, 1905, and over this about 4,000 tons of machinery and supplies were hauled in, as many as 2,500 draft oxen being used. A railroad line is under construction to the port of San Antonio, 150 miles from the mines, of which 40 miles, from Rancagua to La Junta, is being built by the company. This line, of 32" gauge, costing about \$400,000, will give reasonably cheap freight rates on supplies and copper output.

Ore is transported from mines to mill by 3 Biblet aerial trams. The main line, 2,000 meters, runs from the mill to the central transfer station, where connection is had with a 1,000-meter line to El Teniente mine and a 569-meter line to La Fortuna mine. The tramways are of 1,000 tons aggregate daily capacity.

The 250-ton mill, planned as the first unit of a 500-ton mill, which went into commission June, 1906, is thoroughly modern in design and equipment, having Hartz jigs, Overstrom and Wilfley tables, Frue classifiers and Wilfley classifiers, and using the Sherman system for settling slimes. The mill puts about 10 into 1, treating ore averaging 3.5% copper and securing an average extraction of about 70%, producing concentrates averaging about 25% in copper tenor. The company plans eventually treating 1,000 tons of ore daily, and producing 12,000,000 to 15,000,000 lbs. fine copper yearly. Production, 1907, was about 3,500 tons of concentrates, equivalent to 1,750,000 lbs. fine copper. The company plans to produce copper for about 6 cents per pound, but will do well if it can produce at an average price of 8 to 9 cents per pound. The property is one of exceptional promise and is under good management.

#### **BRADLEY MINING & MILLING CO.**

#### **WYOMING.**

Mine office: Centennial, Albany Co., Wyo. Lands, sundry claims on Michigan Hill, near Centennial, developed by a tunnel being driven to reach a 4" vein of auriferous copper ore, claimed to carry average values of \$35 per ton.

#### **BRADFORD COPPER MINING CO.**

#### **ARIZONA.**

Mine office: Patagonia, Santa Cruz Co., Ariz. Idle.

Office: 219 Germania Bldg., Milwaukee, Wis. Letter returned unclaimed from former mine office, Butte, Silver Bow Co., Mont. G. R. Nickey, president and general manager; G. R. Best, secretary and treasurer. Organized Sept. 25, 1892, under laws of Wisconsin; capitalization increased, Mar. 2, 1898, to \$350,000, shares \$1 par. Has paid dividends of \$42,000. Lands, one patented claim, area 13 acres, showing 6 veins, of which 3 parallel veins, of 3' to 30' width, are developed by shafts of 100', 150' and 400', with circa 1,000' of underground openings, showing ore claimed to give average values of about \$35 per ton, mainly in silver. Idle and presumably moribund.

**BRITANNIA SMELTING CO., LTD.****BRITISH COLUMBIA.**

Office: 31 Davis Chambers, Vancouver, B. C. Mine office: Howe Sound, New Westminster district, B. C. Works office: Crofton, Vancouver Island, B. C. Hon. Edgar E. Dewdney, president; Mason T. Adams, vice-president and managing director; J. W. Lee, secretary and treasurer; preceding officers, D. G. Marshall and C. B. McNeill, directors; R. H. Leach, superintendent Britannia mine; W. C. Freeburn, superintendent Mount Andrew mine; S. S. Raymond, smelter superintendent; H. C. Bellinger, consulting engineer; L. E. Gooding, metallurgist; W. H. Yost, master mechanic.

Organized 1905, under laws of British Columbia, with capitalization \$625,000, shares \$25 par, later increased to \$2,500,000, shares \$25 par; issued, \$2,207,000. Acquired, 1908, property of the Britannia Copper Syndicate, Ltd. Annual meeting, first Tuesday in March.

Property includes the Britannia mine, at Howe Sound, owned outright, and the Mount Andrew mine, at Ketchikan, Alaska, held under lease, a 49-acre smelter site and 3 townships.

The Britannia mine, 7 claims, crown-granted, area 297 acres, lies on Britannia Mountain, 4 miles from and about 3,500' above the sea, carrying approximately 8,500' of the strike of a mammoth mineral zone, ore-body consisting of mineralized schist in lenses and large irregular bodies, ranging 300' to 600' in width, the schistose siliceous material being impregnated with copper and iron pyrites. Considerable diamond drilling was done, 1907. There are 8 known ore bodies, of which 3, developed, carry an average of about 2.5% copper, 0.04 oz. silver and 50 to 80 cents gold per ton. Climate is favorable, and owing to immense width of the ore body, mine can be worked open-cast for many years. Development is by large glory-holes, and by tunnels of 300', 300', 200', 1,000', 1,500' and 300', with about 8,000' of workings, estimated to show 2,000,000 tons of ore, with about 500,000 tons blocked out for stoping. Principal tunnels are the Big Bluff and Jane, latter, which is the main oper-

ing tunnel, having a 600' trestle with 10-ton self-dumping cars and an automatic incline railroad. The Big Bluff tunnel has a 640' trestle with 10-ton self-dumping cars, and a gasoline locomotive. At the mine are Blake crushers that pass crushed ore to a sorting-belt, thence to a 1,000-ton receiving bin, whence ore is taken by a 16,900' aerial tram in 2 sections, the upper of 5,800' and the lower of 11,100', with an intermediate transfer station. The tram is rated at about 300 tons daily capacity, but has given some trouble in operation. The upper section has a drop of 1,400' and the lower a drop of 1,800'.

Equipment includes 300 h. p. in steam, 400 h. p. in water and 500 h. p. in electric energy. A 35-drill Rand air-compressor, at the beach, sends air to the mine through an 18" pipe line. There is a 3-mile transmission line, with two 300-kw., 6,600-volt generators, driving the machinery plant at the mine, actuated by a Pelton water wheel, located at the beach, which receives water from a creek under an effective head of about 1,900'. At the beach there is a 250' wharf with a 90' wing for receipt of mine supplies and shipment of concentrates.

The 300-ton concentrator, 125x133' in size, of wood, has 2 Blake crushers, 3 Chilean mills, 4 rolls, 34 Harz jigs, 1 Hancock jig, 2 Cammett concentrators, 11 Wilfley tables, 11 Overstrom tables, 10 Johnson vanners and 22 Frue vanners. Mill was remodeled, 1907, changing its method from fine to coarse crushing, some trouble having been experienced in concentration under the fine crushing system. Buildings include a 40x80' wooden machine-shop, saw-mill, school and store, with about 50 dwellings and miscellaneous buildings.

The Mount Andrew mine, operated under lease, is separately described.

The smelter, built 1902, by the Southwestern Smelting & Refining Co., is located on the eastern coast of Vancouver Island, about 50 miles from Victoria, with which there is rail and water connection, and receives ore by water from the Britannia mine, 60 miles distant, the works being well located for the receipt and treatment of coast and Alaskan ores. Ore is received from the Britannia in railway cars, loaded on barges, at a 750' wharf having 21' of clear water, and cars are hauled up incline trestles to six 300-ton receiving bins. There also are eight 300-ton storage-bins, with room for additional bins, all bins having automatic discharge gates.

The sampling mill, 28x32' on the ground and 84' high, has two 10x20" Blake crushers, 1 pair of Davis 12x13" crushing rolls, Constand automatic sampler and a Coolidge sampler, with a 45-h. p. engine.

The furnace building, 45x75', has two 250-ton water-jacket blast-furnaces. The dust-flue is 10x12x200', with a 24x40' dust-chamber, connecting with a circular brick stack 12' in diameter and 120' high, on a concrete base. Slag is granulated and dumped by bucket elevator.

The converter building, 65x73', has 1 hydraulic stand and four 84x126" shells, of trough type. Molten matte runs from settlers to converters in a launder, and converter fumes pass through a steel flue into a dust-chamber having water sprays. The converter department has a silica mill, with pneumatic tamper run by a small air-compressor. Product is a blister copper of 99.5% tenor, carrying 12 oz. silver and 2 oz. gold per ton, sent to the United States refinery at Chrome, N. J., for electrolytic treatment.

The briquetting plant is housed in a 35x73' building with 78x104' dryshed. Equipment includes a No. 7 Chambers briquetting machine and 2 Scott elevating brick-cars, with steam coils in the loft of the dry-shed. Briquettes are roasted with raw ore.

The power building is 50x60', with blower-room 40x50', and boiler-house 40x48', housing three 140-h. p. boilers. The power plant has a 110-kw. West-

inghouse current generator, air-compressor for convertor blast, and Nos. 5 and 8 Connerville blowers, connected with a 54" blast-pipe, leading to the furnace, blowers having a united capacity of 9,000 cubic feet of free air per minute.

Smelter fuel is coal and coke, amounting to about 6,000 tons of coal and 10,000 tons of coke yearly. Owing to local shortage, 1907, some coke was imported from New Zealand. The smelter does practically no custom business.

Miscellaneous buildings include a well constructed office, assay offices and a small but complete machine-shop. The smelter plant is lighted throughout by electricity.

The company employs, normally, about 300 men, but operations were suspended October, 1907, owing to the low price of copper, coupled with necessity of reconstructing the concentrator. The mill was started, on a test run, June, 1908. Production, 1906, was 4,409,650 lbs. fine copper, 38,265 oz. silver and 5,261 oz. gold. In 1907 about 65,922 tons of ore were treated, yielding 3,011,410 lbs. fine copper, of which the Britannia mine furnished 1,706,734 lbs. The Britannia has been very thoroughly developed and equipped, but to date has proven somewhat disappointing. The management is good, however, and with changes made in the milling system, should obtain better results in the future than have been secured in the past.

#### **BRITANNIA WEST COPPER CO., LTD.**

#### **BRITISH COLUMBIA.**

Mine office: Howe Sound, New Westminster district, B. C. Thos. Gibson, mine manager. Organized 1906. Is said to have paid \$250,000 for lands, which are on Howe Sound, opposite the Britannia, and were known formerly as the Mallory or Tweatieth Century group. Lands have an available water power. Nothing heard of company since shortly after organization, and presumably moribund.

#### **BRITISH AMERICAN COPPER MINES & SMELTER CO.**

#### **BRITISH COLUMBIA.**

Office: Williamson Bldg., Cleveland, Ohio. Chas. H. Tucker, president; J. C. Kernohan, vice-president; C. H. Taylor, treasurer; Thos. G. Selleck, secretary; Francis J. Peck, consulting engineer. Organized Aug. 15, 1906, with capitalization \$5,000,000, shares \$1 par. Lands, 10 claims, area circa 500 acres, held by location, on Warren Creek, a tributary of Wells Creek, which is a tributary of the Similkameen river, which is a tributary of the Columbia river. Lands are 43 miles from Golden and 10 miles from Wells Landing, and instead of neighboring the Granby, as advertised, are distant about 300 miles, in an air-line, from the Granby. Lands, well watered and timbered, are in a very rugged country, showing strong outcrops. Company claimed, in its advertisements to have a 16' vein, and to have "contracted for" 1,000' of tunnel, which would "block out ready for mining," \$10,575,000 worth of high grade copper ore, which, of course, is a downright lie. Company claims to have a practically inexhaustible body of ore assaying 7% copper, "at a conservative figure," which happens to be an exceedingly reckless figure. Mr. Kernohan, the promoter, stated, 1907, that he had examined this property, and reported that "2 tunnels, one 750' and one 250', with shaft connecting, block out \$10,000,000 worth of ore, if half the values continue in the 16' vein." There being no evidences of either tunnels or shaft, this statement carries its own refutation. The company's advertising and literature state that a 10-mile wagon road will give an outlet to the Kootenai Central Railroad, but unfortunately the Kootenai Central has not yet materialized beyond the point of 10 miles of grading, and there is no railroad within 100 miles of the company's mines, neither is there wagon road or river transportation, and the total copper production of the entire district was valued at \$1,654 in 1905. Statements of the company in its advertising that this is the richest copper district

in the world, and that the mine would begin shipping ore at once, were deliberate and intentional lies. The company must be regarded as a swindle.

**BRITISH AMERICAN GOLD & COPPER MINING CO. SOUTH DAKOTA.**

Office: 70 Grand River Ave., Detroit, Mich. Letter returned unclaimed from former mine office, Deadwood, Lawrence Co., S. D.

Dead. Property was the B. C. mine, now owned by British Columbia Copper Co., Ltd. Formerly at Summit, Boundary district, B. C. Described Vol. VI.

**BRITISH COLUMBIA COPPER BRITISH COLUMBIA & WASHINGTON CO., LTD.**

Office: 814-31 Nassau St., New York, N. Y. Mine and works office: Greenwood, Boundary district, B. C. Newman Erb, president; F. L. Sommer, vice-president; preceding officers, F. L. Underwood, Copley Amory, Anthony N. Brady, Colgate Hoyt, Edwin Hawley, C. E. Laidlaw, Josiah C. Reiff and C. A. Starbuck, directors; R. H. Eggleston, secretary and treasurer; J. E. McAllister, general manager; Frederick Keffer, engineer; M. D. McIntosh, P. W. Lover and H. Johns, mine superintendents; W. C. N. Wilson, cashier.

Organized March, 1898, under laws of West Virginia, with capitalization \$2,000,000, increased, 1907, to \$3,000,000, shares \$5 par; issued, \$2,515,000. Paid first dividend, 40 cents per share, \$201,200, Sept. 4, 1907. Company has about 1,375 shareholders. Annual meeting, second Tuesday in February. New York Trust Co., registrar and transfer agent. Metropolitan Audit Co., auditor.

Lands are extensive, including various mining groups in the Boundary district of British Columbia, and in the adjoining state of Washington, also a 60-acre millsite. The principal mines are the Motherlode and adjoining properties, in the Deadwood camp, which have large and strong ore bodies that are slightly lower in average grade than the Granby. The mines use about 1,800 h. p., mainly electrical.

The Motherlode group, area 180 acres, has 5 ore bodies, of which 3 are developed, occurring as contact deposits between limestone and eruptive dykes. Ore is exclusively auriferous and argentiferous chalcopyrite, occurring with silicious and calcareous gangue, or in magnetite. The ore bodies are irregular in occurrence, the main vein ranging 80' to 150' in width, and is proven, by surface trenching and natural exposure, for a length of 1,800'. Ore assays about 1.5% copper, 0.2 to 0.5 oz. silver and \$1 to \$2 gold per ton. Underground workings are about 3 miles, disclosing at least 3,000,000 tons of ore, with about 1,000,000 tons blocked out for stoping. Development is by a 475' four-compartment shaft, with 3 tunnels, latter connected with surface by 6 upraises, of 200' average height, these reaching quarries on surface, ore being milled through the upraises to tram-cars in the tunnels. Main tunnel has double tracks, equipped with 3-ton tram cars. At the portal of the tunnel there are 24x36" and 36x42" Farrel crushers. Equipment at the Motherlode includes a 500-h. p. steam plant, but electric power is used mainly throughout the mine and on surface. Machinery includes two 35-drill Rand-Corliss duplex tandem air-compressors, driven by a 500-h. p. Canadian General Electric motor.

Buildings at the Motherlode include a 30x50' carpenter-shop, 30x70' machine-shop, 17 other mine buildings and 20 dwellings for employees.

No. 7 mine, adjoining the Motherlode, has a continuation of the latter's ore-body, with a 300' main shaft and about a mile of workings.

The Oro Denoro mine, 4 claims, area 180 acres, bought June, 1906, adjoins the Emma and British Columbia mines, showing 3 ore bodies, of 20' to 120' width, carrying auriferous and argentiferous chalcopyrite, associated with pyrite, with silicious and calcareous gangue, being valuable for fluxing, owing to excess of both iron and lime. New ore bodies were proven, 1907, by diamond drill borings. Mine has a 190' shaft and 3 tunnels, but is worked largely open-cast.

The British Columbia mine, about a mile from the Emma, held formerly by the British Columbia Chartered Co., consists of 11 claims, 3 fractional, developed by about 2 miles of workings, showing argentiferous and slightly auriferous chalcopyrite, similar to the ore of the Oro Denoro and Emma. Equipment includes a 225-h. p. steam plant, with 4-drill Rand and 5-drill Ingersoll-Sergeant air-compressors.

The Emma mine, adjoining the British Columbia and Oro Denoro, is owned three-fourths by the British Columbia Copper Co., Ltd. and one-fourth by the Hall Mining & Smelting Co., but is operated by the British Columbia. The incline shaft is 252' deep, ore being much the same as at the Oro Denoro. Electric power has been substituted for steam, equipment including a 200-h. p. Westinghouse motor, 8x10" Lidgerwood hoist and a 1,400' Rand air-compressor.

The Sunset group, at Princeton, B. C., on Copper Mountain, in the Similkameen district, has low grade copper ore, high in silica and low in iron.

The Napoleon mine, in the Pierre Lake district, near Marcus, Stevens Co., Wash., consists of 46 claims, bought for \$60,000. Ores are low in copper tenor, but carry good gold values. Property has a rock-crusher and aerial tram, and installation of a cyanide plant, to treat gold ores, is under consideration.

The Lone Star mine, also in Washington, shipped, 1907, circa 1,500 tons of high grade copper ore, secured from development, and is considered a promising property.

The Apex group of 11 claims, and the Gloucester group of 8 claims, in the vicinity of Chesser, Okanogan Co., Wash., are in the development stage.

The smelter, at Greenwood, 5 miles from the Motherlode mines, receiving ore therefrom over the Canadian Pacific railway, does a general custom business. Motive power is electric energy, taken from Bonnington Falls, normal requirements being circa 1,600 h. p. All buildings are of steel, and the plant, remodeled, 1907, is of about 2,000 tons daily capacity.

The bins at the works have capacity for 12,000 tons of ore and 2,000 tons of coke. A 600-ton sampling mill, 65x79' and 3 stories high, has a custom-ore bin, connected with the sampler ore bins by a belt-conveyor.

The blast furnace building has 3 new 700-ton blast-furnaces, each 48x240" at the tuyeres. A 12x14x620' dust-flue leads to a 121' stack. There are five 15-ton Baldwin-Westinghouse electric locomotives, 3 for charging and miscellaneous purposes and 2 for the slag line, latter having 25-ton side-dumping ladle-cars, each with an electric motor having a worm gear for tilting and dumping, operated from the locomotive.

The converter building, 45x90', of steel, adjoining the blast furnace building, has 2 stands, with 84x126" horizontal shells, taking matte of 15 to 55% copper tenor, and producing blister copper of 99.3% tenor, carrying 20 to 50 oz. silver and 10 to 25 oz. gold per ton, sent to the United States Metals Refining Co., at Chrome, N. J., for electrolysis. Stands are tilted by hydraulic

accumulators, and shells are handled by a 40-ton 4-motor traveling crane. The converter department has a 72" silica-mill for linings.

The power-house, 40x81', has three 100-h. p. boilers and a 150-h. p. Reynolds-Corliass engine, held in reserve for emergencies, electric power being used throughout the works. Equipment includes three 300' Connerville blowers, each belted to a 300-h. p. induction motor. There also is a Nordberg air-compressor, operated by a 300-h. p. induction motor.

The works have a briquetting plant handling fine dust. Smelting fuel is coke, costing \$6.50 per ton, consumption being circa 90,000 tons yearly.

The works include a machine-shop and several other buildings. The plant is protected by a complete water system, having hydrants at frequent intervals. About 600 men are employed at the mines and works.

The company's balance sheet of November 30, 1907, showed cash and accounts receivable, \$338,645.87, with current liabilities of \$268,844.40. Production, 1905, was 5,601,809 lbs. fine copper, 95,410 oz. silver and 26,226 oz. gold; production, 1906, was 5,820,651 lbs. fine copper, 82,193 oz. silver and 20,238 oz. gold, while for 1907 production was 5,519,502 lbs. fine copper, secured from 242,788 tons of ore smelted, of which the Emma mine produced 18,374 tons, the Oro Denoro 14,480 tons, and the British Columbia 1,712 tons. Ores are slightly lower in average grade than those of the Granby, returning from the smelter an average of 21 lbs. copper and \$1.25 per ton in combined gold and silver values. Smelter costs, 1907, were \$1.18 per ton. For fiscal year ending Nov. 30, 1907, costs were about 18 cents per pound for fine copper, but should be much smaller on the larger tonnage since secured, and for June, 1908, costs were said to have been only 9.79 cents per pound. The mine has an immense tonnage of assured ore, and while the ore is low in average tenor, it can be milled and smelted at unusually low costs. The management is good, and the property has been carefully developed, to the present point of assured productive capacity, with excellent prospects for the future.

#### **BRITISH COLUMBIA EXPLORATION, LTD. BRITISH COLUMBIA.**

**BROMIDE COPPER CO.**

NEW MEXICO.

Dead. Formerly at Tusas, Rio Arriba Co., N. M.

**BROMIDE COPPER & GOLD MINING CO.**

NEW MEXICO.

Dead. Lost lands circa 1904. Foundry at Tusas, Rio Arriba Co., N. M.

**BROMIDE COPPER MINING CO.**

NEW MEXICO.

Office: Bloomsburg, Pa. Mine offices: Tusas, Rio Arriba Co., N. M. Lands, 42 claims, including the Pay Roll mine, opened to depth of 250', showing auriferous copper sulphides of good average tenor.

**COMPANIA ESPLORADORA LOS BRONCES.**

CHILE.

Mine office: Los Condes, Santiago, Chile. Has a long tunnel, driven in connection with Francisco de P. Perez. Ore is shipped to the Maitenes smelter for reduction. Production, 1903, was circa 400,000 pounds fine copper.

**SOCIEDAD MINERA DE LOS BRONCES.**

CHILE.

Office and mine: La Serena, Coquimbo, Chile. Organized Apr. 12, 1902, under laws of Chile, with capitalization 60,000 pesos, shares 250 pesos par. Presumably idle.

**BROOKLYN-ARIZONA COPPER CO.**

ARIZONA.

Office: 2 Kilby St., Boston, Mass. Mine office: Mayer, Yavapai Co., Ariz. Dr. S. P. Smith, president; Calvin Cruchet, secretary; F. E. Small, treasurer. Organized under laws of Maine, with capitalization \$2,500,000, shares \$25 par. Was promoted by the American Securities Co., of which Small is also treasurer. Lands, 14 claims, known as the Brooklyn group, in the Squaw district, circa 20 miles east of Mayer, opened by a 70' three-compartment shaft, said to show ore assaying 10% copper, 12 oz. silver and \$9.50 gold per ton. Mine is claimed to have \$5,000,000 worth of ore in sight, which is not credited. Has a 12-drill air-compressor. Property considered promising.

**BROOKLYN COPPER & GOLD MINING CO.**

WASHINGTON.

Dead. Formerly claimed lands in the Colville Reserve, Stevens Co., Wash.

**BROOKLYN MINING CO.**

CALIFORNIA.

Mine office: Dale, San Bernardino Co., Cal. H. H. Ames, superintendent. Ores carry gold and copper. Has gasoline power and a 8-stamp mill. Idle. **BROOKLYN MINING CO.**

COLORADO.

Mine office: Silverton, San Juan Co., Colo. Ores carry gold, silver and copper. Has steam power and a 10-stamp mill. Presumably idle.

**BROOKLYN MINING CO.**

NEVADA.

Mine office: Contact, Elko Co., Nev. Has gasoline power. Long idle.

**BROOKS CONSOLIDATED COPPER CO.**

MEXICO.

Office: Bisbee, Ariz. Mine office: Fronteras, Arizpe, Sonora, Mex. Clinton W. Moon, president; G. O. Schaecker, secretary and treasurer; George Motz, superintendent. Organized Jan. 25, 1906, under laws of Arizona, with capitalization \$1,000,000, shares \$1. par, as a reconstruction of the Cochise Prospecting, Mining & Development Co. Lands, 3 groups, area 620 acres, in the Tordillo district of the Ajo Mountains, 40 miles northeast of La Cananea. Development is by open-cuts, pits, and a 45' tunnel, showing oxide, carbonate and sulphide ores, latter predominating, ores being estimated to average 8.75%

copper, 4% zinc, 12 oz. silver and \$5 gold per ton. Vein is very strong, ranging 50' to 60' in width, and traceable 1½ miles. Property is considered promising.

**BROOKSHIRE MINING CO.**

**ARIZONA**

Mine office: Mayer, Yavapai Co., Ariz. Organized January, 1900, under laws of West Virginia, with capitalization \$100,000. Is controlled through ownership of 80% of stock, by the George A. Treadwell Mining Co., a notorious swindle. Mine, 4 miles south of Jerome, has been idle since 1905.

**BROUGHTON COPPER CO., LTD.**

**ENGLAND**

Works office: Widnes, Lancashire, Eng. Property is a copper reduction plant.

**BROWHEAD COPPER MINES.**

**IRELAND**

Office: 7 Tower Bldgs. North, Water St., Liverpool, Eng. R. Shacklady, liquidator. Was organized June 30, 1906, under laws of Great Britain, with capitalization £65,000, shares £1 par, to take over a mining property known as the Crookhaven Estate, area 3,135 acres, situated in the northern part of County Cork, Ireland, but did not buy the property, and on September 7, 1906, resolved to liquidate voluntarily.

**BROWN-ALASKA COPPER CO.**

**ALASKA & BRITISH COLUMBIA**

Office: 1201 Alaska Bldg., Seattle, Wash. Mine offices: Coppermount, Prince of Wales Island, Alaska, and Port Simpson, Skeena division, B. C. G. D. Mumford, president; Maurice D. Leehey, secretary; N. O. Lawton, manager Mamie mine; Arthur A. Wakefield, manager Maple Bay mine. Capitalization \$1,000,000, shares \$1 par.

The Mamie mine, at Coppermount, has an ore body of about 40' width, said to give average assays of 6% copper and \$1 per ton in combined gold and silver values. Ore is chiefly chalcopyrite, associated with pyrite and pyrrhotite, occurring in lenticular bodies connected by thin seams. Early 1907 the Mamie was shipping circa 1,500 tons monthly.

The Maple Bay group, 14 claims, partly fractional, northeast of Maple Bay, in the Portland Canal district, includes the Maple Bay or Outsiders mine, Blue Bell, Regina and Copper Queen mines. The Regina and Copper Queen, opened by 3 tunnels, longest 300', show a vein of 5' to 14' width, carrying disseminated chalcopyrite averaging about 3% copper. Production of the Maple Bay group, 1906, was 293,269 lbs. fine copper, and the group was said, March, 1907, to be shipping, circa 2,200 tons monthly.

Normal forces are about 40 men at the Mamie and 60 men at the Maple Bay, ore going to the Alaska Smelting & Refining Co., commonly known as the Brown-Alaska smelter.

**BROWN-ALASKA SMELTER.**

**ALASKA**

Owned by Alaska Smelting & Refining Co.

**BRUCE & CHESSOR MINING CO.**

**BOLIVIA**

Mine office: Oruro, Bolivia. Has steam power and employed about 100 men at last accounts, producing native copper from conglomerate strata.

**BRUCE COPPER MINES, LTD.**

**ONTARIO**

Dead. Voluntarily liquidated May, 1908. Lands are now held by Copper Mining & Smelting Co. of Ontario, Ltd. Formerly at Bruce Mines, Algoma, Ont.

**BRUCE MINING CO.**

**IDAHO**

Mine office: Junction, Lemhi Co., Idaho. A. T. Bruce, general manager, at last accounts. Has copper-gold ores, opened by tunnel. Presumably idle.

**BRUGER y CA.**

**BOLIVIA**

Office and mine: Toledo, La Paz, Bolivia. Has steam power and firm is a small copper producer.

**BRUNSWICK MINING & MILLING CO., COLORADO.**

Mine office: Tin Cap, Gunnison Co., Colo. A. Lejane, superintendent. Property is the Jimmy Mack mine, producing gold, silver and copper. Has steam power and a 100-ton concentrator. Employs circa 20 men.

**BUSTAD MINES, LTD., NORWAY.**

Office: 62 London Wall, London, E. C., Eng. Mine office: Eidsvold, Hedemarken, Norway. G. T. Broadbridge, secretary. Organized Feb. 11, 1905, under laws of Guernsey, as a second reconstruction of Golden Mint Mines, Ltd., with capitalization £120,000, shares £1 par. Mine, 8 miles east of Lake Mjosen and 50 miles north of Christiania, was first worked very early in the Nineteenth Century. Development is by tunnel, showing a vein of 30' width, carrying copper and gold values. Has a mill with 15 stamps, 3 True vanners, Wilfley tables and an Elmore concentrating plant. Mine evidently has made some considerable production in the past, as evidenced by large slag-piles.

**BUCHANAN COPPER MINES, LTD., AUSTRALIA.**

Mine office: Mungana, Queensland, Australia. Lands, sundry claims at Welcome Creek, circa 15 miles west of Mungana. Presumably idle.

**BUCHANAN MINE, CALIFORNIA.**

Office and mine: care of G. A. Pherson, owner, Daulton, Madera Co., Cal. Lands, sundry claims, 5 miles northeast of Daulton, near the Green Mountain mine, opened by shafts and tunnels. Property shows diabase and amphibolite schist, both mineralized. Ores are oxidized near surface and unaltered sulphides at depth. Shipments made by lessees averaged about 15% copper and \$3. gold per ton. Idle for some years.

**BUCKEYE & CALUMET-ARIZONA MINING CO., ARIZONA.**

Mine office: Red Rock, Pinal Co., Ariz. Organized circa April, 1906, to operate in the Owl Head district. Presumably idle.

**BUCKEYE CONSOLIDATED GOLD & COPPER MINING CO., NEW MEXICO.**

Dead. Formerly at Socorro, Socorro Co., N. M.

**BUCKEYE COPPER CO., WASHINGTON.**

Office: 318 American Trust Bldg., Cleveland, Ohio. Letter returned unclaimed from former mine office, Index, Snohomish Co., Wash. Organized under laws of Washington. Lands, 3 claims, 5 miles southeast of Index, formerly held by Index-Independent Mining Co., showing a vein of 4' to 12' width, carrying a 15" to 18" pay-streak of massive chalcocite, balance of vein carrying bornite and chalcopyrite with quartz gangue. Has tunnels of about 500' and 1,000', and has shipped several carloads of ore giving returns of about 50% copper. Idle.

**BUCKEYE COPPER MINING CO., IDAHO.**

Office and mine: care of S. P. Fairweather, Wallace, Shoshone Co., Idaho. Organized circa July, 1907, with capitalization \$375,000, shares 25 cents par. Lands, 9 claims, adjoining the Bullion property, near the Montana line.

**BUCKEYE MINING & SMELTING CO., OREGON.**

Office: care of W. H. Ramsey, vice-president, Grants Pass, Ore. Mine office, Galice, Josephine Co., Ore. J. M. James, president; W. P. McCoy, general manager. Organized under laws of Pennsylvania. Property is the Buckeye mine, opened by two tunnels, showing ore assaying up to 20% copper and \$5 to \$20 gold per ton. Company planned building a 100-ton smelter, but it did not materialize.

**BUCKHORN GOLD & COPPER MINING CO., BRITISH COLUMBIA.**

Dead. Formerly at Greenwood, Boundary district, B. C.

**BUCKSKIN MOUNTAIN COPPER CO., ARIZONA.**

Mine office: Ryan, Coconino Co., Ariz. Lands, 33 claims, area 660 acres.

also 80 acres miscellaneous lands, 7 miles from Ryan, showing blanket veins carrying highly siliceous carbonate ores, estimated to average 10% in copper, which is too high, and said to have 500,000 tons of ore in sight, with 100,000 tons blocked out for stoping, also considered an overestimate. Mine is worked open-cast, and ore is sent to works at Ryan by wagon. Works include a 100-ton leaching plant and a small smelter, obtaining water from the mine by a 7-mile pipe-line.

**BUDGEYGAR MINING CO., N. L.**

AUSTRALIA.

Mine office: Hermidale, Canbelego Co., N. S. W., Australia. Organized 1907, under laws of New South Wales, with capitalization £5,000, shares 2s. par. Has a 260' shaft said to shew a 9' vein of 30% copper ore. In July, 1908, planned installing a £700 hoisting plant.

**BUDGEY KING COPPER MINING CO., N. L.**

AUSTRALIA.

Mine office: Hermidale, Canbelego Co., N. S. W., Australia. Organized circa November, 1907, under laws of New South Wales, with capitalization £6,000, shares £5 par.

**BUDGEY MINES, N. L.**

AUSTRALIA.

Mine office: Cobar, N. S. W., Australia. Mine office: Hermidale, Canbelego Co., N. S. W., Australia. M. J. Corbett, chairman; J. M. Williams, superintendent. Organized 1906, under laws of New South Wales, with capitalization £80,000, shares 10s. par. Lands, 3 miles from Hermidale, show a series of lenses, with an oxidized zone of considerable depth carrying native copper and cuprite. The 865' main shaft shows low grade ores of about 4.5% average copper tenor, and a vein of black sulphide ore, reported as 20' to 25' in width. Company claims ore reserves of 40,000 tons on the 104' level. Production, 1908, was circa 200 long tons of ore, yielding 22 tons long fine copper. Employed 22 men at last accounts. Property considered promising.

**COMPANIA MINERA EXPLOTADORA DE**

CHILE.

**BUENA ESPERANZA.**

Office: Iquique, Chile. Mine office: Santa Rosa, Tarapacá, Chile. Organized Dec. 5, 1905, under laws of Chile, with capitalization £10,000, shares 21 par.

**BUENA VISTA COPPER MINES, LTD.**

MEXICO.

Dead. Formerly at Santa Rosalia, Sur, Baja California, Mex. Described Vol. VI.

**BUENA VISTA COPPER MINING CO.**

ARIZONA.

Mine office: Solomonville, Graham Co., Ariz. Has a 100' shaft, showing ore, and sent a sample shipment of 25% ore to the El Paso smelter, 1903. Idle.

**BUENA VISTA COPPER MINING CO.**

CALIFORNIA.

Mine office: Valley Springs, Amador Co., Cal. Property includes the Bull Run and Russell mines, carrying sulphide copper ores in schistose diabase. Has steam power. Idle.

**BUENA VISTA MINING & MILLING CO.**

ARIZONA.

Dead. Formerly at Washington, Santa Cruz Co., Ariz.

**BUENA VISTA SMELTING & REFINING CO.**

COLORADO.

Office: Chester, Pa. Works office: Buena Vista, Chaffee Co., Colo. R. G. Hinkson, general superintendent; Wm. P. Eyre, superintendent. Plant is a 125-ton smelter, employing circa 40 men. Company does a general custom smelting business on gold, silver and copper ores.

**BUENOS AIRES MINING CO.**

MEXICO.

Dead. A swindle, perpetrated by the notorious Dr. R. C. Flower. Supposedly located at Cusihuiriáchic, Iturbide, Chihuahua, Mex. "Assets" were inherited by the Pan-American Mining & Smelting Co.

**COMPAÑIA MINERA BUERREERO DE  
VALLE HERMOSO.**

Office: Santiago de Chile. Mine office: Mendoza, Argentina. Organized Feb. 16, 1907, under laws of Chile, with capitalization 230,010 pesos, shares 15 pesos par.

**BUFFA MINING, MILLING & SMELTING CO.**

Mine office: 709 Lankershim Bldg., Los Angeles, Cal. Letter returned unclaimed from former mine office, La Bfta, Sahuaripa, Sonora, Mex. Davis Richardson, president; Wm. B. Richardson, vice-president and general manager; Baton W. Biley, secretary; Lewis B. Richardson, treasurer. Organized 1902, under laws of Arizona, with capitalization \$1,500,000, shares \$1 par. Has paid 5 dividends, last being \$60,000, July, 1905. Lands, 123 acres, also a 10-acre millsite, and 5,000 acres miscellaneous lands, showing 6 fissure veins, of which 2 under development average 4' width, opened by a 60° incline, giving average assays of 10% copper, 10% lead, 4% zinc, 150 oz. silver and \$2.50 gold per ton, from argentiferous tetrahedrite and copper sulphides. Has shafts of 300' and 600'; and a 225' tunnel, with 8,000' of workings and about 20,000 tons of high-grade ore blocked out, with a considerable amount of low-grade ore on the dump, for eventual treatment.

Machinery includes a 120-h. p. plant at the mine, with 2 hoists, 2 Rand air-compressors and 7 power drills. Mine buildings include several small shops, a store, sawmill and about 20 dwellings.

The 35-ton concentrator has a small sampling mill attached. There also is a 20-ton leaching plant.

The smelter, at the mine, receives ore by gravity tram. Equipment includes 10-ton and 25-ton reverberatory furnaces, built of silica brick, made on the ground. Fuel is inferior wood, cut on the premises. Product is a matte carrying 50% copper, 600 to 800 oz. silver and 1.5 oz. gold per ton, which is shipped to Aguascalientes, via Guaymas, for refining, some rich ore being shipped also. Transportation is by burros, but rail connection is expected from the extension of the Cananea, Rio Yaqui y Pacifico. Production, 1904, was about 1,200,000 lbs. fine copper, but operation since hampered by Yaqui Indian uprising. Has employed as many as 600 men in the dry season. Idle since circa 1906.

**BUFFALO-ARIZONA GOLD MINES CO.**

**ARIZONA.**

Office: 42 Westminster St., Providence, R. I. Mine office: Turkey, Yavapai Co., Ariz. Arthur E. Brown, secretary and treasurer. Lands, 18 claims, area 360 acres, known as the Parker group, 2½ miles from Turkey. Mine, originally a gold producer, shows copper values at depth of 50' in a vein of 75' estimated width. Has a 5-stamp mill and plans adding a cyanide plant. Has shipped a little ore to the Humboldt smelter.

**BUFFALO & ARIZONA MINING CO.**

**ARIZONA.**

Mine office: Morristown, Maricopa Co., Ariz. W. H. Crandall, treasurer; J. Harry Bennett, general manager; Henry G. Bennett, superintendent. Lands, in Bennett Gulch, on lower Turkey Creek, between Morristown and Hot Springs, have a 319' shaft, bottomed in chalcopyrite ore running about 3% copper, 2 oz. silver and \$2 gold per ton. Mine has 3 levels, with about 800' of workings. Has steam and gas power, a 2-stamp-mill having a 5,000-gallon storage tank, and 13 buildings. Employed 15 men and shipped a \$4,000 bullion bar, circa June, 1908.

**BUFFALO MINING CO.**

**MONTANA.**

Mine office: Saltese, Missoula Co., Mont. O. H. Linn, superintendent. Capitalization increased, 1907, to \$1,500,000, shares \$1 par. Lands, 28 claims, on Big Creek, near the divide of the Bitter Root Mountains, 6 miles east of the

**Monitor**, showing 4 copper veins, 2 ~~argentiferous~~, developing by a crosscut tunnel.

**BUFFALO SMELTING WORKS.**

**NEW YORK.**

Owned by Calumet & Hecla Mining Co.

**COMPAÑIA DEL FERROCARIL y MINAS DEL BUITRÓN.**

**SPAIN.**

Mine office: Zalamea la Real, Huelva, Spain. Don Diego Bull, general manager. Company is controlled by F. C. Hills & Co., of London. Mines include El Castillo del Buitrón and La Poderosa, area 6 hectares, at Zalamea la Real, and the Concepción mine, area 42 hectares, at Almonáster. Sundry other properties are under exploration. Annual production averages about 1,500,000 lbs. fine copper.

**BULLARD BROS.**

**ARIZONA.**

Office: Wendendale, Yuma Co., Ariz. Lands, 5 claims, in Cunningham Pass, Harcúvar Mountains, are said to show considerable oro assaying 7 to 10% copper and \$10 in gold and silver per ton.

**BULL DOMINGO MINING CO.**

**WYOMING.**

Mine office: Hecla, Laramie Co., Wyo. Ores carry copper and gold values. Idle for several years.

**BULLION-BECK & CHAMPION MINING CO.**

**UTAH.**

Office: Salt Lake City, Utah. Mine office: Eureka, Juab Co., Utah. John Beck, president; W. J. Beatty, secretary; Philo T. Farnsworth, general manager; L. C. Doty, superintendent. Capitalization \$1,000,000, shares \$10 par. To March, 1908, had paid dividends of \$2,568,000, regular dividend rate being 2 cents per share, and paid a 60-cent dividend, of \$60,000, April, 1908.

Lands, 3 claims. In 1908 sold circa 10 acres of fractional claims, formerly in dispute, to the Centennial-Eureka, and made side-line agreements with that company, stopping litigation. Mine produces mainly auriferous lead carbonates and silver chlorides, with small copper values, and has one small reserve of high grade ore, with considerable quantities of low grade ore developed for extraction later. Has a 1,300' shaft, with a 200' winze from the bottom level, and is mining from the 100' to 1,200' levels, inclusive, there being considerable water on the 1,300' level. Has a 200-ton mill, with steam and electric power, employing about 75 men, and has been a producer since circa 1880. Production, 1907, was 248 carloads of ore, and output, first half 1908, was circa 1,000 tons of ore monthly, partly from work of leasers.

**BULLION CITY BORNITE COPPER**

**COLORADO.**

**MINING & MILLING CO.**

Office: Ebensburg, Pa. Letter returned unclaimed from former mine office, Aspen, Pitkin Co., Colo. T. V. Hott, president; A. W. Van Houten, secretary and general manager. Lands, 11 claims, 7 patented, area 110 acres, 8 miles distant from railroad, with good wagon-road between. Has shafts of 50' and 90', showing a 2' vein of bornite, assaying 25% copper, 53 oz. silver and 1 oz. gold per ton.

**BULLION GOLD & COPPER CO.**

**NEVADA.**

Letter returned unclaimed from former mine office, Reno, Washoe Co., Nev. Capitalization \$1,000,000, shares \$1 par. Lands, 8 claims, in the Peavine district, circa 20 miles north of Reno and 1½ miles from a railroad, having several shallow shafts.

**BULLION MINING CO., LTD.**

**IDAHO.**

Office: Wallace, Idaho. Mine office: Mullan, Shoshone Co., Idaho. B. F. O'Neil, president; Jas. H. Taylor, secretary; A. D. McKenzie, general manager. Organized 1902, under laws of Idaho, with capitalization \$1,000,000, shares \$1 par. Lands, 8 claims, 3 patented, area 160 acres, lying about 4 miles west of the Monitor mine, on the Idaho slope of the Bitter Root divide.

Property shows a vein of 20' maximum width, with average of 6' to 12', carrying mainly chalcopyrite, with some bornite, associated with siderite, having a limestone gangue, said to average 3.2% copper and 0.4 oz. silver per ton, with traces of gold, also some ore of better grade. Mine is opened by a 70' upper tunnel and a 780' crosscut lower tunnel, with 1,380' of workings, well timbered with pine, hemlock, tamarack and fir. Has steam power and a 12-h. p. hoist.

**BULLION MOUNTAINS COPPER CO.**

CALIFORNIA.

Office: 1221-52 Broadway, New York, N. Y. Mine office: Lavie, San Bernardino Co., Cal. Organized under laws of Arizona, with capitalization \$1,500,000, shares \$1 par. Was promoted by H. R. Leighton & Co., since bankrupt. Company claims to have mines and reduction works at Lavie, hence presumably succeeded to property of the Peacock Copper Co., which had a 50-ton concentrator, but ran out of ore. Regarded with suspicion. Idle.

**BULLOCK MINING & MILLING CO.**

UTAH.

Mine office: Eureka, Juab Co., Utah. Has 600,000 shares. Property has 2 veins, carrying argantiferous copper sulphides of fair tenor. Begun shipments 1908.

**BULLWHACKER COPPER CO.**

MONTANA.

Office: care of Patrick Clark, president, Spokane, Wash. Mine office: Butte, Silver Bow Co., Mont. J. J. Stewart, vice-president; W. C. Moyer, secretary; F. S. Hays, treasurer; John Breanahan, superintendent. Organized March 20, 1906, under laws of Arizona, with capitalization \$1,000,000, shares \$1 par. Is controlled by President Clark, who is supposed to own about 80% of the stock. Paid monthly dividends of 1 cent per share, early 1907. Lands, 1 claim, lying east of the Pittsburg & Montana, having a 400' shaft showing a 50' fault with a paystreak of 15' to 20' width, carrying workable values, mainly in carbonate ores and chrysocolla, averaging about 3.5% copper, both carrying practically no gold or silver values. Also has a little chalcocite, up to 24% in copper tenor. Ore is silicious and does not concentrate well, hence experiments have been made with a leaching process. In 1906 lessees produced 6,228 tons of silicious ore, averaging 4.97% copper, extracted from depth of less than 100', and company itself produced nearly an equal amount of ore, giving production estimated as equal to 850,000 lbs. fine copper. Shipments ceased latter half of 1907. Property considered promising.

**BULLWHACKER GOLD & COPPER CO.**

ARIZONA.

Dead. Merged in Great Belcher of Arizona Co. Formerly at Prescott, Yavapai Co., Ariz.

**BULLY HILL COPPER MINING & SMELTING CO.**

CALIFORNIA.

Office: 42 Broadway, New York, N. Y. Mine office: Winthrop, Shasta Co., Cal. D. M. Riordan, president; Anson W. Burchard, vice-president; M. F. Westover, secretary; John B. Keating, general superintendent; Herbert R. Hanley, assistant superintendent. Organized 1900, under laws of New Jersey, with capitalization \$2,500,000, shares \$25 par, full paid, but, after acquisition of control, 1905, by General Electric Co., capitalization was reduced to \$1,000,000. Bonds, \$400,000, issued for construction of Sacramento Valley & Eastern Railway, stock of which is owned by the Bull Hill.

Lands, 23 claims, 18 patented, area 213 acres, in the Pittsburg district, circa 25 miles northeast of the Iron Mountain mine and supposedly in the same geological horizon. Property includes the Bull Hill, Winthrop, Copper City and Anchor or Rising Star mines, all connected properties except the Copper City, circa 3 miles southwest of the Bull Hill. Company is said to have bought the Northern Light mine, at Winthrop, and the Tamarack group at Shasta City is held under a \$10,000 bond.

The Bully Hill was opened as a gold mine, working the gossan with rather indifferent results, until copper ores were developed at depth. Bully Hill, with a diameter of about 4,000', rising 1,800' above the surrounding country, is composed of eruptive rocks, principally basalt and rhyolite, with 8 mineral zones, having a strike of approximately north and south, the ore occurring in shear-zones in rhyolite and meta-diabase dykes, all of superficially slaty structure, lenses having a clay gonge of 1' to 30' on one or both walls. Main lenses have stringers and feeders, ranging from a few inches to 80' in width, carrying 2 to 30% copper. The principal lenses are 20' to 300' long and 2' to 40' wide, averaging about 30', and opened to a depth of circa 1,000'. The zone of secondary enrichment shows about 10' of bonanza ore, the main ore bodies below carrying chalcopyrite associated with pyrite, also a little bornite and chalcocite, with occasional oxidized ores and native copper. The best ore body gives average assays of about 15% copper, 6 oz. silver, and \$8 gold per ton, and shows native copper and native silver in considerable quantities on the 670' level, the average copper tenor of the mine being about 5%, with combined gold and silver values up to \$25 per ton.

The Bully Hill mine is opened by crosscut tunnels of 600', 800', 1,000' and 1,200', giving a back of about 350'. No. 2, the main working tunnel, 1,000' long, has double tracks and a 100x100' underground station containing powerful pumps and double-drum electric hoist for the 3-compartment 970' blind shaft starting from this point.

The Bully Hill has steam and electric power aggregating 300 h. p. at the mine and 350 h. p. at the smelter. Equipment includes four 100-h. p. hoists, good for 1,000' depth each, and 3 Rand air-compressors, of 14 drills aggregate capacity. Buildings, about 20 in number, include a 40x50' iron-sheathed machine-shop.

The Copper City mine, area 70 acres, is opened by an upper tunnel of 150' and a lower tunnel of circa 1,000' length, driven by Capt. J. R. De La Mar.

The Anchor, or Rising Star mine, has a 3-compartment 800' shaft, with double-drum electric hoist, and works 2 levels, known as the 6th and 7th, showing considerable good ore.

The Winthrop mine has a 18' vein of ore of fair copper tenor.

The smelter, about one-half mile from the mine, receives ore therefrom by the Bully Hill railroad, a 4-mile standard-gauge private line having a 65-ton Baldwin locomotive. The smelter, remodeled 1907-1908, is reported by company to have about 250 tons daily capacity, fuel being mainly coke, supplemented by petroleum for the reverberatory. The smelter building is 39x310', with a 90' stack, and is terraced throughout, permitting handling of all material by gravity. The calcining department has roast-stalls in series, with 2 McDougal circular calcining furnaces and two 48x120" rectangular water-jacket blast-furnaces, with one 50-ton reverberatory for treating fines and flue-dust. First-fusion product is a matte of 35 to 50% copper tenor, taken in ladles, by electric traveling crane, to the converter department, which has 2 stands, with 68x96" shells of barrel type, turning out blister copper of 99% tenor, shipped to the Delamar works at Chrome, N. J., for electrolytic refining. Limestone and iron ore for fluxing are obtained from quarries on the McLeod river, 6 miles distant, but there is a scarcity of suitable ferruginous copper ores for fluxing the high grade sulphides of the Bully Hill mine.

The Sacramento Valley & Eastern Railway, 17 miles long, controlled by the company, completed, 1907, at a cost of circa \$500,000, runs from Winthrop to a connection with the Southern Pacific, at Pitt, 3 miles from Kennett, running through Heroult and Copper City.

The property employs about 500 men. Ores from the 3 leading mines

have been given thorough smelting tests, and the company's permanent plans arranged in accordance with the results. There was no copper production, 1906 or 1907, during which years the property was being systematically developed, but smelting was resumed March 30, 1908, with one furnace. Annual production formerly was about 8,000,000 lbs. fine copper, but should reach nearly 15,000,000 lbs. fine copper in 1909. The Bully Hill is perhaps the highest grade copper mine in California, and has an experienced and thoroughly capable management.

**BUNDARRA MINE.**

Mine office: Bundarra, N. S. W., Australia. Max Gorler, owner. Lands, in the Tingha division of the Port & Uralla mining district, show a 4' to 8' vein of sulphide ore, deepest workings being circa 300'. Has a smelter with a small reverberatory furnace, making 45% matte. Production, 1907, estimated at 250,000 lbs. fine copper. Employed 60 men, 1907.

**BUNKER HILL MINE.**

Office: care of Col. Emil Rautman, Prescott, Ariz. Mine office: Big Bug, Yavapai Co., Ariz. Lands, 10 claims, in the Big Bug and Walker districts, circa 10 miles southeast of Prescott, opened by a tunnel of about 1,600' length.

**BUNKER HILL MINING & SMELTING CO.****WASHINGTON.**

Office: 5011-1 Madison Ave., New York, N. Y. Mine office: Index, Snohomish Co., Wash. Works office: Reiter, Snohomish Co., Wash. Chas. G. Reiter, president; Lewis H. Nash, vice-president; John D. Campbell, secretary; Wilbur Morris, treasurer; V. V. Clark, general manager; Chas. A. McClain, superintendent; Thos. W. Collins, smelter superintendent. Organized Oct. 24, 1902, under laws of Maine, with capitalization \$3,000,000, shares \$1 par, as successor of Bunker Hill-Sullivan Copper Mining Co., and capitalization reduced, June, 1908, to \$1,500,000, shares \$1 par; also, June, 1908, authorized an issue of \$500,000 of 8% cumulative preferred stock, to raise funds for retirement of bonded debt, payment of second-mortgage notes, and payment of sundry current obligations.

Lands, 18 claims, area circa 300 acres, 5 miles west of Index, on May Creek, below Lake Isabelle, known as the Copper Bell group, also a 5-acre millsite. Lands show fissure veins in granite, and contact veins between granite and diorite. Property was diamond-drilled, 1907. Mine has shafts of 86' and 600', showing 2 ore bodies, one a vein of 2' to 50' estimated width, carrying chalcopyrite averaging about 1% copper, 0.5 oz. silver and 40 cents gold per ton. Has compressed air and electric power, generated by a water-wheel taking water from Lake Isabelle, 2 hoists and a 10-drill Ingersoll-Sergeant duplex air-compressor, with various mine buildings.

The mill, enlarged, 1907, to 100 tons daily capacity, has Blake and Austin crushers, rolls, Wiffley tables, slime tables, bouldles and a magnetic separator.

The 75-ton smelter, of wood frame, was blown in July, 1908. Some concentrates were shipped, 1906.

**BUNKER HILL-SULLIVAN COPPER MINING CO.****WASHINGTON.**

Dead. Organized March 20, 1900, and reorganized Oct. 24, 1902, as Bunker Hill Mining & Smelting Co. Formerly at Index, Snohomish Co., Wash.

**BUNKERVILLE MINING CO.****NEVADA.**

Mine office: Bunkerville, Lincoln Co., Nev. Idle.

**BURGAN DEVELOPMENT CO.****MEXICO.**

Office: Douglas, Ariz. Mine office: Fronteras, Arizpe, Sonora, Mex. Property, near Fronteras, is said to be opened to depth of circa 400'. Presumably idle.

**BURLINGTON COPPER MINING CO.****WYOMING.**

Mine office: Encampment, Carbon Co., Wyo. Idle.

**BURMA COPPER MINES, LTD.**

Office: 716 Salisbury House, London, E. C., Eng. W. T. Warriner, secretary. Organized Nov. 5, 1903, under laws of Great Britain, with capitalization £100, shares £1 par. Moribund.

**BURMA MINES DEVELOPMENT & AGENCY, LTD.****BURMAH.**

Office: 730 Salisbury House, London, E. C., Eng. M. F. Kindersley, chairman; H. E. Franck, secretary. Organized Nov. 6, 1903, under laws of Great Britain, with capitalization £50,000, shares £1 par, fully issued, to prospect for copper in the Monywa district, and dredge for gold on the Chindwin river, Burmah.

**BURNETT (QUEENSLAND) EXPLORATION CO., LTD.****AUSTRALIA.**

Dead. Lands sold to Queensland Copper Co., Ltd. Formerly at Mount Perry, Bowen Co., Queensland, Australia.

**BURNIE COPPER MINES.****TASMANIA.**

Office: National Mutual Bldg., Melbourne, Australia. Mine office: Cuprona, Tasmania. Jas. Harvey, chairman; Leigh J. Hancock, superintendent; H. Hodgson, auditor. Is incorporated. Lands, 205 acres, partly freehold, including the townsite of Cuprona. Mine, known as the Copper King, has a 155' shaft, sunk in the footwall. At 150' depth the north ore chute had disappeared, and the south ore chute showed decreased values. Property has a fair power equipment. A little ore, shipped to New South Wales smelters, returned circa 25% copper. Employs about 30 men. Production, 1906, was 236,880 lbs. fine copper. Prospects of company are not especially promising.

**BURNS MINING CO.****WASHINGTON.**

Mine office: Darrington, Snohomish Co., Wash. Lands include the Myrtle and Justice claims, opened by tunnel. Idle.

**BURNS-MOORE MINING & TUNNEL CO.****COLORADO.**

Mine office: Jackson Bldg., Denver, Colo. Mine office: Idaho Springs, Clear Creek Co., Colo. Dr. John M. Shaller, secretary, treasurer and general manager. Organized March 27, 1902, under laws of West Virginia, with capitalization \$250,000, shares 10 cents par. Lands, 40 lode claims, 5 placer claims and a millsite, all patented. Development is by a 3,210' tunnel, starting from Chicago Creek, circa 7 miles from Idaho Springs, and running to Saxon Mountain, intersecting a number of mineralized veins carrying gold, silver, lead and copper values. Has water power. Idle for several years.

**BURRA (BOBBY) COPPER MINING CO.****AUSTRALIA.**

Mine office: Cobar, Robinson Co., N. S. W., Australia. Organized, 1907, under laws of New South Wales, with capitalization £1,500, shares £10 par.

**BURRA BURRA COPPER MINING CO., N. L.****AUSTRALIA.**

Office: Eagle Chambers, Adelaide, South Australia. Mine office: Burra Burra, Burra Co., South Australia. T. B. Gall, chairman; V. Lawrence, secretary and treasurer; Wm. West, general manager; Jas. S. Pryor, superintendent. Organized 1901, under laws of South Australia, with capitalization £120,000, shares £1 par, 10s. paid in; issued, £95,173. Lands, 672 acres, freehold, with mineral rights to 11,065 acres of adjoining lands. Country rock is argillaceous slate. Mine is opened by 5 tunnels, of 600', 300', 330', 420' and 180'. Ores in upper levels were cuprite, malachite, azurite and native copper, occurring in very rich but irregular bunches, lower levels showing bornite and chalcopyrite. Property, opened 1845 and closed 1877, made 51,662 long tons fine copper, valued at £4,749,224; and paid dividends of £826,585. Ore was shipped to Port Adelaide, 107 miles, by rail, for smelting. Fuel was wood, costing 12s. per cord, and soft coal at 30s. per ton. Was reopened 1901, ore averaging about 2% copper only, and production, 1903, was about 100 long tons fine copper. Has steam and electric power. Idle several years.

**BURRAGA COPPER CO.**

Mine office: Burraga, Bathurst Co., New South Wales, Australia. Mine, opened 1877, circa 1 mile east of the Lloyd, has a vein of 67' average width, with a chute of rich ore of about 100' length carrying chalcopyrite with quartz gangue, averaging 6.5% copper tenor, with 1 to 3 oz. silver per ton. The vein occurs in a belt of highly altered rocks, ranging from porphyry to schistose slate. Mine is circa 800' deep. Smelter has 3 reverberatory furnaces, using wood for fuel, making a 47% matte, sent to Lithgow for refining. Supply of fuel is precarious in bad weather, when the roads are impassable. Presumably idle.

**BURRO MOUNTAIN COPPER CO.****NEW MEXICO.**

Office: 402-108 Equitable Bldg., Chicago, Ills. Mine office: Leopold, Grant Co., N. M. Nathan F. Leopold, president; E. Shepherd, vice-president; Alfred F. Leopold, secretary and treasurer; Jas. T. Hall, superintendent. Organized 1904, under laws of New Mexico, with capitalization \$50,000, increased, 1906, to \$100,000, shares \$1 par. Phelps, Dodge & Co. hold a share interest, and are represented on the board of directors by C. E. Mills. Company is operated as a close corporation.

Lands, 60 claims, area circa 1,000 acres, formerly held on bond and lease, but bought, 1906, from Southwestern Copper Co. Property shows 36 porphyry dykes, all carrying silicates giving assays of 10 to 25% copper, 5 ore bodies being developed. Extensive diamond drilling is planned.

The old mine, 15 claims, known as the St. Louis, is said to have produced upwards of \$1,000,000 worth of ore, under former ownership, shipping ores ranging 15 to 25% in copper tenor.

Principal development has been on the Sampson and St. Louis veins, opened laterally for more than 2,000', estimated to show about 3,000,000 tons of ore with approximately 2,500,000 tons blocked out, assaying 3.4% copper, mainly from chalcocite, without appreciable precious metal values. About 25,000' of openings have been made on the 2 veins, and the Sampson ore body is estimated at 100' to 200' width, 300' depth and about 1,000' length.

Mine is developed by 4 shafts, the Sampson, St. Louis, McKinley and Boston, each more than 200' in depth, with especially promising indications in the Boston shaft. The east ore body, which is the last developed, shows about 2,000,000 tons of ore, averaging over 3% copper. Mine is operated largely on the caving system, obviating excessive timber requirements. Equipment includes electric hoists and pumps, with a steam hoist at the Sampson shaft.

Lands include townsite, improved with water-works, electric lights and substantial buildings, including a hotel and numerous dwellings.

The concentrator, built circa 1905, has been twice remodeled and brought to present capacity of 300 tons daily. Equipment includes a dynamo for power and a 300-light electric generator. It is planned increasing the mill to 1,500 tons daily capacity.

There is a 10-ton smelter, of antiquated design, left by former owners, which is idle and worthless.

Survey has been made to the mine for a 14-mile spur of the Atchison, Topeka & Santa Fe railway, and road probably will be built in 1909.

The Burro Mountain was a considerable producer in 1907, and did not suspend work during the panic period, though reducing output of concentrates and curtailing in various directions. Concentrates have been smelted by the Boston & Colorado Smelting Co. and Shannon Copper Co., and production, to end of 1907, was about 15,000,000 lbs. fine copper. Property is considered of exceptional promise, and management is good.

**BUTTON CONSOLIDATED COPPER CO.**

WYOMING.

Dead. Formerly at Encampment, Carbon Co., Wyo.

**BUSTER BROWN CO.**

ARIZONA.

Office and mine: Tucson, Pima Co., Ariz. Chas. E. Hoff, president and general manager. Capitalization \$3,000,000; shares \$1 par. Lands, 5 claims, area 100 acres, in the Amole district, 16 miles northwest of Tucson, slightly developed, showing ores carrying fair assay values in copper and silver. Presumably idle.

**BUSTEE MINES SINDICATE, LTD.**

ARIZONA.

Dead. Formerly at Prescott, Yavapai Co., Ariz. Described Vol. VI.

**BUTLER-LIBERAL CONSOLIDATED MINING CO.**

UTAH.

Office: 418-69 State St., Boston, Mass. Mine office: Bingham Canyon, Salt Lake Co., Utah. J. J. Corum, president; C. N. Strevel, vice-president; S. M. Orem, secretary and treasurer; Walter C. Orem, general manager; Wm. Robbins, superintendent. Organized 1903, under laws of Utah, as a consolidation of the Ben Butler Mining & Smelting Co. and the Liberal Mining Co., with capitalization \$500,000, shares \$1 par. Paid a dividend of \$2,500, October, 1903.

Mine so opened by the Butler shaft and tunnel, latter said to show 2' of smelting ore, and the Jacobs tunnel. Has shipped ore to the United States smelters returning 6% copper, 12 oz. silver and \$1 gold per ton.

**BUTLER MINING & MILLING CO.**

UTAH.

Dead. Merged, 1904, in Butler-Liberal Consolidated Mining Co. Formerly at Bingham Canyon, Salt Lake Co., Utah.

**BUTTE & ANACONDA COPPER CO.**

MONTANA.

Dead. Succeeded, 1908, by Carlisle Copper Co., also dead. Formerly at Butte, Silver Bow Co., Mont.

**BUTTE & ANACONDA COPPER MINING CO.**

MONTANA.

Office and mine: Butte, Silver Bow Co., Mont. Phil C. Goodwin, president; Wm. Metting, vice-president; John E. Corette, secretary and treasurer; preceding officers, F. Tomšek, Geo. P. Porter and Jas. R. Spencer, directors. Organized June 6, 1908, under laws of Montana, with capitalization \$1,000,000, shares \$1 par. Lands, 20 claims, north of the Butte & Basin, showing mineralized ledges.

**BUTTE-ARGENTA COPPER CO.**

MONTANA.

Office: Butte, Silver Bow Co., Mont. Mine office: Argenta, Beaverhead Co., Mont. J. P. Oppenheimer, president; John F. Cowan, manager; J. T. Ross, superintendent. Organized Feb. 12, 1906, under laws of Montana, with capitalization \$3,000,000, shares \$10 par. Property, 12 miles west of Dillon, known as the Iron Mountain mine, has a tunnel and 2 shafts, opened to a depth of 800' on a wide vein of argentiferous silver-lead and copper ore, having streaks assaying up to 16.5% copper and 30 oz. silver per ton. Upper levels were worked, years ago, for silver-lead, which changed to copper at slight depth. Equipment includes a 125-h. p. hydro-pneumatic power plant, with Pelton wheel, and an 8-drill Ingersoll-Rand air-compressor. Employed about 36 men at last accounts.

**BUTTE & ARIZONA COPPER CO.**

ARIZONA &amp; MONTANA.

Dead. Formerly at Butte, Silver Bow Co., Mont., and Prescott, Yavapai Co., Ariz. Described Vol. VI.

**BUTTE & ARIZONA COPPER MINING CO.**

ARIZONA.

Office: care of J. H. Vivian, president, Butte, Mont. Mine office: Hereford, Cochise Co., Ariz. A. P. Bohndorff, president; B. H. Dunshee, vice-president; John E. Corette, secretary; John C. Adams, treasurer; preceding officers, L. O. Evans, Charles S. Shoemaker and D. M. Watts, directors; John Hoatson, gen-

eral manager; Caspar Schultz, mine superintendent. Capitalization \$1,250,000, shares \$1 par.

Lands, 14 claims, 11 patented, costing circa \$60,000; for which directors took \$450,000 stock, well watered and partially wooded, in the Huachuca Mountains, circa 35 miles west of Bisbee and about the same distance north of Cananea.

Property shows an ochrous gossan of 10' to 300' width, covering a contact vein between syenite and limestone carrying occasional copper oxides, chalcocite, pyrite and argentiferous gray copper, chalcocite of fair tenor, though not in large quantities. Development is by a 2,300' tunnel cutting several small veins giving assays up to 18% copper with an average of 4.5% tenor, mine having upwards of 3,000' of workings. Main vein 360' from mouth of tunnel is claimed to show 39' of 6% chalcopyrite, which probably is an overestimate. Nearest railroad is 15 miles, with fair wagon road. Has steam power, and air-compressor, employing circa 20 men. Continued work steadily during period of depression, but in 1908 suspended operations temporarily on account of a fire.

#### BUTTE & ARIZONA COPPER MINING CO.

ARIZONA.

Office: Prescott, Ariz. Mine office: Mayer, Yavapai Co., Ariz. Ernest A. Haggott, president; Emil J. Baxter, vice-president; T. C. Job, secretary; M. B. Hazeltine, treasurer; preceding officers and B. O. Kendall, directors; Ivy Burleson, superintendent. Organized June 6, 1905; under laws of Arizona; with capitalization \$5,000,000, shares \$1 par; issued, \$2,200,000. Annual meeting, first Monday in May.

Lands, 9 claims, unpatented, area 180 acres, also 160 acres placer lands, in the Big Bug district, showing Algongkian schists, quartzite and diorite, carrying 3 veins, ore bodies occurring as replacements in chlorite schist and as contact deposits between hornblende schists and quartzite, 2 being developed. Main vein, of 70' estimated width, tractable 4,800', with 1,800' of workings, is opened by a 360' tunnel and shafts of 120', 175' and 300', showing chalcopyrite averaging about 2.5% copper, 2 oz. silver and \$2 gold per ton. Company plans continuous development.

#### BUTTE & BACON MINING CO.

MONTANA.

Office and mine: Butte, Silver Bow Co., Mont. F. W. Badorn, president and manager; Geo. I. Whitney, treasurer; H. L. W. Hyde, secretary; Ed. Renouard, superintendent. Organized Feb. 12, 1906; under laws of Maine, with capitalization \$5,000,000, shares \$1 par. Lands, 21 claims, partly fractional, area circa 280 acres, in the northeastern part of Butte, about 1 mile north of the Pittsburg & Montana and 1 mile northeast of the Anaconda, some distance from any producing mine. Allowed options on claims on which the Calumet shaft is located to expire, 1907, and attempted to remove improvements, but owners of lands prevented. Had 3 shafts, including the Calumet, the Colleen Bawn shaft being about 400' deep and the Belinda shaft 840'. The 1,050' Calumet shaft crosscut and drifted on 2 veins, showing ore below commercial grade. Had an 18x36" first-motion hoist, good for 1,500', on the Calumet claim. Idle early 1908, owing to failure of fiscal agents. Property is entirely outside the proven zone, but is not devoid of promise, though payable ore, if found, probably will occur at great depth.

#### BUTTE-BALLAKLAVA COPPER CO.

MONTANA.

Office: 315 Sellwood Bldg., Duluth, Minn. Mine office: Butte, Silver Bow Co., Mont. R. B. Dear, president; P. H. Nelson, vice-president; John A. Percival, secretary; Milie Bunnell, treasurer; preceding officers, John Panton, I. Freimuth and Gus Carlson, directors; Hon. D. E. Morgan, J. T. Wyman and W. D. Winston, trustees of escrow stock; Chas. W. Newton, superintendent.

Organized under laws of Arizona, with capitalization \$2,500,000, shares \$5 par; issued, \$2,100,000.

Lands are the adjoining Burke and Ballaklava claims, fractional, area 6.5 acres, in a long irregular strip. Property was tied up by litigation for many years, but a settlement finally was secured between various claimants, by which title was vested in the Catholic bishop of Helena, who sold lands to present company for \$400,000 cash, final payment being made circa October, 1907. Property is entirely surrounded by holdings of the Anaconda, Boston & Montana and Butte Coalition. Owing to the peculiar shape of the tract, which is 1,860' long on the strike of the vein system, it carries the apex of 5 veins, of 25' average width, with an aggregate of about 3,600' of their strike. These veins are the Speculator and Edith May of the North Butte, the Old Joe, Mountain Chief and Sioux Chief, which, by reason of aping on Butte-Ballaklava lands, can be followed to any depth desired. By reason of this peculiar situation, the property is, for all practical purposes, materially larger than its actual area, by reason of the law permitting the following of aping veins.

The mine has 2 shafts, 1 to the northwest of shallow depth, while the other, an old 2-compartment shaft, 283' deep, has been cut down to 3-compartment size and sunk to 1,000' depth. Crosscuts have been run on the 500' and 700' levels, and are being run on the 1,000' level. The 2 upper levels show 5 veins, ranging 25' to 90' in width. The 500' level shows iron pyrites and a little high grade silver-lead ore, which probably will not hold to depth. The 700' level shows stringers of massive chalcopyrite, with frequent bornite, both argentiferous, and a narrow streak of chalcocite was cut in the shaft.

Electric power is used throughout, with an auxiliary steam plant in reserve for emergencies. Equipment includes a 165-h. p. double-drum electric hoist, good for 1,500' depth, and 2 Ingersoll-Sergeant compound belt-driven 8-drill air-compressors having cross-compound air-cylinders, each driven by a 100-h. p. General Electric motor. An electric station pump is to be installed. Buildings include a wooden head-frame, engine-house, carpenter-shop, smithy and office.

The Butte-Ballaklava is 640' from the North Butte mine, and carries the extension of both the Speculator and Edith May veins of the North Butte. The Mountain Chief mine of the Butte Coalition, immediately to the north, was a small producer under the management of Mr. Heinze. The Modoc and Modoc Extension claims of the Anaconda, immediately to the south, carry the largest ore body in Butte, but this is of low grade to the depth developed, which is only 1,000'. The Butte-Ballaklava lies immediately west of the Leonard and north of the Colusa, which are about 1,000' distant each, these being the principal mines of the Boston & Montana. The location is one of the best in Butte, and as the management is good, there seems every reason to predict the opening of an exceptionally large and rich mine.

#### BUTTE & BEAVERHEAD COPPER CO.

MONTANA.

Office: Butte, Mont. Mine office: Argenta, Beaverhead Co., Mont. John P. Reins, manager. Organized 1907, with capitalization \$1,000,000, shares \$1 par. No trace of operations.

#### BUTTE & BINGHAM COPPER CO.

UTAH.

Office: Butte, Mont. Mine office: Bingham Canyon, Salt Lake Co., Utah. W. H. Nichols, president. Lands, 6 acres. In debt and moribund.

#### BUTTE & BINGHAM COPPER MINING & DEVELOPMENT CO. UTAH.

Letter returned unclaimed from former office, 35 Congress St., Boston. Mine office: Bingham Canyon, Salt Lake Co., Utah. Idle.

**BUTTE & BOSTON CONSOLIDATED MINING CO. MONTANA.**

Office: 42 Broadway, New York, N. Y. Mine office: Butte, Silver Bow Co., Mont. Jas. Phillips, Jr., president; Wm. D. Rockefeller, secretary and treasurer; John D. Ryan, general manager; Wm. E. Kane, mine foreman. Organized 1896, under laws of New York, with capitalization \$2,000,000, shares \$10 par. Debentures, \$1,500,000 first-mortgage bonds, at 6%, due April, 1917. Has paid dividends, to Dec. 31, 1907, of \$1,800,000, last dividend, \$1 per share, having been paid February, 1904. Annual report to Montana authorities, June 1, 1908, gave assets of \$3,636,918 and liabilities of \$209,734. Net earnings were circa 89 cents per share in 1904; \$5.38 per share in 1905; \$8.25 per share in 1906, and \$1.47 per share in 1907. Is controlled, through ownership of practically entire stock issue, by Amalgamated Copper Co. Annual meeting, first Monday in April.

Lands, 261 acres, including sundry mines and undeveloped claims, with part interests in other properties, also several thousand acres of placer lands, all in the Butte district.

Silver Bow No. 1 mine has a 3-compartment 1,000' main shaft, connected underground with the Pennsylvania, Berkeley and Silver Bow No. 3 mines. Timbering is with 8x8" square sets, and ore is trammed by horses. There is an 800-gallon Riedler pump on the 1,000' level. Hoisting is done by a 16x42" engine, operating 2 single-deck cages.

Silver Bow No. 2 has been idle for some years.

Silver Bow No. 3 mine has a 4-compartment 700' shaft, planned to be deepened, and is timbered with 10x10" square sets, with a 500-gallon Knowles pump on the 600' level, and a 12x14" Risdon hoist operates 2 single-deck cages.

The East Grey Rock mine has a 3-compartment 1,600' shaft. Surface equipment includes a 20x48" hoist, operating 2 double-deck cages, and a 28-drill Nordberg air-compressor.

The West Grey Rock mine has a 1,200' shaft.

The Berkeley has a 3-compartment 900' shaft, with 18x32" hoist, operating 2 single-deck cages. It has been planned to work the Snohomish and Tramway mines through the Berkeley shaft. Property was tied up for nearly 5 years, until 1906, by litigation with the Heinze interests.

The Blue Jay mine has a 1,075' incline shaft, sunk at 72°, having 2 compartments to the 600' level and 3 compartments below. Hoist is 16x32", operating 2 single-deck cages, with skips swung under.

The Belle of Butte mine, in Walkerville, has a 500' shaft, developing argentiferous copper ore, with values mainly in silver, and has been worked, on a small scale, by leasers, for the past 10 years or more.

The Josephine mine, supposed to have a continuation of the Lexington vein of the La France, was operated, 1906-1907, by leasers, mainly for silver values.

Miscellaneous properties include the Kane No. 3, having a 200' shaft, Wild Bill and various other mines having slight development.

The Butte & Boston owns two-thirds of the Tramway mine and one-half of the Snohomish mine, balance belonging to Butte Coalition, and these properties are described under title of latter company. The Tramway shaft has been sunk 1,500', jointly, by the Butte & Boston and Butte Coalition.

The old concentrator and smelter, at Meaderville, were closed, 1905, and demolished later, ore now being sent to the Washoe works at Anaconda. There remain at the site of the old Meaderville works large quantities of slag, which may be remelted.

The company employs, normally, about 400 men at its various mines.

The Butte & Boston ores are leaner in copper and richer in silver than

the average of the camp, ore averaging returns of circa 60 lbs. fine copper per ton, while its blister copper carries about 100 oz. silver per ton. For fiscal year ending June 1, 1906, production was 331,630 tons, yielding gross values of \$10.89 per ton, with cost of extraction of \$3.79 per ton, and of reduction \$2.27 per ton. Gross proceeds for year were \$3,611,652, and total operating expenses \$2,362,184, leaving net earnings of \$1,249,467. For year ending June 1, 1908, extraction was 192,830 tons of ore, with gross costs of \$1,609,763 and total expenses of \$1,314,152, leaving net earnings of \$295,604. Production, 1907, was about 10,000,000 lbs. fine copper.

#### BUTTE & BOULDER MINING CO.

MONTANA.

Office: Butts, Mont. Mine office; Boulder, Jefferson Co., Mont. Lands, 2 claims, held under bond and lease, having a 750' tunnel, expected to cut, at depth of circa 500', a vein carrying argentiferous and auriferous copper-lead ores. Was developing with a small force at last accounts.

#### BUTTE & BOZEMAN COPPER MINING CO.

MONTANA.

Letter returned unclaimed from former office and mine, Butte, Silver Bow Co., Mont. G. P. Chisholm, president; C. B. Chisholm, vice-president and treasurer; R. B. Chisholm, secretary. Organized July, 1906, with capitalization \$100,000, shares \$1 par. Lands, 2 claims, area 40 acres, known as the Emily and Etta, lying northeast of the Butte & Bacorn. Idle.

#### BUTTE & BRADLEY COPPER MINING CO.

MONTANA.

Mine office: Butte, Silver Bow Co., Mont. Jas. A. Talbot, manager. Organized circa January, 1907, with capitalization \$1,500,000, shares \$1 par. Lands, 8 undeveloped claims, in the extreme northeastern portion of the Butte district, said to carry 6 veins showing surface ore carrying copper and silver values. Idle.

#### BUTTE & BUXTON COPPER MINING CO.

MONTANA.

Office and mine: Butte, Silver Bow Co., Mont. Chas. O. Savage, vice-president; Chas. Fasel, secretary and manager; Jas. B. Higgins, consulting engineer. Organized April, 1906, under laws of Arizona, with capitalization \$3,500,000, shares \$10 par; issued, \$1,500,000.

Lands, 13 claims, 8 held under bond and lease, area circa 250 acres, 15 miles southwest of Butte, in the foothills of Fleecer Mountain, carrying circa 6,000' of the strike of a vein which was mined for silver-lead values, circa 1890, by several shallow shafts. Country rock is granite, much similar to that at Butte, covered by a 1' to 4' wash, having a mineralized zone of about one-half mile width, with 4 veins, with a diorite dyke to the northward. Shallow pits and trenches show continuity of veins, which are leached at surface, showing a little carbonate ore below commercial grade.

Development is by several old and shallow shafts, and by a tunnel of circa 300'. A wide ledge carries a mineralized streak along the foot-wall, showing mainly pyrite, with some argentiferous chalcopyrite and occasional carbonate stains, with a highly silicious gangue. Has secured ore assaying up to 14 to 23% copper and 24 oz. silver per ton, with small gold values, also galena assaying 11% lead, 24 oz. silver and \$1 gold per ton. Company plans sinking shafts. Property considered promising and present management good.

#### BUTTE-CABLE COPPER & GOLD MINING CO.

MONTANA.

Office: 116 Hamilton St., Butte, Mont. Mine office: Cable, Deer Lodge Co., Mont. R. G. Huston, president; J. Chauvin, secretary and treasurer. Organized Nov. 21, 1906, under laws of Montana, with capitalization \$1,000,000, shares \$1 par. Lands, 6 claims, 4 patented, circa 15 miles west of Anaconda, near the Cable Consolidated Mining Co., showing a 30" vein of ore of commercial grade, opened by tunnel.

**BUTTE-CAROLINA MINING & MILLING CO.** MONTANA.

Office and mine: 47 East Broadway, Butte, Silver Bow Co., Mont. J. R. Ellingwood, secretary and treasurer. Organized circa 1896 with capitalization \$200,000. Company advertised May, 1906, that it would be shipping ore next month, but failed to redeem this promise. Apparently merely a stock-jobbing enterprise.

**BUTTE CENTRAL & BOSTON COPPER CORPORATION.** MONTANA.

Office: 27 State St., Boston, Mass. Mine office: Butte, Silver Bow Co., Mont. Chas. Howard Weston, president; R. G. McMechin, vice-president; John A. Candy, secretary; Freeman I. Davidson, treasurer; Sir F. W. Gordon, chairman executive committee; John M. Cameron, managing director. Organized April, 1906, under laws of Maine, with capitalization \$15,000,000, redated, August, 1906, to \$7,500,000, shares \$10 par, divided into \$2,500,000 cumulative 7% preferred stock and \$5,000,000 common stock. Lands, 2 claims, patented, area 28 acres, one of which is the Ophir mine. In 1906 bought lands of the Butte Northern Copper Co., area 98 acres, over which there was some litigation, apparently now settled. Company claims 8 ore bodies, of which 4 have been developed more or less. The Ophir has 3 veins, carrying fair silver values, with increasing copper values at depth, and with only slight traces of zinc on the 800' level. Company reports veins as of 17' to 90' width, with sulphide ores ranging from a trace to 1% copper, 3% lead, from a trace to 8% zinc, 20 oz. silver and \$1 to \$10 gold per ton. Development is by shafts of 520', 120' and 160', with several other shafts of 20' to 60' depth, giving a total of 9,000' of workings, estimated to show 750,000 tons of ore, with 250,000 tons blocked out for stoping, which seems an overestimate. The Ophir, which has yielded ore assaying up to 7.2% copper, 5 oz. silver and \$2.20 gold per ton, is an old property, operated 1880-1888, when a considerable producer, though poorly opened, with indications that a profitable copper zone may be reached at a depth of about 1,000'. Old shaft was cut down and enlarged, 1907, to 3 compartments. Mine has levels opened at 100' intervals, upper levels having been stopeed out by former owners. Property includes the Snowbird claim, south of the David-Daly, with options on various other claims in Butte.

Equipment includes a 250-h. p. steam plant and 60-h. p. electric plant, 60-h. p. and 500-h. p. hoists and a 7-drill Rand air-compressor. There are several buildings, including an 18x24' carpenter shop, 18x36' smithy, office, engine-house, etc.

Work was suspended December, 1907, previous to which 16 sets of leasers were working, paying 35% royalty on gross values. Second-class ore is stocked, as extracted, and probably can be concentrated later. Ore produced, 1907, carried 30 oz. to 60 oz. silver per ton, with trivial copper values.

Company has confessed judgment of \$51,445 on a note due the Tri-National Copper Corporation, of Boston, and is said to have an indebtedness of circa \$150,000. Considerable property was attached, 1908, but a petition in bankruptcy, filed by sundry creditors, was defeated, circa June, 1908.

**BUTTE CENTRAL COPPER MINING CO.** MONTANA.

Office and mine: Butte, Silver Bow Co., Mont. Organized Apr. 17, 1906, under laws of Montana, with capitalization \$1,000,000, shares \$1 par. Apparently has some connection with the Butte Central & Boston Copper Corporation.

**BUTTE CENTRAL COPPER MINING & SMELTING CO.** MONTANA.

Mine office: Butte, Silver Bow Co., Mont. Organized February, 1906, under laws of Montana, with capitalization \$2,500,000, shares \$5 par. Ap-

parently is the parent company of the Butte Central & Boston Copper Corporation.

#### BUTTE COALITION MINING CO.

MONTANA.

Office: 42 Broadway, New York, N. Y. Mine office: Butte, Silver Bow Co., Mont. Thos. F. Cole, president; John D. Ryan, vice-president; Arthur C. Carson, general manager; preceding officers, Urban H. Broughton, Capt. Thos. Hoatson, Chester A. Congdon, Benj. B. Thayer, F. L. Ames and Wm. Dixon, directors; J. W. Allen, secretary; Jas. O'Grady, treasurer; Geo. Moulthrop, superintendent.

Organized Feb. 24, 1906, under laws of New Jersey, with capitalization \$15,000,000, shares \$15 par. Retired, 1906-1907, bonds at 6% to amount of \$3,500,000, these being \$2,500,000 bonds of Nipper Consolidated Copper Co. and \$1,000,000 bonds of Montana Ore Purchasing Co. Paid initial dividend, Sept. 17, 1906, and to Dec. 31, 1907, had paid dividends of \$2.45 per share, first dividend being 40 cents, 3 next 50 cents each, and last, December, 1907, being 15 cents per share. Dividends were passed, first half 1908. American Trust Co., Boston, transfer agent. Old Colony Trust Co., Boston, registrar. Shares are listed on the Boston stock exchange. Net income, 1907, was \$1,461,465, and company began 1908 with cash, on hand and in banks, \$3,503,156, with liabilities of only \$5,842. Company began business with \$4,000,000 cash.

The Butte Coalition Mining Co. holds its properties through the Red Metal Mining Co., which has direct title, but entire stock issue of the Red Metal is owned by Butte Coalition, hence the property is described under this title, although the Red Metal is the operating company, in Butte.

The Butte Coalition was formed by the joint efforts of John D. Ryan and Thos. F. Cole, to put an end to the desperate litigation that had raged for 7 years between the Amalgamated and Heinze interests. This end was effected, the Butte Coalition taking over all of the Heinze holdings except La France Copper Co., properties and interests so taken over including the Montana Ore Purchasing Co., Nipper Consolidated Copper Co., Guardian Copper Co., Minnie Healy Mining Co., Belmont Mining Co., Johnstown Mining Co., Hypocka Mining Co. and Corra-Rock Island Mining Co., in addition to which the company owns a controlling interest in the Alice Gold & Silver Mining Co.

Lands are circa 145 acres, including various preponderant fractional interests, with a total of about 60 claims and fractional claims, also mineral rights to 108 town lots in Butte, on one of which the Glengerry mine is located. Principal properties are the Rarus group, Nipper group and the Corra group, also a 38% interest in the Pennsylvania mine, of which the Boston & Montana owns 62%, the Pennsylvania being described under the title of Boston & Montana. Properties turned over by the various Heinze companies were largely interlocking fractional interests in various Heinze properties.

Company's principal productive mines are in the Rarus group, which includes the Minnie Healy, Rarus, Tramway and Snohomish mines. The Minnie Healy, area circa 5 acres, is perhaps the best mine of the Butte Coalition, as matters now stand. The Minnie Healy adjoins the Leonard and Colusa mines, the best properties of the Boston & Montana, and had a 2-compartment 1,400' shaft, connected underground with the Leonard, Rarus and Tramway mines, but shaft was lost through fire, 1907-1908, on the 600' and 700' levels, and the mine is to be operated through the new Rarus shaft. The Minnie Healy shows a mineralized zone of 200' to 300' extreme width, carrying ore of excellent average grade.

The Barus has a 3-compartment shaft, 2,000' deep, August, 1908, which will operate the Minnie, Healy, Tramway and Snohomish mines also. Ore body is not clearly defined, but is upwards of 300' wide in places, and of good grade, averaging about 4% in copper tenor. Levels are opened at 200' intervals, and the mine is timbered with square sets. Little stoping has been done below the 800' level. A Webster Camp & Lane 32x32" hoist operates 2 double-deck cages, with 6-ton skips swung under.

The Johnstown, area 6.66 acres, is a fractional claim lying next east of the Barus, and is operated as part of the Barus mine.

The Tramway, lying between the Minnie Healy and Barus, owned one-third by Butte Coalition and two-thirds by the Butte & Boston Consolidated Mining Co., has a 3-compartment 1,700' shaft, but will be operated partly through the new Barus shaft. Mine shows a large body of very rich chalcocite on the 1,400' level. Shaft has a 108' steel headgear with 3 sheaves, and a 2,500-h. p. hoist.

The Snohomish mine, adjoining the Tramway, south of the Minnie Healy, is owned half and half by Butte Coalition and Butte & Boston, and is operated in connection with the Tramway.

The Mountain Chief claim, area 1.15 acres, lies next north of the Butte-Balaklava, and is said to have produced about \$1,500,000 worth of ore, from a shallow shaft which was blown up by dynamite, under the Heinze regime, on account of litigation, injunctions and dynamite being the favored weapons of those happy days.

The Nipper group includes the Nipper, Chief Joseph, Balm and L. E. R. claims. The Nipper mine, area 15.18 acres, has 2 shafts, of circa 1,000' and 1,200' depth, with 12 exits, being connected underground with the Parrot, Never Sweat and Little Minah mines, and has been operated to some extent through the Parrot shaft. Mine is timbered with 10x10" square sets.

The Belmont mine, adjoining the Anaconda and formerly having ore hoisted through the Anaconda shaft, has an 1,800' shaft, cut down to 3 compartment size and retimbered. Upper levels showed ore rich in silver, with an impoverished zone at depth of circa 350', but good ore shows again at 1,000'. The Belmont Mining Company turned over to the Butte Coalition sundry fractional interests, with claims aggregating 67½ acres, lying in the southeastern part of Butte.

The Corra group, turned over by the Corra-Rock Island Mining Co., includes the Corra and Rock Island mines, with a ninth interest in the Silver Queen, a third interest each in Robert Emmet I and II, a seventh interest in the Snoozer and a half interest in the Blackfoot. The Corra mine has a 2,200' shaft, with mainly silver values above the 1,000' level, below which the ore is low in copper, and higher in silver than the average of the district. The area of the Corra-Rock Island group is circa 30 acres, including the Corra mine of 13.15 acres, Rock Island mine of 5.15 acres and Snoozer of 9.37 acres.

The Glengerry mine, having an 800' shaft, has the mineral rights to sundry town lots in Butte.

Miscellaneous claims, slightly developed or practically virgin, owned in whole or part by the Butte Coalition, include the Little Ida claim, area 1 acre; Nightingale, area 1.3 acres; Sweitzer, area 3.5 acres; Highland Chief, area 12 acres; Mountain Chief No. 3, Black Diamond, Wild Goose, A. J. P., Hazley, Pompey, Montana, Clifton, Scottish Chief, Lioness, Kinkaid and Taffy.

The Alice property, controlled through stock ownership, is described under title of Alice Gold & Silver Mining Co.

The ore of the Butte Coalition is smelted under contract by both the

Boston & Montana and Anaconda smelters, going mainly to the Washoe Works.

In September, 1907, production was reduced about two-thirds and was suspended December 1st, until early spring. Production, 1907, was circa 377,000 tons of ore, returning an average of 51.47 lbs. copper and up to 18 oz. silver per ton, yielding 19,416,377 lbs. fine copper, 444,809 oz. silver and 2,480 oz. gold. For 1908 ore treated gave average returns of 75.86 lbs. copper and 2.216 oz. silver per ton. About 10% of the ore mined is of smelting grade, averaging 9% in copper tenor, balance being concentrating ore. The various mines have a large amount of ore developed, and reserves are being added systematically, despite difficulties caused by the Minnie Healy fire. The property has a maximum productive capacity of about 2,000 tons of ore daily, or circa 35,000,000 lbs. fine copper yearly, at a cost of about 10 cents per pound, and before the drop in metal prices, 1907, was yielding about 1,600 tons daily. Costs, April, 1908, were said to be under 8.5 cents per pound. Ores mined July, 1908, were said to average about 5% copper and \$2 per ton in combined gold and silver values. The numerous properties of the Butte Coalition are of greatly varying values, but include some excellent mines, and the management is experienced, aggressive and capable.

#### **BUTTE & COEUR D'ALENE MINING CO.**

**MONTANA.**

Office: care of F. C. Robertson, Spokane, Wash. Mine office: Saltese, Missoula Co., Mont. Organized circa July, 1907, under laws of Washington, with capitalization \$1,500,000, shares \$1 par. Lands, 9 claims, adjoining the Boston-Colby, having a 670' crosscut tunnel showing a vein carrying oxidized copper ores of low average tenor and a 2' vein of silver-lead ore assaying up to 10% lead and 100 oz. silver per ton.

#### **BUTTE COMMERCIAL COPPER MINING & DEVELOPMENT CO.**

**MONTANA.**

Dead. Formerly at Butte, Silver Bow Co., Mont. Described Vol. VI.  
**BUTTE CONSOLIDATED COPPER CO.**

**MONTANA.**

Letter returned unclaimed from former office and mine, Butte, Silver Bow Co., Mont. Capt. Alvin P. Nipgen, president; Robt. J. Buckley, vice-president; Frank M. Douglass, secretary and treasurer; preceding officers, Dr. W. R. Lincoln and S. H. Johnson, directors. Organized Jan. 12, 1906, under laws of Montana, with capitalization \$6,000,000, shares \$1 par. Lands, 34 claims, area circa 500 acres, including 10 patented claims, known as the Basic group, adjoining the Butte & Bacon on the north, having a 265' tunnel and a 2-compartment 150' shaft, latter very wet. Idle.

#### **BUTTE CONSOLIDATED COPPER MINING CO.**

**MONTANA.**

Office: care of D. D. Twohy, president, Butte, Silver Bow Co., Mont. Mine office: Corbin, Jefferson Co., Mont. Martin Mulvahill, vice-president; preceding officers, C. D. McCarthy, T. J. Walsh and C. R. Griswold, directors. Organized June 30, 1906, under laws of Montana, with capitalization \$600,000, shares \$1 par. Lands, northeast of the Corbin-Wickes, have a 300' shaft with crosscut, seeking the Bertha vein, which has developed a little sulphide ore giving assays of 30 oz. silver. Has steam power.

#### **BUTTE CONSOLIDATED MINING CO.**

**MONTANA.**

Dead. Property, known as the Red Lake Placers, including the Ella mine, is now held by the British Butte. Was promoted by J. Brown Goode, presumably the same as Jas. B. Goode, better known as "Jimmy Be Good," a notorious mining swindler of St. Louis. Formerly at Butte, Silver Bow Co., Mont.

#### **BUTTE CONTINENTAL COPPER MINING CO.**

**MONTANA.**

Office and mine: Butte, Silver Bow Co., Mont. Dr. G. E. Blackburn, president; J. Bruce Kremer, vice-president; E. J. Baker, treasurer; C. E.

Alsop, secretary; preceding officers and Fred Tomek, directors. Organized January, 1907, with capitalization \$1,000,000. Lands, 8 claims, area 160 acres, partly patented, on the continental divide, about 5 miles east of Butte, showing a big vein, on which it is hoped that commercial ore may be found at circa 500' depth. The Maryland claim has shafts of 50' and 150', latter showing about 4' of ore giving assays of 3 to 8% copper.

**BUTTE COPPER CO.****MONTANA.**

Dead. Held bonds on the Jessie and other claims. No relation to present Butte Copper Co. Formerly at Butte, Silver Bow Co., Mont.

**BUTTE COPPER CO.****MONTANA.**

Office and mine: Butte, Silver Bow Co., Mont. Organized March 13, 1906, with capitalization \$1,500,000, shares \$1.50 par. Is controlled, through stock ownership, by the Butte Copper Montana, and apparently is a twin of the Butte Copper Mining Co.

**BUTTE COPPER BELT MINING CO.****MONTANA.**

Dead. Formerly at Butte, Silver Bow Co., Mont. Described Vol. VI.

**BUTTE COPPER EXPLORATION CO.****MONTANA.**

Dead. Formerly at Butte, Silver Bow Co., Mont. Fully described Vol. VI.

**BUTTE COPPER KING MINING CO.****MONTANA.**

Letter returned unclaimed from former office and mine, Butte, Silver Bow Co., Mont. Organized Apr. 19, 1906, under laws of Montana, with capitalization \$1,500,000, shares \$1.50 par. Lands, 8 fractional claims, area 28 acres, west of the Jennie Dell mine. In August, 1906, was said to plan sinking a shaft on the Missouri Girl claim, but nothing since heard of the proposed shaft.

**BUTTE COPPER MINING CO.****MONTANA.**

Office and mine: Butte, Silver Bow Co., Mont. Organized March, 1906, with capitalization \$1,500,000, shares \$1.50 par. Is controlled, through ownership of majority of stock, by Butte Copper Montana, latter being practically a reorganization of the Butte Copper Co. Apparently is a twin of the Butte Copper Co.

**BUTTE COPPER MINING & SMELTING CO.****MONTANA.**

Dead. Formerly at Butte, Silver Bow Co., Mont. Described Vol. V.

**BUTTE COPPER MONTANA.****MONTANA.**

Office: 42 Broadway, New York, N. Y. Letter returned unclaimed from former mine office, Butte, Silver Bow Co., Mont. C. E. Burrelle, president; E. H. Sherman, vice-president; John MacGinnis, general manager; W. L. Lawler, treasurer; preceding officers and W. L. Moyer, directors; Robt. Haugwirth, superintendent. Organized Dec. 1, 1906, under laws of Maine, with capitalization \$1,750,000, shares \$1 par. Trust Company of America, New York, transfer agent. Was practically a reorganization of the Butte Copper Mining Co., but apparently was formed without the knowledge of the Butte owners of the old company's lands and without notice to shareholders, plan of promotion seeming decidedly devious. Controls, through stock ownership, the Butte Copper Co. and Butte Copper Mining Co. Lands, owned or claimed to be owned, apparently are the Trifle, Anselmo 1 and 2, and a part interest in Robert Emmet 1 and 2. Lands lie just west of Missoula Gulch, there being a total of 5 patented claims, area circa 35 acres, but the Butte Copper Mining Co. apparently claims to own these lands outright. Lands are supposed to carry the Gagnon and Stewart veins, the North Anselmo vein supposedly being an extension of the Gagnon. Properties have produced about \$700,000 in gold and silver, mainly in the latter, some bonanza ore in the past running up to 9,000 oz. silver per ton. Principal development is on the Trifle claim, which has a 700' shaft, planned to be sunk to 1,000' depth, which ent

a large vein at depth of 375', this giving assays of about 4% copper from selected ores. Machinery plant is good for 1,000' depth. The Emmet claims have a 300' shaft, said to show 7% copper in the bottom when former operators were driven out by water and lack of cash. Work suspended July, 1907. Is not regarded favorably.

#### BUTTE COPPER & ZINC CO.

MONTANA.

Mine office: Butte, Silver Bow Co., Mont. Alvin L. Strasburger, president; A. J. Seligman, vice-president; A. L. Bailey, secretary and treasurer; preceding officers, C. A. Wimpfheimer, Dr. Maurice Eisenberg, Bernard Naumburg, W. L. Moyer and V. Thiegeberg, directors. Organized Nov. 28, 1904, under laws of Maine, with capitalization \$2,500,000, shares \$5 par, practically as a reorganization of the Montana Zinc Co. Property is the Emma mine, which has proven a hoodoo to all of its possessors, and has brought to financial grief every company that ever attempted working it. Idle, and finances practically exhausted in paying for property.

#### BUTTE & CORBIN CONSOLIDATED COPPER MINING CO. MONTANA.

Office: Butte, Mont. Mine office: Corbin, Jefferson Co., Mont. Matthew Dunn, president; Lee Dever, vice-president; J. B. Fitzpatrick, secretary and treasurer. Organized April, 1907, under laws of Montana, with capitalization \$700,000, shares \$10 par. Lands, 5 claims, on the eastern side of Valparaiso Mountain. Development was interrupted by a suit of the Copper-Mountain Mining & Smelting Co., decided April, 1908, in favor of the Butte & Corbin.

Development is by the Barus tunnel, said to show an 11' vein assaying 2.5% copper, with a 4' paystreak carrying mainly covellite, assaying 6% copper, 8 oz. silver and \$3 gold per ton. Is said to plan a new machinery plant.

#### BUTTE-CORBIN COPPER CO.

MONTANA.

Office: care of R. P. Barclay, Butte, Mont. Mine office: Corbin, Jefferson Co., Mont. Organized Dec. 1, 1906, under laws of Montana, with capitalization \$500,000, shares \$1 par. Lands, sundry claims in the Corbin district, said to show 7' of high grade ore.

#### BUTTE-CURTIS & MAJORS COPPER MINING CO.

MONTANA.

Office and mine: Butte, Silver Bow Co., Mont. Geo. D. Curtis, manager. Organized Sept. 20, 1906, under laws of Montana, with capitalization \$1,000,000, shares \$2 par. Lands, in the southern part of Butte, have a shaft circa 200' deep. Presumably idle.

#### BUTTE & DULUTH COPPER CO.

MONTANA.

Office: care of Julius D. Howard, Duluth, Minn. Mine office: Butte, Silver Bow Co., Mont. Preceding officer, Fred Stroh, J. D. Welcome, Otto Stroh and Wm. Burrell, directors. Organized 1906, under laws of Montana, with capitalization \$1,000,000, shares \$1 par. Property was an option on sundry lands in the Butte district.

#### BUTTE & ELLISTON GOLD & COPPER MINING CO.

MONTANA.

Office: care of Patrick Wall, Butte, Mont. Letter returned unclaimed from former mine office, Elliston, Powell Co., Mont. Said, 1907, to be paying quarterly dividends of 1½ cents per share. Mine, 6 miles from Elliston, circa 300' deep, shipped ore, 1907, averaging about 8% copper, 17 oz. silver and \$10 gold per ton. Employed circa 25 men at last accounts.

#### BUTTE & ELY COPPER CO.

NEVADA.

Office: 130 Pennsylvania Bldg., Butte, Mont. Mine office: Ely, White Pine Co., Nev. F. L. Melcher, president; Malcolm Gillis, vice-president; Chas. L. Scott, secretary; John L. Carroll, treasurer; preceding officers, Dr. Tom D. Moore and E. F. Pelton, directors; J. B. Leggat, managing director. Organized July 27, 1905, under laws of Montana, with capitalization \$500,000, shares

\$1 par. Stock was made assessable in 1907. Lands, 12 claims, area 210 acres, lying between the Nevada Consolidated and Giroux Consolidated, have shafts of 200', 200' and 300', latter with steam hoist, showing sulphide ore of low tenor, but of some promise, in all shafts. Property includes a water-right, 20 miles distant, said to be capable of supplying 2,000,000 gallons daily. Suspended operations late 1907.

**BUTTE EXEMPTION COPPER CO.****MONTANA.**

Office: Spokane, Wash. Letter returned unclaimed from former mine office, Butte, Silver Bow Co., Mont. Wm. A. Nicholls, president; F. J. Finnane, treasurer; Geo. Seely, secretary; N. E. Linsley, consulting engineer. Organized May 20, 1906, under laws of Maine, with capitalization \$2,500,000, shares \$1 par. Knickerbocker Trust Co., New York, registrar. Trust Co. of America, New York, transfer agent. Lands are the Mountain Spur claim and a  $\frac{1}{4}$  interest in the Colleen Bawn, Canyon and Exemption claims, other fourth being owned by Butte Coalition Mining Co. Lands lie east of the Billwhacker, and a tunnel on the Exemption claim has shown a small vein giving ore assaying 5% copper.

**BUTTE & FURNACE CREEK COPPER MINING CO.****CALIFORNIA.**

Dead. Organized 1906; name changed, circa September, 1906, to Furnace Creek Extension Copper Co. Formerly at Greenwater, Inyo Co., Cal.

**BUTTE-FURNACE RANGE COPPER CO.****CALIFORNIA.**

Office: care of Jos. H. Vivian, Butte, Mont. Mine office: Greenwater, Inyo Co., Cal. Dr. H. D. McDonald, president; A. H. Mueller, secretary and treasurer. Organized June 15, 1906, under laws of Montana, with capitalization \$1,000,000, shares \$1 par. Lands, 4 claims, adjoining the Furnace Creek Copper Co.

**BUTTE GOLD, SILVER & COPPER CO.****WASHINGTON.**

Office: Spokane, Wash. Lands are about 25 miles from head of Lake Chelan, Washington, showing 2 veins, one 8' wide, opened by tunnels. Idle and apparently moribund.

**BUTTE GREEN COPPER CO.****MONTANA.**

Office and mine: care of Samuel A. Hall, general manager, Butte, Silver Bow Co., Mont. Organized February, 1906, under laws of Montana, with capitalization \$500,000, shares \$1 par. Lands include the Green claim, near the Belmont mine of the Butte Coalition. Employed about 20 men, and was claimed to be producing 15 to 20 tons of good copper ore daily, in March, 1906, but shortly later dropped out of sight.

**BUTTE & GREENWATER COPPER CO.****CALIFORNIA.**

Office: care of Wallace Corbett, president, Butte, Mont. Mine office: Greenwater, Inyo Co., Cal. Daniel P. Murphy, vice-president; J. V. Shaw, secretary; O. O. Kinkaid, treasurer; preceding officers, John Adams and R. P. Kelley, directors. Organized October, 1906, under laws of South Dakota, with capitalization \$1,500,000. Lands, 10 claims, near the center of the Greenwater district, showing 6 veins giving assays up to 6% copper. Has a 60' shaft. Idle.

**BUTTE-HERCULES COPPER CO.****MONTANA.**

Office and mine: Butte; Silver Bow Co., Mont. Thos. F. Stephens, president; D. J. Charles, vice-president; C. M. Parr, secretary; Geo. E. DeSnell, treasurer; preceding officers, Emil H. Renisch and C. S. Passmore, directors. Organized 1906, with capitalization \$2,500,000. Lands, 10 claims, near the old Trenton concentrator, in the southwestern portion of the Butte district, slightly prospected by a 75' crosscut tunnel, said to show a 55' vein with 18" paystreak carrying medium grade values in copper, lead, silver and gold. Sunk a 100' shaft and suspended operations February, 1907.

**BUTTE HILL COPPER MINING CO.****MONTANA.**

Office: 1538-42 Broadway, New York, N. Y. Mine office: Butte, Silver Bow Co., Mont. James Higgins, president; Dr. Maurice Eisenberg, vice-president. Organized Apr. 18, 1906, under laws of Montana, with capitalization \$5,000,000, shares \$5 par. Lands, 11 claims, area 173 acres, in an undeveloped district north of Walkerville and about 1 mile from previous mining attempts. Has a 200' shaft, cutting a vein of 40' estimated width, showing a few stringers and bunches of ore assaying up to 3% copper and 20 oz. silver per ton. Idle at last accounts.

**BUTTE & IDAHO GOLD & COPPER MINING CO.****IDAHO.**

Mine office: Salmon, Lemhi Co., Idaho. Wallace Corbett, president; A. L. Desourdy, vice-president; Dr. W. H. Haviland, secretary and treasurer; T. H. Emery, assistant secretary and treasurer. Lands, 6 claims, a millsite and a water right, on the northern fork of Carmen Creek, near Salmon, having a 207' tunnel cutting a 6' vein carrying medium grade auriferous and argentiferous copper ore, with other tunnels of 78' and 150' showing other ore bodies, mine having a total of 600' of workings.

**BUTTE & IOWA MINING CO.****MONTANA.**

Mine office: Butte, Silver Bow Co., Mont. Apparently moribund.

**BUTTE-KNICKERBOCKER MINING CO.****MONTANA.**

Office and mine: Butte, Silver Bow Co., Mont. Geo. H. Conaway, vice-president and general manager; preceding officer, B. F. White; Geo. H. Roberts, Samuel H. Treloar and Thomas Davidson, directors. Organized Nov. 27, 1906, under laws of Montana, with capitalization \$5,000,000, shares \$5 par.

Lands are in 3 groups, the main group of 4 claims including the Jennie Dell, Twilight, October and La Monta claims, lying west of the Lexington and of Missoula Gulch. The Jennie Dell has a 450' shaft, showing, at 358', a 10' ledge, supposedly the continuation of the Lexington vein, carrying about 1% copper, with small gold and silver values. Company is said to plan sinking a 200' shaft on the La Monta claim.

The Determination group of 14 claims, said to have been secured early 1908, lies west of the Butte & Bradley and northwest of the Butte & Bacorn.

The Golden Leaf group, secured 1908, under a 8-year bond and lease, consists of 20 claims, near Bannock, Beaverhead county, Montana, and includes the Montana and Old Gold mines, latter having a mill, which it is planned to remodel.

**BUTTE LODGE EXTENSION MINING CO.****MONTANA.**

Office and mine: Butte, Silver Bow Co., Mont. John MacGintis, president; Chas. S. Warren, vice-president; John M. Murphy, secretary; C. J. Kelly, treasurer; preceding officers and Jos. Russell, directors. Organized Apr. 28, 1906, under laws of Montana, with capitalization \$500,000, shares \$1 par. Lands, 4 claims, known as the St. Angus group, 12 miles northeast of Butte, having a 150' shaft with a crosscut showing 2 veins.

**BUTTE & LONDON COPPER CO.****MONTANA.**

Dead. Organized 1905 and name changed, 1906, to Butte & London Copper Development Co. Formerly at Butte, Silver Bow Co., Mont.

**BUTTE & LONDON COPPER DEVELOPMENT CO.****MONTANA.**

Office and mine: 46 East Broadway, Butte, Silver Bow Co., Mont. Hon. Theo. Brantley, president; James H. Lynch, vice-president; W. E. Reynolds, secretary; Alex. Johnston, treasurer; preceding officers, James A. Talbot, E. J. Anderson, Charles F. Booth, W. W. McDowell, Charles J. Kelly, Guy W. Stapleton, B. F. White and Herman B. Eisenberg, directors; T. H. Emery, assistant secretary; Thos. W. Heather, superintendent. Organized, 1905, under laws of Arizona, with capitalization \$5,000,000, shares \$5 par, as the Butte & London

Copper Co.; title changed April, 1900. Company reported, circa June 1900, assets of \$5,439,527.08, including cash and stock in the treasury, but suspended operations 1907 from lack of funds.

Lands, 113 acres, known as the Greendale placer claims, lying immediately north of the Pittsburg & Montana, and stated by management supposedly to carry the eastern extension of the veins of the North Butte, which is a rather remarkable claim, considering that the North Butte veins have as yet given no indications of a desire to turn at right angles in order to dive under the Greendale placers.

Development is by a 3-compartment 1,130' shaft. North and south crosscuts on the 1,100' level are said to show several veins, one up to 20' in width, the southern crosscut showing ore assaying 2% copper, 50 oz. silver and \$2 gold per ton, but no commercial ore has been developed.

Equipment includes four 125-h. p. boilers, Corliss double-conical drum hoist and a 5-drill air-compressor. Company in bad shape financially, at last accounts, and apparently under the necessity of raising fresh funds or reorganizing. Property, while not devoid of promise, is outside the proven ore zone of Butte.

#### BUTTE & MADISON MINING CO.

MONTANA.

Mine office: Rochester, Madison Co., Mont. Has a 150' two-compartment shaft.

#### BUTTE & MICHIGAN MINING CO.

MONTANA.

Office and mine: care of Dr. Wm. S. Bishop, Butte, Silver Bow Co., Mont. Organized Apr. 28, 1906, under laws of Montana, with capitalization \$1,000,000, shares \$1 par. Lands, in Leslie Gulch, 6 miles southeast of Butte and only  $\frac{1}{2}$  mile southeast of the poor farm, have a 250' shaft on the Julian claim. Presumably idle.

#### BUTTE-MILWAUKEE COPPER CO.

MONTANA.

Office: care of G. M. Minzesheimer & Co., New York, N. Y. Mine offices: Owlesley Blk., Butte, Silver Bow Co., Mont., and Argenta, Beaverhead Co., Mont. John F. Cowan, president and manager; B. E. Calkins, vice-president; C. H. Smith, secretary and treasurer; John H. Mills, superintendent. Organized March 28, 1906, under laws of Montana, with capitalization \$3,000,000, shares \$2 par. Is controlled, through ownership of about 80% of issued stock, by Butte & New York Copper Co., which exchanged 304,000 shares of its stock for 760,000 shares of treasury stock of the Butte-Milwaukee, there being some complaint by shareholders over this deal.

Lands, 6 claims, near the Butte & Argenta, at Argenta, on which apparently no work has been done, and 5 adjoining claims, known as the Pollock, Col. Sellers, Bird, Florence and Stonewall, about a mile north of the North Butte. Final payment on the Butte claims is due February, 1909.

The Pollock mine is said to have produced \$400,000 worth of ore, some years ago, mainly in gold and silver, though a little ore running 2% copper and 15 oz. silver per ton, with small gold values, was produced, 1906, by present owners. The Pollock has 4 veins, of which 2 are developed by a short tunnel and 750' shaft. Equipment includes a 5-ton Nordberg first-motion hoist, good for 2,000' depth.

The Col. Sellers mine, having a 605' shaft, is said to give promising surface indications. The Florence also has a shallow shaft. Work was resumed circa April, 1908, after some months idleness.

#### BUTTE MINE & EXPLORATION CO.

MONTANA.

Dead. Formerly at Butte, Silver Bow Co., Mont. Described Vol. VI.

#### BUTTE MINES EXPLORATION CO.

UTAH.

Office: care of Wallace Corbett, director, Butte, Mont. Letter returned unclaimed from former mine office, Teeoma, Elko Co., Nev. Capitalization, \$1,500,000. Lands are in Box Elder county, Utah, near the Nevada line.

**BUTTE MINING & DEVELOPMENT CO.****MONTANA.**

Dead. Formerly at Butte, Silver Bow Co., Mont. Described Vol. II.  
**BUTTE MONITOR TUNNEL MINING CO.** **MONTANA.**

Office: care of C. W. Pomeroy, vice-president, 63-263 La Salle St., Chicago, Ills. Letter returned unclaimed from former mine office, Butte, Silver Bow Co., Mont. Wm. S. Switzer, president, secretary and treasurer. Capitalization, \$3,750,000, shares \$1 par. Lands, 7 claims, area circa 102 acres, opened by tunnels of 300' and 1,800', showing chalcopyrite averaging about 2% copper and 2 oz. silver per ton, with small gold values. Idle for some years.

**BUTTE MONTANA MINING CO.** **MONTANA.**

Mine office: Butte, Silver Bow Co., Mont. T. M. Barnsball, president; J. T. Browning, vice-president; W. H. Lindsay, secretary, treasurer and general manager; preceding officers, F. J. Bennett, J. K. McMullen, John B. Chatman and C. W. Whitecomb, directors. Organized Feb. 13, 1906, under laws of Montana, with capitalization \$1,000,000, shares \$1 par. It is reported that F. Augustus Heinze is in control, but this is not credited.

Lands include the Alexander Scott and Little Annie claims. The Alex. Scott, said to be owned outright, is a fractional claim of about 5 acres area, adjoining the West Colusa mine on the north, having about 500' of the strike of 4 veins, opened by a 1,050' shaft, showing on the 600' level an 18" pay streak of high grade ore, mainly chalcocite, and it is claimed that \$1,000,000 worth of ore has been blocked out on this level. In April, 1908, leasers were shipping, to the Pittsmont smelter, 75 to 100 tons weekly, of ore said to run 20% to 30% copper, with good gold and silver values, taken from the 600' level. The Boston & Montana did some sinking, 1908, in the Alex. Scott shaft, for the purpose of reaching the fire zone in the Leonard and Colusa mines.

The Little Annie claim, lying between the Goldsmith and Little Georgia claims, northwest of Walkerville, has 200' shaft, and is idle.

The Alex. Scott claim is most excellently located, and scarcely can fail to make a good mine, if properly developed. A reorganization is said to be planned.

**BUTTE & NEW YORK COPPER CO.****MONTANA.**

Office: care of G. M. Minzesheimer & Co., New York, N. Y. Mine office: Butte, Silver Bow Co., Mont. Jas. A. Talbot, president; Harry E. Mittenthal and Wm. L. Moyer, vice-presidents; B. Binnard, secretary; Lee Schlesinger, treasurer. Organized circa October, 1906, under laws of South Dakota, with capitalization \$4,000,000, shares \$5 par. Is a holding company only, controlling the Butte-Milwaukee Copper Co. through ownership of about 80% of stock issue, having exchanged 304,000 shares of Butte & New York for 760,000 shares of the treasury stock of the Butte-Milwaukee, there being some complaint over the transfer by shareholders of the latter. Is said also to control, through total stock ownership, the Montana Consolidated Copper Co. Suit was brought April, 1907, for a share of the partnership profits of promotion by John C. McIntyre and Wm. Saidow.

**BUTTE-NEW YORK COPPER CO.****MONTANA.**

Dead. New Jersey charter forfeited, 1903, account of unpaid taxes. Formerly at Butte, Silver Bow Co., Mont.

**BUTTE NORTHERN COPPER CO.****MONTANA.**

Dead. Lands sold, 1906, to Butte Central & Boston Corporation. Formerly at Butte, Silver Bow Co., Mont. Described Vol. VI.

**BUTTE-POTOSI MINING CO.****MONTANA.**

Mine office: Pony, Madison Co., Mont. Organized Dec. 1, 1906, under laws of Montana, with capitalization \$1,000,000, shares \$1 par. Has a 740' tunnel, showing stringers of argentiferous copper sulphides assaying up to 25% copper and 21 oz. silver per ton with traces of gold. Idle early 1908, but said to plan resumption.

**BUTTE RANGE COPPER MINING CO.****MONTANA.**

Office: care of Geo. B. Conway, Butte, Mont. Organized Dec. 2, 1906, under laws of Montana, with capitalization \$1,000,000, shares \$1 par.

**BUTTE & RED EAGLE COPPER CO.****MONTANA.**

Office and mine: care of A. A. McMillan, Butte, Silver Bow Co., Mont. Organized circa May, 1907, under laws of Montana, with capitalization \$5,000,000, shares \$5 par, by J. D. Simons, Fayette Harrington, et al. Lands, 6 claims, southeast of the Butte & Bacorn, opened by a tunnel, circa 400' long, on the Red Eagle claim, showing little or no ore.

**BUTTE REDUCTION WORKS.****MONTANA.**

Owned by Colusa-Parrot Mining & Smelting Co.

**BUTTERNUT GOLD & COPPER MINING CO.****ARIZONA.**

Dead. Formerly at Humboldt, Yavapai Co., Ariz.

**BUTTE & ST. LOUIS MINING CO.****MONTANA.**

Dead. Formerly at Butte, Silver Bow Co., Mont. Fully described Vol. VI.

**BUTTE & SPOKANE MINING CO.****MONTANA.**

Office: care of Patrick Clark, Spokane, Wash. Mine office: Butte, Silver Bow Co., Mont. Organized 1905, to take over sundry claims at Butte. Apparently succeeded by Bullwhacker Copper Co.

**BUTTE STANDARD COPPER MINING CO.****MONTANA.**

Office and mine: 51 East Broadway, Butte, Silver Bow Co., Mont. W. H. Hall, president; Hon. C. E. Nolan, vice-president; T. E. Collins, treasurer; preceding officers, J. L. Templeman and A. M. Stevens, directors. Organized circa May, 1907, under laws of Montana, with capitalization \$1,000,000, shares \$1 par.

**BUTTE & SUMMIT VALLEY COPPER MINING CO.****MONTANA.**

Office and mine: Butte, Silver Bow Co., Moht. C. D. Joslin, vice-president; Jas. A. Talbott, treasurer; J. W. Thomas, secretary; H. H. Taft, superintendent. Organized Apr. 9, 1908, under laws of Montana, with capitalization \$3,000,000, shares \$5 par. Lands, 5 claims, area 67 acres, in Saratoga Gulch, southeast of Butte, near the Ida-Montana, having 2 shafts, deepest 500'. Did some diamond drilling early 1908.

**BUTTE & SUPERIOR COPPER CO.****MONTANA.**

Office: Duluth, Minn. Mine office: Butte, Silver Bow Co., Mont. Capt. Augustus B. Wolvin, president; presiding officer, Archibald M. Chisholm, W. L. Brown, Arthur H. Wethey, John F. Killoran and Thos. J. Davis, directors; Victor Rakowsky, consulting engineer; R. C. Davis, superintendent. Organized August, 1906, under laws of Arizona, with capitalization \$6,000,000, shares \$5 par. Bonds, \$500,000, first-mortgage, at 8%, authorized; issued, \$201,000.

Lands, 6 claims, including the Black Rock, Niagara, Raymond and Old Silver mines. Principal property is the Black Rock, which had a 500' shaft that has been cut down to 3-compartment size, and was 1,175' deep July 1, 1908. The Black Rock carries an exceptionally strong vein, ranging 50' to 100' in width, with mainly silver values, but with ore up to 3% in copper tenor on the 300' level, with mainly zinc ore showing below. It is believed by the management that the zinc will be replaced, at considerable depth, by a large body of ore of commercial grade. The Black Rock shaft has a 60' gal-lows frame.

The Niagara mine, worked by leasers, 1907, produced a little ore carrying up to 200 oz. silver per ton.

The plant at the Black Rock is exceptionally good, including 7 boilers, a 500-h. p. double-drum hoist good for 2,000' air-compressor and a small electric plant. Buildings include combined engine-house and boiler-house, of steel and brick, a good carpenter shop and other necessary mine structures. Company

plans to complete the electrification of its works, holding the steam plant in reserve as an auxiliary.

Production was suspended, late 1907, because of refusal of smelters to buy ore from leasers. Company has secured several extensions of payments due on its bond. The directorate includes a number of experienced and successful mining men. The property is outside the proven copper zone of Butte, but if the popular theory is correct, and zinc ore is succeeded by copper at depth, the Butte & Superior has excellent prospects of making a good mine.

#### BUTTE & VERONICA COPPER MINING CO.

MONTANA.

Letter returned unclaimed from former mine office, Butte, Silver Bow Co., Mont. John F. Hogan, Maurice Lenihan, M. H. McNulty, John J. Lenihan and Lewis P. Forestell, directors. Organized Apr. 20, 1906, under laws of Montana, with capitalization \$1,500,000, shares \$2.50 par. Lands, 2 claims, area 12 acres, west and south of the Belmont, opened by shafts of 70' and 130'. Shipped a little ore, 1906, ranging 5 to 10% copper tenor. Idle.

#### BUTTE & WALKER LAKE MINING CO.

NEVADA.

Office: Butte, Silver Bow Co., Mont. Mine office: Loma, Esmeralda Co., Nev. Carroll E. Dolan, secretary and treasurer; F. A. E. Starr, superintendent. Lands, 3 miles south of Loma, are said to show, at 60' depth, a 50' vein in granite, carrying melaconite, malachite and chalcopyrite assaying 4.5% copper and \$1 gold per ton.

#### BUTTE-WALLACE COPPER & SILVER MINING CO.

IDAHO.

Mine office: Wallace, Shoshone Co., Idaho. Has 2 tunnels on a vein said to be 15' to 35' wide, with a 2-compartment blind shaft sunk from the lower level, showing ore giving assay values in copper and silver.

#### BUTTE-WALL STREET MINING CO.

MONTANA.

Office: care of Geo. Benjamin, secretary, Boulder, Mont. Preceding officer, W. G. Northrop, E. L. Deno and F. H. Benjamin, directors. Organized circa May, 1907, with capitalization \$1,500,000. Lands, adjoining the Baltimore mine, are said to show an 8' ore body.

#### BUTTE & WASHINGTON MINING CO.

WASHINGTON.

Mine office: Orient, Stevens Co., Wash. Lands, at Hall Bridge, near Orient, have 2 tunnels, lower circa 200' long, said to show bornite and chalcopyrite associated with argentiferous galena and sphalerite.

#### BUTTE-YERINGTON MINE.

NEVADA.

Mine office: Yerington, Lyon Co., Nev. Lands, south of the Copper Mountain mine, have a 145' shaft.

#### BUTTON GOLD MINING CO.

ARIZONA.

Dead. Formerly at Minnehaha, Yavapai Co., Ariz.

#### BY-CHANCE COPPER CO.

NEW MEXICO.

Office: 517 Francis St., St. Joseph, Mo. Mine office: Orogrande, Otero Co., N. M. Geo. J. Greene, president; Geo. A. Guild, vice-president; T. G. Travis, secretary-treasurer; preceding officers, Ben Phillips and E. C. King, directors; Jas. J. Murray, general manager; I. Bohanna, mine superintendent; H. D. Reynolds, engineer. Organized March 29, 1906, under laws of New Mexico, with capitalization \$2,000,000, shares \$10 par; \$1,000,000 issued. Officers and shareholders are closely connected with the Southwest Smelting & Refining Co. Annual meeting, first Thursday after first Tuesday in March. Lands, 4 claims, area 80 acres, in the Silver Hill district, showing two contact veins between granite and limestone, carrying chalcocite and chalcopyrite, estimated to average 3% copper, associated with pyrite, in a main vein of 25' estimated average width, opened by shafts of 25', 30' and 90', with a total of 325' of workings, estimated to give 10,000 tons of ore blocked out for stoping. About 250' of diamond drilling has been done. Has a 35-h. p. steam plant, with 3 mine buildings. Property is 3 miles from the Southwest

smelter, to which ore is sent for reduction, cost of mining and transporting ore being estimated by company at \$2 per ton.

**MINA EL CABALLO.****MEXICO.**

Mine office: Indé, Durango, Mex. Wm. Benton, owner. Has cupriferous silver ores and steam power. Presumably idle.

**CABAÑAS CONSOLIDATED COPPER CO.**

Office: care of A. H. Rose, vice-president, 186 First Ave., San Francisco, Cal. Location of property, if any, not learned.

**MINAS CAREZAS DEL PASTO.****SPAIN.**

Owned by Sociedad Colectiva C. & J. Sundheim.

**CABINET RANGE MINING CO.****IDAHO.**

Office: care of Hon. Wm. C. Maybury, Detroit, Mich. Mine office: Priest River, Kootenai Co., Idaho. Lands, difficult of access, near the Priest Lake Mining Co., are on the west side of Priest River, about 10 miles north of Priest Lake, carry silver-lead and silver-copper ores, former carrying values mainly in silver, running up to 87 oz. per ton, and latter assaying up to 26% copper, 1% lead and 100 oz. silver per ton.

**CABLE CONSOLIDATED MINING CO.****MONTANA.**

Office: care of Fred W. Baicorn, Butte, Mont. Mine office: Cable, Deer Lodge Co., Mont. Property includes the Cable gold mine and other properties, about 20 miles west of Anaconda, former having copper ore, opened 1906, on the tunnel level, this carrying an excess of iron, rendering it valuable for fluxing. Up to Feb. 15, 1907, had shipped 541 tons of copper ore averaging 3.84% copper to the Washoe smelter. Suspended operations late 1907, because of a Pittsburg bank failure, and resumed circa August, 1908.

**CABRALES COPPER SYNDICATE, LTD.****SPAIN.**

Dead. Liquidated, voluntarily, 1906.

**EDMUNDIO CABRERA.****MEXICO.**

Office and mine: Guachinango, Jalisco, Mex. Lands, 30 hectares, showing large ore bodies, carrying values in copper, silver and gold. There are some old workings, with limited development of a recent date. Idle at last accounts.

**CARRERA MINING CO.****MEXICO.**

Dead. Formerly at Velardena, Cuencame, Durango, Mex.

**CABULLONA DEVELOPMENT CO.****MEXICO.**

Office: Calumet, Mich. Operating office: Douglas, Ariz. Mine office: Fronteras, Arizpe, Sonora, Mex. Thos. H. Collins, president and manager; Capt. Jas. Hoatson, vice-president; Capt. Thos. Hoatson, secretary and treasurer; Edw. McFarland, superintendent. Organized 1907, with capitalization \$500,000, shares \$10 par.

Lands, circa 2,000 hectares, extending from a point 16 miles south of Douglas to a vicinity immediately north of Fronteras, including the Sant Rosa group, area 126 hectares, 3½ miles from the Nacoziari railroad, showing 3 contact veins, between porphyry and limestone, carrying ores reported by former owners to assay up to 37% copper, 35% lead and 90 oz. silver per ton, with small gold values, which figures are too high. Development is by 5 short tunnels and 5 shafts, No. 1 being 350'; and No. 3 being 300' deep, showing pockets of ore in leached iron, with a 50' ore body on the 200' level. Equipment includes a good machinery plant, with a 50-h. p. engine, and about a dozen mine buildings. Former owners shipped a little ore to the Douglas smelter. Formerly employed circa 35 men, but company is understood to have surrendered bond and to have dismantled the plant.

**BASILIO CACERES.****CHILE.**

Mine office: Pueblo Hundido, Antofagasta, Chile. Property is El Manto

Tres Gracias, formerly a considerable producer, but reduced, 1903, to selection of rich ore from old dumps. The mine, however, shows large bodies of low to medium grade ore, and might become an important producer, if given adequate transportation facilities, now lacking.

**MINAS Y FUNDICION DE CACOMA.**

MEXICO.

**CACOMA MINING & SMELTING CO.**

MEXICO.

Office: 820 Security Bldg., St. Louis, Mo. Mine office: Autlán, Jalisco, Mex. D. P. Richardson, president and treasurer; John Dee, vice-president and general manager; John Nesserly, secretary; John Mann, mine superintendent; M. E. Baines, smelter superintendent. Organized under laws of Arizona, with capitalization \$1,000,000, shares \$10 par, and protocolized in Mexico.

Lands are various groups in vicinity of Autlán, showing mainly fissure veins in diorite, of 5' to 50' width, carrying silver-lead ore and auriferous chalcopyrite, principal values apparently being in lead and zinc. One vein was worked to shallow depth, and length of nearly 3,000', for gold, by a previous owner.

The Volcancillos mine, area 28 hectares, 12 miles west of Autlán, which is the principal property, shows a vein of 8 meters estimated average width, carrying chalcopyrite assaying 3 to 22% copper and \$4 to \$12 gold per ton, opened by about 1,000' of tunnels and shafts. Massive chalcopyrite from the paystreaks formerly was selected and matted, copper therefrom being sold to native metal workers in the neighborhood.

The Purisima mine, area 24 hectares, 12 miles west of Autlán, has a 6' vein of auriferous chalcopyrite, opened by circa 400' of tunnels, and is said to have produced \$60,000 in gold from oxidized surface ores.

El Paso mine, area 40 hectares, 12 miles west of Autlán, shows an 8' vein, opened by a 150' shaft, carrying copper, lead, silver and gold, values being mainly in silver-lead.

La Veta Grande mine, area 60 hectares, 30 miles west of Autlán, near a proposed railway line, is said to have a 200' vein showing bornite at surface and chalcopyrite at depth, both auriferous. Several thousand horse power is available from the Autlán River at this point.

The Palestina mine, area 8 hectares, 12 miles west of Autlán, has a vein of 6 meters' width, opened by tunnels showing auriferous copper ore, and free gold has been taken, in considerable quantities, from surface workings.

The Olvidado mine, area 4 hectares, 12 miles west of Autlán, has an 8' vein of auriferous copper ore, slightly developed by tunnel.

The San Luis mine, area 2 hectares, 12 miles west of Autlán, carries very low grade argentiferous ore, valuable mainly for fluxing.

El Cajon mine, area 8 hectares, 12 miles west of Autlán, slightly developed by shaft, has a 25' vein of hematite, carrying silver and copper values, useful mainly for fluxing.

Miscellaneous properties are La Junta, area 6 hectares; San Carlos, 15 hectares; San Juan, 15 hectares; San José, 40 hectares; Anaconda, 11 hectares; El Tigre, 75 hectares, and Ouelitlán, 30 hectare. More or less work has been done on all of these properties, which are antiguas, formerly worked above the sulphide zone.

Mining equipment includes a steam plant, with boilers, pumps, etc.

Reduction works consist of a 10-ton mill and a 10-ton smelter, latter apparently left by former owners. Mill has a crusher, rolls and jigs, but the smelter is entirely inadequate for profitable production. Company is in litigation, with affairs considerably snarled, former owners alleging company's failure to comply with contract. Property considered valuable.

**CACTUS DEVELOPMENT CO.****ARIZONA.**

Office: Lonsdale Bldg., Duluth, Minn. Mine office: Globe, Gila Co., Ariz. Employs circa 30 men. W. A. Eaton, president; H. B. Fryberger, vice-president; H. L. Palmer, secretary and treasurer; preceding officers are present directors, but four additional directors are to be named, 1909; C. W. Pritchett, general manager and consulting engineer; Thos. W. Hamilton, superintendent. Organized October, 1908, under laws of Minnesota, with capitalization \$500,000, shares \$1 par. Company sold 480,000 shares at 60 cents, for cash, giving a net cash fund of \$288,000, available for development, 20,000 shares going to owners of lands.

Lands, 33 claims, area circa 600 acres, in 2 groups, held under bonds and leases aggregating \$415,000, of which \$20,000 was paid on organization, leaving \$395,000 due on bonds, in easy installments, over a 7-year period, expiring 1916. Property is 4 miles west of the Miami, on Pinto Creek, which runs through the southern part of the lands, and is circa 14 miles from Globe, with a fairly good wagon road between. The Miami is to have railway connections shortly.

The property shows a formation markedly similar to that of the Miami, with an even better surface showing of iron stains. The lands carry an area of highly altered schist, surrounded by areas of intrusive and extrusive igneous rocks, similar to the holdings of the Miami and Inspiration mines, 4 miles east, and the schistose areas of the Cactus and Miami district undoubtedly were continuous, at some ancient period, but were divided by intrusions of igneous rocks, and subsequent erosion. The schist is very old, and extensively metamorphosed, and apparently was of sedimentary origin. The schist is fractured and crumpled, this affording a basis of subsequent mineralization through forming innumerable cracks and crevices, there being an enormous area of coarsely brecciated schist, well suited for the circulation of mineral-bearing solutions and deposition of ores. The management hopes to develop a large body of cupriferous altered schist, similar to that of the Miami. Payable values were found in the Miami at depth of circa 230', and apparently should be found at depth of 200' to 300' in the Cactus.

Old workings, by former owners, consist of a number of short tunnels and a 300' two-compartment shaft, sunk at the southern end of the property. The old shaft has been abandoned, as it was sunk on a fault-plane showing copper stains, but not likely to prove workable, as the fault was of a comparatively late period, hence the old workings are of no present value. Present development is by a 2-compartment shaft, started Nov. 30, 1908, which is for exploratory purposes only, as the location of permanent shafts will depend upon developments at depth.

Equipment includes a 60-h. p. boiler and a small hoist. Buildings include a smithy, boarding-house and tent-houses for workmen.

Mr. Pritchett estimates that about 2 years will be required to develop a large mine, if ore is found as expected, and that about \$1,000,000 will be required to build a large modern concentrator, with another year or 18 months needed for equipment and beginning of production on a large scale. The property has an excellent management, and is of unusual promise, differing from most new mining promotions in that it is practically certain to make either a very large mine or no mine at all, with chances favoring the making of a large mine.

**CACTUS MINE.****UTAH.**

Owned by Newhouse Mines & Smelters.

**CACTUS SMELTING & COPPER CO.****UTAH.**

Dead. Absorbed by Royal Copper Mining Co., now Newhouse Mines & Smelters. Formerly at Newhouse, Beaver Co., Utah.

**CADENA DE COBRE MINING CO.****MEXICO.**

Office: Secretary, Bisbee, Ariz. Emil Marks, president; H. L. Fenner, vice-president; M. Newman, treasurer; R. C. Stanford, secretary; preceding officers, John W. Gillingham, John Falls, John Pennypacker, H. W. Aiken and C. A. McDonald, directors. Organized Dec. 24, 1904. Lands, circa 250 pertenencias, in the Sahuaripa district of Sonora, Mexico, developed by 8 tunnels, said to show good ore. Company paid for lands, but former officers seem to have vested titles in their own names. Ernest E. Hughes, former president, was deposed early in 1906, and present management sued former officers to cancel the issue of 550,000 shares of stock, which said officers voted themselves as a gratuity. According to statement of new management, the old officers simply stole the 550,000 shares. The case seems a parallel to that of the South Bisbee.

**CADIA COPPER MINING & SMELTING SYNDICATE.****AUSTRALIA.**

Mine and works office: Cadia, N. S. W., Australia. Mine, in the Orange district, has shown payable ore from surface, ranging from 5 to 13% in copper tenor. Has a smelter, built 1906-1907, with 4 reverberatory furnaces, and employs about 150 men. Production, 1906, was 1,043,840 lbs. fine copper. Property considered valuable.

**CADIA EXTENDED MINE.****AUSTRALIA.**

Office: Newcastle, N. S. W., Australia. Mine office: Cadia, N. S. W., Australia. Property, on Waterfall Creek, about 1½ miles from Cadia, known formerly as the Little Canobolas, shows a tremendous blowout, and a remarkably wide gossan of low grade iron ore. A number of shallow shafts show native copper, carbonate and sulphide ores and tetrahedrite. Formerly considerable cupriferous iron ore was taken from this mine for fluxing the ores of the Cadia property. Property considered promising.

**SOCIEDAD ANONIMA MINAS DE CALA.****SPAIN.**

Office: Bilbao, Spain. Mine office: Cala, Santa Olalla, Huelva, Spain. Conde de Rodas, president; Don Emilio Vallejo, secretary. Organized Aug. 31, 1900, under laws of Spain, with capitalization 15,000,000 pesetas. Property is a group of 8 mines, area 346 hectares, at Cala, carrying magnetic iron ore and cupriferous pyrites, ore bodies apparently being extensive. Company is supposed to have built a 97-kilometer railroad, from the mines to San Juan del Aznalfarache, on the Guadalquivir River, in the adjoining province of Sevilla. Presumably idle.

**CALABASAS COPPER CO., LTD.****ARIZONA.**

Dead. A swindle, perpetrated by Douglas, Lacey & Co., 66 Broadway, New York, N. Y. For methods of this firm see article on Amalgamated Gold & Copper Co. Formerly at Patagonia, Santa Cruz Co., Ariz.

**COMPANIA DE MINAS I FUNDICION DE CALAMA.****CHILE.**

Office: Valparaiso, Chile. Mine office: San José del Abra, Calama, Antofagasta, Chile. Works office: Calama, Antofagasta, Chile. Organized Apr. 16, 1903, under laws of Chile, with capitalization 600,000 pesos, shares 100 pesos par, and reorganized, Apr. 31, 1903, under laws of Chile, with capitalization £250,000, shares £1 par. Lands, in the desert, 2 kilometers east of Calama, produce ores of 10 to 18% in copper tenor. Has a hydro-electric power installation, with 260-h. p. turbine, direct-connected with a 250-h. p. dynamo, taking water from the Rio Loa, 1 mile distant. Has a small concentrator with 1 crusher and 3 jigs. Smelter, known as Los Chorillos, has 3 reverberatory calciners and a 5' cylindrical blast-furnace, also a furnace for calcining limestone used for making briquettes, and turns out eges of 46.3% average copper tenor. In 1903 one ton of coke was required for smelting 1.6 tons of charge, slags averaging 0.5% copper. Wages at smelter are high, av-

eraging 4 pesos per day. Production, 1903, was 1,717,085 lbs. fine copper, and should have been much larger for 1907. Is an important property with a vigorous management.

#### CALVERAS MINING ASSOCIATION.

NEW MEXICO.

Mine office: Almagordo, Otero Co., N. M. E. A. Hespelder, superintendent, at last accounts. Lands include the Black Barro mine, showing sulphide ores of copper and lead. Perhaps succeeded by Calaveras Mining Co.

#### CALVERAS MINING CO.

NEW MEXICO.

Letter returned unclaimed from former office, Pittsburgh, Pa. Mine office: Jarilla, Otero Co., N. M. Property is the Garnet mine, held under lease. Main shaft, 400', shows sulphide ore, with gold and silver values. Has shipped some good ore netting \$900 to \$1,500 per ass.

#### CALCANTE MINES.

ITALY.

Mine office: Traves, Torino, Italy. Property, in the western Alps of Piedmont, formerly was a considerable producer of nickel, cobalt and copper, latter from chalcopyrite, found in stratified archeatic rocks. Idle at last accounts.

#### MANUEL CALDERON.

BOLIVIA.

Office and mine: Coro Coro, La Paz, Bolivia. Property is the San Augustin mine, worked in a primitive way, which is a small producer of native copper carried in conglomerate rock.

#### CALDWELL COPPER CO.

MICHIGAN.

Dead. Absorbed December, 1906, by La Salle Copper Co. Was organized June 11, 1906, under laws of Michigan, with capitalization \$2,500,000, shares \$25 par. Lands were 560 acres, south and west of the Tezumaseh. Formerly at Calumet, Houghton Co., Mich.

#### CALEDON COPPER CO.

TRANSVAAL.

Mine office: Zoutpansberg, Transvaal. Lands are 96 claims on Farm Monfarland No. 1485, adjoining the Messina Extension; 96 claims on Farm Sumpo No. 1432; 206 claims immediately west and 800 claims immediately east of M'Tamba, and 204 claims adjoining the Amatola. Apparently only surface trenching has been done, though company planned, 1907, starting a shaft.

#### CALEDONIA COPPER CO., LTD.

NEW CALEDONIA.

Dead. Was promoted by the notorious London & Globe Finance Corporation, Ltd., and was robbed before born. Property sold to Australian Smelting Corporation, Ltd. Formerly at Noumea, Dikhot, New Caledonia. Fully described Vol. VI.

#### CALEDONIA GOLD & COPPER MINING CO.

IDAHO.

Mine office: Wallace, Shoshone Co., Idaho. Lands supposedly are in the vicinity of Stevens Peak.

#### CALEDONIAN EXPLORATION CO.

MEXICO.

Dead. Formerly at San Nicolás del Oro, Coyuca de Catalán, Guanajuato, Mex.

#### CALEDONIAN MINING CORPORATION, LTD.

NEW CALEDONIA.

Dead. Liquidated, voluntarily, December, 1903. Formerly at Noumea, Dikhot, New Caledonia.

#### COMPANIA MINA DE CALIFORNIA.

MEXICO.

Dead. Formerly at Cumuripa, Guaymas, Sonora, Mex.

#### CALIFORNIA-ALASKA MINING & DEVELOPMENT CO.

ALASKA.

Mine office: Valdez, Alaska. Capt. Austin E. Lathrop, manager. Lands, near the Alaska Consolidated Copper Co., in the Copper River district, produced an 800-lb. mass of native copper, 1908.

**CALIFORNIA-AMECA MINING CO.****MEXICO.**

Mine office: Ameca, Jalisco, Mex. Property is the San Pedro mine, showing copper ore. Presumably idle.

**CALIFORNIA-ARIZONA COPPER CO.****ARIZONA.**

Mine office: Wellton, Yuma Co., Ariz. F. A. Meyer, superintendent. Property has tunnels of 100' and 160', and was developing, with a small force, at last accounts.

**CALIFORNIA & ARIZONA COPPER MINING CO.****ARIZONA.**

Dead. Formerly at Ft. Huachuca, Cochise Co., Ariz. Described Vol. IV.

**CALIFORNIA & ARIZONA DEVELOPMENT CO.****ARIZONA.**

Dead. Formerly at Ft. Huachuca, Cochise Co., Ariz. Described Vol. VI.

**CALIFORNIA & ARIZONA GOLD & COPPER CO.****ARIZONA.**

Office: 622 Citizens National Bank Bldg., Los Angeles, Cal. Jos. C. Erman, president; Selwin J. Michelson, vice-president; Jos. Wilkinson, secretary and treasurer.

**CALIFORNIA COPPER CO.****CALIFORNIA.**

Dead. Succeeded, August, 1906, by California-Nevada Copper Co. Formerly at Daulton, Madera Co., Cal.

**CALIFORNIA COPPER KING CO.****CALIFORNIA.**

Dead. Formerly in Riverside County, California. Described Vol. III.

**CALIFORNIA-CORONA MINING & MILLING CO.****CALIFORNIA.**

Office: care of W. S. Zehring, secretary, Salt Lake City, Utah. Mine office: Manvel, San Bernardino Co., Cal. W. J. Craig, president; J. W. Currie, vice-president; E. O. Howard, treasurer; preceding officers, Harrison O. Shepard, A. W. Smith and Andrew T. Stahl, directors; Alex Colbath, Jr., superintendent. Organized December, 1906, under laws of Utah, with capitalization \$600,000, shares \$2 per. Lands, 16 claims, 8 patented, circa 5 miles north of Manvel and about 7 miles from the Salt Lake railroad, showing auriferous and argentiferous copper and lead sulphides with quartz gangue, well suited to concentration. Mine is said to have considerable ore of good grade blocked out for stoping.

**CALIFORNIA GOLD & COPPER CO.****CALIFORNIA.**

Mine office: Spenceville, Nevada Co., Cal. C. C. Bitner, president; Otto Nuehler, general manager. Has auriferous and argentiferous copper ores, with water and electric power, and shipped, 1907, a little high grade ore to Shasta County smelters. Possibly succeeded by Mineral Hill Mining & Smelting Co.

**CALIFORNIA GOLD & COPPER CO.****CALIFORNIA.**

Office: 354 South Hill St., Los Angeles, Cal. Mine office: Vontrigger, San Bernardino Co., Cal. A. H. Cram, president and general manager; C. W. Page, vice-president; H. C. Hibbard, secretary. Organized, 1904, with capitalization \$500,000.

Lands, 9 claims, 2 miles from Vontrigger, including the Vontrigger mine, having contact deposits between granite, quartzite and limestone, with diorite dykes. Property is said to carry 8 clearly defined parallel veins of slightly auriferous copper, ore in 2 ore zones of 200' to 300' width. Below the oxidized zone of circa 80' depth ore is reported to range 9 to 15% in copper tenor, with fair gold and silver values. Development is by shafts of 100', 150' and 317', and a 350' tunnel, with about 4,000' of workings, deepest shaft being bottomed in ore giving average assays of about 20% copper, with gold values up to \$3 per ton.

Mine has gasoline power, and pipes water 6½ miles from Hackberry Springs to a 40x50x7' reservoir. Has circa 15,000 tons of ore on the dump, secured from development work, and has shipped carload lots of ore returning 8.7 to 10.9% copper, with small gold and silver values. Is experimenting

with an electrolytic reduction plant; and is said to plan a 200-ton concentrator. Property considered promising.

**CALIFORNIA IMPROVEMENT CO.****CALIFORNIA.**

Office: 101 Sansome St., San Francisco, Cal. Mine office: Mills College, Alameda Co., Cal. F. M. Smith, president and general manager. Property is the Leona Heights mine, in the outskirts of Oakland, producing cupriferous pyrite, carrying 1 to 2% copper and about 45% sulphur. Production, 1906, was 4,303 tons of pyrite, valued at \$18,958.57, shipped crude to acid-makers.

**CALIFORNIA & MASSACHUSETTS COPPER MINING CO. CALIFORNIA.**

Mine office: Red Bluff, Tehama Co., Cal. N. E. Guyot, manager; Eugène Burrill, foreman. Lands, circa 40 claims, unpatented, west of Red Bluff, in Section 26, Township 27 North, Range 9 West; known as Tom Head mine, which have been bored by diamond drill. Property shows a 24' vein carrying native copper, bornite and chalcopyrite, and considerable ore of medium and high grade has been blocked out. Equipment includes a hoist, 2 air-compressors and a sawmill. Plans were prepared tentatively, 1907, for a 300-ton smelter, to have electric power. Idle at last accounts.

**CALIFORNIA MINING CO.****UTAH.**

Dead. Formerly at Park City, Summit Co., Utah. Described Vol. VI.

**CALIFORNIA MOUNTAIN MINING CO.****COLORADO.**

Mine office: Eureka, San Juan Co., Colo. A. H. Kunkle, superintendent. Has auriferous and argentiferous ores of lead, copper and zinc, with electric power.

**CALIFORNIAN COPPER SYNDICATE, LTD.****CALIFORNIA.**

Dead. Succeeded, April, 1902, by Fresno Copper Co., Ltd. Formerly at Clovis, Fresno Co., Cal.

**CALIFORNIA-NEVADA COPPER CO.****CALIFORNIA.**

Office: 1801-43 Exchange Place, New York, N. Y. Mine office: Daulton, Madera Co., Cal. F. L. Underwood, president; E. B. Van Norden, treasurer; Horace Mitchell, clerk; W. C. Brace, manager. Organized Aug. 11, 1906, under laws of Maine, with capitalization \$2,500,000, shares \$5 par; issued, \$1,375,000. Has authorized a bond issue of \$2,500,000, at 7%, convertible into stock within 5 years. Controls, through stock ownership, the Bristol Consolidated Mines & Smelting Co., and owns the Ne Plus Ultra mine, near Daulton, formerly held by the California Copper Co., having refractory ores that have proven difficult of economical reduction. The Ne Plus Ultra has a 100-ton smelter, which is not a success. Company also owns the Aetna gold mine, near the Treadwell mine, Alaska, said to show a vein of 50' to 100' width, traceable 3 miles, carrying an average of \$3.50 gold per ton.

**CALIFORNIA-NEVADA MINING & MILLING CO.****CALIFORNIA.**

Office: care of E. S. Collett, secretary, Denver, Colo. Mine office: Bishop, Inyo Co., Cal. B. Gregory, president; J. E. Reinhart, treasurer; Albert E. Gregory, superintendent. Organized Dec. 7, 1906, under laws of Arizona, with capitalization \$1,500,000, shares \$1 par. Lands, 10 claims, at the head of Black Cañon, 5 miles north of Cedar Flat and circa 16 miles southeast of Bishop, developed by a number of 10' pits and tunnels, said to show well-defined veins carrying auriferous and argentiferous copper and lead ores.

**MINA DA CALINHHA.****PORUGAL.**

Office: care of M. Paul Chapuy, manager, Santa Appolonia, Lisbon, Portugal. Supposedly owned by a French company. Property is in Portugal, presumably in province of Alemtejo. Is a small exporter of cupriferous iron pyrites to England.

**CALLINGTON COPPER MINING CO.****AUSTRALIA.**

Mine office: Callington, South Australia. Mine is opened to depth of

600' and length of 700', on a vein circa 16' wide. Company asks an advance of £1,000 from the government, for the reopening of the mine, which has been idle since 1875.

**CALSTOCK TIN & COPPER, LTD.**

**ENGLAND.**

Offices: 16 Place Vendome, Paris, France, and 30 Moorgate St., London, E. C., England. Mine office: Calstock, Cornwall, England. Geo. Robinson, chairman; G. Gilnicki, mine manager; John A. Russell, secretary. Organized May 5, 1900, under laws of Great Britain, with capitalization £60,000, shares £1 par; issued, £63,988. Debentures, £14,120, at 5%. Property is the Prince of Wales tin mine, and sundry mineral licenses on adjoining property. Has a 56-stamp mill. Idle.

**CALUMET & ALGOMA DEVELOPMENT CO.**

**ONTARIO.**

Dead. Succeeded, 1903, by Hermina Mining Co., Ltd. Formerly at Massey, Algoma, Ont.

**CALUMET & ALGOMA MINING CO.**

**ONTARIO.**

Office: 109 Fifth St., Calumet, Mich. Mine office: Massey Station, Algoma, Ont. Joseph Hermann, chairman; Lucas Hermann, secretary. Organized, circa 1905, with capitalization \$1,000,000, shares \$1 par, as successor to Copper Queen Mining Co., Ltd. Lands, 1,166 acres, showing a 45' fissure vein, traceable circa 3 miles, carrying medium grade chalcopyrite, more or less auriferous, with occasional bornite and malachite, and giving assays of 5 to 25% copper. Has 2 shafts, No. 1 being 138' deep, and 2 tunnels, longest 195'. Lands are heavily timbered and well watered. Is in bad shape financially. Idle several years and practically moribund.

**CALUMET & ARIZONA MINING CO.**

**ARIZONA.**

Office: Calumet, Mich. Mine office: Bisbee, Cochise Co., Ariz. Works office: Douglas, Cochise Co., Ariz. Chas. Briggs, president; Capt. Jas. Hoatson, vice-president; Capt. Thos. Hoatson, second vice-president; Louis W. Powell, third vice-president and general manager; Gordon R. Campbell, secretary; Peter Ruppe, treasurer; preceding officers, Thos. F. Cole, Geo. E. Tener, Chester A. Congdon and Chas. d'Autremont, Jr., directors; Jas. Wood, smelter superintendent; Henry B. Paull, auditor; W. E. McKee, master mechanic; W. H. Whitley, engineer; J. N. Kinsey, smelter clerk; John Collins, mine foreman; A. J. McDermott, smelter foreman.

Organized March, 1901, under laws of Arizona, with capitalization \$2,500,000, shares \$10 par; issued, \$2,000,000. Annual meeting, second Monday in April. Merchants & Miners Bank, Calumet, Mich., registrar. Shares are listed on the Boston stock exchange. Has paid dividends as follows: \$6.50 per share in 1904; \$8.50 in 1905; \$13 in 1906, and \$16.50 in 1907. Dividends for 3 first quarters of 1908 were \$1 each, giving total dividend payments, to Sept. 1, 1908, of \$7,500,000. Ended 1907 with quick assets of \$3,383,732, including \$1,297,387.31 in demand loans and bills and accounts receivable; \$1,240,474.32 in cash and copper on hand at 12½ cents per pound, and \$105,250 shares owned in other companies. Total liabilities were \$277,908.52. Company holds bonds and options on various properties aggregating \$900,000, and during 1907 expended \$315,445.55 for development work on properties under option, and made payments on options of \$58,911.97, a total of \$374,357.52.

Lands include the original mining claims at Bisbee, the Mammoth group, bought 1907, and the 640-acre smelter-site at Douglas, with various other groups of Arizona claims, held under bond and lease.

The Calumet & Arizona mine proper includes 12 claims, patented, area 178 acres, adjoining the Copper Queen, side-line agreements with the Copper Queen insuring freedom from possible litigation, and continuance of the present exceedingly neighborly relations. The mine is opened in limestone, near

a porphyry contact, with occasional porphyritic intrusions. The surface gives small indications of values, showing but small and infrequent outcrops, the existence of the Irish Mag ore bodies having been inferred from underground work in the adjoining shafts of the Copper Queen, after careful study of the general geological conditions of the district. Ore occurs in highly irregular bodies, the mine showing native copper, cuprite, malacomite, malachite, azurite, chalcocite and chalcopyrite, usually with a talcose gangue, and with considerable hematite and manganese ores, the latter carrying malachite in small disseminated nodules, and frequently averaging 10 to 18% in copper. The ore, which is practically self-fluxing, averages about 2 oz. silver and 0.05 oz. gold per ton, as smelted. The ore bodies are extensively developed, but are not largely blocked out, owing to the constant shifting of the ground, caused by the creeping of the mountain above, as is the case at the neighboring Copper Queen mine, requiring very heavy timbering, with frequent bulkheading, and constant care for all openings, which renders it prudent to keep costs down by blocking out ore but a comparatively short time ahead of actual stoping requirements. Timber is secured from a great distance, and to guard against emergencies large stocks are carried. The mine as a whole is not especially wet. A mine fire, 1907, caused some trouble, but was overcome speedily. New openings, 1907, were 23,016'.

The Irish Mag shaft, sunk on a single 20-acre claim, was the original mine of the Calumet & Arizona. This property has a well-timbered 4-compartment vertical shaft of 1,298' depth, sunk in hard limestone throughout, except where occasional ore bodies were cut, rendering the shaft safe from drawing. Levels are opened at 100' intervals, from 750' to 1,250' inclusive, the upper levels showing exceedingly rich ore, there being entire stopes assaying up to nearly or quite 40% in copper. In 1907 four new bodies of high grade ore were opened on the 1,150' and 1,250' levels. The Mag shaft has an auxiliary double hoist on the 1,050' level. The shaft has a 78' steel-gallows frame and a 114' ore-bin, with a 20x60" direct-acting Nordberg hoist, capable of raising a 3-deck cage at the rate of 2,000' per minute from a depth of 1,600'. This hoist has raised, for some years, about 600 tons of ore daily, from an average depth of 1,000', besides caring for men, timber and tools, and the Irish Mag shaft was operated continuously, for 5 years, without the loss of a day's time, probably establishing a world's record.

The 4-compartment Oliver shaft, 1,150' deep, is bottomed on the same level as the Irish Mag, the collar of the Oliver being 150' lower than the Mag, and 50' higher than the collar of the Lowell shaft of the Copper Queen. The Oliver shaft, developing both of the Senator claims, shows large bodies of high grade ore, having first cut ore at 710', or about 300' higher than ore was found in the Lowell shaft. The lower workings show rich sulphides, with high grade oxidized ore above, there being large stopes of high grade oxidized ores in the upper levels, practically untouched, except for opening work. The Oliver shaft has a 600-gallon Nordberg electric pump, which is giving good service, and on the surface is a powerful Nordberg hoist.

The Buckeye claim has been explored, and slightly developed, by cross-cuts from the Oliver shaft, and from the Cole shaft of the Superior & Pittsburg, there being a good body of sulphide ore opened on the 1,050' and 1,150' levels.

The Pride claim has a promising ore body, opened by a drift from the 1,250' level of the Irish Mag shaft.

The Gibraltar claim, which is the southernmost, wedges into the holdings of the Superior & Pittsburg. The Gibraltar has several exploring shafts and treches, showing iron and a little low grade copper ore of promising appearance, though below commercial tenor.

The Wagner and Hope claims, lying circa 2,000' southwest of the Irish Mag shaft, adjoin the Pittsburg & Duluth mine of the Superior & Pittsburg, and have been explored by a crosscut from the Mag that traversed 600' of Copper Queen ground, stopping about half way across the Wagner and Hope group, showing nothing of especial promise.

The Washington, Angel and Old Republic claims lie on the porphyry side of the gulch, and were secured mainly as a possible smelter-site, then being considered of little promise for mineral, but, in view of developments in the Junetion and Calumet & Pittsburg mines of the Superior & Pittsburg, these claims are of possible mineral value.

The surface equipment and machinery plant at the mine is very complete. The original plant was clustered about the Irish Mag shaft, on a steep hillside, where limited room was secured by grading; but later equipment includes extensive buildings at the Oliver shaft and elsewhere. The boiler plant at the Oliver has five 280-h. p. marine boilers, burning crude petroleum. The principal compressor plant at the Oliver has a 35-drill Sullivan-Corlies cross-compound 2-stage air-compressor, with 17x34" steam cylinder and 20x34" air cylinder, having a piston displacement of 6,600 cubic feet of free air per minute. There also are 3 class WB2 Sullivan straight-line air-compressors. Much of the ore is so soft that it can be bored with a breast-auger, thus reducing requirements in the way of air for power drills. Electricity is used extensively on surface, and also for pumping. The electric power plant at the Oliver shaft has 300-kw. and 500-kw. Westinghouse-Parsons 2,200-volt, 60-cycle, 3-phase turbo-generators, two 220-kw., 2,200-volt, 60-cycle, 3-phase motors, direct-connected with the steam turbine, a 300-kw. General Electric rotary converter, transforming a 2,200-volt alternating current to a 550-volt direct current, for operating the street-car line to Warren, four 40-h. p. Buffalo vertical engines, direct-connected to four 25-kw., 115-volt Crocker-Wheeler generators for electric light and power for ventilating fans, and various minor electrical machinery. An automatic telephone system, having 25 stations underground and on the surface, is connected with the smelter at Douglas.

The new steel-frame machine shop is divided into two 60x48' parts, for the machine shop and smithy. Adjoining is a plate shop, 40x128', of steel frame, with corrugated iron roof and siding. There is a framing mill at the Mag shaft, also a warehouse and office building. A 60x125' administration building is planned to be erected at Warren, the townsite adjacent to the Calumet & Arizona and Superior & Pittsburg mines. A hospital with an efficient staff is maintained for employees, and a model changing house has hot and cold running water, tub and shower baths and lockers for 500 men. Fire protection is furnished by direct pipe-lines to large storage tanks, giving an effective pressure of 100 pounds, with hose-houses and hose-carts at each shaft, all hose-couplings being made to connect with those of the Bisbee fire department.

The Mammoth group of 35 claims, also known as the Scanlon or Clark-Scanlon property, in the Copper Creek district, 16 miles northeast of Mammoth, Pinal Co., Ariz., was bought September, 1908, when the final payment of \$125,000 was made thereon. The Mammoth property has been bored extensively by diamond drills, giving good cores, and has a 2-compartment working shaft, with several levels opened, the workings blocking out considerable high grade sulphide ore. It is said that the company plans a 16-mile railroad from Copper Creek to the Mammoth mine.

The Costello-Casey group, 5 claims, sometimes known as the Collins group, near the Leadville mine, at Pearce, Cochise county, is held under bond, time of final payment having been extended to March 30, 1909. Two shafts are

sinking, showing considerable good carbonate and sulphide ore, and prospects are promising. Bond on the Leadville property at Pearce was forfeited circa 1907.

The smelter is at Douglas, 25 miles from the mine, receiving ore over the El Paso & Southwestern railway, at a very favorable freight rate. The first stack was blown in Nov. 15, 1902, but in 1907-1908 the works were so thoroughly enlarged and overhauled as to amount to a practical rebuilding, the old equipment having 1,500 tons daily capacity, while the new equipment, when completed, will give 3,500 tons, daily capacity, providing for the smelting of Superior & Pittsburg ores, as well as the reduction of ores of the Calumet & Arizona.

Ore is received at the works in new steel ore-bins circa 200' in length, with 2 rows of 180 chutes, bins being surmounted by a railway track. The entire plant is served by a standard-gauge railway line, having tracks to each furnace and to every department of the works.

The blast-furnace building, of steel frame, is 50x208' in size, having a steel dust-chamber, and steel smokestack 200' high and 16' in diameter. The old equipment consisted of five 300-ton furnaces, and a sixth furnace, of 500 tons daily capacity, was blown in circa September, 1908. The 5 old furnaces are to be overhauled and lengthened, making each of 500 tons daily capacity, and a seventh 500-ton blast-furnace is to be installed, giving the works a nominal capacity of 3,500 tons daily, though in practice it is likely that one furnace will be held as a spare, giving an actual working capacity of 3,000 tons daily. The management is considering the building of a reverberatory furnace, for treatment of flue dust and slags.

The converter building, widened 15' in 1905 and lengthened 30' in 1907, has 4 stands which have been moved to the opposite side of the building in order to give room for 2 additional furnaces. Matte is discharged into tilting wells, and taken thence by 3 electric traveling cranes to the converters, which turn out blister copper of 99.2% tenor, carrying small gold and silver values, which is shipped to the Nichols Copper Co., New York, for refining. A new dust-chamber has been built for the converter flue. The lining plant of the converter department has a silica mill operated by a 180-h. p. motor, and the briquetting plant is operated by a 100-h. p. motor.

The old power-house, 80x160' in size, was increased, 1907, by the building of a transverse section 100x100' in size, the new building being divided through the center by a row of columns into 2 bays, each 55' wide, and each served by a 10-ton hand-power traveling crane. The machinery equipment of the power plant has been greatly enlarged, and includes a 500-kw., 440-volt, 60-cycle, 3-phase Allis-Chalmers-Parsons turbo-generator, a 160-kw. synchronous motor generator set, which can be run to furnish electric energy at various voltages, and with either an alternating or direct current; an 850-h. p. Nordberg steam engine; a 400-h. p. engine running 2 Nordberg air-compressors, with cross-compound steam ends having 22" and 42" cylinders and 48" stroke, and air cylinders of 48x48", giving a 12-pound blast pressure; 2 Murray-Corliss tandem compound engines with 14" and 28" cylinders and 36" stroke, direct-connected to 2 Connersville No. 10 blowers; a pump of 5,000 gallons per minute capacity; 2 Prescott compound vertical-beam condensers, having steam cylinders of 14" and 25", with 24" stroke; two 36x24" vacuum pumps; a direct-acting Prescott pump for circulating water; a Prescott compound duplex 500-gallon mine pump for furnishing hydraulic power for converter stands, and various minor engines, the power-house having machinery with an aggregate of 3,750 h. p.

The boiler-house at the power plant formerly had five 250-h. p. boilers and two 280-h. p. boilers, which were added to, 1907, to furnish power for the new

plant. Fuel is petroleum, there being four 45,000-gallon oil tanks for storage. Water in ample supply is secured from flowing artesian wells, of 450' average depth.

Miscellaneous buildings at the works include a new steel-frame machine-shop and steel-frame smithy. There are two 16-room lodging houses, and a considerable number of dwellings for employees.

Average forces, 1907, were 1,028 men, of whom 621 were employed at the mine and 407 at the smelter. Some trouble was had, 1907, with labor unions, but this came to an end by the refusal of the company to submit to the dictation of a miner's union, organized against the wishes of a majority of the mine workers of Bisbee, as proven by a referendum vote, on the Australian plan, in which the proposition to organize was voted down by a majority of 4 to 1, before organization was effected, the Western Federation of Miners refusing to be bound by the vote that it had itself invoked.

Production, 1906, was 36,934,387 lbs. fine copper, 194,451 oz. silver and 4,241 oz. gold, ore yielding 7.91% actual copper extraction. For 1907 production was 30,689,448 lbs. fine copper, with combined gold and silver values of \$210,846.12, an average of \$13.74 in precious metals per ton of fine copper, secured from 260,815 wet tons of ore, making 232,460 dry tons of ore, giving an average extraction of 6.56% per dry ton, or 5.85% per wet ton, the decrease from nearly 8% extraction in 1906 being caused, not by decreased ore values, but by the treatment of lower grade ores, owing to the high price of copper. Costs, 1906, were 5.71 cents per pound of fine copper, including construction, rendering this one of the lowest cost copper mines of the world; but for 1907, owing to a combination of fortuitous circumstances, costs, exclusive of construction, were about 10.5 cents per pound of copper. The latter figure, however, is much above normal, and cannot be taken as a criterion. The Calumet & Arizona is one of the best among the world's big copper mines, and has a management that is most excellent, from the president of the company down to the heads of departments.

#### CALUMET & BISBEE DEVELOPMENT CO.

ARIZONA.

Office: Calumet, Mich. Mine office: Bisbee, Cochise Co., Ariz. Frank S. Carlton, president; Wm. R. Oates, secretary. Organized Oct. 20, 1902, under laws of Arizona, with capitalization \$400,000, shares \$10 par; 15,000 shares issued and fully paid. Lands, 4 claims, at Don Luis, adjoining the Lake Superior & Pittsburg. Has a 960' main shaft. Idle for several years, owing to lack of funds. Fully described Vol. IV.

#### CALUMET & BOSTON COPPER CO.

ARIZONA.

Office: care of J. C Stout, secretary and treasurer, St. Paul, Minn. Mine office: Bisbee, Cochise Co., Ariz. C. W. Ruth, vice-president and manager. Organized October, 1906, with capitalization \$500,000, shares \$10 par. Lands, 10 claims, area circa 150 acres, on the porphyry side of Tombstone Cafion, having a 400' tunnel on the Bessemer claim showing ore assaying 2 to 3% copper, also quartz assaying up to \$25 gold per ton.

#### CALUMET & BUTTE DEVELOPMENT CO.

MONTANA.

Dead. Reorganized, 1907, as Calumet & Butte Mining Co. Formerly at Butte, Silver Bow Co., Mont.

#### CALUMET & BUTTE MINING CO.

MONTANA.

Dead. Organized, 1907, under laws of New York, with capitalization \$1,500,000, shares \$1 par, as successor of Calumet & Butte Development Co. Reorganized circa August, 1908, as Western Copper Co. Formerly at Butte, Silver Bow Co., Mont.

**Co., Ariz.** Jas. Harvey, president; B. B. Adams, treasurer; preceding officers, Edgar N. Hunt, M. M. Gassar, E. C. Blanchard and Benj. M. Crawford, directors. Organized October, 1906, under laws of Arizona, with capitalization \$750,000, shares \$5 par. Lands, 5 claims, area 100 acres, northeast of the Shannon, having a 75' tunnel in a vein claimed to be 15' wide and to average 30% copper throughout, which is an exaggeration, also 2 shorter tunnels and 2 shallow shafts. Apparently excessive claims were made in the press, without authorization by officers of the company. Has secured assays of 4.6 to 27.6% copper, 5 oz. silver and \$4 gold per ton. Idle.

**CALUMET & COCHISE DEVELOPMENT CO.****ARIZONA.**

Dead. Liquidated, 1906, with all debts paid. Formerly at Bisbee, Cochise Co., Ariz. Fully described Vol. IV.

**CALUMET CONSOLIDATED COPPER CO.****ARIZONA.**

Mine office: Kelvin, Pinal Co., Ariz. Lands, 40 claims.

**CALUMET COPPER CO.****COLORADO.**

Letter returned unclaimed from former office, 409 Tacoma Bldg., Chicago, Ills. Mine office: Turret, Chaffee Co., Colo. Hon. Wm. E. Mason, president; David W. Medbury, secretary; Elmer E. Briggs, general manager; G. W. Men- denhall, superintendent. Lands, 3 claims, known as the Copper King group, on Middle Mountain, showing schistose veins in a formation of micaceous granite, with porphyry intrusions, carrying auriferous and argentiferous copper oxides and sulphides. Development is by incline shafts of 40' and 85' on a 4' vein. Idle.

**CALUMET COPPER MINING CO.****ARIZONA.**

Dead. Merged, 1907, in Kelvin-Calumet Copper Mining Co. Formerly at Kelvin, Pinal Co., Ariz.

**CALUMET COPPER MINING CO.****WASHINGTON.**

Dead. Property sold, under foreclosure, to Mount St. Helens Consolidated Mining Co. Formerly at Spirit Lake, Skamania Co., Wash.

**CALUMET COPPER MINING & SMELTING CO.****COLORADO.**

Office: 2 Toltec Bldg., Denver, Colo. Mine office: Bellinsville, Gilpin Co., Colo. John J. Webber, secretary; J. D. Caldon, engineer. Organized July 16, 1903, with capitalization \$1,250,000, shares \$1 par. Lands, claimed to be circa 200 acres, 160 acres patented, located at various points in Boulder and Gilpin counties, Colorado. Presumably idle.

**CALUMET & DULUTH DEVELOPMENT CO.****ARIZONA.**

Dead. Formerly at Bisbee, Cochise Co., Ariz. Described Vol. IV.

**CALUMET & GLOBE MINING CO.****ARIZONA.**

Dead. Was organized Jan. 16, 1907, under laws of Arizona, with capitalization \$300,000, shares \$5 par. J. P. Peterman, president; Col. Paul Peterman, vice-president; Jas. T. Fisher, treasurer; preceding officers, Edw. Lieblein, Frank S. Carlton, D. D. Sullivan and Dr. T. Shields Collins, directors. Lands, 9 claims, 2 fractional, on the southwest side of Lower Pinto creek, having a 390' shaft on the Brewery claim, showing a vein of 170' width, but leached, though possibly carrying commercial ores at depth. Bond and lease were allowed to expire, and company was wound up, 1908.

**CALUMET & HECLA MINING CO.****MICHIGAN.**

Office: 12 Ashburton Place, Boston, Mass. Mine office: Calumet, Houghton Co., Mich. Mill office: Lake Linden, Houghton Co., Mich. Smelter offices: Hubbell, Houghton Co., Mich., and 1 Austin St., Buffalo, N. Y.

Alexander Agassiz, president; Col. T. L. Livermore, vice-president; Quincy A. Shaw, Jr., second vice-president; Rodolphe L. Agassiz, third vice-president; Jas. MacNaughton, general manager; preceding officers, Francis L. Higginson and Francis W. Hunnewell, directors; Geo. A. Flagg, secretary

and treasurer; Walter Fitch, general superintendent; Will A. Childs, superintendent; W. M. Gibson, assistant superintendent; Fred S. Eaton, chief clerk; E. S. Grierson, chief engineer; E. D. Leavitt, consulting mechanical engineer; John Knox, chief mining captain; Henry Fisher, acting mill superintendent; Jas. B. Cooper, smelter superintendent at Lake Linden; Morris B. Patch, smelter superintendent at Buffalo; Hon. Chas. Smith, chief mill and smelter clerk at Lake Linden works; Geo. M. Kendall, chief smelter clerk at Buffalo works; Franklin E. Bay, land agent.

Organized 1871, under laws of Michigan, with capitalization \$2,500,000, shares \$25 par; \$12 paid in, and \$1,058.50 per share in dividends paid out to end of 1907. Charter renewed, 1900, for 30 years, and amended, 1905, under new laws of Michigan, making the corporation a securities holding company as well as a mining and smelting company. Is a consolidation of the Hecla, Calumet, Portland and Scott mining companies. Fiscal year ends April 30. Annual meeting, third Wednesday in August. Stock is listed on the Boston Stock Exchange, and traded in on the unlisted department of the New York Stock Exchange. Controls various subsidiary corporations, including 3, organized 1905, known as the Frontenac Copper Co., Gratiot Mining Co. and Manitou Mining Co.

Dividends, to Dec. 31, 1907, were \$105,850,000, being the largest mining profits ever divided by any incorporated mining company. Dividends were \$5,000,000 in 1905; \$7,000,000 in 1906, and \$6,500,000 in 1907. Two first quarterly dividends of 1908 were \$5 each. Ended fiscal year, Apr. 30, 1908, with quick assets of \$6,295,717 and liabilities of \$1,584,734, giving a surplus of \$4,700,964. Net earnings, for fiscal year ending Apr. 30, 1907, were \$11,297,390.

Since the change in charter, 1905, permitting the company to acquire and hold stock in other corporations, the Calumet & Hecla has secured control of various other mines and mineral tracts, either by organizing subsidiary corporations, acquiring stock in companies previously independent, purchasing lands outright, or taking options on mining properties of promise.

There are 3 directly subsidiary corporations, these being the Frontenac Copper Co., Gratiot Mining Co., and Manitou Mining Co. The Calumet & Hecla controls the entire stock issue of the Frontenac, 18,000 shares of Manitou out of 20,000 shares issued, and 50,100 shares of Gratiot, out of 100,000 shares issued.

There are various corporations controlled by the Calumet & Hecla through ownership of majority share interests. These include the Centennial Copper Mining Co., in which the Calumet & Hecla owns 46,080 shares out of 90,000 shares issued from the capitalization of 100,000 shares; La Salle Copper Co., with ownership of 160,050 shares out of 302,977 shares issued; Superior Copper Co., with 50,100 shares owned out of 100,000 shares issued; Dana Copper Co., with 35,450 shares owned out of 40,000 shares issued, and St. Louis Copper Co., with 36,400 shares owned out of 40,000 shares issued. The Calumet & Hecla also controls the Allouez Mining Co., through the ownership of 42,978 shares out of 100,000 shares issued, this being not quite a majority interest. A large minority share interest is owned in the Osceola Consolidated Mining Co. The Calumet & Hecla also holds 1,900 shares of stock of the Laurium Mining Co., and 891 shares of stock of the Seneca Mining Co. The various corporations named are described under their respective titles.

The attempt of the Calumet & Hecla to secure control of the Osceola Consolidated Mining Co., at the annual meeting in March, 1907, was met by determined opposition from the Osceola management, which took the fight into the Michigan legislature and into the Federal courts. By reason of litigation, the Calumet & Hecla was unable to gain control of the Osceola

at the annual meetings, 1907 or 1908, but in October, 1908, Judge Knappen decided in favor of the Calumet & Hecla, and while there will be further legal opposition, it seems probable that the Calumet & Hecla will succeed shortly in securing control of the Osceola.

The landed holdings of the Calumet & Hecla, including property owned outright, property controlled through subsidiary corporations, mining lands under option and miscellaneous lands, in Houghton, Keweenaw and Ontonagon counties, Michigan, amounted, 1907, to 74,841 acres, or 117 square miles. In addition to its corporate interests, direct options have been taken on the White Pine, Nonesuch and other old mines in Ontonagon county, on which more or less exploratory work has been done. An option on the Clark mine expired circa August, 1907.

The Calumet & Hecla mine proper, area circa 2,750 acres, lies in a compact tract in Sections 11, 13, 14, 15, 22, 23 and 24, Town 56 North, Range 33 West, in addition to which the company owns considerable tracts, west of the Tamarack mine, carrying the underlay of the Calumet conglomerate at such stupendous depths that its opening would require a 2-mile vertical shaft, and it is problematical whether these lands ever will become available for mining on the Calumet conglomerate. The lands west of the Tamarack were explored 1904, by diamond drill, in search of a supposed cupiferous conglomerate, but nothing of importance was found.

The mine was opened originally on the Calumet conglomerate, and a parallel mine has been developed on the Osceola amygdaloid bed, while a third parallel mine is in process of development on the Kearsarge amygdaloid.

The Calumet conglomerate has proven unprofitable both to the north and south of the Calumet & Hecla, though workable at the Tamarack mine, which has developed the underlay by vertical shafts. The conglomerate has an average strike of N. 39° E., with average dip of 37° 30' with the horizon. The bed is of 8' minimum and 40' maximum width, with average width of 12' to 14', giving circa 2,400 fathoms of stoping ground per acre, equal to about 43,200 tons of stamp-rock. As a rule, the richer portions of the conglomerate are in the central part of the Calumet & Hecla tract. The walls of the conglomerate carry considerable copper, especially the amygdaloidal footwall, and much of the adhering trap rock formerly rejected is now milled. Pillars of 75' width, left on either side of every conglomerate shaft, contain stamp-rock equivalent to about 18% of the stoping ground available before the robbing of the pillars. The conglomerate mine is opened 6 to 8 years in advance of immediate requirements, and has about 200 miles of shafts, drifts, crosscuts and winzes. About 30,000,000' of timber is used in the mine yearly. The life of the old conglomerate mine was said, 1907, by President Agassiz, to be about 15 years, at the present rate of ore extraction, but it is probable that the mine will be producing at least limited quantities of conglomerate rock for 20 and perhaps 25 years to come, though 10 years may see the old mine past its crest, by which time other sources of supply, now developing, should enable the company to maintain production at its regular rate.

The Calumet & Hecla has suffered severely from underground fires. The amygdaloidal trap rock carrying native metal cannot burn, like sulphide ore, but the old timbering eventually becomes nearly as inflammable as so much tinder. The really serious mine fires, 5 in number, occurred in 1884, July and November 1887, Nov. 30, 1888, and May 27, 1900. All possible precautions are taken against mine fires, these including the partial fire-proofing of all mine timber with zinc chloride solution, regular sprinkling of all

shafts, the maintenance of water-pipes and hydrants, fire-hose, chemical engines, an electric alarm system and 18 telephones at various pump stations, from the 8th to the 51st levels, inclusive, in 5 different shafts, so distributed as to be most readily accessible from all parts of the mines. From the first 4 fires the Calumet & Hecla suffered aggregate losses of several millions of dollars, while a number of lives were lost, and 3 valuable shafts were drawn so badly that they were abandoned. The fifth and last fire, in May, 1900, severely tested the mine's fire system, the fire breaking out on Sunday evening, when the mine was deserted by all but a few employees, and gaining great headway before it was discovered. The burning portion of the mine was shut off by closing the fire-doors, and the mine was sealed at surface, by covering the mouths of the shafts with heavy timbers, with dirt tamped tightly into the crevices between. Wherever gas escaped through holes in the earth, dirt was tamped in and luted with water. The fire was extinguished in three weeks, and the South Hecla portion of the mine continued working without interruption. The 5 serious fires, and sundry smaller blazes nipped in their inception, all have been of mysterious origin, and there seem reasons for suspecting incendiarism. Great precautions are taken to prevent unauthorized persons entering the mine, and permission to go underground is given only by the president, in writing, each pass being for a single trip.

The conglomerate property of the Calumet & Hecla is worked as 2 separate mines, known as the Hecla and Calumet branches, the South Hecla being a southerly continuation of the Hecla branch, and the Red Jacket vertical shaft is a portion of the Calumet mine. The Calumet to the north, the Hecla in the centre and the South Hecla at the south, form a continuous mine, developing the Calumet conglomerate by incline shafts, the Red Jacket shaft opening the same bed vertically. The conglomerate, opened for 2 miles along the outcrop, has 11 shafts, 8 being known as single compartment, which means a single hoisting compartment, with 2 shafts having double compartments, and one vertical shaft having 6 compartments. In May, 1908, the Calumet & Hecla operated 318 power drills, this being the largest number in use at any American mine. The 6 shafts have auxiliary electric hoists, in underground stations, with pump actuated by compressed air and electricity.

Iron pillars are used extensively as supports, in crosscuts connecting the Red Jacket shaft with drifts on the bed, and in various incline shafts, to support the hanging wall. Iron, mainly scrap material, such as worn-out skip-rails, cut to 10' lengths and placed above "I" beams, is used for lagging to some extent. The conglomerate bed in the lower workings is scarcely up to its average value, being wide but low in copper contents, and it is evident from the results secured by the deep shafts in the district, that while the cupriferous stratified beds of Lake Superior may descend to tremendous distances, copper values grow less at depth.

The conglomerate shafts on the outcrop are as follows, from north to south: Nos. 6 and 5 Calumet have 2 compartments each, No. 5 being bottomed at the 78th level, and it is planned to establish an electric pumping system in this shaft, to drain practically all of the conglomerate workings now unwatered by the Red Jacket shaft, in order to increase the ore hoisting capacity of the latter. There is a considerable stretch of lean ground from No. 6 shaft to the Centennial boundary.

No. 4 Calumet, with 1 compartment, has a vertical depth of 4,748', and an actual depth of 8,100' on the incline of 37° 30', with a 190' winze from the bottom, giving a total depth of 8,290' from the collar of the shaft to the bottom of the winze.

No. 3 Calumet shaft has been abandoned.

No. 2 Calumet shaft, with one compartment, is 7,000' deep, practically at the boundary, and it is probable that it will be gutted in the near future.

No. 1 Calumet shaft has been abandoned for some years.

No. 1 Hecla shaft has been abandoned.

No. 2 Hecla shaft, 4,400' deep, is bottomed at the Tamarack boundary. Stopes are exhausted and the mine is being robbed, lower workings having been gutted up to the 31st level, July, 1908.

No. 3 Hecla, 4,000' deep, also is bottomed at the Tamarack boundary, and is being gutted.

No. 4 Hecla shaft has been abandoned for some years.

No. 6 Hecla shaft, one compartment, is 6,800' feet deep, in good ground, and can be sunk to circa 8,500' depth.

No. 7 and 8 Hecla, a double shaft of one compartment each, are 6,800' deep, in good ground, and can be sunk to about 9,000' depth.

No. 9 and 10 Hecla, 2 compartments, are 6,500' deep and can be sunk to 8,100' depth.

No. 11 Hecla, 2,400' deep, showed very poor ground at the bottom, and gutting was begun several years ago, robbing all pillars from the bottom up. It is probable that this shaft will be abandoned within a comparatively short time.

No. 12 Hecla shaft, at the company's south line, is 6,700' deep, bottomed in unprofitable ground, and is partly gutted. It is probable that this shaft will be worked out and abandoned circa 1909.

The Red Jacket vertical shaft, permanently bottomed at 4,920' depth, cuts the lode at 3,287'. Rock temperature was 87° Fahrenheit, reduced to 70° to 80° by connection with No. 4 Calumet shaft, exhaust air from the power-drills aiding in cooling the mine. The Red Jacket was planned to open a mine unconnected with the older shafts, to give reserve stopes in case of fire, but owing to heat and danger, connection was made with the older workings. The Red Jacket shaft is 14' 6" by 24' 6" within timbers, and is built of brick and cement from collar to the solid rock, and timbered below with Georgia pine. There are 6 compartments, 2 used for hoisting, 2 for water, and 2 for men and supplies. The 2 hoisting compartments, at the eastern end, have cages with 9-ton Kimberly self-dumping skips swung under. The 2 western compartments have double-deck cages for men and material, and the 2 middle compartments have large cylindrical steel bailers, for raising water. It is probable that the bailers will be replaced by an electric pumping plant at No. 5 Calumet shaft, which will permit doubling the present hoisting capacity of 1,800 tons of rock daily, by using 4 compartments for raising ore. Timber for the Red Jacket shaft is lowered through No. 5 Calumet, with which the Red Jacket is connected by a crosscut. The Red Jacket shaft hoists rock from all of the northern shafts below the 56th level, at which point the conglomerate is intersected. The Red Jacket shaft has 9-ton steel storage bins at its various productive levels, which aid in maintaining the uninterrupted hoisting service that is absolutely essential in a shaft of a mile depth. A ventilating chimney at the collar of the shaft does away with ice formerly caused in winter by vapors arising from the shaft. The shaft rockhouse of the Red Jacket is 100x100' on the ground and 110' high, with crushers for 2,000 tons of rock daily, and room for doubling the present crushing equipment.

A tract of 200 acres, a quarter-mile wide and 1 1/4 miles long, lying between the Tamarack and Tamarack Junior mines, carries the underlay of the conglomerate at great depth, and, to obviate sinking a deep and costly

vertical shaft, this tract is being opened by a blind shaft, which starts 1,500' east of the Red Jacket vertical and near the bottom of Calumet No. 4 shaft, which abuts on the Tamarack boundary line at a depth of 8,400'. The blind shaft is being sunk 25' under the footwall, at the same angle as the dip of the conglomerate, thus assuring solidity of walls while saving long and expensive crosscuts to the bed on each level. A "footwall drift" on the 57th level parallels the regular drift at a distance of 25' in the footwall, between the Red Jacket vertical shaft and the blind shaft, offering an avenue for operation which obviates the confusion certain to result were the regular mine drifts given double duty. The blind shaft starts in the footwall drift under and parallel with the 57th level, and eventually will be about one mile in depth, opening four of the five 40-acre tracts, leaving the fifth and last to be opened by a sub-shaft from the blind shaft, which doubtless will be sunk on the same system. The necessity for this peculiar method of development arises from the fact that the boundary lines of the property run north and south, while the strike of the lode is N. 39° E., giving a plane of dip of N. 51° W. Owing to the incline shafts being sunk on the dip of the lode while the blind shaft must follow the section lines, the latter descends diagonally on the dip of the bed, giving the blind shaft an average dip of about 22° only, although the bed dips at 87° 30'. This unusually flat incline permits the hoisting of rock in tram-cars, which are hauled through the blind-drift and dumped into the steel bins of the Red Jacket shaft for hoisting, thus saving a transfer at the mouth of the blind shaft. The showing in the workings of the blind shaft is satisfactory, the bed averaging about 14' width, with circa 10' fairly mineralized. The abandoned workings of the Tamarack Junior mine of the Osceola Consolidated, which adjoins the "five forties," is drained by holes bored by diamond drill from the blind shaft, obviating possible damage by flooding.

The amygdaloid mine of the Calumet & Hecla is opened on the Osceola amygdaloidal bed, which outcrops 730' east of the Calumet conglomerate, with parallel strike and average dip of about 40°, underlying the entire main tract of the Calumet & Hecla mine. There are 6 shafts in the amygdaloid mine, Nos. 13 to 18 inclusive, numbered from south to north. Shafts are duplicates in size, each having 8 compartments, of which 2 are used for hoisting and 1 for pipes and ladderways. The amygdaloid mine has upwards of 20 miles of workings, and has frequent connections with the conglomerate by crosscuts. The amygdaloid mine was closed 1901, and reopened 1904. In this mine the Osceola bed runs about 85' in width, with principal values along the foot and hanging, the middle third being lean as a rule. Lateral in the Osceola workings are carried as drift-stoops of 12' height along the hanging wall. The Calumet & Hecla owns, on its main tract, about 11,000' of the strike of the Osceola bed.

No. 13 shaft, the southernmost on the Osceola bed, was opened to the 23d level March, 1908.

No. 14 shaft, 3,200' north of No. 13, reopened 1905, was at the 23d level March, 1908.

No. 15 shaft, 2,600' north of No. 14, reopened 1906, was at the 16th level March, 1908.

No. 16 shaft, 1,800' north of No. 15, resumed work 1905, and is the principal productive shaft of the amygdaloid mine.

No. 17 shaft, 1,800' north of No. 16, was at the 11th level March, 1908.

No. 18 shaft, the northernmost of the amygdaloid mine, started 1907, was circa 300' deep July, 1908, giving a very good showing of stamp-rock.

The Kearsarge amygdaloidal bed outcrops about 2,200' east of the Osceola

amygdaloid and 2,900' east of the Calumet conglomerate, with parallel strike and dip of about 41°, underlying the entire main tract. Work of development was begun August, 1903, and there are 3 shafts, numbered from north to south, each having 3 compartments and being practically duplicates of those on the Osceola amygdaloid. The shafts are "timbered" with steel, brick and concrete, the hanging wall being lined with 3 arches of brick, laid in 3 to 5 courses, thickness being increased with depth, supported by 2 rows of "I" beams which serve also as dividers for the shaft. The Kearsarge lode, as opened by these shafts, is somewhat erratic, though showing considerable stretches of ground that probably will yield 18 to 22 lbs. fine copper per ton, with reasonable selection. The Kearsarge shafts have permanent equipments, with railroad tracks, and are connected with the compressed air mains of the company's system.

No. 19 shaft, about 1,000' south of the Centennial boundary line, is 1,300' deep, and has furnished some stamp-rock to the mill, but was closed down October, 1907.

No. 20 shaft, next south of No. 19, is about 1,300' in depth, and idle also.

No. 21, the southernmost shaft on the Kearsarge bed, is 8,000' south of No. 20, and, at shallow depth, showed well in copper, but deeper workings are not so rich. Work is in progress.

The Calumet amygdaloid, lying between the conglomerate and the Osceola amygdaloid, has been little opened, but might prove payable, if developed, as it shows some rich ground in a crosscut on the 900' level.

The shaft rockhouses at the conglomerate incline shafts, of uniform pattern, were remodeled, 1908, to accommodate 40-ton railroad cars. The old 5-ton skips were replaced, 1907, by 7½-ton skips. Rock is hoisted to the top of each shaft-rockhouse, passing thence over grizzlies that allow the finer rock to fall through, the larger masses being reduced in 24x36" crushers, going thence to 18x24" crushers on the floor beneath. Crushed rock falls by gravity into storage bins, whence it is dumped into cars that take it to the mills, railroad tracks running underneath each rockhouse. The standard equipment includes a 50-h. p. induction motor at each shaft for driving crushers.

The surface equipment at the Calumet & Hecla is the most complete found at any mine in the world. With few exceptions everything is duplicated, to prevent possible delays or suspension, by reason of fire or accident.

The power plants at the main mine on the Calumet conglomerate include 4 large boiler plants and 6 hoisting plants. The hoists of the conglomerate mine are very powerful, ranging in capacity from 1,000 to 8,000 h. p. each. Miners are carried to and from work, in the incline shafts, by man-cars, these being long trucks having tiers of circus seats, replacing skips when needed, being shifted quickly on or off the skip-tracks by large cranes. This method has proven the safest, quickest and cheapest for moving men in and out of deep incline shafts.

At No. 4 Calumet shaft there is a group of the most powerful machinery ever built. The brick engine-house, 62x146', contains the 4,700-h. p. Corliss engine "Superior," with 40" cylinders and 72" stroke; the auxiliary engines "Baraga" and "Rockland," of 2,000 and 600 h. p. respectively; two Rand air-compressors, of 25 and 40 drill capacity, and the engine "Mackinac," a 7,000-h. p. quadruple-cylinder triple-expansion steel giant, operating 4 Nordberg air-compressors with a combined capacity of 650 drills, or about double the requirements of the mine. There also are four 35-drill auxiliary compressors. In the old Leavitt compressor, water was injected into the compression cylinders, while the Nordberg machines deliver the compressed and greatly heated air to a cylindrical steel cooler, 12" in diameter and 30' high, into which water

is sprayed from above and drawn off at the bottom, this cooling the air to 80° F. The hoist has 4 drums, each 8' 6" wide and 20' 6" in diameter, operating 4 different shafts, 2 of these drums carrying nearly 2 miles of steel cable each. Power is supplied by batteries of boilers in 2 boilerhouses adjoining, these having a brick chimney 250' high, with inside diameter of 12' 6". Locomotives haul the coal into the boiler-houses, where it is fed to the grates by automatic stokers.

The Hecla engine-house, of brick, 47x80', flanked by a large boiler-house, contains the 2,000-h. p. compound hoisting engine Frontenac and 2 auxiliary engines of 600 and 900 h. p., also a 30-drill Rand air-compressor and a pair of water-plunger air-compressors with combined capacity of 144 drills—the largest machines of this type ever constructed.

South of the Hecla plant is the G. H. & S. engine-house, having the Houghton and Seneca engines, of 2,000 h. p. each. The Hecla boiler-house has 5 large boilers and a 200' smoke stack, of 9' 6" internal diameter.

The engine-house operating Hecla shafts 7 and 8 contains the engines Hancock and Pewabic, each of 2,000 h. p., which operate 25' drums by spur gearing, and a 5,000-h. p. Leavitt engine for man-cars. A 50x120' boiler-house has 10 boilers and a 250' smokestack of 12' 6" internal diameter.

The South Hecla engine-house at shafts 9 and 10 contains the engines Detroit and Onota, of 1,000 h. p. each.

The South Hecla engine-house at shafts 11 and 12 has two 1,000-h. p. Lidgerwood hoists.

The Red Jacket shaft has an 8,000-h. p. quadruple hoist, housed in a 70x220' brownstone building, and in an adjoining brownstone building, 70x150', with a 250' smokestack of 12' 6" inside diameter, are ten 1,000-h. p. boilers. At the rear of the engine-house is a 32x412' brownstone annex, floored with cement and roofed with slate, in which is carried the fleet-gear. In raising 10-ton loads perpendicularly from a depth of one mile, the weight of the cage and steel cable nearly equals that of the cargo of rock, but with the aid of counterbalance the engines can hoist 10-ton loads at a speed of 40 miles per hour, the regular hoisting time being about 90 seconds for the vertical distance of nearly a mile, this including time taken for starting and stopping, an achievement no locomotive could duplicate on a horizontal plane. The engine operates on a system devised by S. B. Whiting, formerly manager of the company. To overcome the dangerous strain caused by unequal wearing, Walker differential rings have been placed on the sheaves, with excellent results, the cables taking 4 complete turns around the driving sheaves.

Equipment at the amygdaloid shafts on the Osceola lode is practically the same at shafts 13, 14, 15, 16 and 17, the new shaft, No. 18, having a combined engine and boiler-house with a small Lidgerwood hoist. Shafts 13, 14 and 15 have large stone engine-houses, with a steel engine-house at No. 16. Shafts 13 to 17, inclusive, have Nordberg first-motion double conical-drum hoists, operating 10-ton skips in balance, good for 5,000' depth each. All engine-houses have air connections with the main compressor plants at the old mine, and shafts 13, 14, 15, 16 and 17 have permanent shaft-rockhouses of the same general design as at the conglomerate workings.

The machine-shop, 225x250', largely rebuilt in 1907, has an equipment that is excelled by only a few of the largest shops in the country, including a 25-ton electric traveling crane and mammoth planers, electric power being used throughout. These shops are capable of handling anything and everything in the line of repair work, and also have complete manufacturing facilities for the making of mining, milling and smelting machinery, and have

turned out hundreds of Wilfley tables and other special machinery, under agreement with the owners of the patents.

The foundry, 78x96', has 2 iron cupolas and a brass foundry, with a 20-ton electric traveling crane.

The pattern shop, just north of the foundry, is of brick and steel, divided into 2 compartments, one for the shop proper and one for the storage of patterns.

The carpenter-shops are of great size, and are equipped with as complete a line of labor-saving machinery as can be found in any general woodworking establishment.

The blacksmith shops are of larger size than may be found elsewhere, except in the works of a few of the very largest manufacturers of machinery, and are equipped with steam hammers, forges, blowers, emery wheels, etc. The Calumet smithy alone sharpens upwards of 50 tons of steel drills daily, requiring the services of a small regiment of drill-boys between the shops and mines. The Hecla blacksmith shop does general blacksmithing and forging for the entire mine, a stone addition of 66x152' having been built to the Hecla shop in 1903. The various shops of the Calumet & Hecla employ upwards of 100 blacksmiths.

A timber mill at the mine mortises and tenons the bed-pieces, legs and stulls of the square sets that are used underground, and furnishes blocks and wedges.

The electric building at the mine is 74x74', of stone, housing the old electric power and lighting plant, but the main electric plant now is at the mills in Lake Linden.

Warehouses include a very large brick building for general supplies, and special warehouses for steel and iron, oil, paint, etc., the main buildings having direct rail connections. There are also barns and a considerable number of miscellaneous structures, required in connection with the operation of the mine. The office building is a large and handsome stone structure, housing the various executive departments and engineering force of the mine. The company's private telephone system has an exchange with about 150 instruments, including a number of deep underground stations, with local and long-distance connections.

The company maintains a large hotel and a fine stone clubhouse for employees, the latter containing bath-rooms, bowling alleys, etc. The changing houses for the miners, at the various shafts, are well equipped with hot and cold running water, bath-tubs, lockers, etc.

The Calumet & Hecla library, of more than 30,000 volumes, contains books, periodicals and newspapers printed in a score of languages, about 80 different nationalities being represented on the company's pay roll. There also is a combination library and clubhouse at Lake Linden, for stamp-mill and smelter employees.

The company maintains a hospital, for employees solely, built 1898, noted for its complete surgical and laboratory apparatus. Nearly a dozen physicians on the hospital staff are at the call of any employee, or any member of his family that may require medical or surgical attendance.

The company owns about 1,200 dwellings, rented to employees at an average price of 6% on actual cost, plus cost of maintenance, and upwards of 1,200 dwellings are owned by employees on lands leased from the company at low yearly rentals.

There are 8 schoolhouses on the lands of the Calumet & Hecla, most of which were built by the corporation, including a fine manual training school, and a truly magnificent high school building at Calumet.

On Calumet & Hecla lands there are upwards of 30 churches, occupied by a dozen different denominations. All of these sites were donated by the company, and in most cases substantial aid has been given in their erection and maintenance, entirely regardless of creed.

The company maintains 3 distinct systems of waterworks, one at the mines in Calumet, one at the mills in Lake Linden, and one on the shore of Lake Superior, 4 miles from Calumet, the latter pumping water for domestic uses, against a head of 600', raising about 4,000,000 gallons daily. Electricity was substituted for steam, 1908, at this plant, and the pipe-line is to be continued to Lake Linden, to furnish Lake Superior water for the boilers of the new power plant. At the Calumet dam and mine there are 7 pumps, having a combined daily capacity of upwards of 45,000,000 gallons.

The company maintains a complete fire department, modeled on metropolitan lines, which affords protection to the mine buildings and location, also responding to calls from Red Jacket, Laurium and the other towns that go to make up the mining camp of Calumet, of 40,000 population, that has grown up around this great property.

The Hecla & Torch Lake railroad, owned by the company, connects the mines, mills, smelter and shops by upwards of 20 miles of main tracks, spurs and sidings, reaching every shaft, shop, warehouse, mill and furnace. The 5-ton wooden rock-cars formerly used were replaced, 1908, by 150 forty-ton steel rock-cars, and the line was widened to standard gauge, 1907, by the addition of a third rail. Three new locomotives were bought and the old narrow-gauge locomotives rebuilt to standard gauge in the company's shops.

The stamp mills are at Lake Linden, 4 miles from the mine, on a tract of 998 acres having several miles of frontage on Torch Lake. There are 2 mills, known as the Hecla and Calumet, each originally having 11 Leavitt steam-stamps with 14x21½" cylinders and 24" stroke. A 165x308' steel addition to the Hecla mill, with 6 stamps, was built in 1903 and, upon its completion, the rebuilding of the 2 old mills was begun, each being divided into 2 sections, with one section rebuilt at a time, each section requiring approximately one year for completion, remodeling being completed in 1907. Great as was the cost of this work, the new mills practically had paid for themselves upon completion, through reduced cost of operation and increased saving of copper. While the mills are termed rebuilt, they actually are entirely new mills, standing upon the old sites, practically nothing of the old material having been utilized. The new mills handle rock with about 60% of the wash-water formerly required, thus effecting a double saving, inasmuch as all water used in the mills first must be pumped in, and thereafter raised as sludge, by the sand-wheels, for discharging.

The new mills, built by the Wisconsin Bridge & Iron Co., have heavy steel frames, with concrete foundations, cement floors, corrugated iron siding and Carey roofs of tarred burlap. Foundations are much heavier than in the old mills, and the wash-room below the heads is much greater. Foundations are of very massive piles, spaced 20" apart, with 2 and 3 tiers driven to bed-rock and topped with 6x12" square timber, capped by a 4' 6" bed of concrete. The mills have 29 Leavitt heads and 1 Nordberg steeple-compound head, of which 28 heads are in commission regularly, with 2 in reserve, 20 heads treating conglomerate rock and 6 crushing amygdaloid rock. Stamps are actuated by steam power, except the 6 stamps in the Hecla addition, which have independent 25-h. p. motors each, but the other milling machinery is operated electrically. The Leavitt heads have a daily capacity of about 400 tons of conglomerate, 500 tons of Osceola amygdaloid or 550 tons of Kearsarge amygdaloid.

The mill equipment includes, below the stamps, Woodbury-Benedict jigs; ten 4-deck Evans-Rawlings round-tables, from which slimes are treated by 96 Wilfley tables; Chilean regrinding mills, Avery grinders and classifiers, there being a total of 220 Wilfleys, which effect a considerable saving of the very fine copper formerly lost, and greatly reduce the water consumption. By special arrangement the Wilfleys were built in the company's shops.

The regrinding plant, built 1908, occupies a steel building 195x340' in size, and is of circa 1,500 tons daily capacity. Equipment includes 48 Chilean mills, set on massive concrete piers, and 200 Wilfley tables, latter built in the Calumet & Hecla shops. There is an electric traveling crane and a 50' sand-wheel is to care for the tailings. The experiments in regrinding at the mills proved so successful that the new plant has been built, to treat about 20% of the tailings from the stamp-mills.

As the mills stand on the flat western shore of Torch Lake, but little above water level, tailings speedily filled the shallow lake for some distance off shore, and to waste the sand it became necessary to secure a considerable initial elevation, which is gained by sand-wheels. The material entering the mills as conglomerate rock leaves as coarse sand, to the extent of fully 8,000 tons daily. The sludge is washed through launders to the sand-houses, where it is scooped up by the buckets of the wheels and dumped, high above, into launders running on trestles far out into the lake, these spouting forth miniature brick-red Niagaras. There are two wheelhouses, one for each mill. The Calumet wheelhouse has sand wheels of 40' and 50' diameter, and the Hecla wheelhouse, caring for the sands from a much larger mill, has sand-wheels of 40', 50' and 64' diameter, the latter being housed in a three-story steel annex, 65x78' on the ground and 94' high. The old wheelhouses are of wood, iron-sheathed. The steel in the annex to the Hecla wheelhouse weighs 490 tons, and the building is equipped with a 45-ton Sellers traveling crane. The sand wheel is to appearance a gigantic bicycle wheel, fitted with a spur gearing where the rubber tire should be. The complete wheel weighs 500 tons, and is mounted upon massive concrete masonry. Four 25-ton iron bed-plates support the pillars carrying the 21-ton Krupp forged steel axle, which is 27' long and 32" in diameter with a hollow core of 26" diameter. Radiating from axle to rim are 2" steel spokes 32' long. The rim is in 20 segments weighing 10,700 lbs. each, the inner perimeter of the wheel having 550 buckets, in pairs, each 3" wide and 4' 6" long, and holding 100 gallons, giving the wheel a capacity of 55,000 gallons per revolution. The completed wheel is 10' wide and 64' in diameter, driven by gear and pinion, power being furnished by a 700-h. p. dynamo. Nearly two years were required to build and adjust this monstrous wheel. Foundations for another wheelhouse were begun April, 1908, and another sand-wheel of 50' diameter is to be installed.

The tailings at the Lake Linden mills are the most extensive in the world, containing nearly 40,000,000 tons of stamp-sand, carrying about 8 to 10 lbs. copper in the newer sands, the older tailings having 12 to 20 lbs. of copper per ton, and there probably is fully 250,000 tons of copper in these sands. Extensive experiments at reworking the tailings have been made, from time to time, but without success. By reason of the included copper, which can be extracted only through regrinding, and the rapid oxidation of the metal in the tailings, the problem of economical extraction is not simple, and as yet lacks a solution.

The new boiler-house, of steel frame, 108x220', with two 200' self-supporting brick-lined steel smokestacks, is planned for twenty 500 h. p. Babcock-Wilcox tubular boilers, with 15 in place. The old boiler-house is to be demolished. The power-house has coal crushers, feeding an endless link-belt system with

308 steel link buckets, of 60 tons hourly capacity, which takes the coal to overhead bins, from which it is fed to the grates by Roney automatic stokers. Water requirements at the new boiler plant are about 650,000 gallons daily, and water is secured from a reservoir, artesian wells and Torch Lake, going through a Jewell filtration plant of 500,000 gallons daily capacity, in which impurities are precipitated by lime, but the new plant is to take water from a large reservoir, fed from Lake Superior via the Calumet pipe-line.

The new power plant at Lake Linden furnishes electric energy for the mine, as well as for the mills, the electrification of the property having begun in 1904. It is the plan of the company eventually to use electric energy throughout the mine and works, wherever practicable, though in the case of some of the big compounded hoists, a change from steam to electricity would be doubtful economy, as well as necessitating enormous initial outlays. Steady progress has been made in the application of electric energy, and the work will be completed in the near future. Eventually practically all the machinery of the company, except hoists, air-compressors and stamps, will be operated electrically.

The central power station, of steel, is located at the mills rather than at the mine because fuel can be delivered alongside from the largest vessels plying the great lakes, effecting a saving of about 10 cents per ton on transportation cost of coal formerly burned at the mines, with a much greater saving in the case of isolated plants lacking rail connections. There also will be a saving in slack, resulting from one less handling of the coal. Some of the former steam installations consumed as much as 4 pounds of coal per horsepower-hour, while the new electric plant requires approximately 1½ pounds per horsepower-hour. There are numerous other economies resulting from a central electric power plant, especially in labor, the company formerly employing 100 freemen in its various power plants. The coal consumption of the Calumet & Hecla, at its mines, mills and smelters, is about 250,000 tons yearly. Machinery at the power plant includes the old engines Saginaw and Gratiot, the former an Allis-Chalmers twin vertical tandem compound-expansion engine having 17x40x48" cylinders, each engine being direct connected to a 1,000-kw. alternating current generator. The completed plant will have, in addition, the Leavitt engines Owego and Ontonagon, of 3,000 h. p. each, built originally for hoisting purposes, direct-connected to 2,000-kw. generators. There is room for a third 2,000-kw. generator, which will give a total capacity of 8,000 kw., equal to more than 10,000 h. p. The electric equipment of the mills includes 15 motors of 20-h. p. to 250-h. p. each.

Water for the mills is supplied by 5 pumps, of which the Michigan is the most powerful in the world, having a daily capacity of 60,000,000 gallons. The daily capacity of the engines Huron and Ontario is 20,000,000 gallons each, of the Erie 10,000,000 gallons, and of an I. P. Morris pump, 22,000,000 gallons.

Miscellaneous buildings at the millsite include a 50x100' steel frame smithy, 48x175' warehouse, machine-shop, carpenter-shop, paint-shop and sundry other shops required in connection with the works.

The Torch Lake smelter is at Hubbell, about a mile south of the mills, on a 30-acre site having ample water frontage, shipping facilities including deep water in front and 3 railways at the rear. The smelter has 4 furnace buildings, each 80x130', and a 50x70' blister copper furnace building. Both the reverberatory and blast furnaces have been rebuilt within the past few years, there being 11 reverberatory furnaces, with 93' stacks. Reverberatories are top-charged, having platforms above on which the mineral is thoroughly dried before smelting. The largest blast furnace is 40x36" at the tuyeres, its comparatively small size being due to the use of reverberatory furnaces

for the bulk of the smelting work required in the process of reducing the native copper mineral treated. The practice at the smelting plant is fully abreast of the times, in all essentials.

The smelting works have 3 mineral-houses, with a combined storage capacity of 18,000 tons. Calumet & Hecla mineral now carries less than 60% copper, being dressed much lower than formerly, to effect the saving of the very fine copper previously lost in the slimes.

The power plant at the smelter has three 125-h. p. boilers, and a fourth boiler, in the cupola building, generates steam by the combustion of waste gases from the reverberatory furnaces. A small electric plant has an 85-kw. generator, with a 25-kw. generator in reserve.

The smelting works have a 2-story assay office and laboratory, 40x42', with a 14x14' wing, exceptionally well arranged and complete in equipment. There also is an office and a large warehouse for supplies.

The eastern reduction plant, known as the Buffalo Smelting Works, at Black Rock, in the northern part of Buffalo, is located on the Niagara river, with deep water in front and direct rail connections in the yards. The works include the reverberatory and blast-furnace buildings, an electrolytic plant, 2 large mineral storage houses, office, laboratory and coal-sheds. The works are well arranged, but have grown to nearly the capacity of the site, and soon will require more room. A 30-ton electrolytic refinery, originally installed for experimental purposes, has grown to large size, with 700 tanks having multiple arrangement of electrodes, and it is planned to increase its capacity to 20,000,000 lbs. of anodes yearly. Formerly only high grade mineral was shipped to the Buffalo works for smelting, but at present all grades of mineral are treated at both plants, though the mineral from the deeper workings of the Calumet & Hecla, which is decidedly arsenical, is treated exclusively at the Buffalo works, by electrolysis, which effects the saving of considerable silver, formerly lost. The Buffalo plant employs about 150 men.

A fleet of steel steamers and barges is operated by the company, carrying mineral east and bringing back return cargoes of coal, this fleet including the fine steel steamer Geo. A. Flagg, of 3,300 tons register. Sufficient mineral is shipped to the Buffalo works, during the open season of navigation, to keep the plant operating steadily from December till May, during the closed season.

The dock system of the Calumet & Hecla is extensive, including a series of very large coal-sheds at Lake Linden, with one of 200,000 tons capacity, the old sheds being of wood and the new of steel. There is a series of docks at the mills and smelts on Torch Lake, all with substantial wharves having at least 21' of clear water alongside, frequent dredging being required to maintain this depth of clear water, owing to stamp-sand filling in. The wharves were extended, 1904-1905, both at Lake Linden and Hubbell. The 750' coal wharf has 11 Hunt hoists and three 52' movable derricks, one of wood and two of iron.

The Calumet & Hecla owns and operates the ship-canal connecting Torch Lake with the government waterways on Portage Lake, this canal being 21' deep and accommodating the largest vessels plying the great lakes. Tolls, ranging from 10 cents on soft coal to 50 cents per ton on package freight, are charged by the company, on independent cargoes entering Torch Lake through this canal.

A sawmill, at the head of Torch Lake, receives logs by rafts, and ships sawed lumber and timber by a branch of the Hecla & Torch Lake railway. The company has sawmills at Ashland, Wisconsin, and Sheldrake, Michigan, both on the southern shore of Lake Superior, the latter having a capacity of 12,000,000' of sawed lumber yearly, with several years' supply of standing

timber tributary thereto. The company owns extensive tracts of pine, hemlock and hardwood timber along the southern shore of Lake Superior, this land carrying about 500,000,000' of standing timber. The company also has a long-term timber contract with the Keweenaw Association, Ltd., and buys extensively of jobbers, the requirements for underground timbering alone being about 30,000,000' annually, in addition to the many million feet of timber and lumber used on surface, at the mines, mills and smelters.

An aid fund for employes, instituted 1877, and managed by directors chosen by the workmen, pays death and disability benefits, enormous sums having been disbursed since the formation of the fund, every dollar going to the sick and injured, or to families bereaved of their bread-winners by accident or disease. Surplus monies accumulated in this fund have been invested in the company's shares, bought on the open market, and these investments have been highly profitable. Disbursements from this fund are \$50,000 to \$75,000 yearly. For the maintenance of this fund each employe pays 50 cents monthly, and the Calumet & Hecla adds an equal amount. The company is said to have established, 1907, a pension fund for superannuated employes of long and faithful service.

Beginning with the new century, the policy of the Calumet & Hecla has been one of expansion. Almost from its birth it was the greatest copper producer of the world, and the most profitable mine of any metal. The company was progressive, leading all other mines in the introduction of heavy mining machinery and modern methods, but was self-contained and self-sufficient. It was seen, however, in 1901, that the old mine, great as it was, must come to an end sometime, hence a radical change in policy, which included the reconstruction of its mills, many changes in mining practice, and, most important of all, the acquisition of mineral resources outside of the old mine, in addition to the opening of a fine new mine on the Osceola amygdaloid, upon the old tract, and the tentative opening of a mine on the Kearsarge amygdaloid. Some excellent team work, led by Messrs. Agassiz, Livermore and MacNaughton, has been done by the responsible heads of the company, and in consequence the Calumet & Hecla, instead of being the decadent property that it would be in 1909, but for this work, continues well at the front, in both production and earnings. Costs have been reduced largely, and savings effected in innumerable ways. The growth of the property, during the new century, has been well balanced, every department having been brought to a higher degree of efficiency. Operating costs have been largely reduced, without cutting wages, while charging millions of dollars for new equipment direct to operating expenses, and despite the decreasing percentage of copper due to deepened mines, the cost of making a pound of copper was reduced, from almost 11 cents in 1901, to about 8.25 cents in 1906.

The policy of acquiring new mines, either through direct purchase or by control of stock, begun in 1904, has been adhered to consistently, and the Calumet & Hecla now is in control of two promising neighbors to the north, these being the Centennial and Allouez, and, although the Centennial made a failure of working the Calumet conglomerate, it is probable that eventually this bed can be worked profitably, on Centennial ground, by the Calumet & Hecla, though the task would be hopeless if attempted by an independent company. The Calumet & Hecla also is likely to be in control, shortly, of its southern neighbor, the Osceola, which also has extensive mines in the vicinity of the Centennial and Allouez, to the north. The Superior Copper Co., at Houghton, is developing a fine mine on the Baltic amygdaloid, and may be considered a large and permanent asset of the Calumet & Hecla. The La Salle, south of the Osceola, remains in a development stage. In Ontonagon

county, exploratory work undertaken by the company has given disappointing results. In Keweenaw county, where the Calumet & Hecla owns a tremendous acreage of mineral lands, no mine has been developed as yet, but it is altogether probable that, in the course of time, payable mines will be opened on the lands of the Manitou, Gratiot and Frontenac companies.

The company markets its own copper, and in the course of 40 years of honest dealings, has built up a patronage that is simply unassailable. The advantages resulting from direct contact with consumers are very great, one of the principal benefits, in addition to the friendly relations established by direct communication with consumers, being the closeness with which the company is kept in touch with the copper market, reflected by the exceedingly skillful marketing of the company's products, resulting in high average prices, yet protecting the interests of customers.

The conglomerate rock from the old Calumet & Hecla workings, which yielded 59.93 lbs. fine copper per ton in 1900, returned only 39.68 lbs. per ton in 1907, yet the company made its copper cheaper in the latter year. The mill, at the beginning of the latter half of 1908, was stamping about 8,500 tons daily, of which circa 6,500 tons was conglomerate and 2,000 tons amygdaloid rock, the amygdaloid mine working one-third of the power drills employed. In 1906 the company produced, from Osceola amygdaloid rock, 6,892,458 lbs. fine copper, and in 1907 made 11,145,820 lbs. fine copper from 603,881 tons of Osceola amygdaloid rock stamped, a yield of 18.45 lbs. fine copper per ton, which was most satisfactory. The cost of treatment of Osceola amygdaloid rock for the fiscal year ending April 30, 1906, was only \$1.57 per ton.

Detailed figures of production and dividends by years will be found in the statistical chapter. The statistical confusion so frequently noted in figures of Calumet & Hecla production is caused by the use of four sets of figures of production of refined copper, to say nothing of two sets of figures of output of crude mineral (unsmelted copper), and numerous estimates of more or less authenticity. The four sets of official figures of annual production are far actual output of refined copper, and also quantity of fine copper contained in mineral produced, for the calendar year, and also for the company's fiscal year. Figures used in this publication are those of actual outputs in refined copper by calendar years.

Production, 1906, was 100,023,420 lbs. fine copper, leading the mines of the world; and for 1907 was 83,863,116 lbs. fine copper, while for the first half of 1908 the production was circa 42,000,000 lbs. fine copper, or at practically the same rate as in the preceding year.

#### CALUMET, HECLA & MUSOATINE MINING CO.

Office: Cass Ave. and Second St., St. Louis, Mo. Location of property, if any, not known.

#### CALUMET & JEROME COPPER CO.

Mine office: Jerome, Yavapai Co., Ariz. Organized April, 1907, under laws of Arizona, with capitalization \$1,500,000, shares \$1 par, by Geo. H. Avery, Geo. W. Avery and Joseph Larson. Lands, sundry claims, about 2 miles south of the United Verde. Incorporators stand well locally, but no work done on property at last accounts.

#### CALUMET MINING CO.

Office: 2 Toltec Bldg., Denver, Colo. Letter returned unclaimed from former mine office, Rollinsville, Gilpin Co., Colo. Emerson J. Short, president and general manager. Main shaft, 100', is said to show a 2' pay streak of auriferous and argentiferous chalcocite assaying 25 to 40% copper. Idle.

**CALUMET & MONTANA MINING CO.****MONTANA.**

Office: Duluth, Minn. Mine office: Dillon, Beaverhead Co., Mont. Saml. Clark, president; Wm. Buchanan, first vice-president; Gust Levine, second vice-president; John Cox, secretary; Solomon Goldberg, treasurer; preceding officers, Thos. Bastian, J. J. Lefevre and Angus McDonald, directors; Capt. Jas. Lanyon, superintendent. Capitalization \$300,000, shares \$1 par.

Lands, 6 claims, area 180 acres, in the Copper Queen district, near the Idaho line, including the Dark Horse mine at the head of the Big Hole, having tunnels of 125' and 160', and a 2-compartment 200' shaft, with circa 1,800 of workings, developing a 5' fissure vein carrying auriferous and argentiferous chalcocite and bornite of excellent grade. Property shows 3 practically parallel fissure veins, of circa 12', 15' and 22' width. Test shipment, to Salt Lake smelter, gave returns of 18% copper, 7 oz. silver and 66 cents gold per ton, and ores shipped, 1907, to Washoe smelter, averaged 21.4% copper, 73 oz. silver and 38 cents gold per ton. Equipment includes two 50-h. p. boilers, a hoist good for 1,000' depth, and a 2-stage Sullivan air-compressor. Property considered promising.

**CALUMET & ONTARIO DEVELOPMENT CO.****ONTARIO.**

Office: Calumet, Mich. Letter returned unclaimed from former mine office, Massey Station, Algoma, Ontario. Lands, sundry claims near the Hermina mine. Idle for several years and apparently moribund.

**CALUMET-PINAL MINING CO.****ARIZONA.**

Office: 1267 Broadway, New York, N. Y. Mine office: Red Rock, Pinal Co., Ariz. Chas. Doty, president; G. E. Crawford, secretary; Hon. Nott E. Guild, superintendent. Organized July 3, 1905, under laws of Arizona, with capitalization \$1,000,000, shares \$1 par.

Lands, 12 claims, area 240 acres, and a 5-acre millsite, in the Owl Head district, 15 miles northeast of Red Rock. Mine was opened 1879, and worked, in a desultory way, to depth of 85', producing circa \$60,000 worth of ore. The 96' Yankee Girl shaft is opened in porphyry showing deposits of medium grade ore. The 185' Cloud Burst shaft develops a vein between porphyry and slate, carrying sulphide ore of good average tenor. Property is considered promising with a good local management.

**CALUMET & PITTSBURG MINING CO.****ARIZONA.**

Dead. Merged, 1907, in Superior & Pittsburg Copper Co. Formerly at Bisbee, Cochise Co., Ariz. Very fully described Vol. VII.

**CALUMET & SAULT STE. MARIE DEVELOPMENT CO.****ONTARIO.**

Office: Calumet, Mich. Letter returned unclaimed from former mine office, Massey Station, Algoma, Ontario. Fred. Roehm, president; Wm. F. Ashton, superintendent. Lands, near the Hermina, have a 100' shaft, showing a vein of 14' reported width, carrying auriferous chalcopyrite. Idle several years and apparently moribund.

**CALUMET & SONORA OF CANANEA MINING CO., S. A.****MEXICO.**

Is the Mexican incorporation of the Calumet &amp; Sonora Mining Co.

**CALUMET & SONORA MINING CO.****MEXICO.**

Office: 606 Sellwood Bldg., Duluth, Minn. Mine office: La Cananea, Arizpe, Sonora, Mex. Jerome E. Cooley, president; Jas. W. Norton, first vice-president and general manager; B. Silberstein, second vice-president; Hubert V. Eva, secretary; Chas. W. Ericson, treasurer; preceding officers, Wm. D. Underhill and H. E. Prudden, directors; Forbes McRae, superintendent; Thos. M. Dunlop, assistant superintendent. Organized May 14, 1903, under laws of Minnesota, with capitalization \$600,000; capital increased to \$3,000,000, shares

\$10 par. Direct title to lands is held through a Mexican corporation, the Calumet & Sonora of Cananea Mining Co., S. A. Annual meeting, second Tuesday in October.

Company began business with 173 acres of land, and has increased its holdings to 1,146 acres, all in the Ronquillo district. Properties are the Buena Vista group of 306 acres, Catalina group of 630 acres, and Ronquillo-Duluth group of 210 acres, principal developments being on the Catalina.

The Buena Vista group, near the Greene-Cananea, has the 100' Underhill shaft and the 293' Norton shaft, with a 552' crosscut tunnel, showing a vein of 57' width, carrying sulphide ores with tricose gangue assaying 1.25 to 1.75% copper.

The Catalina group has 2 old shafts of circa 75' each, and a new shaft of 205' depth, with about 900' of workings, showing ore, from surface, of good average grade. A 16-ton test shipment returned 3.64% copper, 53% lead, 113 oz. silver and \$20 gold per ton.

The Catalina group has a 150-h. p. equipment, and a townsite has been platted adjoining the Bonanza de Cobre mine, with a lumber yard. Company is free from debt, meeting all obligations monthly, and Aug. 1, 1908, had on hand, \$13,000 cash. Employs 71 men. Company continued active development during the period of depression, in 1907. Property considered promising and management good.

#### CALUMET & TEXAS MINING CO.

TEXAS.

Office: Cedar Rapids, Iowa. Mine office: Carlsbad, N. M. John H. Shary, president and general manager; Wm. Fullerton, secretary and treasurer; W. G. Woerner, general manager. Organized, May, 1901, under laws of New Mexico, with capitalization \$250,000, shares \$1 par. Lands, 36 claims, area 720 acres, also 640 acres of oil lands, in the Guadalupe Mountains, El Paso county, Texas, 64 miles southwest of Carlsbad, nearest railroad point, showing carbonate ore assaying 20% copper, 5% lead and 1 oz. silver per ton, with a trace of gold, opened by tunnels of 40', 200', 210' and 328'. Has expended about \$30,000 and claims to have \$500,000 worth of ore developed. A 23-ton test smelter shipment returned 19 to 24% copper. Idle several years.

#### CALUMET & YAQUI RIVER COPPER CO.

MEXICO.

Letter returned unclaimed from former office, La Cananea, Sonora, Mex. Mine office: Soyopa, Ures, Sonora, Mex. H. C. Rolfe, president; Geo. H. Nolte, secretary; W. J. Elliott, treasurer. Organized Apr. 28, 1903, under laws of Arizona, with capitalization \$3,000,000, shares \$10 par. Apparently is successor of Santa Marguerita Mining Co., and bought lands of the Vénice Copper Co., 7 miles from Soyopa, area 85 hectares, opened by a 1,200' tunnel, showing copper sulphides of fair tenor at shallow depth. Is said to have a 50-ton smelter. Presumably idle.

#### SOCIÉTÉ DES MINES DE CUIVRE DU CAMAQUAM.

BRAZIL.

Office: Brussels, Belgium. Mine office: Camaquam, Rio Grande do Sul, Brazil. Organized 1900. Lands, circa 80 kilometers from Rio Negro station of the Southern Brazilian Railway, and 3 kilometers from the Rio Camaquam, show an intrusive core of melaphyr, surrounded by conglomerate and sandstone, carrying fissure veins which are narrow but rich in the conglomerate, but leaner in the sandstone, veins averaging about 4' in width, but lacking regularity, and even continuity. The oxidized zone is shallow, the secondary zone carrying considerable chalcocite and bornite, with gangue of quartz and occasional barite. The ore below the shallow zone of secondary enrichment is mainly chalcopyrite, associated with pyrite and showing octahedral particles of chalcocite and dendrites of native copper. Four veins worked average 4' in width and carry circa 6.5% copper and 30 grams gold per metric ton. Mine

is opened by 3 adits, having backs of 300' to 350', and a fourth adit is planned to be driven 3,300', to cut additional veins shown at surface.

Equipment includes a fair mining plant with hydro-electric power installation, taking water from a dam 453' long and 53' high, holding sufficient water to run the mill for the entire year, as there are long droughts occasionally. All ore is hand-sorted, selected ore assaying about 30% copper. Gangue rock is discarded, and remainder, averaging about 70% after hand selection, is concentrated in an 80-ton mill with hand-jigs to an average of about 28% copper tenor. Smelter has a small matting furnace. Production, 1904, was 90 to 100 tons of 28 to 30% ore monthly, shipped to England for smelting, and about 225 tons monthly of matte of 45 to 50% copper tenor. Production, 1907, is estimated at 2,000,000 lbs. fine copper.

#### CAMBRIA COPPER CO.

#### NEVADA.

Mine office: Aurum, White Pine Co., Nev. Owen Pritchard, superintendent. Lands, 4 claims, area circa 80 acres, known as the Texas group, at Muncey creek, Spring Valley, in the Silver Mountain district, circa 30 miles north of Ely, also 10 miles of water rights on Muncey creek, and 580 acres of ranch lands. Has shipped carload lots of ore to Salt Lake smelter returning 22.55 to 23.4% copper.

#### CANADA DEL ORO MINING & DEVELOPMENT CO.

#### ARIZONA.

Letter returned unclaimed from former office, care Maj. W. A. Denebrough, secretary and manager, Tucson, Ariz. Mine office: Oracle, Pinal Co., Ariz. Eugene S. Dives, president; Louisa M. Matos, treasurer; preceding

officers, A. C. Waters and Uri Embody, directors. Organized 1906, with capitalization \$1,000,000. Lands, 23 claims, in the Cañada del Oro district of the Santa Catalina Mountains, showing well defined ore bodies, having 7 shafts and tunnels, with about 1,000' of openings, showing ore said to give assays of \$51.75 to \$181 per ton, in lead, copper, silver and gold. Presumably idle.

**CANADIAN-AMERICAN MINING CO.****BRITISH COLUMBIA.**

Mine office Gribbell Island, Skeena River division, Cassiar district, B. C. Company succeeded the Eureka Copper Mines, Ltd. Lands, 7 claims, 3 fractional, with geological conditions markedly similar to those of the copper fields of Texada Island. Mine has tunnels of 40' and 600', and a 200' shaft, with 2 levels opened, showing mainly bornite, in crystals of varying sizes, disseminated in garnetite and feldspar, with footwall carrying a little chalcopyrite, as impregnations, to a considerable depth. Ore is auriferous, and of medium copper tenor. Has steam power, employing circa 20 men, and has produced about 2,000 tons. Shipments, 1906, of 940 tons to the Trail smelter returned circa \$14 per ton.

**CANADIAN CONSOLIDATED MINES, LTD.****BRITISH COLUMBIA.**

Dead. Title changed, 1906, to Consolidated Mining & Smelting Co. of Canada, Ltd. Formerly at Trail, Trail district, B. C.

**CANADIAN CONSOLIDATED MINING & SMELTING CO.****BRITISH COLUMBIA.**

Mine office Nelson, Kootenay district, B. C. Lands, 7 claims, 3 fractional, on Forty-nine Creek, bought, 1906, of Eureka Copper Mines, Ltd., having a 150' shaft showing a considerable body of auriferous copper ore of fair grade. Has steam power. Former owner shipped about 1,000 tons of ore to the Trail smelter.

**CANADIAN COPPER CO.****ONTARIO.**

Office: 2402-43 Exchange Place, New York, N. Y. Mine and works office: Copper Cliff, Algoma, Ont. A. P. Turner, president; F. S. Jordan, vice-president; J. L. Ashley, secretary and treasurer; Capt. John Lawson, general superintendent; David H. Browne, metallurgist; Capt. Thos. Travers, mine superintendent; E. W. C. Perry, superintendent of roast-yard; Wm. Hamby, superintendent Creighton mine; C. F. Griswold, superintendent Crean Hill mine. Organized Jan. 6, 1886, under laws of Ohio. Is controlled, through ownership of nearly the entire stock issue, by International Nickel Co.

The Canadian Copper Co. is the world's largest nickel mine, and is a copper producer of present importance and even greater future promise. Ore was discovered 1882, and the first mine opened in 1886. Lands are extensive, including mineral holdings in the districts of Algoma and Nipissing. Protracted diamond drill borings have shown large reserves of ore. Principal ore bodies are irregular contact deposits in basic igneous rocks, mainly diorite and granite, carrying a mixture of chalcopyrite, pentlandite and pyrrhotite, returning 1 to 4% copper and 2 to 6% nickel, with an average of 2 to 2.5% copper and 4 to 5% nickel.

The Creighton mine, employing about 200 men and producing circa 800 tons of ore daily, 1906, has 2 shafts, but extraction is mainly from an immense open pit, circa 225' wide, from foot to hanging, about 500' long and 150' deep. The pit has 13 railroad tracks, converging to an entry on the footwall that leads to an incline shaft. Ore is broken in steps, and thrown to the bottom, where block-holed and trammed to the shaft. Drill borings prove the Creighton ore body to extend some distance west of the pit. A new shaft, No. 2, sunk in the granite, about 500' west of the old shaft, has 3 compartments, with walls concreted for about 40' depth from the collar. No. 2 shaft has a rockhouse 42x46' on the ground and 72' high, of reinforced concrete to the

bin floor, above which the walls are of 3" planks, 10" wide, spiked together. The rockhouse equipment includes two 18x30" Blake crushers and a picking belt 3' wide and 50' long.

No. 2 mine, which produced circa 200 tons daily, 1906, was idle, 1907, though kept free of water.

The Crean Hill mine, about 2 miles east of the Victoria mine, has been diamond-drilled extensively, showing a series of lenses of 50' to 80' width, containing a much larger portion of pentlandite than any of the other mines, ore requiring different treatment from the massive ores found at the Creighton and Stobie mines. The Crean Hill is opened by a 4-compartment 300' shaft, sunk at an angle of 57°, and concreted to a depth of 40'. Equipment includes a rockhouse similar to that at the Creighton.

The Stobie mine, in Blezard Township, 4 miles north of Sudbury, has ores similar to those of the Creighton, and is an important producer.

Miscellaneous mines include the Evans, McArthur, McDonald, Clara Bell A and B and various other workings. There is a quartz quarry, about 1½ miles southeast of Naughton, producing about 150 tons of quartz daily, used for fluxing and lining converter shells.

In 1908 the company built large new shops, including a machine-shop, smithy and foundry under one roof, and a large carpenter and pattern shop. There is a fire-proof laboratory building, of concrete and brick, 35x80', 2 stories high, with one of the best equipments to be found at any metallurgical plant. At the Creighton and Crean Hill mines there are 36x80' change-houses, with concrete floors, brick walls and tile roofs, having separate lockers for each man, with enameled basins and shower baths.

Electric power is used throughout the mine and works. The development of power is through a subsidiary corporation known as the Huronian Company which has a hydro-electric installation at High Falls, on the Spanish river, utilizing an effective head of 85' with total available energy of about 14,000 h. p., of which about half is now developed. The power-house at High Falls is 55x106', of brick and concrete. Installation includes two 3,550-h. p. turbines, with speed of 375 revolutions per minute, each direct-connected to a 2,000-kw., 2,400-volt, 3-phase, 25-cycle generator, with space for 2 additional units, of which one is under construction. The transmission line, of about 30 miles length, has double sets of poles, spaced at 130' intervals, carrying 6 bare No. 1 copper wires. At Copper Cliff there is a 100x200' sub-station, where the current is stepped down to low voltage, and distributed to various motors about the mines and works.

The Creighton mine has an air-compressor with piston efficiency of 1,635 cubic feet of free air per minute, driven by a 300-h. p. 550-volt constant-speed induction motor. The Creighton mine is operated exclusively by electricity for hoisting, crushing and other work.

Water for general use and fire protection is stored in a 60,000-gallon steel tank.

A private railroad line, connecting the principal mines with the roast-yards and works, has two 80-ton locomotives, hauling 50-ton drop-bottom dump-cars, and a brick roundhouse.

Ore is heap-roasted, in yards near the town of Copper Cliff. Roast-heaps of circa 5,000 tons size are built up by unloading raw ore from wheelbarrows. The company has experimented extensively with the size and shape of roast-heaps, obtaining best results from heaps requiring about 3 months' roasting. Roasted ore is loaded from heaps by steam-shovels and taken to the smelter by rail.

The smelter, at Copper Cliff, 6 to 20 miles from the various mines, is of

2,000 tons daily capacity. These works were perhaps the first to use the Bessemer process for treating nickel ores. The new plant has taken some ideas from the Tennessee Copper Co., but none from the Mond Nickel Co., mixed charges of raw and roasted ores being a modification of the Tennessee process. A limited amount of custom smelting is done, but no mispickel is treated.

The smelter, which is served by electric locomotives, has 35x700' ore-bins, of 15,000 tons capacity, and a blast-furnace building 85x375' in size, with five 400-ton blast-furnaces, each 50x204" at the tuyeres, with 2 tiers of water-jackets, the lower being 8' 6" and the upper tier 6' in height, furnace having a total height of 35'. Slags flow from the back of the settlers into 22-ton cast-iron slag-pots, which are made in sections, with 4 side pieces and a separate bottom piece.

A new converter building, built 1907, is 60' from the cupola building and parallel therewith, having a 60x280' main structure, with a shed 35x280' for matting, casting and sculling, and at one end is the relining department, 60x112' with a 35' shed on each side, having a continuation of the crane-run of the main building, with storage for material, etc., entire length of the converter building being 522'. The structure is of steel frame, with corrugated sides and roof, having two 50-ton Morgan electric traveling cranes, of 55' 8" span, and a 20-ton auxiliary hoist. Matte from settlers in the blast-furnace department is poured into cast-steel moulds, 5' in diameter and 5' deep, and taken by electric crane to the converters, there being 10 stands, with 10-ton shells, 84x126", of the Anaconda type. First fusion product of the blast-furnaces is a matte of 30 to 35% tenor in combined nickel and copper, the second fusion product, from the converters, being an 80% nickel-copper matte. Stands are controlled electrically from 2 pulpits, each handling 5 stands, each stand having a 30-h. p. induction motor, with solenoid brake. Blowing is precisely the same as in treatment of ordinary copper matte, except that the blast is cut off as soon as the iron is fully eliminated. The copper and nickel behave as one metal, similarly to copper alone, up to the final elimination of sulphur and iron. Matte is taken from the converters in clay-lined ladles, by crane, and poured into moulds under the shed roof. Slag from converters is poured into steel slag-pots, lifted by crane to slag-cars and taken to the slag-casting machine, which consists of a circular steel framework, of 58' diameter, on a circular track, carrying cast-iron moulds, forming a continuous flat ring. The moulds, 4x12x30", holding 150 pounds of slag each, are mechanically rotated under the stream of slag. The cast bricks are allowed to cool before the moulds reach a hand-controlled tripper, which reverses the moulds, dropping the bricks into a hopper, a chute from the hopper discharging the slag-bricks into a skip, that carries them up an inclined track to a 500-ton steel bin above the charging tracks leading to the blast-furnaces.

The lining department has a silica mill and extensive bins for storage of material, linings being tamped by machine.

The 80% nickel-copper matte from the converters is shipped to the Oxford Copper Co., New Brighton, N. Y., where it is smelted with sodium sulphite, effecting the separation of the combined nickel and copper, and the resultant copper product is refined electrolytically.

The smelter power plant, in a 101x158' building, includes a complete steam plant, held in reserve for emergencies, but regular operation is by electric power throughout. The power plant includes 3 Nordberg radial-valve blowing engines, rope-driven by induction motors arranged to work at 3 speeds, to give full control of volume of air for the furnaces. The converter

blast is furnished by a Nordberg air-compressor with capacity of 12,600 cubic feet of free air per minute, reduced to 12 pounds pressure.

A separate refining plant, built on the site of the old Orford refining works, treats cobalt-silver-nickel-arsenic ores from the mines of the Cobalt district, producing speiss containing cobalt, nickel and silver, which is sent to the Orford works for parting and refining.

Production, 1905, was 4,743 short tons of nickel, a decrease of 2,255 tons from 1903, and 4,326,000 lbs. fine copper, as against 8,010,000 lbs. fine copper in 1903. Production was materially larger, 1906-1907, and the normal capacity of the company, beginning 1909, may be rated at about 20,000,000 lbs. fine copper and 40,000,000 lbs. nickel yearly. The new plant of the Canadian Copper Co. is one of the best planned and most complete in existence, and the management of the company is excellent.

#### CANADIAN MINING & DEVELOPMENT CO.

MONTANA.

Dead. Formerly at Basin, Jefferson Co., Mont.

#### CANADIAN SMELTING & REFINING CO., LTD.

ONTARIO.

Office: care of Frank Arnoldi, president, Toronto, Ont. Works office: Sault Ste. Marie, Algoma, Ont. G. W. Monk, vice-president; E. Douglas Warren, secretary and treasurer; Otto Stahlmann, manager. Organized under laws of Ontario, with capitalization \$2,500,000, shares \$1 par. Plans erecting a 125-ton smelter to treat copper and nickel ores.

#### CANADIAN SMELTING WORKS.

BRITISH COLUMBIA.

Owned by Consolidated Mining & Smelting Co. of Canada, Ltd.

#### CANANEA-ARIZONA CONSOLIDATED

ARIZONA & MEXICO.

#### COPPER CO.

Office: 1511 First National Bank Bldg., Chicago, Ills. Letters returned unclaimed from former mine offices, Globe, Gila Co., Ariz., and La Cananea, Arizpe, Sonora, Mex. S. W. Osgood, president; Chas. E. Noble, vice-president; Jas. W. Luther, secretary; preceding officers, Arthur T. Sexton, O. M. Cone, John F. Donovan, F. Silverstein, J. Leathead and Jas. Jay Sheridan, directors. Organized 1907, under laws of Arizona, with capitalization \$2,500,000, shares \$5 par. Lands include the Bisbee Extension mine, area 37 acres, near the Greene Cananea; circa 100 acres in the Sierra Manzanal, southeast of La Cananea, and the Copper Basin group, near the Black Hawk mine of the Arizona Commercial, at Globe. Idle and apparently moribund.

#### CANANEA-BISBEE DEVELOPMENT CO.

MEXICO.

Office: care of Hayden, Stone & Co., 87 Milk St., Boston, Mass. Mine office: La Cananea, Arizpe, Sonora, Mex. P. J. T. Haney, president and general manager; C. E. Watson, superintendent. Organized Dec. 21, 1906, under laws of Maine, with capitalization \$300,000. Was promoted by W. B. Thompson. The Cananea property, supposed to carry the extension of the Massey ore body of the Greene-Cananea, has 3 shafts. Lands at Bisbee, having 8 shafts, deepest 165', each showing ore of about 2% copper tenor, were surrendered, late 1907, and apparently Cananea lands have been thrown up also. Idle and apparently moribund.

#### CANANEA CENTRAL COPPER CO.

MEXICO.

Office: Lyceum Bldg., Duluth, Minn. Mine office: La Cananea, Arizpe, Sonora, Mex. Capt. Jas. Hoatson, president; Chas. A. Duncan, first vice-president and treasurer; G. Ashley Tomlinson, second vice-president; preceding officers, Thos. F. Cole, Chester A. Congdon, Wm. J. Olcott, Jas. B. Cotton, John D. Ryan and Col. Wm. C. Greene, directors; Dr. L. D. Ricketts, general manager; Frederic R. Kennedy, secretary; Danl. R. Smith, assistant secretary; Wm. G. Hegardt, assistant treasurer. Organized Aug. 6, 1906, under laws of Minnesota, with capitalization \$10,000,000, shares \$10 par; issued, \$6,000,000.

The Cananea Central Copper Co. owns the entire capital stock of the San Pedro Copper Co., S. A., organized under laws of Mexico, which holds claims as follows: American, Copper Belt, Bryan, Seguro, Square, eastern part of Massey No. 2, and El Oriente.

The Cananea Central Copper Co. owns 268,120 shares of the issued capital stock of the Cananea-Duluth Copper Co., which has an issued capitalization of 269,186 shares, leaving only 1,066 shares outstanding, and it is probable that the Cananea-Duluth Copper Co. will be wound up as soon as the small balance of stock outstanding can be secured, and its property absorbed by the Cananea Central. It is said that the Cananea Central paid \$450,000 for the Cananea-Duluth.

The Cananea-Duluth Copper Co. owns the entire capital stock of the Cananea Development Co., S. A., a Mexican corporation owning Los Dos Naciones claim, at Cananea.

Financial statement of the Cananea Central, of date Dec. 31, 1907, showed cash on hand, \$61,882.10, with loans of \$619,267.52 to the Greene-Cananea Copper Co., Cananea Consolidated Copper Co., S. A., Cananea-Duluth Copper Co. and San Pedro Copper Co., S. A. Liabilities included bills payable of \$102,267.52.

Lands are 3,708 acres, including the holdings of subsidiary companies. Col. Wm. C. Greene turned over a large portion of this land to the Cananea Central, the lands from Col. Greene including properties granted the Sonora Copper Co., S. A., on May 4, 1904, which concessions were allowed to expire May 17, 1906. The land was denounced immediately thereafter by Col. Greene, personally, and turned over to the new company, presumably for the benefit of the Cananea Consolidated, in exchange for \$2,000,000 stock in the Cananea Central, which was said to have been given, October, 1906, to the Greene Consolidated.

Litigation relative to stock in the Cananea Central, between Messrs. Thos. F. Cole, Col. Wm. C. Greene, Col. Epes Randolph and Lycurgus Lindsay, was settled, late 1907.

The Cananea Central Copper Co. is controlled, through the ownership of about 90% of the total stock issue, by the Greene-Cananea Copper Co., and, owing to the fact that the properties of the Cananea Central and its subsidiary corporations are operated as a portion of the Greene-Cananea, the mines are listed and described under the title of Greene-Cananea Copper Co.

#### CANANEA CONSOLIDATED COPPER CO., S. A.

#### MEXICO.

Office and mine: La Cananea, Arizpe, Sonora, Mex. Thos. F. Cole, president; Dr. L. D. Bicketts, general manager; E. J. Campbell, treasurer; Chas. A. Duncan, assistant treasurer. Organized Sept. 30, 1899, under laws of Mexico, with capitalization 20,000 pesos, shares 100 pesos par. Entire stock issue is owned by the Greene Consolidated Copper Co., the Cananea Consolidated merely being the operating company having direct title to the lands of the Greene Consolidated. Is operated as a close corporation and gives out no information. Mines and smelters of this company, formerly described under title of Greene Consolidated Copper Co., are described, in this volume, under title of Greene-Cananea Copper Co., the operating company that is in control of the Greene Consolidated.

Although the Cananea Consolidated is supposed to be merely the operating company, and the Greene Consolidated was supposed to own the entire stock issue of the Cananea Consolidated, there seems to have been either a lax system of bookkeeping, or else a juggling of accounts between the Cananea Consolidated and the Greene Consolidated, as 200,000 shares of Cananea Central stock, supposed to have been turned over to the Greene Consolidated, ap-

parently never was owned by the Greene Consolidated, but belonged to the Cananea Consolidated. This stock, if sold at \$20 per share, as publicly asserted, would have placed \$4,000,000 cash in the treasury of the Cananea Consolidated. The 200,000 shares of stock in question was preferred, being issued fully paid, the balance of stock being issued \$5 paid and subject to \$5 in assessments. The 200,000 shares of stock in question was taken over from the putative owner by Messrs. Thos. F. Cole, John D. Ryan, Col. Wm. C. Greene, Henry H. Rogers, Wm. G. Rockefeller and Cleveland H. Dodge, as individuals, presumably at the stated price of \$20 per share.

The 51% of stock of the Sierra Madre Land & Lumber Co., given, 1906, as an asset of the Greene Consolidated, never was opened by the Greene Consolidated, but was owned by the Cananea Consolidated, which sold the stock back to Col. Greene, who apparently was unable to pay for it. The sale price was secured by 75% of the stock of the Sierra Madre company, which apparently has been forfeited by reason of non-payment of notes to the Cananea Consolidated or Greene Consolidated, by Col. Greene, hence apparently the Cananea Consolidated or Greene Consolidated now holds 75% of the stock of the Sierra Madre Land & Lumber Co., which has very extensive tracts of valuable timber lands in northern Mexico, with several sawmills.

The Cananea Consolidated Copper Co., S. A., has authorized bonds at the rate of \$10,000 per kilometer at 6% for a 52-kilometer railroad, to be secured by a 20-year first mortgage on the railroad, principal and interest being guaranteed by the Greene Consolidated.

Col. Wm. C. Greene turned over about 4,000 acres of mineral land to the Cananea Central, which originally was part of the concessions granted the Sonora Copper Co., S. A., in 1904, allowed to lapse May 17, 1906, and immediately thereafter denounced by Col. Greene privately, and turned over to the Cananea Central, presumably for the benefit of the Cananea Consolidated, in exchange for \$2,000,000 stock in the Cananea Central.

The mines and works of the Cananea Consolidated are described under title of the Greene-Cananea Copper Co., in connection with the properties of the Cananea Central Copper Co.

#### CANANEA DEVELOPMENT CO.

MEXICO.

Mine office: La Cananea, Arizpe, Sonora, Mex. Is a subsidiary corporation of the Cananea Central Copper Co.

#### CANANEA & DULUTH DEVELOPMENT CO.

MEXICO.

Dead. Succeeded, circa 1906, by Cananea-Duluth Mining Co. Formerly at La Cananea, Arizpe, Sonora, Mex.

#### CANANEA-DULUTH MINING CO.

MEXICO.

Office: Hibbing, Minn. Mine office: La Cananea, Arizpe, Sonora, Mex. Geo. McMillan, president; Walter J. Power, vice-president and general manager; S. L. Proctor, treasurer. Capitalization \$500,000, shares \$1 par. Is controlled by the Cananea-Central Copper Co., which owns 208,128 stock, out of issued capital of \$209,206. Company probably will be wound up as soon as small balance of stock outstanding can be retired, and property is described under title of Greene Cananea Copper Co.

#### CANANEA-EASTERN MINING CO.

MEXICO.

Office and mine: La Cananea, Arizpe, Sonora, Mex. J. J. Williams, president; E. P. Draper, secretary; M. J. Thomas, treasurer; N. J. Nash, superintendent. Organized Sept. 9, 1904, under laws of Arizona, with capitalization \$1,000,000, shares \$1 par. Lands were 149 pertenencias in 2 groups, but 490 hectares, in the Ajo Mountains, were sold, 1907, to the Fay-Cananea Mining Co., payment being in stock of latter. Apparently the Cananea-Eastern has

some lands remaining, as in May, 1908, it was planned to do some diamond drilling on copper claims in the Ajos.

**CANANEA & GLOBE EXPLORATION &  
DEVELOPMENT CO.**

**ARIZONA & MEXICO.**

Office: 522 Bradbury Bldg., Los Angeles, Cal. Mine offices: Globe, Gila Co., Ariz., and Baca Bldg., La Cananea, Arizpe, Sonora, Mex. Robt. Mitchell, president and general manager; Henry J. Stevens, vice-president; Geo. A. Fitch, secretary; J. C. Britt, superintendent. Capitalization \$15,000,000. Is controlled by Geo. Mitchell. The Five Points Copper Mining Co., controlled by stock ownership, holds the Globe lands, which include the Clark, Lockwood and Van Wagnen groups, 34 claims, near the Gibson Copper Co. at the head of Pinto Creek, 14 miles west of Globe. Company also holds the Peabody group of 5 claims, near the Superior mine, at Superior, Pinal county, Arizona. Also has lands in the Cananea district, and is said to have purchased the South Cananea tract. The Superior property has a 3-compartment shaft, claimed to be 665' deep, which seems doubtful, and is stated to be in rich ore and to be driving a tunnel to connect with shaft. Begun grading, 1906, for a 300-ton smelter, on the North Dominion property, 2 miles north of Globe, but did not get beyond the grading stage. Apparently moribund.

**CANANEA MANZANAL MINING CO.**

**MEXICO.**

Mine office: La Cananea, Arizpe, Sonora, Mex. Organized circa July, 1907, under laws of Arizona, with capitalization \$1,000,000, by W. J. Downing and B. H. Yeager.

**CANANEA MIDLAND COPPER CO.**

**MEXICO.**

Office: Tucson, Ariz. Letter returned unclaimed from former mine office, La Cananea, Arizpe, Sonora, Mex. Chas. M. Shannon, president and general manager; M. P. Wright, vice-president; Frank J. O'Brien, secretary and treasurer; preceding officers, Geo. Gruning, F. O. Havener, Alfredo May and L. J. F. Iaeger, directors. Organized January, 1907, under laws of Arizona, with capitalization \$2,000,000, shares \$10 par, issued, \$120,000. Lands, 230 acres, said to be near the Cananea Central. Idle since organization, but company plans raising funds by stock sales and beginning development.

**CANANEA NORTHERN MINING & DEVELOPMENT CO.**

**MEXICO.**

Office: care of Guy Neely, Bisbee, Ariz. Letter returned unclaimed from former mine office, La Cananea, Arizpe, Sonora, Mex. Organized 1907, and is operated as a close corporation. Lands, circa 500 acres, north and northwest of the Bonanza de Cobre mine.

**CANANEA NUEVA MINING CO.**

**MEXICO.**

Letter returned unclaimed from former mine office, La Cananea, Arizpe, Sonora, Mex. Marshall P. Wright, president. Is said to be controlled by the Lewisohn interests. Lands, circa 1,200 hectares, about 2 miles northwest of the Puertecitos mines of the Greene-Cantanea, on the line of the Cananea road to fumiris, having 5 shafts, deepest 112', showing ore from depth of about 40', giving average assays of about 17% copper. Suspended operations May, 1908.

**CANANEA ORE CO.**

**MEXICO.**

Office: 1206-24 Broad St., New York, N. Y. Mine office: La Cananea, Arizpe, Sonora, Mex. Organized March 22, 1906, under laws of Maine.

**CANANEA-PITTSBURG MINE**

**MEXICO.**

Letter returned unclaimed from former mine office, La Cananea, Arizpe, Sonora, Mex. E. M. DeMaine, manager. Lands are in the vicinity of the Pay-Cananea, in the Sierra Azul, east of La Cananea.

**CANANEA-SONORA DEVELOPMENT CO.**

**MEXICO.**

Mine office: La Cananea, Arizpe, Sonora, Mex. J. E. Thompson, presi-

dent. Organized circa 1907, with capitalization \$500,000. Lands are sundry claims in the Sierra Manazanal, to the southeastward of La Cananea.

**CANANEA WESTERN COPPER CO.**

MEXICO.

Mine office: La Cananea, Arizpe, Sonora, Mex. J. T. Wilkie, general manager; preceding officer, M. McDonald; Donald Gillis, T. Pittman, J. R. Martin and J. T. Wilkie, directors. Capitalization, \$3,000,000. Supposedly controlled by Chas. Schwab. Lands, 398 hectares, 7 miles west of La Cananea, slightly developed, showing promising ore indications.

**CANANEA WEST MINING CO.**

MEXICO.

Dead. Succeeded circa April, 1907, by Cananea Western Copper Co. Formerly at La Cananea, Arizpe, Sonora, Mex.

**CANAS MINES, LTD.**

MEXICO.

Office: 33 Eldon Street House, London, E. C., Eng. Mine office: Zimapán, Hidalgo, Mex. Sir J. Rivett-Carnac, Bart., chairman; F. H. Baxter, secretary and treasurer. Organized Dec. 23, 1896, under laws of Great Britain, with capitalization £75,000, shares £1 par; issued, 266,607. Lands, sundry silver and copper claims, area 66 acres, circa 15 miles from Zimapán, bought for £65,000 in shares from the Mines Contract Co., Ltd. Presumably idle.

**CANBELEGO COPPER MINING CO., LTD.**

AUSTRALIA.

Office: Cobar, N. S. W., Australia. Mine office: Canbelego, Canbelego Co., N. S. W., Australia. Lands carry considerable standing timber, available for fuel and mining use. Property has 2 parallel veins, with aggregate width of about 40', showing stretches of good ground, succeeded by poor patches. To Apr. 1, 1908, had shipped 76 long tons of ore, yielding 17 long tons fine copper.

**CANBELEGO NORTH COPPER MINING CO.**

AUSTRALIA.

Mine office: Canbelego, Canbelego Co., N. S. W., Australia. Property adjoins the Canbelego Queen.

**CANBELEGO QUEEN CO., LTD.**

AUSTRALIA.

Dead. Liquidated October, 1907. Lands were 60 acres, adjoining the Canbelego North. Formerly at Canbelego, Canbelego Co., N. S. W., Australia.

**CANDELARIA MINING & EXPLORATION CO.**

MEXICO.

Dead. Lands sold to Mexican Standard Mining Co. Formerly at Hidalgo del Parral, Chihuahua, Mex. Described Vol. V.

**CANTON MINE.**

GEORGIA.

Mine office: Pierceville, Fannin Co., Ga. Has micaceous schist, impregnated with chalcopyrite. Idle for many years.

**CANTON MINING CO.**

NEVADA.

Dead. Was succeeded by McKinley Mining & Smelting Co., which was succeeded by McKinley Consolidated Mines Co., which was succeeded by Willard-Ely Copper Co., which was succeeded by Consolidated Copper Co., the history of the property thus constituting a notable series of successes. Formerly at Ely, White Pine Co., Nev.

**CANYON COPPER CO.**

ARIZONA.

Office and mine: Grandview, Coconino Co., Ariz. Jas. H. Page, president and general manager; H. H. Smith, secretary and treasurer; John Curran, mine superintendent. Organized 1902, under laws of Arizona, with capitalization \$600,000, shares \$10 par, buying lands of Last Chance Mining Co. Lands, 10 claims, area 200 acres, also a 10-acre millsite, in the Grand Cañon of the Colorado river. Has contact deposits between limestone and porphyry, said to give average assays of circa 30% copper, from cuprite, malachite, azurite and chalcopyrite. In 1904 produced circa 350,000 lbs. fine copper and in 1906 made 26,798 lbs. fine copper and 324 oz. silver. Property considered promising. Suspended operations October, 1907.

**CANYON GOLD & COPPER CO.****MONTANA.**

Office: Helena, Mont. Letter returned unclaimed from former mine office, Canyon Ferry, Lewis & Clark Co., Mont. Canoll & Martin, managers; A. W. Martin, superintendent. Property has been a small shipper of smelting ore, averaging about 22% copper, with fair gold values. Idle several years.

**CANYON MINING CO.****ARIZONA.**

Mine office: Mayer, Yavapai Co., Ariz. Organized, circa 1905, as successor of the Black Canyon Copper Co., Ltd., which failed. Presumably idle.

**MINA CANZA.****PERU.**

Office and mine: care of A. Garland y Co., owners, Canza, Ica, Peru. Is an old property, once a considerable producer. Numerous cupriferous veins, in igneous rocks, carry bodies of ore that are oxides and carbonates above and sulphides below, 3 principal veins being opened to depths of 700' on the Adechida, 1,000' on the Concoladon, and 500' on the Tapadita, the latter mine having been the largest producer in the past. Idle.

**SOCIETA DELLE CAPANNE VECCHIE e FOGGIO BINDQ.****ITALY.**

Dead. Formerly at Massa Marittima, Grosseto, Tuscany, Italy. Mine now owned by Società Anonima delle Miniere de Montecatini.

**CAPE BRETON COPPER CO., LTD.****NOVA SCOTIA.**

Office: 308-53 State St., Boston, Mass. Mine office: Coxheath, Cape Breton Co., N. S. John C. Watson, president; Isaac P. Gragg, secretary; J. Dorr, treasurer. Capitalization \$2,000,000. Property is the old Coxheath mine and adjoining lands, 10 miles from Sidney, Cape Breton, showing several cupriferous veins, of which the principal, averaging 10' width, traverses felsite and diorite, carrying argentiferous and auriferous chalcopyrite, in a silicious gangue, ore averaging about 4.5% copper. Deepest shaft, 420'. Idle for some years.

**CAPE BRETON PROSPECTING, MINING  
& DEVELOPMENT CO.****NOVA SCOTIA.**

Office: Sidney, N. S. Mine office: Inverness, Cape Breton Co., N. S. F. W. Morley, president; W. F. Dennison, vice-president; A. N. McLennan, secretary and treasurer; preceding officers, C. V. Wetmore, Dr. A. McLennan, Dr. C. E. McMullen and Hon. D. McNeil, directors; H. N. Borden, mine superintendent. Organized under laws of Nova Scotia, with capitalization \$500,000, shares \$1 par. Property is sundry mineral lands, including the Scottsville mine, which shows copper ore. Presumably idle.

**CAPE COPPER CO., LTD.****CAPE COLONY & NEWFOUNDLAND.**

Office: 9 Queen Place, London, E. C., Eng. Mine office: O'okiep, Little Namaqualand, Cape Colony. Works office: Briton Ferry, Glamorganshire, Wales. Edmund A. Pontifex, chairman; preceding officer, T. Russel Kent, John E. Champney, John Taylor and T. Blair Reynolds, directors; John Taylor & Sons, managers; Percy John Frank, secretary. Organized Apr. 30, 1888, under laws of Great Britain, as a reconstruction of the Cape Copper Co., Ltd., organized 1863, with capitalization of £750,000, in £150,000 cumulative 6% preference shares, par £2, and £600,000 ordinary shares, par £2; issued, £690,000. Dividends have been, as follows: 1½s. in 1901; 5s. in 1903; 8s. 6d. in 1904; 9s. in 1905; 13s. in 1906; 19s. in 1907; 16s. 6d. in 1908. Annual accounts are made up to April 30th at the Cape, and to August 31st in London, and are submitted in December. Separate accounts are kept for the Tilt Cove mine. Profits for fiscal year 1907 were £343,384, a gain of £79,822.

The Tilt Cove mine in Newfoundland is held on a 99-year lease, expiring 1989, at an annual rental of £4,400, plus one-half of net profits. The Tilt Cove is separately described under title of its owner, the Tilt Cove Copper Co.,

Ltd. Net profits of the Tilt Cove mine, 1906, were £29,340, 7s. 10d., divided equally between the Cape Copper Co., Ltd., and the Tilt Cove Copper Co., Ltd.

The company has 3 properties under option in America, and one in India, on all of which exploratory work is in progress.

The Cape Copper, Co., Ltd. is entitled to one-half the net profits of the Briton Ferry Chemical & Manure Co., Ltd., which takes the sulphur fumes given off by the company's works at Briton Ferry, profits from this source, 1906, having been £1,299.

The company has 4 producing mines and 3 mines under development, in addition to various idle mines and prospects, in the vicinity of O'okiep, the older including the O'okiep and Spektakel mines, opened 1852. Ores are mainly chalcopyrite, with limited quantities of bornite and chalcocite, intimately associated with pyrite, showing occasional cuprite and malachite, with a little malachite, azurite and chrysocolla near surface. The ore bodies are irregular, massive deposits of pyritic ore, associated with basic igneous intrusives in granite and gneiss.

The O'okiep, long the principal producer, has dwindling ore reserves, estimated, 1907, at 12,000 long tons of 20% ore, and, in 1907, produced 11,827 long tons of ore of 17.4% copper tenor, a decrease of 3,204 tons. The O'okiep Blast mine shows a limited amount of low grade ore.

The Nababeep mine, opened 1890, includes the Nababeep South, now the company's principal producer, in 1907 yielding 51,507 tons of 4.7% ore, as against 58,151 tons of ore of the same tenor in 1906. Reserves are estimated at 180,000 long tons of ore, of 50% copper tenor. The Nababeep North mine is nearly worked out, yielding, 1907, only 2,092 long tons of ore, of 5.39% average tenor. Several trial shafts have been sunk in the neighborhood of the Nababeep South, 2 showing copper bearing ground, but no important ore body has been developed.

The Narrap mine is a new property, under development, which, in 1907, yielded 1,238 tons of 4% ore. The property is developing fairly, showing reserves of about 25,000 long tons of ore of 4 to 5% tenor. An aerial tram is being installed, to connect the Narrap with the smelting works.

The Spektakel is an old mine, opened 1852, which has been idle for some years. Its ore bodies occur in both the granite and basic intrusive rocks.

Miscellaneous properties include the Kopperberg mine, which is idle, the Coetzee mine, which has been abandoned and plant removed to the Flat mine, 4 miles north of Nababeep, which is being reopened; the Carolusberg East mine, and the Springbok mine. On the whole the prospects of opening large new mines in the vicinity of O'okiep do not seem especially reassuring.

The machinery plant at the O'okiep mine has been electrified, the old steam plant being held in reserve for emergencies.

In addition to a tram-line connecting the smelter with the principal mines, the company owns a 100-mile railway, running from O'okiep to Port Nolloth, where there are docks, wharves, cranes, tugs and lighters for the receipt and dispatch of freight. Local traffic of the railroad, 1907, was 94,988 long tons. Negotiations are under way for the sale of this railway to the government of Cape Colony.

The reduction works at the mines include small smelters at O'okiep and Nababeep. Two blast-furnaces at the O'okiep works were rebuilt, 1907, and the Nababeep furnaces were rebuilt 1908. Production of the total smelters is a matte of about 48 to 50% copper tenor, shipped to the Briton Ferry works for refining.

The Briton Ferry smelter, which is the largest in Wales, in addition to treating the company's own ores does a general custom business smelting the

ores of the Namaqua Copper Co., Ltd., under contract, in 1906, treating 13,879 long tons of Namaqua ore and 888 tons of Namaqua matte of 54% copper tenor. The Briton Ferry works are located on the Great Western and Rhondda railways, also having canal connection with Swansea, receiving ores mainly by rail. The works have revolving cylindrical calciners up to 80' in length, heated by gas, and four 70-ton blast-furnaces, making matte. Ores are smelted, without calcining, in reverberatories, to a 76% white metal, which is refined by the Nicholls direct method; by which some of the white metal is calcined and mixed with uncalcined white metal, the consequent reaction eliminating the remaining sulphur. Tilt Cove sulphide ores are burned in kilns, for their sulphur contents, fumes going to an acid plant, which makes circa 30,000 tons of chamber acid yearly. The works have a double concentric chimney of steel and concrete, and a telpherage plant for handling material. In 1906 the Briton Ferry works produced the equivalent of 10,212 long tons of fine copper, of which 783 tons were turned out as bluestone.

Production of fine copper, for calendar year 1905, was 16,358,720 lbs. The Cape Copper Co., Ltd., is an old producer, with an honorable record, and it is to be hoped that the company may succeed in its efforts to locate and develop new and profitable mines, to replace its waning properties in South Africa.

#### CAPE D'OR COPPER DEVELOPMENT CO.      NOVA SCOTIA.

Mine office: Cape d'Or, Cumberland county, Nova Scotia. Long idle.

#### CAPE NOME COPPER MINING CO.

Office: 328 Dixon Block, Missoula, Mont. Mine office: Clinton, Missoula Co., Mont. F. C. Webster, president; F. H. Woody, vice-president; H. T. Wilkinson, secretary, treasurer and general manager; Ole Ericson, superintendent; preceding officers and A. L. Coffey, directors. Organized November, 1906, under laws of Montana, with capitalization \$1,000,000, shares \$1 par; issued \$893,600. Annual meeting, first Monday in June.

Lands, 8 claims, patented; area 40 acres, in the Clinton district, showing 4 fissure veins in granite, of which 3 are under development, one, of 8' average width, traceable 800', being opened by 4 crosscut tunnels, longest 340', and by 4 tunnels of 75', 850', 500', and 450', and shafts of 49', 70', and 500', with 3,850' of workings. Company plans crosscutting for ore on the 500' level. Equipment includes a 120-h. p. steam plant with a 40-h. p. Lidgerwood hoist and a 12-drill Ingersoll air-compressor. There are 6 buildings, including a 35x50' machine shop and 2 small smithies. Property considered promising.

#### CAPILLITAS COPPER CO., LTD.

#### ARGENTINA.

Office: 6 Princes St., London, E. C., Eng. Mine office: Cerro de Capillitas, Tucumán, Argentina. Works office: Muschaca Quebrada, Catamarca, Argentina. Geo. Grinnell-Milne, chairman; J. G. Tait, secretary; D'Arcy Weatherbee, general manager; T. Beckett, mine superintendent; C. H. Jones, metallurgist; R. Underhill, engineer. Organized Nov. 25, 1901, under laws of Great Britain; with capitalization £670,000, shares £1 par; issued, £600,000, in £150,000 cumulative 7% preference shares, £150,000 cumulative ordinary shares, and £300,000 deferred shares. Accounts for year ending June 30, 1906, showed total expenditures to date of £47,867, after deducting £20,161 from receipts of production.

Lands are extensive, including the Capillitas and Atajo groups of mines, and the Pilciao and Constancia smelters, bought for £95,000, also miscellaneous lands, fairly timbered. The Capillitas group, of about 20 properties, in the district of Andalgala, in the eastern part of Catamarca, shows 12 veins, principal development by former owners having been on the Restauradora, Rosalia, Carmelita, La Grande and Ortiz mines, reopened, under present management, by 2 tunnels under the old workings of La Grande, and by one tunnel in

the Restauradora. The Atajo mines are 6 miles northwest of the Capillitas group. Company claimed ore from development work averaged about 15% copper, with good gold and silver values, but the smelter returned an average of only 7% copper, 8 oz. silver and 0.7 oz. gold per long ton. These mines have been worked, spasmodically, by local capital, since circa 1850. The Restauradora mine has upwards of 3 miles of workings, with a vein of 18" to 6' width, ore occurring irregularly, in chutes, being chalcopyrite, associated with pyrite, containing considerable chalcocite and bornite.

Property is located in an extremely rugged mountain country, necessitating former shipment of ore to smelters by pack-mules, mines being 8,000' above sea-level, and more than 6,000' above the temporary works at Pilciao. Nearest railroad station is Chumbicha, 165 kilometers distant, over exceedingly rough and dusty roads, on which a traction engine was tried, but stuck in the sand. The Argentine government promised, years ago, to extend the Córdoba Central railroad to Andalgala, but the line failed to materialize. To cover the worst stretch between the mines and smelters, a single line aerial tram was ordered, from Bullivant & Co. The line is 22 miles in length, with longest span of 2,765' and highest span of 625'. Plant weighs circa 2,000 tons, and was designed to carry 40 tons of ore hourly, at a speed of 2.5 meters per second, with buckets of 500 kgs. capacity. The tramway was started Apr. 1, 1907, after almost interminable delays in delivery of material, but did not succeed in filling the 600-ton bins at the smelter until May, when one blast-furnace was blown in, beginning semi-pyritic smelting, with 5% charcoal charges, but experiencing unusual difficulties. Much trouble was had with the tram-line from buckets falling off. Experts from the designers were sent to Argentina, but failed to remedy the trouble. Instead of a rated capacity of 150 tons daily, the maximum quantity of ore transported in one day was 50 tons, and the average, for several months, was about 15 tons daily. The tram-line leaves a 20-mile gap between Pilciao and Muschaca, over which transportation is by carts.

The smelter has two 50-ton water-jacket blast-furnaces, with dam, filter and tanks, water being supplied through an 8½-kilometer pipe-line. The old Constancia smelter has 2 reverberatory furnaces. The new smelter gave much trouble in operation, but was amply capable of caring for all ore the tramway could bring. First-fusion product was a 30% matte, remelted to 50% copper tenor, which was packed and carted 120 miles, over a desert, to the nearest railroad station. Production, 1907, was circa 350 tons of 50% matte, equal to circa 400,000 lbs. fine copper, secured with a force of 125 men at the mine and 50 at the works. At the end of 1907 company claimed to have reserves of 58,000 long tons of ore, estimated at 8.5% copper tenor, though Mr. Wetherbee had advised previously closing down the property, by reason of the small amount of ore in sight, and poor transportation facilities. The board refused to act on Mr. Wetherbee's advice, and ordered a continuation of the work, but by the end of 1907 all good ore in sight had been gouged out, and, lacking funds to continue systematic development, work was suspended and machinery packed at the end of 1907, permission to close for 2 years, pending the completion of the promised railroad, having been obtained from the Argentine government. French shareholders were disgusted, with good reason, and sent a committee to investigate.

Given adequate transportation facilities, sufficient mine development and a modern smelting plant, the Capillitas properties might be made profitable, but, as matters stand, the property is practically worthless. The management made large promises, none of which were redeemed, and has boggled its work, making a lamentable mess of the job. Bankruptcy apparently is inevitable.

**CAPITOL CONSOLIDATED MINING CO.****MONTANA.**

Letter returned from former mine office, Helena, Lewis & Clark Co., Mont. Lands, 4 miles south of Helena, known as the Copper Chief group, show a 20" vein giving assays up to 14% copper, 35% lead, 175 oz. silver and \$7 gold per ton.

**CAP SHEAF COPPER & GOLD CO.****BRITISH COLUMBIA.**

Dead. Formerly at Van Anda, Texada Island, B. C.

**CARACAHUI MOUNTAIN COPPER CO., LTD.****MEXICO.**

Office: Kansas City, Mo. Mine office: Llano, Magdalena, Sonora, Mex. Lands, 50 hectares, circa 10 miles south of Llano, between the Calumet & Sonora and Sonora Copper Co., showing 8 parallel veins, in a cross-section of circa 250', with about 500' of workings, showing cuprite, malachite, and chalocite.

**MINAS DE COBRE DE CARAHYBA.****BRAZIL.**

Mine office: Praba Jaguarary, Bahia, Brazil. Dr. José Gonçalves da Silva, owner. Mine, on the São Francisco river, was opened in 1783, and is perhaps the most important copper mine of Brazil. Pits and shafts of 1 to 28 meters depth show copper oxides. Ores apparently are distributed over a large extent of territory, but depth reached has been insufficient to determine the extent of the oxidized zone or the nature of the ores below.

**MINA CARAMBOLA.****MEXICO.**

Office and mine: care of D. Pablo Palacio, owner, Indé, Durango, Mex. Lands, 18 pertenencias, in two groups, opened by La Chusa shaft, 15 metres, showing a 10' vein of auriferous copper ore, carrying 4 to 30% copper and 30 oz. silver per ton. Average assay values range from 3.5% copper and 300 grams silver, in the argentiferous ore, to 14.5% copper and 100 oz. silver in the best copper ore. Early in 1906 was shipping 20 to 30 tons of ore daily.

**CARBON COUNTY GOLD MINING & MILLING CO.****WYOMING.**

Mine office: Morgan, Carbon Co., Wyo. Ores carry gold, silver, lead and copper. Has steam power and a 10-stamp mill. Presumably idle.

**CARDEÑAS COPPER CO.****ARIZONA.**

Dead. Absorbed, circa 1903, by Anita Consolidated Copper Co. Formerly at Williams, Coconino Co., Ariz.

**MINAS CARDENILLO y ARMADILLO.****MEXICO.**

Mine office: Túxpam, Santiago Ixquintla, Tepic, Mex. Fernando Diaz, owner; A. C. Gonzales, manager. Mines have silver-copper ores, with steam power, employing circa 50 men, at last accounts.

**CARDIFF MINING & MILLING CO.****UTAH.**

Office: care of Hugh A. McMillan, secretary and treasurer, Salt Lake City, Utah. Mine office: Alta, Salt Lake Co., Utah. Fred W. Price, president and general manager. Organized 1906, under laws of Utah, with capitalization \$50,000, shares \$1 par. Property is the Mountain Chief group, near the Columbus Consolidated, on the divide between the Big Cottonwood and Little Cottonwood districts. Mine has a 270' shaft, showing a fair ore body, and has shipped some ore to Salt Lake smelter ranging up to 2% copper, 3% lead and 65 oz. silver per ton, with a little gold.

**CARIBBEAN MINING CO.****COLORADO.**

Office: Holyoke, Mass.; Mine office: Ophir, San Miguel Co., Colo. Ores carry gold, silver, lead and copper. Has water power and a 20-stamp mill. Presumably idle.

**CARIBOU GOLD & COPPER CO.****IDAHO.**

Office: care of Frank A. Putnam, Gray, Idaho. Organized September, 1903, with capitalization \$2,500,000, shares \$10 par, to develop claims 65 miles

southeast of Idaho Falls, in Bingham county, Idaho, said to have an 8' vein, traceable 3,000'. Idle for some years and apparently moribund.

#### COMPÀNIA MINERA CARIDAD Y ANEXAS.

MEXICO.

Office: care of Adolph Marx, president, Mexico, D. F. Mine office: Guachinango, Mascota, Jalisco, Mex. Otto Vorath, manager. Capitalization, 200,000' pesos. Lands, 180 hectares, on the Rancho Pánuco, showing highly argentiferous and auriferous copper ores. Made small shipments, 1907, to Aguascalientes smelter.

#### CARIDAD COPPER MINING CO., LTD.

SPAIN.

Office: 20 Lawrence Lane, Gresham St., London, E. C., Eng. Mine office: Lozoyuela, Madrid, Spain. Robert Summerside Simpson, chairman; Geo. Thompson, secretary. Organized Feb. 15, 1899, under laws of Great Britain, and capitalization increased, 1901, to £350,000, shares £1 par; issued, £75,492. Lands, 325 acres, including the Caridad, San Antonio and Descuidado mines. Idle some years.

#### MINA CARISA.

MEXICO.

Office and mine: care of Carlos Blake, owner, Autlán, Jalisco, Mexico. Lands, 30 pertenencias, circa 30 miles west of Autlán, showing a 30' vein, carrying auriferous and argentiferous chalcopyrite. Has about 400' of openings. Presumably idle.

#### CARISA COPPER & GOLD MINING CO.

UTAH.

Dead. Succeeded, 1907, by Carisa Gold & Copper Mining Co. of Maine. Formerly at Mammoth, Juab Co., Utah. Described Vol. VI.

#### CARISA GOLD & COPPER MINING CO. OF MAINE.

UTAH.

Office: 161 Main St., Salt Lake City, Utah. Mine office: Mammoth, Juab Co., Utah. Henry G. McMillan, president; Henry Newell, vice-president; E. B. Critchlow, secretary and treasurer; W. N. Roseberg, superintendent. Organized 1907, under laws of Maine, with capitalization \$300,000, shares \$1 par, as successor of Carisa Gold & Copper Mining Co., which was organized 1901, under laws of Utah, with same capitalization. Old company levied assessments of \$30,000 and paid a \$30,000 dividend, 1902. Lands, 8 patented claims, area 57 acres, adjoining the Centennial-Eureka, said to show 6 veins as fissures in limestone and as contact veins between limestone and quartzite, 3 of which, more or less developed, of 4' average width, are said to give average returns of circa 5% copper, 3 oz. silver and \$2 gold per ton, from oxidized ores. Mine, as sampled by Newton A. Dunyon, gave average assays of 4.51% copper, 3.54 oz. silver and 0.037 oz. gold per ton. Has shipped ore to smelter ranging up to 11% copper tenor. Some copper ore was found, 1907, on the Spy side of the mine, and an effort is being made to locate the continuation of the ore bodies from the adjoining Colorado mine. Estimate of 80,000 tons of ore blocked out for stoping was an exaggeration, though considerable low grade concentrating ore is in sight. Mine is very pockety, but carries occasional very rich pockets. Has 3 shafts, including the 350' Cornish shaft and the 800' Spy shaft, also a 7,000' tunnel with about 3 miles of workings. Formerly was under the management of Hon. Harry S. Joseph, who did good development work. Stock was rigged unmercifully, early 1906, when a 2-cent monthly dividend was promised by new management, but not paid, and a 1-cent dividend, that was paid, apparently, to promote stock sales. Company's estimate of production of 1,200,000 lbs. fine copper for 1906 was grossly exaggerated. At last accounts property was being operated in a small way, under the leasing system. Mine apparently of some value, but company not regarded favorably.

#### CARLISLE COPPER CO.

MONTANA.

Dead. Formerly at Butte, Silver Bow Co., Montana.

**CARMACK GOLD & COPPER MINING CO.**

WASHINGTON.

Letter returned unclaimed from former office, Arcade Bldg., Seattle, Wash. Mine office: North Bend, King Co., Wash. G. W. Carmack, president; L. O. Lane, secretary. Organized 1899, with capitalization \$500,000, shares 25c par. Lands, 6 claims and a millsite, with good water power available for development, on the south fork of the Snoqualmie river, 22 miles northeast of North Bend. Has 375' of openings, showing veins of 12", 30" and 12', latter with a 1' to 3' paystreak, giving fair assay values in gold, silver, lead and copper. Idle.

**CARMAN CONSOLIDATED COPPER CO.**

MEXICO.

Office: Hibbing, Minn. Operating office: Douglas, Ariz. Walter J. Power, president; John T. Casey, vice-president and general manager; J. F. Ross, secretary and treasurer; preceding officers, J. S. Martindale, C. B. Bell, Homer Prickett and F. S. Douglas, directors. Organized, circa 1906, with capitalization \$500,000, shares \$2.50 par. Holds title to lands through Compania de Oro y Plata, S. A., organized under laws of Mexico. Lands, in northern Sonora, are 9 groups of 351 pertenencias, area 877 acres, adjoining Las Chispas mines, showing several strong veins, with 1,911' of workings. The Carmen and Don Placido groups have dumps carrying about 1,100 tons of ore, said to average 4.65% copper; 62.2 oz. silver and 0.21 oz. gold per ton. The Blanca Rosa group gives average assays of 16.8% copper, 77 oz. silver and 0.42 oz. gold per ton. The Maria group gives average assays of 3% copper, 107 oz. silver and 1.32 oz. gold per ton. Los Tercos group gives average assays of 4.2% copper, 29% lead, 38 oz. silver and 0.03 oz. gold per ton. Various ore shipments to El Paso smelter have given returns ranging from \$82.98 to \$4,575.79 per ton. Property considered promising.

**MINAS DEL CARMEN.**

CHILE.

Mine office: Pueblo Hundido; Chañaral; Atacama, Chile. Simon Baldívieso, owner; Adriano Fernandez, manager. Lands, 15 hectares, including El Carmen, Cañazuela, Cardumen, Nuevo, Areavaca, Quillazo, Ademexa, Laufago and other mines. Property shows 2 main veins in syenite; the Veta Manto ranging 4 to 12 meters in width, with a minor vein of 2 to 3 meters width, both having north and south strike, with dip of 40°. Ore occurs in lenticular chutes, the oxidized zone of 100 meters depth carrying oxides, carbonates and silicates, with an abundance of native copper at approximately 200' depth in the Carmen mine, with secondary sulphides at a vertical depth of circa 110 meters, followed by chalcopyrite, associated with arsenopyrite, disseminated in a gangue of iron oxide, limestone and decomposed porphyry.

El Carmen, the principal mine, is opened by 2 shafts, 190 meters apart, sunk at an angle of 45°, to depths of 85 meters and 250 meters, the vein ranging 3 to 12 meters wide, with an average width of 5 meters. The other mines are opened by shafts. The properties, as a whole, show reserves of about 75,000 tons of ore, of 5 to 15% copper tenor. Property has, in reserve, on dumps, about 7,000 metric tons of ore of 6 to 12% copper tenor, and about 30,000 metric tons of 5% ore.

Equipment includes a good steam plant, and forces are about 100 men. Ore is selected before smelting. Production, 1903, was circa 6,000 metric tons of ore of 12% ore, yielding circa 1,800,000 lbs. fine copper.

**MINAS DEL CARMEN AMPLIACION.**

MEXICO.

Mine office: Cerro Salvo, Cuarto, Nuevo Leon, Mex. Mariano E. Villa-real, owner and manager. Ores are argentiferous copper and lead sulphides. Presumably idle.

**CARMEN COPPER CO.**

MEXICO.

Office: 52 Front St., New York, N.Y. Mine office: Mineral del Carmen, El Oro, Durango, Mex. H. Van Leer, general manager. Property is El Car-

men mine; carrying silver and copper ores. Has steam power and a mill of 100 metric tons daily capacity, employing about 150 men at last accounts.

#### CARMEN COPPER MINES, LTD. CHILE & NEWFOUNDLAND.

Letter returned unclaimed from former office, St. George's House, Eastcheap, London, E. C., Eng. Mine office: Cerro Blanco, Copiapó, Atacama, Chile. Alfred Hambley Rowe, chairman; John Pye, secretary. Organized June 28, 1900, under laws of Great Britain, with capitalization £125,000, shares £1 par; issued, £75,307. Absorbed the Newfoundland Copper Co., Ltd., 1901, thereby securing the Little Bay and Lady Pond copper mines, in Newfoundland, now idle. The Little Bay mine, operated 1878-1892, has a main shaft of 1,350' and a small smelter, and was a small but steady copper producer, when worked, but has been idle several years.

Chilean property includes the Perseverancia mine, at Guanaco, Taltal, the Carmen Bajo, in the Capiapó district, and the Bella Vista, Aguardos and other mines, in Coquimbo. The Copiapó properties have been idle some years, and only light exploratory work has been done at the other mines. Apparently out of business.

#### GUILLERMO CARMONA.

CHILE.

Office and mine: Higuera, La Serena, Coquimbo, Chile. Mines include La Estrella de María, San Tomás and Santiago. Production, 1903, was circa 250 metric tons of ore averaging about 10% copper tenor.

#### CARNARVON ASSOCIATED GOLD & COPPER MINES, LTD.

WALES.

Office: care of Paddison, Trevor & de la Chapelle, 34 Gresham St., London, E. C., Eng. Organized Jan. 31, 1903, under laws of Guernsey, with capitalization £10,000, shares 10s. par. No business done. Moribund.

#### CARNATION MINING CO.

ARIZONA.

Mine office: Parker, Yuma Co., Ariz. Lands are in vicinity of Empire Flats, on the Colorado River. Idle.

#### CARN BREA & TINOBROFT MINES, LTD.

ENGLAND.

Office and mine: Carn Brea, R. S. O., Cornwall, Eng. Frank Harvey, J. P., chairman; T. Forster Brown, consulting engineer; John Trevathan, secretary; Capt. J. Penhall, general manager. Organized May 24, 1900, under laws of Great Britain, with capitalization £150,000, shares £1 par; issued, £136,366. Property is tin and copper mines at Bedruth and Illogan, Cornwall, formerly making nearly 1,000 tons of copper yearly, but present annual output averages about 50,000 lbs. fine copper only, tin being the principal product. Output, 1906, was 672 long tons of copper ore averaging 4% copper, equivalent to about 60,000 lbs. fine copper.

#### CARNEGIE COPPER CO.

VIRGINIA.

Letter returned unclaimed from former office, Carnegie, Pa. Mine office: Red Oak, Charlotte Co., Va. Wm. H. McLain, superintendent. Has auriferous and argentiferous copper ores, slightly developed.

#### CARNEY COPPER CO.

IDAHO.

Mine office: Mullan, Shoshone Co., Idaho. Jos. L. Martin, president; W. G. Greenough, secretary and treasurer; Joseph Carson, superintendent; preceding offices, C. D. Miller and Hans J. Rice, directors. Organized 1906, under laws of Idaho, with capitalization \$1,500,000, shares \$1 par. Lands, 11 claims, 3 fractional, well timbered, and a water-right area circa 175 acres, on the north slope of Stevens Peak, about 4 miles from Mullan. Mine has 2 tunnels, No. 2 being 710', also several open cuts and pits, showing ore of about 3% copper tenor. Jos. Carney, former owner of lands, has brought suit for \$50,000 damages and annulment of deed, claiming that purchaser got him drunk and kept him drunk two months. If verdict rendered for plaintiff, court should allow a reasonable offset for value of whiskey consumed.

**CARNEY COPPER CO.****MICHIGAN.**

Office: care of John O. Broden, president, Norway, Mich. Mine office: Carney, Menominee Co., Mich. Antoine Anheier, superintendent. Organized 1904, under laws of Michigan, with capitalization \$20,000. Has an 88' shaft, showing ore in bottom assaying 1.4% copper. Idle.

**GEORGE E. CARNE Y OTRO.****CHILE.**

Mine office: Cobija, Tocopilla, Antofagasta, Chile. Property is the Buena Vista mine, idle some years.

**CAROLINA COPPER CO.****NORTH CAROLINA.**

Office: 15 Atwater St., W., Detroit, Mich. Mine office: Cullowhee, Jackson Co., N. C. Lewis C. Waldo, president and treasurer; Thomas A. Cox, vice-president and superintendent; Hugh M. McCormick, secretary; preceding officers, Stephen H. Knight, Geo. W. Clark, Thomas W. Newton, Chas. E. Bredin, David E. Thomas and Edwin P. Snider, directors. Organized Oct. 12, 1901, under laws of Michigan, with capitalization \$2,500,000, shares \$25 par; issued, \$1,585,000. Lands, 1,450 acres, freehold, including the Wayehutte mine, showing 4 veins, of 27' estimated average width, carrying mainly chalcopyrite, with estimated average values of 3% copper, 4 oz. silver and \$1 gold per ton, opened by a 55' shaft and a 200' tunnel. Lands, also include an undeveloped water power. Cloud was removed from title August, 1907. Idle for several years.

**CAROLINA GOLD & COPPER CO.****NORTH CAROLINA.**

Dead. Formerly at New London, Stanley Co., N. C., and Gap Creek, Ashe Co., N. C. Fully described Vol. VI.

**CAROLINA KING MINING CO.****NORTH CAROLINA.**

Mine office: Virginina, Halifax Co., Va. Organized 1903, taking over property of the Copper World Mining Co., and the Danville & Virginia Copper Mining Co. Lands, in Person county, North Carolina, just south of the Virginia line, include the Copper World mine, having 2 shafts, deepest 100', in a vein of fair width, showing chalcocite, also carbonate and oxide ores, assaying 15 to 65% copper. Idle.

**CARP LAKE MINING CO.****MICHIGAN.**

Office: Cleveland, Ohio. Mine office: Ontonagon, Ontonagon Co., Mich. H. L. Payne, general manager. Organized 1858, under laws of Michigan, and reorganized June, 1878, with capitalization \$500,000, shares \$25 par. Lands were 1,087 acres, in Town 51 North, Range 43 West, near Lake Superior, but part of holdings have been sold to Porcupine Mountain Copper Co. Property shows native copper, occurring as irregular streaks of high mineralization, ranging up to 40% in copper tenor, native metal occurring in exceedingly thin flakes in strata ranging from fine conglomerate to coarse sandstone. Main bed, of about 7' width, apparently is not an extension of the Nonesuch lode, as the strata do not resemble each other physically, though carrying copper in a markedly similar manner. Lands have an excellent water-power available from Carp Lake. The mine, opened 1858, has several shallow shafts and a 1,250' tunnel, and once had a mill with 20 gravity stamps. Idle some years. Very fully described Vol. II.

**SOCIEDAD ANONIMA MINAS DE CARRACEDO.****SPAIN.**

Office: Bilbao, Spain. Mine office: Vafes, Palencia, Spain. Property was undergoing development, in a leisurely manner, at last accounts, and presumably is idle.

**CARRANZA-LAFONE COPPER MINING &  
SMELTING CORPORATION, LTD.****ARGENTINA.**

Dead. Property sold, 1904, to Capillitas Copper Co., Ltd. Formerly at Cerro de Capillitas, Tucumán, Argentina.

**CARRERAS HERMANOS.**

Office and mine: Coro Coro, La Paz, Bolivia. Principal property is the Santa Rosa mine, 280 meters deep, opened 1868, on 2 successive conglomerate strata, carrying 3 to 4% native copper. Has a concentrator known as the Bella Vista, product being exported to Europe through port of Mollendo, Peru, as *Mariñas de cobre* of 82% average copper tenor. Production is 7,000 to 8,200 long tons of mineral bruto yearly, equivalent to circa 600,000 lbs. fine copper, estimated by Bolivian government to cost 7.5 bolivars per quintal of 80% copper tenor. Employs circa 300 men.

**CARRIE COPPER CO.**

Dead. Formerly at Globe, Gila Co., Ariz.

**CARRINGTON UNITED MINES CO.**

Mine office: Charters Towers, Queensland, Australia. T. A. Waters, manager. Lands, 30 miles from Charters Towers, show ore said to average about 10% copper, 1 oz. silver and 0.4 oz. gold per long ton, with an average value of £8. Has a smelter with 3 small reverberatory furnaces. Production, 1907, was 103 long tons ore smelted, yielding 23,520 lbs. fine copper, 89 oz. silver and 39 oz. gold. Production was reported, March, 1908, as circa 800 tons of ore monthly. Smelting costs are very high.

**SOCIEDAD DE MINAS y FUNDICIONES DE CARRIZAL.****CHILE.**

Office: Catedral 2409, Santiago de Chile. Mine offices: Cerro Blanco, Freirina, Atacama, Chile, and Carrizal Alto, Atacama, Chile. Works office: Canto de Agua, Freirina, Atacama, Chile. Samuel Gonzalez-Julio, chairman; M. Tirapegui and Alberto Fabrés, vice-chairmen; L. Tirapegui, secretary; Wm. H. Martin, general manager. Organized June, 1898, under laws of Chile, with capitalization 2,100,000 pesos, shares 100 pesos par. The Carrizal Share Trust, Ltd., is a heavy shareholder. Dividends have been as follows: 22½% for fiscal year 1899; 14% for 1900; 6.5% for 1901; 6.5% for 1902; 7% for 1905; 26% for 1906; 10% for 1907. For fiscal year ending Oct. 31, 1906, net profits were 732,948 pesos.

Lands are 4 groups, including 14 mines, many of which are idle, mainly in the Carrizal Alto district.

The Amarilla mine, at Cerro Blanco, opened 1867, has a main shaft of 800 meters vertical depth. Ores in upper workings show considerable silver, with little at depth. Country rocks are porphyry and limestone. The Amarilla mine, with extensions, in 1907 employed 130 men and produced 7,996 metric tons of ore averaging 14% copper, equivalent to circa 2,450,000 lbs. fine copper.

The famous Carrizal Alto group includes the Armonia and Santa Margarita mines, the former, 1,200' deep, having been a notable producer for many years.

The mina Socavón, at Carrizal Alto, has a vein with strike of nearly north and south and dip of 60° to 80°, in granite. Ores, to depth of 70 meters, are oxidized and associated with iron oxides, below which occurs chalcopyrite disseminated in pyrite. Extreme depth is 281 meters, with horizontal workings 250 meters in length.

The Astillas mine, in the Carrizal Alto district, opened 1878, has a 260 meter main shaft. The Jarillas or Bronces mine, opened 1881, has a 408 meter shaft. The Jarillas and Astillas mines, in 1903, jointly produced, with a force of 67 men, 3,493 metric tons of 6% ore, equal to circa 450,000 lbs. fine copper.

Smelter, known as the Chafarcitos, on the Carrizal & Interior railway, has 6 reverberatories and a 42x84" blast-furnace using semi-pyritic smelting. Fuel is imported coke, and about two-thirds of the mineral treated is calcined. The converter department has 5 shells, and slags average about 0.5% copper. Smelters employ 80 men, at average daily wages of 1.92 pesos, and in 1903 the reduction of one metric ton of ore required 1.56 workmen-days, with consumption

**BOLIVIA.****ARIZONA.****AUSTRALIA.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.****CHILE.**

tion of 453 kgs. coal, giving a total cost of 12.325 pesos for labor and fuel, with total smelting costs of 20.64 pesos per metric ton. Smelter in 1903 treated 18,497 metric tons of ore, producing there from 4,957 metric tons of matte, of 48% average tenor, with a net production of 2,379,360 lbs. fine copper.

### CARRIZO COPPER CO.

### MEXICO.

Office: 711 Missouri Trust Bldg., St. Louis, Mo. Mine and works office: Ayutla, Autlán, Jalisco, Mex. Col. Kent E. Keller, president and general manager; Whitney Gilbreath, vice-president and treasurer; Jos. T. Schneider, secretary; preceding officers, F. M. Steers, S. E. Walker, Dr. W. H. Perry and Harry B. Keller, directors; Albert L. Waters, resident manager; Chas. H. Williams, mine superintendent; John T. Delaney, mill superintendent; T. A. Dickson, smelter superintendent; Salvador Quintero, engineer. Organized Sept. 15, 1904, under laws of Maine, with capitalization \$1,000,000, shares. \$1 par; issued, \$800,000. Had, September, 1908, about \$40,000 cash and bills receivable, with liabilities of only current expenses. Annual meeting, second Tuesday in January.

Lands, 204 hectares, also a 50-acre millsite, 70-acre smelter site and circa 10,000 acres miscellaneous lands, mainly well timbered, including the 7,500-acre Palmito ranch. Property includes the mines and mill formerly owned by the Ayutla Copper Co., adjacent to the Carrizo. Lands show andesite, with porphyry and diorite intrusions, with 30 known ore bodies, 12 of which have been more or less developed, these occurring as fissures in andesite, carrying ore chutes of 2' to 12' width, 60' to 600' long, traceable 3 miles. Principal property is an antigua, known to have been worked from 1700 to 1880, reopened Dec. 1, 1906. Property formerly was worked for native copper and cuprite, shown at and near surface. The oxidized zone, showing practically all the common oxides and carbonates, to a depth of about 100', is followed by chalcopyrite, with occasional chalcocite.

Workings include the San Felipe shaft of 350' depth, the Zapatero of 115', the Chico of 140' and Medrano of 140', and other shafts of 90', 65', 60', 50', 65' and 40', with various prospecting pits and shafts. Mine also has tunnels as follows: No. 1, of 497'; No. 2, of 535'; No. 3, of 110'; Vesuvio, 200'; Inyo, 160'; Los Reyes, 220', and Chico, 526'. Mine has 4,458' of workings, and is conservatively estimated to show 67,000 tons of ore, with 50,000 tons blocked out for stoping. The ore average about 5.5% copper, 5 oz. silver and \$1 gold per ton, silver values increasing with depth.

Equipment includes a 200-h. p. steam plant, furnishing 75 h. p. for the mines, 40 h. p. for the mills and 85 h. p. for the smelter, with an available water power, at Carrizo, rated at 330 h. p., and machinery for a 230-h. p. installation on the ground. Mine has two 25-h. p. hoists and a 3-drill Leyner air-compressor. Buildings, 19 in number, include a 30x36' carpenter-shop, 14x20' adobe smithy, machine shops, engine-houses and dwellings.

The company has given some consideration to the matter of building a 35-mile narrow gauge railway, through a fairly easy country.

The 100-ton wooden concentrator, 60x100', has a 6x15" Sturtevant crusher, 2 rolls, 1 Harz jig, 1 Barton table, 2 Wilfley tables, 2 Card tables and 1 slime table. Machinery is on the ground for a new 150-ton mill, to be erected 1909.

The smelter, on a 40-acre site just north of Ayutla, 1½ miles from the nearest mine, receiving ore by cart and pack trains, is rated at 75 tons capacity, and in a trial run, June, 1908, treated 90 tons daily. The smelter has a Colorado Iron Works 42" hexagonal blast-furnace, with flue-pipe hot-blast attachment, turning out matte carrying circa 50% copper, 40 to 400 oz. silver and 0.1 to 1 oz. gold per ton, sent to the Aguascalientes works for refining. Fuel is Pocohontas coke, costing laid down, \$19 gold. per long ton, and a little

local charcoal may be used. Smelter is planned to do a general custom business, with company furnishing about 60% of the ore treated, and is expected to be blown in during the winter of 1908-1909. The works include a small sampling mill and laboratory, and are lighted by electricity.

Miscellaneous improvements include a 4,000' sawmill and a 6-ton ice-plant. Company plans steady mine development, construction of ore-bins and an aerial tram, doubling the mining equipment and adding a 150-ton blast-furnace to the smelter. About 200 men are employed. Property considered promising and management good.

#### CARE MINE & COLORADO CO., LTD.

COLORADO.

Dead. Wound up April, 1903. Formerly at Black Hawk, Gilpin Co., Colo.

#### CARROLL GOLD & COPPER CO.

ARIZONA.

Mine office: Humboldt, Yavapai Co., Ariz. A. J. Carroll, president; H. H. Clond, vice-president; Hon. C. P. Hicks, secretary; preceding officers, A. J. Head and G. E. Barth, directors. Organized June 2, 1906, with capitalization \$750,000, shares \$1 par. Lands, 5 claims, area 85 acres, in the Agua Fria district, 6 miles east of Humboldt, showing strong surface indications of copper, opened by a 240' tunnel showing a vein of 2' to 8' width, stated by president to assay a few thousand dollars per ton, which obviously was a slip of the pen, meant for a few dollars per ton, as the company has not made other claims to the possession of any considerable quantity of developed ore of high grade. Has shipped a little ore giving returns of 14% copper.

#### CARTER COPPER CO.

VIRGINIA.

Dead. Name changed, 1903, to Manassas Gap Copper Mines. Formerly at Reager, Rappahannock Co., Va.

#### GUILLERMO CARVALLO.

CHILE.

Mine office: Los Loros, Quillota, Valparaiso, Chile. Works office: Llai-Llai, Quillota, Valparaiso, Chile. Operates the Santa Maria and Santa Elena mines, having a vein up to 4 meters in width, with approximately north and south strike and dip of 45°, opened to depth of 60 meters, carrying sulphide ores with calcite gangue. Smelter, known as the Fundicion Llallai, has 1 reverberatory furnace, using English coke costing 21 pesos per ton, 1 ton of coke being required to smelt 3 tons of ore, slags running about 0.5% copper. Product is ejes, of about 50% average copper tenor. Production, 1903, was 3,000 metric tons of ore averaging about 8% copper, making 496,035 lbs. fine copper.

#### CASA GRANDE COPPER & GOLD MINING CO.

ARIZONA.

Dead. Succeeded by Producer Mining & Smelting Co. Formerly at Casa Grande, Pinal Co., Ariz.

#### CASA GRANDE DEVELOPMENT CO.

ARIZONA.

Office: Duluth, Minn. Mine office: Vekol, Pinal Co., Ariz. Henry B. Hovland, president; preceding officer, Lemuel C. Shattuck, Hoval A. Smith, Samuel Kaufman and Edw. N. Breitung, directors; Chas. S. Norris, manager. Capitalization \$500,000, shares \$10 par.

Lands, 6 miles west of Vekol and circa 38 miles southwest of Casa Grande, are held under 30-month bond and lease, from United-Arizona Copper Co., Ltd. Property shows blanket veins in limestone superimposed on quartzite adjacent to granite-porphry, and fault veins in limestone. Mine, known as the Reward, opened circa 1893, and idle since circa 1901, until taken over by present company, is opened on the upper bed of 8' to 10' thickness, carrying ore assaying up to 12% copper, with good silver values and a little gold. Main shaft, 600' deep, is opened on the 400', 500' and 600' levels. Property produced, in the past, a little copper, under great disadvantages. Water is secured from an 800' artesian well. The smelter, built 1892, has a 30-ton water-jacket blast-furnace, too small and antiquated for present use. Shipped, 1907, some high grade ore to El Paso smelter.

**CASA GRANDE MINING & SMELTING CO.**

ARIZONA.

Dead. Was a swindle perpetrated by Douglas, Lacy & Co., of New York. Formerly at Casa Grande, Pinal Co., Ariz. Described Vol. VI.

**CASANO COPPER MINING & SMELTING CO., LTD.**

SPAIN.

Mine office: Cabrales, Oviedo, Asturias, Spain. Organized July 28, 1902, under laws of Guernsey, as a reconstruction of the Oviedo Mines Development Syndicate, Ltd., with capitalization £150,000, shares £1 par; issued, £38,989. Was formed to acquire an option to purchase 15 mining claims, area 738 acres. Idle.

**FUNDICION DE CASAPALCA.**

PERU.

Owned by Backus & Johnston.

**CASCADE COPPER MINING CO.**

WASHINGTON.

Dead. Merged, circa 1902, in Mt. St. Helens Consolidated Mining Co. Formerly at Spirit Lake, Skamania Co., Wash.

**CASCADE COPPER MINING CO.**

WISCONSIN.

Office: care of Walter Fowler, manager, West Superior, Wis. Organized circa 1898, with capitalization \$250,000, shares \$25 par. Lands, 425 acres, in Section 23, Town 48, Range 10, west of the Brule river, in Douglas county, Wisconsin. Idle for some years and apparently moribund.

**CASCADE COPPER MINING CO.**

WYOMING.

Dead. Formerly at Encampment, Carbon Co., Wyo. Described Vol. V.

**CASCADE COPPER MINING CO., LTD.**

BRITISH COLUMBIA.

Office: Victoria, B. C. Mine office: Alberni, Vancouver Island, B. C. Hon. Erick B. McKay, president; Lawrence Manson, vice-president; W. J. Dowler, secretary and treasurer; preceding officers, H. H. Jones and W. H. R. Whitney, directors. Organized under laws of British Columbia, with capitalization \$250,000, shares 25 cents par.

Lands, on the northern shore of Uchucklesit Harbor, an arm of the Alberni Canal, show an 8' diabase dyke traversing limestone, impregnated with chalcopyrite and pyrite, selected samples assaying 5.5% copper, 0.12 oz. silver and 0.6 oz. gold per ton, with occasional assays up to 28.3% copper. Development is by several shallow shafts and short tunnels, with 2 opencuts on adjoining outcrops. Mine has a 600' three-rail gravity tramway, leading from the shaft to a 150-ton bunker on a wharf at tidewater. Has shipped a little ore of fair tenor.

**CASCADE GOLD & COPPER MINING CO.**

WASHINGTON.

Office: Ashland, Ohio. Mine office: Chelan, Chelan Co., Wash. E. J. Worst, president; D. F. Brubaker, secretary; B. H. Palmer, treasurer. Organized 1901, under laws of Washington, with capitalization \$2,000,000, shares \$1 par. Lands, known as the Davenport mine, near the head of Horseshoe Basin, are somewhat difficult of access. Mine has a 500' tunnel, cutting 2 small veins, and sample smelter shipment of 1 ton gave returns of \$69 in copper, lead, silver and gold. Presumably idle.

**CASCADE MINING CO.**

NEW MEXICO.

Office and mine: Santa Fé, Santa Fé Co., N. M. Geo. M. Kinsell, president; J. W. Mayes, vice-president; Dr. Chas. A. Whedon, secretary and treasurer; preceding officers, A. D. McInturff and J. A. Burlington, directors. Organized circa October, 1907. Lands are in the Pecos National Forest Reserve, near Santa Fé.

**CASCADES CONSOLIDATED COPPER CO.**

WYOMING.

Mine office: Encampment, Carbon Co., Wyo. John T. Baker, president and treasurer; W. S. Russell, vice-president and secretary. Organized 1902, under laws of Wyoming, with capitalization \$1,250,000, shares \$1 par, succeeding the

**CASCADES COPPER CO.** Lands, 15 claims, unpatented; including the Pasadena and High Five groups, circa 5 miles from Encampment, having a 100' shaft, showing a 20' vein, and a 900' tunnel cutting several small veins carrying auriferous and argentiferous copper ores.

WYOMING.

Dead. Succeeded, 1902, by Cascades Consolidated Copper Co. Formerly at Encampment, Carbon Co., Wyo.

**CASCADIA MINING & DEVELOPMENT CO.**

WASHINGTON.

Office: 1 Canterbury Bldg., Portland, Ore. Mine office: Spirit Lake, Skamania Co., Wash. E. A. Sessions, president; W. A. Gray, vice-president; G. W. Simpson, secretary and treasurer; C. E. Luckel and J. A. Gray, directors. Organized March 12, 1907, under laws of Washington, with capitalization \$1,000,000, shares \$1 par. Lands, 16 claims, area 320 acres, also 5 mill-sites, in the Mount St. Helena district of Skamania and Lewis counties, including the Polar Star mine, opened by tunnel, showing quartz veins traversing syenite, carrying mainly chalcopyrite, with some galena and tetrahedrite, associated with pyrite, giving assays of 8 to 25% copper and \$5 to \$15 gold per ton, with trivial silver values.

**CASHIER COPPER MINING CO.**

ARIZONA.

Mine office: Mayer, Yavapai Co., Ariz. Hon. M. P. Snyder, president and treasurer; G. W. Bedbury, vice-president and general manager; Wm. A. Eckley, secretary. Organized January, 1905, under laws of Arizona, with capitalization \$1,000,000, shares \$1 par. Is controlled, through ownership of majority of stock, by Arizona Diamond Drill Mining Development Co. Lands, 8 claims, area 152 acres, in the Agua Fria district, 5 miles northeast of Mayer, showing country rock of Yavapai schist carrying lenticular veins of copper ore with silicious gangue, lenses following the planes of schistosity.

**CASHIER GOLD MINING & REDUCTION CO.**

COLORADO.

Mine office: Central City, Gilpin Co., Colo. Wm. Auger, superintendent. Lands include the Brooklyn mine, developed to depth of 800', carrying auriferous and argentiferous chalcopyrite and tetrahedrite, principal values being in silver, running up to circa 700 oz. per ton. Has steam power and is a small but steady producer, partly from work of lessees. Employs circa 30 men.

**CASH MINE CO.**

ARIZONA.

Mine office: Groom Creek, Yavapai Co., Ariz. Harrington Blarvelt, general manager, at last accounts. Has auriferous copper ore and argentiferous lead ore. Mine has 2 shafts, with steam power and a 10-stamp mill.

**CASH MINING & MILLING CO.**

COLORADO.

Dead. Apparently succeeded by American Queen Mining Co. Formerly at Gold Hill, Boulder Co., Colo.

**ANTONIO GÓMEZ CASTELLANOS.**

MEXICO.

Office and mine: Compañía 48, Zacatecas, Zac., Mex. Property includes La Cobriza and La Iguana mines, carrying gold, silver and copper ores, and employing about 35 men, at last accounts.

**CASTELLANOS y CA.**

CHILE.

Mine office: Combarbalá, Coquimbo, Chile. Production, at last accounts, was about 75 tons fine copper yearly, shipped as matte. Presumably idle.

**MINA CASTILLO DEL BUITRON.**

SPAIN.

Owned by Compañía del Ferrocarril y Minas del Buitron.

**SOCIEDAD ESPAÑOLA MINAS DEL CASTILLO**

SPAIN.

**DE LAS GUARDAS.**

Office. Apartado 162, Bilbao, Spain. Mine office: Castillo de las Guardas, Sevilla, Spain. Juan Alonso Alende, president; Victoriano Galíz, vice-president; Francisco De Záraga, secretary; Antonio González Nicolás, managing

director; Ramón de Urritia, engineer. Organized July 12, 1901, under laws of Spain, with capitalization 7,500,000 pesetas, shares 500 pesetas par.

Lands, 153 hectares, on which considerable development has been secured, 23 kilometers from Zalamea La Real, having a private railroad of 15.5 kilometers running from Castillo de las Guardas to Estación Ronquillo, on the Ferrocarril Sevilla y Cala. The company maintains a school for employees. Property considered promising.

#### CASTLE DOME COPPER CO.

ARIZONA.

Office: Calumet, Mich. Mine office: Globe, Gila Co., Ariz. John R. Ryan, president; Geo. Hall, Jr., secretary; Bat. Quello, treasurer; preceding officers, Michael Richetta, Adolph F. Heidkamp, Paul Schneller, Jacob Utti, Matt Drazick and Thos. Hoffman, directors. Organized under laws of Arizona, and reorganized, Apr. 8, 1908, with capitalization \$600,000, shares \$10 par.

Lands, 12 claims, area circa 240 acres, 17 miles west of Globe, near the Continental mine of the Old Dominion, on the eastern side of Pinto Creek, with deepest workings of 800', in schist and diorite.

#### CASTLE DOME DEVELOPMENT CO.

ARIZONA.

Dead. An honest mining failure. About \$30,000 was expended on development work and notices were issued, November, 1907, that money paid in would be refunded shareholders by the promoters. Formerly at Globe, Gila Co., Ariz.

#### CASTLE DOME EXPLORATION & REDUCTION CO.

ARIZONA.

Office: care of B. L. Worthen, president, Tucson, Ariz. Mine office: Yuma, Yuma Co., Ariz. Chas. F. Flack, secretary and treasurer; Jas. H. Bennett, general manager. Capitalization \$500,000, shares \$10 par. Lands, 17 claims, area 320 acres in the Castle Dome Mountains, circa 30 miles northeast of Yuma. Occasional small shipments have been made to smelters in San Francisco, during the past 25 years, these ranging from 37 to 52% copper; 50 to 70 oz. silver and \$8 to \$20 gold per ton. Development is by 10 open-cuts, and shallow shafts, deepest only 80'. Property shews a wide mineral zone, carrying ore bodies in schist, with a porphyry contact to the north, and quartzite and limestone to the south. Idle and apparently moribund.

#### CASTREJÓN HERMANOS.

MEXICO.

Office and mine: Huacana, Ario, Michoacán, Mex. Property is the China mine, a small producer of copper for some years. Employs circa 23 men.

#### CASTRO-GREECAN MINING CO.

UTAH.

Office: care of Dr. P. Kassimikos, president, Salt Lake City, Utah. Mine office: Bingham Canyon, Salt Lake Co., Utah. L. C. Moore, secretary and treasurer. Organized 1905, under laws of Utah, with capitalization \$1,500,000, shares \$1 par. Company is composed exclusively of Greek residents of Utah. Lands, sundry claims at Bingham, near the United States mines, also miscellaneous claims in Carbon, Emery and Wasatch counties, Utah. Latter lands apparently sold, circa September, 1905, to Uintah Mining, Milling & Development Co. In June, 1907, was planning to begin development.

#### CATALINA COPPER CO.

MEXICO.

Office: Bisbee, Ariz. Mine office: La Cananea, Arizpe, Sonora, Mex. Organized February, 1904, with capitalization \$500,000, shares \$10 par. Lands are circa 30 miles south of La Cananea. Idle and apparently moribund.

#### CATALINA COPPER MINING CO.

ARIZONA.

Dead. Formerly at Tucson, Pima Co., Ariz. Fully described Vol. V.

#### CATARACT COPPER MINING CO.

MONTANA.

Office: 308 The Bowse, Philadelphia, Pa. Mine office: Basin, Jefferson Co., Mont. Carl G. Weldinger, president; Samuel B. Vrooman, vice-president; Hon. Marcus L. Hewett, second vice-president and general manager; John H.

Cromie, Jr., secretary; J. L. Ketterlinus, treasurer; preceding officers, Dr. Otis K. Newell and Carl F. Boker, directors; Leverett S. Ropes, superintendent. Organized May 14, 1901, under laws of South Dakota, with capitalization \$2,500,000, shares \$5 par.

Lands, 21 claims, area 420 acres, also 300 acres of placer claims, in the Cataract district, circa 12 miles from Basin, including the Bullion, Buckeye, Gray Eagle, Cataract, Yellow Gambler, Timbuctoo and Goldbug claims, several of which were worked in early days for gold. Country rock is granite, with intrusive porphyritic dykes, carrying fissure veins, ore being mainly cupriferous pyrite, with some tetrahedrite, having a gangue of quartz and siliceous altered granite. Zone of oxidation is shallow.

Property has 2 veins, one known as the Bullion having been traced circa 8,000', and proven for nearly 3,000', this being 10' to 20' wide, with 7' to 8' of commercial ore, and a 2' paystreak of smelting ore, the Bullion mine having nearly 2 miles of workings. Development is by 4 tunnels, including the Crystal tunnel of 1,100' and the No. 3 tunnel, which apparently has shrank from claimed lengths of 5,000' and 3,600', down to 1,212' length.

The Buckeye mine is said to show a 20' vein of ore of concentrating grade, with a 4' paystreak of smelting ore. The mines, as a whole, are claimed to have circa 1,000,000 tons of low grade ore in sight, averaging about 2% copper, with gold and silver values.

Equipment includes a power plant with 6-drill air-compressor, and necessary mine buildings.

The concentrator, of 150 tons nominal daily capacity, and actual capacity of about 100 tons, seems to have been built wrong, and has given considerable trouble.

The 250-ton smelter has a 44x144" Colorado Iron Works water-jacket blast-furnace, taking blast heated to 800° F. in a "U" stove, a 150-h. p. engine, Connersville blower and a small electric plant. The smelter is very poorly located for economical receipt of coal and fluxes.

A trial run of 6,000 tons of ore, 1905, gave a 10 to 15% matte, with average extraction from ore of 2.29% copper, 18 oz. silver and \$7.60 gold per ton.

The company has been in financial straits almost since organization, and has redeemed none of the extremely liberal promises made from time to time. The promoter of the company, Marcus L. Hewett, is said to have made individual profits of \$75,000 from the sale of the company's stock. The local management is good.

#### CATARACT COPPER MINING CO.

WYOMING.

Dead. Was a twin of the Cascade Copper Mining Co. Formerly at Encampment, Carbon Co., Wyo.

#### CATAS VIEJAS COPPER CO.

MEXICO.

Office: 211 Binz Bldg., Houston, Texas. Mine office: Tepezála, Ocampo, Aguascalientes, Mex. A. L. Hays, president; G. H. Barnes, secretary and treasurer.

#### CATAS VIEJAS MINING CO.

MEXICO.

Office: Iron Block, Milwaukee, Wis. Organized under laws of Arizona, with capitalization \$250,000, shares \$1 par. Claims to have lands somewhere in Mexico, but location not learned, despite requests. In December, 1906, advertised that every share then bought doubtless would be worth \$25 within 1 year, but this was a very bad guess. Apparently a wildcat.

#### SOCIÉTÉ DES MINES DE CUIVRE DE CATEMOU.

CHILE.

Office: 50 Blvd. de la Senne, Brussels, Belgium. Mine offices: El Solado, Putaendo, Aconcagua, Chile, and Nogales, Valparaiso, Chile. Works offices:

Nilgue, Estación Chagres, Putaendo, Chile, and Melon, Quillota, Valparaiso, Chile. Max Lyon, president; preceding officer, Comte Leopold-Fernand-Balny d'Avricourt, Comte Hubert Delamarre, Octave Maggiar, Emil Parif, Eugene Benevey, Ernest Stouls, D. Ghesquierre, Adam Collignon, A. L. Pearse, Georges Benevey, L. Consis and R. Franklin, directors; Guillaume Wouters, secretary; H. Macnutt, general manager; F. C. Vigeon, superintendent; J. R. Starkey, mill superintendent. Organized June 2, 1899, under laws of Belgium, with capitalization 5,000,000 francs, shares 500 francs par, divided into 10,000 preference shares at 8%, and 35,000 ordinary shares without stated value. Debentures, 2,500,000 francs authorized, at 5%; issued, 1,070,000 francs. Annual meeting, last Friday in June.

Lands, 155 claims, with sundry miscellaneous tracts, held in fee and under government concessions, including a hacienda of 7,500 hectares, giving total landed holdings of about 30,000 acres, in the districts of Putaendo, Los Andes, Melipilla, La Ligua, Quillota and El Nilgue.

The local management reports that ores carry an average of 6% copper, but a director stated, 1903, that the average would be only about 3.5% copper and 2 oz. silver per ton. Veins carry the usual oxidized ores near surface, in a comparatively shallow surface zone, succeeded by chalcocite, bornite and chalcopyrite.

El Solado mine, opened 1841, at Putaendo, one of the Nogales group, shows a series of veins with approximately north and south strike and dip of 45° east, between trachyte and feldspar-porphyr. There are 15 known veins, with average width of 5' to 7', composed mainly of quartz, impregnated with copper sulphides, while several veins carry oxidized copper ores, with gangue of aluminous silicates. This series of veins frequently is faulted, with throws of 1 to 2 meters, and there is another series of dykes and veins crossing at approximately right angles to the dip, but with parallel strike, which is unusual, dykes being partly decomposed porphyry, carrying occasional oxidized ores and aluminous silicates. These veins have been worked extensively in the past, showing many antiguas, and average 7 to 8% in copper tenor. Development is mainly by tunnels, greatest vertical depth obtained being 80 meters, and old workings are about 150 meters in length. This mine shows some immense chambers, one being called the cathedral, in recognition of its vast size. The Mantos Rojos of the Nogales group, opened 1820, has 2 blanket veins, of 5' to 7' thickness, composed of calcareous matter impregnated with chalcopyrite to an estimated average of about 4% copper. These blanket veins have been worked on a large scale, since circa 1835, and, while low in grade, the ores are especially suitable for fluxing purposes, and, by reason of the vast size of the ore bodies, the Mantos Rojos offers great possibilities of future production.

Miscellaneous mines include El Cobre de Melón, in the Quillota district, opened 1886; El Nilgue mine, in the department of Putaendo, opened 1886; Las Maquinas de Catemu mine, in the department of Putaendo, opened 1870; La Esmeralda mine, opened 1880; La Constancia and La Democracia mines, circa 10 kilometers from the smelter, carrying blanket veins; the Marquesa Malva, Tabourina, Caracoles, Almendro y Pleito, La Poza and other properties, in various stages of development, some of considerable promise.

La Poza smelter, at Chagres, is 12 kilometers from Chagres station, on the Andes railroad. These works include a concentrator, of modern design and equipment, having mainly American machinery. The mill, of 60 tons rated capacity, has 7 Wilfley and Ferrari tables, and slime tables. La Poza smelter, of 400 tons daily capacity, has two old 75-ton rectangular water-jacket blast furnaces, and new blast-furnaces of 36x96" and 36x120" dimensions at the tuyeres, turning out 45% matte. The converter department has five 57x77"

shells, with 12 tuyeres each, of the Copper Queen type, turning out Chile bars carrying 99.7% copper and 32 oz. silver per ton. There is a 40-ton briquetting plant, and the converter department has a quartz mill. Power is furnished by a 165-h. p. Pelton water wheel and 175-h. p. engine. Furnace blast is supplied by No. 6 Connersville blowers, and converter blast is furnished by a Riedler air-compressor, with capacity to reduce 20,000 cubic feet of free air per minute to 15 lbs. pressure. Fuel is coke, one ton of coke smelting 5.21 tons of ore, ore treated being highly silicious, with slags averaging 0.4 to 0.5% copper. In 1903 La Poza smelter treated 19,063 metric tons of ore, of 6% average tenor, obtaining therefrom 1,046.25 metric tons fine copper, employing 90 men, at average wages of 2 pesos daily.

El Cobre del Melon smelter, 16 kilometers from Estación del Melon, on the Calera & Cabildo railway, has a 36x84" Allis-Chalmers cylindrical water-jacket blast-furnace, making ejes, which are sent to La Lota and La Poza smelters for conversion. Ores smelted at this plant carry excess of silica and alumina, and are deficient in sulphur, necessitating the free use of low grade cupriferous pyrite and limestone, for fluxing. Fuel is very expensive, coke costing 43.5 pesos per metric ton, and English coal 31 pesos per ton, one ton of fuel smelting about 3.5 tons of ore. Equipment includes a Pelton water wheel, 60-h. p. locomotive and Green No. 6 blower. A 4-kilometer aerial tram is proposed to the Nogales group. In 1903 these works employed 40 men, at average wages of 2 pesos daily, treating 8,882 metric tons of ore averaging 6% copper, producing therefrom 928 tons of ejes, of 45.5% tenor, carrying 422,240 kgs. fine copper. It is planned to greatly enlarge this smelter by adding a 48x120" Allis-Chalmers blast-furnace, converter plant, Babcock & Wilcox boilers, Corliss engine and Riedler air-compressor, increasing the smelting capacity to 40,000 metric tons of ore yearly.

Los Mantos mines are capable of a large output, and the management is progressive. Production, 1903, was 15,851 metric tons of ore averaging 5.5% copper. With improvements at the smelters the capacity of the property should be increased to nearly or quite 6,000 metric tons of fine copper yearly. Production, 1905, was 4,401,270 lbs. fine copper.

#### SOCIEDAD NACIONAL DE MINAS I FUNDICIONES DE CHILE. CATEMU I MELON.

Office: Valparaiso, Chile. Organized Sept. 7, 1906, under laws of Chile, with capitalization 2,000,000 pesos, shares 50 pesos par. Obviously is closely related to Société des Mines de Cuivre de Catemu, and probably is the Chilean incorporation of that company.

#### SOCIEDAD MINERA DE CATIGUA. CHILE.

Office: Santiago de Chile. Mine office: Tarapacá, Tarapacá, Chile. Organized Dec. 13, 1906, under laws of Chile, with capitalization £230,000, shares £1 par.

#### CAUCASUS COPPER CO., LTD. RUSSIA.

Office: 3 Bond Court House, Walbrook, London, E. C.; Eng. Mine office: Dzansul, Kutais, Russia. A. A. Swan, chairman; preceding officer; J. Douglas, J. Colquhoun, M. Grancini, E. V. Lockhart and J. N. Sparks, directors; John F. Allan, general manager; W. B. Van Liew, smelter superintendent; H. H. Knox, consulting engineer; John Tripp, secretary. Organized Oct. 4, 1900, under laws of Great Britain, with capitalization £500,000, shares £1 par. Debentures, £500,000, at 6%. Property was bought for £398,000. Company, to October, 1907, had expended £247,150 on development and improvements.

Lands are 6 groups, including the Dzansulski copper and silver-lead mines, in the Murgne Gorge, Artvin district of the government of Kutais, in the Russian Caucasus. Mine is developed extensively, company estimating reserves

at, 5,000,000 long tons, of 3.1%, copper ore, practically, in sight. Ore is chalcopyrite, with a silicious gangue, occurring in a mammoth lens of 50 to 100 meters width, with about 300 meters length. Mine is worked open-cast, and ore is trammed to the mill.

The mill, nominally of 500 tons daily capacity, planned as the first unit of a 1,000-ton mill, has electric power, with automatic operation throughout. The ore slimes badly in concentration, and is so high in silica and so deficient in iron that heavy fluxing is necessary, in a district where fluxing ores are secured with difficulty. Wet concentration having proved unsatisfactory, the process was changed. Equipment includes Blake crushers and series of grinding rolls, with screens, ore being taken by belt conveyers to the roasters. The process of reduction in use requires the fine crushing of ore, which is minutely subdivided, followed by roasting to change the iron sulphides to iron oxides, after which the ore goes to a Wetherill magnetic separation plant which carries over the iron oxide, taking with it the copper, giving a concentrate of about 12% copper tenor. The mill has given considerable trouble in operation, but apparently will be adjusted, eventually.

The old works had a small smelter, which was increased to 300 tons capacity, and rebuilt, 1907-1908, to 500 tons daily capacity. Production, 1904, was 1,946,360 lbs. fine copper, and for fiscal year 1905, was 511,920 lbs. fine copper. Property is considered valuable, though as yet it cannot be called a success.

#### CAVE CREEK MINING CO.

#### ARIZONA.

Mine office: Cave Creek, Maricopa Co., Ariz. G. J. Corset, president; Frank Dommier, secretary. Has authorized a \$40,000 bond issue. Lands, 4 claims, area 80 acres, and 5-acre millsite, formerly held by Mormon Girl Mining Co., showing two 4' contact veins, between granite and slate; claimed by former owners to give average assays of 6 to 8% copper, 4 to 15 oz. silver and \$4 gold per ton, which was a grievous overestimate, from silicious oxides and carbonates, and copper silicates. Development is by 500' shaft and a 400' tunnel. Has steam power and several mine buildings, also a 25-ton mill with 5 stamps and a 20-ton Huntington-Heberlein mill, and a 25-ton leaching and cyanide plant. Idle at last accounts.

#### MINA DA CAVEIRA.

#### PORTUGAL.

Mine office: care of Crookston & Hawkins, owners, Grandola, Portugal. Was undergoing development at last accounts.

#### CÄVIN MINING & MILLING CO.

#### CALIFORNIA.

Office: Stockton, Cal. Mine office: Raymond, Mariposa Co., Cal. E. W. King president and general manager. Lands, 12 claims, having tunnels of 40' to 650', and 6 shafts, of 50' to 175' depth. Has shipped a little ore.

#### SOCIEDAD EXPLORADORA DE GAYLLOMA.

#### PERU.

Office: Valparaiso, Chile. Mine office: Arequipa, Peru. Organized May 23, 1906, under laws of Chile, with capitalization £32,000, shares £1 par.

#### CEDAR-CANYON SMELTING & REDUCTION CO.

#### WASHINGTON.

Mine office: Springdale; Stevens Co., Utah. W. Shock, general manager. Lands, on the Columbia river, west of Springdale, show copper sulphides. Company is said to plan a 50-ton mill.

#### CEDAR FOREST GOLD & COPPER CO.

#### ARIZONA.

Dead. Formerly at Kingman, Mohave Co., Ariz. Described Vol. VI.

#### CEDAR MINING CO.

#### UTAH.

Mine office: Milford, Beaver Co., Utah. Lands, 12 miles from Milford, have a 275' shaft showing argentiferous copper ores with values mainly in silver.

**CEDAR VALLEY GOLD & SILVER MINING CO.****ARIZONA.**

Mine office: Cedar, Mohave Co., Ariz. Philip P. Baker, superintendent. Lands include the Arnold, Silver Queen and other claims. Ores carry gold, silver and copper. Has steam power and a 15-stamp mill. Presumably idle.

**CELTIC COPPER CO.****ARIZONA.**

Office and mine: care of Archibald Morrison, Clifton, Graham Co., Ariz. Lands, 16 claims, area 320 acres, circa 15 miles from Clifton, opened by a 65' shaft. Shipped, 1907, circa 200 tons of sulphide ore of about 19% copper tenor. Presumably idle.

**CENTENNIAL-BINGHAM MINING CO.****UTAH.**

Dead. Succeeded, Feb. 11, 1904, by South Columbus Mining Co. Formerly at Park City, Summit Co., Utah.

**CENTENNIAL COPPER MINING CO.****MICHIGAN.**

Office: 60 State St., Boston, Mass. Mine office: Calumet, Houghton Co., Mich. H. F. Fay, president; Geo. G. Endicott, secretary and treasurer; Jas. MacNaughton, general manager; preceding officers, A. Agassiz, F. W. Hunnewell, Quincy A. Shaw, Jr. and R. L. Agassiz, directors; John Pentecost, mining captain.

Organized 1896, under laws of Michigan, as successor of Centennial Mining Co., with capitalization \$2,500,000, shares \$25 par; issued, \$2,250,000, with \$19.50 per share paid in. Last assessment, 1905, was \$4. Is controlled, through ownership of circa 46,000 shares, a majority of the stock issued, by the Calumet & Hecla Mining Co. Old Colony Trust Co., Boston, registrar. Annual meeting, first Tuesday in April.

The company's floating debt, amounting to \$835,894.24 on Jan. 1, 1905, was met, partially, by the sale of the mill, for \$200,000, to the Lake Milling, Smelting & Refining Co., which corporation the Centennial owns jointly with the Allouez Mining Co. Company ended 1907 with accounts payable of \$31,366.58.

Lands, circa 670 acres, being Section 12, Town 56 North, Range 38 West, also a triangular patch of about 30 acres, at the southeastern corner of the main tract, bought to secure the outcrop of the Kearsarge lode, and including about 10 acres, bought, 1905, of the Old Colony for the surface plant. The first work was done, 1869, by the Schoolcraft Mining Co., which failed to open a paying mine, and was reorganized, 1876, as the Centennial Mining Co., and again reorganized, 1896, with present title. Expenditures of upwards of \$1,500,000 were made, mainly by the old companies, in unsuccessful efforts to open a paying mine on the northern extension of the Calumet conglomerate. Seven shafts, 3 of considerable depth, were sunk on this bed, No. 3, the deepest, being bottomed at 3,200'. The Centennial lands are in the great mining camp of Calumet, and are available for building purposes. Two additions have been platted, and the lots sold at good prices. Only surface rights are sold, mineral being reserved.

The present company did a few months' work, in 1897, on the old conglomerate shaft, then turned attention to the Osceola lode, deepening 2 shallow shafts to 1,050' and 1,150' depth respectively, shafts being 17x12' inside of timbers, sunk at 38°. The Osceola lode, where opened on the Centennial tract, averages about 15' width, but is lean.

Work on the Kearsarge lode was begun September, 1899. Owing to the outcrop of the Kearsarge occurring on the 30-acre tract bought of the Osceola, with only 100' right-of-way connecting it with the main tract, it was necessary to open the mine on the Kearsarge lode in a peculiar manner, by 2 shafts. These are but 90' apart, on surface, and continue parallel, on the dip of the lode, until the 13th level, when the main tract is reached, after which No. 2 shaft diverges from No. 1 at an angle of 15° on the plane of the lode, 300'

being taken by the curve. This method of opening gives short drifts until the shafts enter the main Centennial tract. Each shaft is 17x18' inside of timbers, with 3 compartments, sunk at an angle of 39° with the horizon, through an overburden of about 100' depth. The Kearsarge lode averages about 16' in width, and showed fair copper values in the upper levels, followed by a comparatively barren zone until the 14th level, when there came a gradual improvement. The mine has large ore reserves opened, and should get the rich Wolverine ore chute at depth.

No. 1 shaft, 3,070' deep, can be sunk circa 12,000' before reaching the boundary. No. 1 has a steel shaft-rockhouse, with 3,000-ton bins and a 32x72" Nordberg duplex hoist, with double conical drum, good for depth of 6,000', operating 5-ton skips.

No. 2 shaft, circa 3,100' deep, cut down, 1907, to 3 compartments, shows good ground from the 28th to the 31st levels, inclusive. Equipment includes a cylindrical steel shaft-rockhouse with 1,000-ton bins, and a 32x60" Sullivan duplex straight-face hoist, with 2 drums of 14' diameter and 15' 6" winding face, grooved for 1 $\frac{1}{8}$ " cable. The hoist is fitted with devices to prevent over-winding, and is calculated to raise 5-ton skips at the rate of 4,000' per minute, operating under 150 lbs. steam pressure.

The principal mine buildings are of Lake Superior redstone, finished ashlar, and include duplicate engine-houses for the 2 shafts. The new compressor house, 32x78', has a 70-drill Laidlaw-Dunn-Gordon 2-stage compound air-compressor, and the old compressor house, 32x46', has 35-drill Nordberg and 20-drill Rand air-compressors, with a Dean jet condenser in the basement. A 54x58' boiler-house has four 125-h. p. Burt locomotive-firebox boilers, and a 125' brick-lined self-supporting steel smokestack of 7' diameter. A 16x46' frame pumphouse, with corrugated iron roof, has a fire-pump, fire-hose and hose-carts. The combination machine-shop and smithy is 50x108', with steel truss roof, having traveling cranes, with railroad track from end to end. Miscellaneous buildings include a 36x50' carpenter shop, 30x40' warehouse, 30x40' office building, and a 26x50' changing house with hot and cold water, baths, lockers, etc. There also is a large number of dwellings for employes, the surface plant being well planned and substantial.

The mine is served by the Copper Range and Mineral Range railroads, and has a private line connecting the shops and shafts.

Rock is stamped by the mill of the Lake Milling, Smelting & Refining Co., which is separately described. The Centennial employs about 400 men.

Production was begun July 5, 1904, and output of fine copper has been as follows: 641,294 lbs. in 1904; 1,446,584 lbs. in 1905; 2,253,015 lbs. in 1906 and 2,373,572 lbs. in 1907. Rock hoisted, 1907, was 225,271 tons, of which 200,040 tons were milled, discard being 11.2%, producing 3,604,970 lbs. mineral, which averaged 65.842% fine copper, the production of copper per ton of rock stamped, 1907, being 0.593%, or only 11.86 lbs., as against 0.679%, or 13.58 lbs., in 1906, a very discouraging showing. For the first half of 1908 about 87,000 tons of rock were stamped, a decrease of about 5,000 tons, yielding circa 1,870,000 lbs. of mineral, an increase of about 70,000 lbs. Production, October, 1908, was at the rate of about 15,000 tons of rock monthly, and production of copper for 1908 should prove slightly larger than in the preceding year. The mine was looking somewhat better, late in 1908. Costs per ton, less construction, have been as follows: \$3.54 in 1905; \$2.21 in 1906, and \$2.34 in 1907.

It is possible, and even probable, that the Calumet conglomerate may be worked to advantage, eventually, under the management of the Calumet & Hecla, though this would not be possible were the Centennial an independent company. It is possible that something may be done also with the Osceola bed, on the Centennial tract.

**CENTENNIAL-EUREKA MINING CO.****UTAH.**

Office: 50 Congress St., Boston, Mass. Operating office: 508 Dooly Bldg., Salt Lake City, Utah. Mine office: Eureka, Juab Co., Utah. Wm. G. Sharpe, president; Alfred F. Holden, managing director; preceding officers, Wm. H. Coolidge, Robert D. Evans, Clarence A. Hight, J. J. Storrow and Sidney W. Winslow, directors; F. Winthrop Batchelder, secretary and treasurer; C. E. Allen, superintendent. Organized 1876, under laws of Utah, and reorganized, 1899, under laws of Maine, under same title, with capitalization \$5,000,000, shares \$25 par; issued \$2,500,000. Company is controlled by the United States Mining Co., which holds all but circa 100 shares. National Shawmut Bank, Boston, registrar. Annual meeting, third Wednesday in April.

Lands, in the Tintic district, include the Centennial, Eureka, Tintic, Dove, Swan and Pelican groups. A suit over land, against the Bullion Beck & Champion Mining Co., was dismissed, 1908. Mines are extensively developed, producing ore of 2 grades, the oxidized ores carrying high values in gold and silver, while the low grade deposits, though of enormous extent, carry only small gold and silver values. The east fissure has upwards of 500,000 tons of ore blocked out; and reserves, 1905, were estimated by J. Parke Channing at 600,000 tons, carrying average values of \$11.88 per ton.

Forces are circa 300 men. Production, 1907, was 2,310 carloads of ore, or about 80,000 tons. Property is valuable and under good management.

**CENTENNIAL MINE.****COLORADO.**

Office and mine: Georgetown, Clear Creek Co., Colo. David Kennedy, general manager; S. G. Evans, superintendent. Lands, circa 640 acres. Has cupriferous gold and silver ores in a 30" paystreak, assaying up to 24% copper, 5 to 150 oz. silver and 3 to 5 oz. gold per ton. Has steam power.

**CENTENNIAL MINING CO.****MICHIGAN.**

Dead. Reorganized, 1896, as Centennial Copper Mining Co. Formerly at Calumet, Houghton Co., Mich.

**CENTRAL ALASKA GOLD & COPPER CO.****ALASKA.**

Dead. Succeeded, 1907, by Chisna Consolidated Mines Co. Formerly at Landlock, Prince William Sound, Alaska. Described Vol. VI.

**CENTRAL BLACK HILLS COPPER CO.****SOUTH DAKOTA.**

Office: 701 New England Bldg., Cleveland, Ohio. Mine office: Custer, Custer Co., S. D. O. L. Olmsted, president; Chas. Waite, vice-president and manager; W. H. Buffum, treasurer; Alex Cameron, Jr., secretary. Organized July, 1902, under laws of South Dakota, with capitalization \$1,500,000, shares \$1 par; was practically reorganized, and management changed, April, 1907.

Lands, 6 claims, area 600 acres, also a 40-acre milleite, and 80 acre miscellaneous lands, in the Pennington district, showing 2 contact veins, between slate and quartzite, of 18' claimed average width, opened by shafts of 108' and 110', and by tunnels of 102' and 225', showing malachite, azurite and chalcopyrite said to give average assays of 6% copper, 2 oz. silver and \$4 to \$200 gold per ton. Ore was expected by old management to average about 3% copper in actual treatment, which probably was an overestimate. Has a 200-h. p. steam plant, and a mill with 2 crushers and 4 jigs, and a 100-ton leaching plant, also a sawmill. Property shows large bodies of low grade ore that possibly might be leached to advantage. Idle.

**CENTRAL CHILI COPPER CO., LTD.****CHILE.**

Office: 15 Angel Court, Throgmorton Court, London, E. C., Eng. Mine and works office: Panulcillo, Ovalle, Coquimbo, Chile. Eugene A. J. Goldschmid, chairman; Bertrand C. Hinman, managing director; Harris K. Masters, general manager; Herbert Brownhead, secretary; Thos. Higgins, smelter superintendent; H. M. McLaughlin, engineer. Organized Jan. 10, 1898, under laws of Great Britain, as a second reconstruction of the Panulcillo Copper Co., Ltd.,

With capitalization increased, November, 1905, to \$500,000, shares \$1 par, issued, £312,468. Debentures outstanding, £8,075, at 4%, convertible into fully paid shares at option of holder. Net earnings, 1905, were £10,982, and 1906 were £24,913. Dividends were 6d. in 1906; 6d. in 1901, and 1s. in 1907.

Lands, 56 hectares, at Panulcillo, including the Panulcillo and San Gregorio groups, showing strong lenses of ore up to 150' in width, with generally north and south strike and dip of about 45°, worked to depth of 200 meters and length of 1,500 meters. Ore is mainly chalcopyrite, associated with pyrite in limestone gangue, with malachite, azurite and chalcocite produced in commercial quantities.

The Condesa mine, 3 kilometers from Panulcillo, has a 5' vein, with nearly north and south strike, and is opened to depth of circa 100' only. Production, 1903, was about 600 metric tons of 6% ore.

The Cecina and Inagotable mines, at Ferro Negro, show lenses up to 70' in width, with dip of about 45°. Production, 1903, was only 1,200 metric tons of 6.5% ore, but probably was very much larger in 1907, the Cecina group of 4 mines being said to show nearly 2,000,000 long tons of ore.

The Nistales mine has a stockwork, opened by 3 tunnels to depth of circa 300 meters, and produced, 1903, circa 2,500 metric tons of 4.5% copper ore.

The 400-ton smelter, connected with the Panulcillo mine by tram, is equipped with 3 calcining furnaces, 2 reverberatory furnaces and three 42x84" blast furnaces. The company's ores, being rich in sulphur, permit their smelting in connection with silicate custom ores. The works have a converter department, with quartz mill and crushers for linings, power being furnished by three 160-h. p. boilers, three 60-h. p. engines and 2 Connersville blowers. Fuel is imported coke, costing 40 pesos per ton, and imported English coal, costing 23 pesos per ton, one ton of coke smelting 7.7 tons of ore.

Labor is somewhat scarce, forces employed being about 250 men at the mine and 200 men at the works, at average wages of 1.5 pesos daily.

Production, 1905, was 4,596,480 lbs. fine copper, and for 1906 was 4,159,680 lbs. fine copper. The mines, though low in grade, are carefully handled, by a prudent management, and the smelter is modern and profitable.

#### CENTRAL CONSOLIDATED COPPER CO.

#### MEXICO.

Office: Hibbing, Minn. Operating office: Douglas, Ariz. Letter returned unclaimed from former mine office, Fronteras, Arizpe, Sonora, Mex. Organized 1907, succeeding La Union Consolidated Copper Co. Lands, 240 hectares, including La Reina de Cobre group, in the Tordillo district of the Ajo Mountains, circa 25 miles west of Fronteras. Mine has a 100' shaft showing a 13" vein said to give average assays of 13 oz silver and \$12 gold per ton. Shipments of 230 tons taken from depth of 40' returned 6% copper, 3.5 oz silver and \$7 gold per ton. Property considered promising. Idle at last accounts.

#### CENTRAL COPPER CO.

#### ARIZONA.

Office and mine: Globe, Gila Co., Ariz. Patrick Rose, treasurer; F. L. Toombe, manager; W. J. Powell, mine superintendent. Capitalization \$100,000, shares \$1 par. Lands, 3 claims, between the Union and Gibson, on the divide between Mineral Creek and Pinto Creek, having a 160' shaft cutting a 4% ore body with pay streak of 30% copper tenor.

#### CENTRAL COPPER MINING SYNDICATE.

#### AUSTRALIA.

Mine office: Cobar, Robinson Co., N. S. W., Australia. Lands, 80 acres, circa 3 miles north of the Queen Bee mine, prospected during 1907, showing ore giving fair assay values in gold, silver and copper. Presumably idle.

#### SOCIEDAD MINERA CENTRAL DE COLLADUASI.

#### CHILE.

Office: Santiago de Chile. Mine office: Collahuasi, Tarapacá, Chile. Organized Feb. 14, 1906, under laws of Chile, with capitalization 90,000 pesos, shares 15 pesos par.

**CENTRAL GOLD & COPPER CO.****NEW MEXICO.**

Dead. Formerly at Mineral Hill, San Miguel Co., N. M.

**LA GRAN FUNDICION CENTRAL MEXICANA.****MEXICO.**

Is the Aguascalientes plant of the American Smelting &amp; Refining Co.

**CENTRAL MINE.****MICHIGAN.**

Owned by Frontenac Copper Co.

**CENTRAL MINING CO.****MICHIGAN.**

Dead. Property sold, circa 1905, to Frontenac Copper Co., and final dividend in liquidation, 98 cents per share, paid March, 1908, and company wound up. Company paid total dividends, 1864-1908, of \$2,049,600. Formerly at Central Mine, Keweenaw Co., Mich. Described Vols. I. and II.

**CENTRAL MINING CO.****WASHINGTON.**

Mine office: Keller, Ferry Co., Wash. Jas. LeFevre, general manager. Lands, sundry claims developed by a 60' shaft showing ore assaying 3 to 16% copper.

**CENTRAL MINING & DEVELOPMENT CO.****ARIZONA.**

Mine office: Winkelman, Pinal Co., Ariz. Irvin Jordon, president; C. H. Werner, vice-president; preceding officers, T. B. Enochs, J. A. McCabe and Dr. A. F. Angeni, directors; V. K. Heinberg, secretary; F. B. Garden, superintendent. Organized July 13, 1906, under laws of Arizona, with capitalization \$10,000,000, shares \$1 par. Lands, 9 claims, one fractional, area 175 acres, a millsite and a 160-acre ranch. Lands include the Two Queens mine, 7 miles from a railroad, having 4 nearly parallel veins and a cross vein, one vein showing surface ore claimed to assay \$200,000 gold per ton, which is too good to be true. Mine has shafts of 21', 38', 50', 155' and 184', and a 440' tunnel, showing ore with quartz gangue, from which selected samples have given high assay values in gold and silver, with a little copper. Has a 25-h. p. gasoline hoist and an air-compressor. Despite the marvelous assays, 3 small smelter shipments, 1907, gave returns of only \$36.53 per ton. Company was promoted by Frank H. Horn, of Kansas City, Mo., but he dropped out and entire management was changed, September, 1908.

**CENTRAL SIBERIA, LTD.****SIBERIA.**

Office: Dashwood House, London, E. C., Eng. Marquis of Winchester, chairman; E. A. Maund, managing director; Wm. Owen, secretary. Organized Dec. 6, 1906, under laws of Great Britain, with capitalization £100,000, shares £1 par; issued, £90,000. Property consists of sundry options on mineral properties, including copper deposits circa 40 miles from Verchneoodinsk, Transbaikal, Siberia, on the Siberian railway between the Selenga and Chilok rivers, showing quartz veins carrying native copper and carbonate ores.

**CENTRE STAR CONSOLIDATED MINING CO.****BRITISH COLUMBIA.**

Mine office: Rossland, Trail district, B. C. E. B. Kirby, manager. Organized January, 1906, as successor of Centre Star Mining Co., and is controlled, through stock ownership, by Consolidated Mining & Smelting Company of Canada, Ltd. The Centre Star Mining Co. paid, 1895-1904, dividends of \$210,000.

The mine has a 3-compartment main shaft, with dip of only 17°, having 14 levels opened, at intervals of 125' to 175' on the slope, which is sinking for the 16th level, which will give a total depth of 2,400', rendering it the deepest in Canada. Drifts, where possible, are run along the footwall. Ore and country rock stand well, requiring practically no timbering, and the mine is not especially wet. There are loading pockets at each level. Veins range from 6" to 40' in width, with pay chutes extending, in some cases, from wall to wall, and forming local enrichments, walls being very indistinct, ore shading into the country rock. There are several veins, the most important being the Centre Star, on which the mine is opened mainly, this being a large shear-zone fissure,

carrying chalcopyrite disseminated in pyrite and pyrrhotite, with occasional arsenopyrite, having good gold values and small silver values. The lowest levels show good ore. The Centre Star is connected with the War Eagle mine on the 9th level.

Electric power was substituted, 1906, for steam. Equipment includes a 52x56' engine-house with a 28x60" Nordberg hoist having drums of 10' diameter and 5' face, with hoisting capacity of 135 tons per hour from a depth of 3,000', raising 4½-ton skips in balance, at a speed of 2,500' per minute. A 650-h. p. Westinghouse induction motor drives a 40-drill air-compressor, and there is a 24x36" Jenckes-Farrel crusher, with capacity to reduce 100 tons of ore per hour to 6" size.

The company employs about 400 men. Figures of production are not given out for the property individually, but output, 1904, was 77,892 tons of ore averaging 0.72% copper, 0.35 oz. silver and 0.3 oz. gold per ton, yielding 1,121,644 lbs. fine copper, and present production is larger.

#### CENTRE STAR MINING CO., LTD.

#### BRITISH COLUMBIA.

Dead. Succeeded, January, 1906, by Centre Star Consolidated Mining Co. Formerly at Rossland, Trail district, B. C.

#### CENTURION ARIZONA MINING CO.

#### ARIZONA.

Mine office: Willcox, Cochise Co., Ariz. Lands, circa 2 miles northwest of Dragoon station, are said to have a 17' vein carrying high grade cuprite, azurite and malachite, assaying up to 30% copper, opened to shallow depth only.

#### CENTURY DEVELOPMENT CO.

#### NORTH CAROLINA.

Office: 52 Broadway, New York, N. Y. Mine office: Centre, Guilford Co., N. C. W. B. Feakins, president; Frank F. Hesse, secretary and treasurer; Chas. E. Dickens, superintendent. Organized under laws of Maine, with capitalization \$300,000, shares \$10 par; issued, \$138,000. Bonds, \$10,000 authorized, at 6%; issued, \$5,000. Annual meeting, third Tuesday in December.

Lands, 92 acres, freehold, known as the North Carolina or Fentress mine, said to have produced considerable ore of 14 to 20% copper tenor previous to the American Civil War. Property shows 3 contact deposits, between granite and diorite, reported by company as of 7' average width, but otherwise stated as of 3' to 4' width, with outcrop traceable for 3 miles, having an ore chute of 80' to 90' in length, carrying auriferous chalcopyrite and pyrite, with quartz gangue, values being mainly in gold. Management reports average assays of 8% copper, 3 oz. silver and up to \$12 gold per ton. Mine has shafts of 269', 80', 55', 303' and 175', and a 431' tunnel, with about 3,000' of workings. Property was opened circa 1840, closed 1856, reopened 1900. Has a 250-h. p. steam plant, with a 50-h. p. hoist and 10-drill air-compressor. Has 7 buildings, including a machine-shop, carpenter-shop, smithy, etc. Stampmill, 28x40', of wood, has 10 stamps, built by the Mecklenburg Iron Works, and Blake crusher. Company plans deepening the new incline shaft by 300'.

#### CENTURY MINING CO.

#### WYOMING.

Dead. Formerly at Rambler, Carbon Co., Wyo. Organized 1880.

#### CERMA DEVELOPMENT CO.

**CERRO COLORADO MINING & MILLING CO.**

ARIZONA.

Office and mine: 82 Pennyton St., Tucson, Ariz. Daniel J. Sully, president; Elias S. Gifford, vice-president; Chas. E. Udall, general manager. Organized 1905, with capitalization \$5,000,000, shares \$1 par. Lands, 72 claims, unpatented, also 5 millsites, in the Cerro Colorado district, circa 45 miles from Tucson, the nearest railroad point, including the old Silver Queen mine, formerly a considerable producer of copper. Mine has a 520' shaft, showing streaks of rich copper ore on the 350' level, ore being mainly argentiferous tetrahedrite, with about 2,000' of workings. Has a steam plant with 3 hoists, air-compressor and 10 power drills. Property considered promising, but handicapped by poor transportation facilities, though a little high grade ore has been shipped. Property attached for debt, August, 1908, and company apparently in a bad way.

**CERRO COPPER CO., LTD.**

PERÚ.

Office: 21 Ironmonger Lane, London, E. C., Eng. H. J. Page, secretary. Organized Oct. 27, 1900, under laws of Great Britain, with capitalization £101,000, shares £1 par; issued, £16,416. Has abandoned the copper property formerly held in the Cerro de Pasco district of Perú.

**COMPÀNIA MINERA CERRO DE LA GLORIA.**

CHILE.

Office: Santiago de Chile. Mine office: Coecharpaol, O'Higgins, Chile. Organized Nov. 28, 1906, under laws of Chile, with capitalization 2,160,000 pesos, shares 25,000 pesos par.

**CERRO DEL CORE MINING CO.**

MEXICO.

Office: care of Dr. C. D. Warner, Coldwater, Mich. Letter returned from former mine office, Alamos, Sonora, Mex. Geo. L. Beach, secretary and treasurer. Organized under laws of Arizona, with capitalization \$10,000,000, shares \$10 par. Lands, 435 acres, circa 9 miles from Alamos, having several shallow shafts bottomed in ore, mainly sulphide. Property has been worked on a small scale for some years, furnishing considerable fluxing ores for reduction of silver ores of the district, and also ore for production of a little copper used by natives for making domestic utensils. Test shipment of 100 tons returned circa 20% copper, 1.7 oz. silver and \$4.03 gold per ton.

**COMPÀNIA SOCAVONERA DEL CERRO DE PASCO.**

PERÚ.

Mine office: Cerro de Pasco, Junín, Perú. Organized 1906, under laws of Perú, for the purpose of completing sundry old tunnels at Cerro de Pasco, and working the highly argentiferous copper ores of the oxidized zone of the district.

**SOCIEDAD CERRO DE PASCO.**

PERÚ.

Dead. Property taken over by Cerro de Pasco Mining Co. Formerly at Cerro de Pasco, Junín, Perú.

**CERRO DE PASCO MINING CO.**

PERÚ.

Office: 5-15 Broad St., New York, N. Y. Peruvian general office: Lima, Perú. Mine office: Cerro de Pasco, Junín, Perú. Works office: La Fundicion, Tihuanca, Junín, Perú. Railway office: Oroya, Junín, Perú. Rossie H. Channing, Jr., general manager; H. Esk Moller, treasurer; F. W. MacLennan, mine superintendent; S. J. Gormly, smelter superintendent; Frank Klepeck, consulting engineer. Organized June 6, 1902, under laws of New Jersey, with capitalization \$10,000,000. Is closely connected with the Cerro de Pasco Investment Co. and the Cerro de Pasco Copper Co., and is controlled by Jas. B. Haggin, J. Pierpont Morgan, D. O. Mills, H. McK. Twombly, and other wealthy residents of New York. Owns entire stock issue of the Cerro de Pasco Railway Co., and entire stock issue of Sociedad Minera Copay-Cocha,

and entire stock issue, excepting founders' shares, is owned by Cerro de Pasco Investment Co.

Lands, 941 claims, and 70,000 acres miscellaneous lands, including copper claims in the Morococha and Yauli districts, and about 400 acres of land that includes three-fourths of the rich Cerro de Pasco district, with a smelter site and extensive coal tracts north of Cerro de Pasco.

Cerro de Pasco lies 14,300' above sea-level, rendering physical labor very fatiguing. The population of the town is about 15,000. The surrounding country is bleak, and all food and supplies must be brought in from considerable distances. The year is divided into two periods, the wet and dry, the wet season being from November to April. The summers are not hot, owing to the great altitude, and the winters are not cold, owing to the low latitude. Snow and hail fall at any time, summer or winter, but rarely remain on the ground as long as 48 hours, even in winter. The fluctuation between mean summer and winter temperatures is about 20° Fahrenheit, only.

Silver was discovered at Cerro de Pasco A. D. 1630, and the production of the district, to the close of the Nineteenth Century, is estimated at 450,000,000 ounces, secured from about 40,000,000 tons of silver and copper ore, nearly all extracted by hand labor, and carried 3 to 6 miles on the backs of llamas, to primitive smelters, whence the silver bullion was transported, by llamas, 200 miles to Lima, until circa 1870, when a railroad was completed to Oroya. Formerly only the richest copper ores were worked, ore shipped ranging 25 to 40% in copper tenor, after careful hand selection.

Authorities disagree hopelessly as to the geology of the district, but in an area approximately one mile wide and nearly 2 miles in length, there is ore on nearly every claim, proving Cerro de Pasco one of the richest mineral fields of the globe. Ore bodies outcrop prominently, as crestones, or ridges, and carry gold, silver, copper, galena, zinc and cobalt. The oxidized zone carries considerable gold, running as high as 1 to 2 oz. per ton, occurring in rich but erratic chutes. The high silver values usually extend to about 100' depth only, occasionally running up to thousands of ounces per ton, in decomposed quartz, followed by highly argentiferous copper ores, which, in turn, at a little greater depth, are succeeded by ores low in silver, but richer in copper, all of the copper ores being more or less argentiferous, being estimated to have averaged 15 to 35 oz. per ton in the old workings. Primary ores below the water level are bornite and chalcopyrite, associated with pyrite, tetrahedrite, arsenopyrite and sphalerite, containing little silver and only traces of gold. There are occasional veins of high grade silver-lead ores, and occasional sphalerite up to 8% in zinc tenor, but not enough to give any particular trouble. Practically all of the copper ores are bismuthiferous, hence refractory in reduction. The ores carry about 35% silica and 14 to 30% iron, the excess of silica requiring considerable limestone for fluxing.

The property of the Cerro de Pasco company includes hundreds of old mine workings, some opened to 300' depth, though the majority are under 100'. The surface of the property shows scores of tajos, big pits resulting from the caving in of old open-cast workings, some of these being nearly or quite 300' deep. The property lies in a basin, and the mines are very wet, especially below a depth of 400', but unwatering by tunnel is impracticable, unless by a very long drainage tunnel. There have been three attempts at drainage tunnels, the only one of importance having been the Rumaillana tunnel, begun 1887, by Henry Meiggs, and discontinued, because of his death, at a distance of 1,000'. Meiggs held a concession from the Peruvian government for 25% of the gross values extracted by mines drained through this tunnel, which concession passed later to a company that cleaned out the old heading and drove the tunnel to a length of 1,466'. There is a possibility of

litigation between the Cerro de Pasco and the owners of this tunnel, in case the work is completed.

The company has disregarded the hundreds of old workings, except as throwing light upon the geology of the district, and has opened a new mine, by 2 tunnels, of about 2 miles length each, and by 5 new shafts, these being the Diamante 2-compartment shaft of 400'; the Pefia Blanca 2-compartment shaft of 400'; the Carmen 2-compartment shaft of 450'; and the Noruega 2-compartment shaft of 350', all 4 shafts being connected. The 4-compartment Esperanza shaft is planned to do the hoisting for the entire mine, and is to have a steel headgear and electric hoists, with shops and power plant grouped near by. Waste is used for filling, timber being very expensive, and used only for lining shafts and timbering important tunnels. The mines are equipped with powerful pumps. Estimates of ore in sight vary from 2,000,000 to 75,000,000 tons, the latter figure being ridiculously excessive, and not countenanced by the management, but there unquestionably are large reserves of ore blocked out, these including first grade ore of 8 to 10% copper tenor, with good silver values; second grade ore of 5 to 6% copper tenor, with fair silver values, and low grade ore of uncertain copper tenor, though probably workable, in the main.

In addition to the regular mining work, considerable prospecting has been done, and many diamond drill borings have been made, adjoining the main tract of the Cerro de Pasco and in the adjoining coal fields.

The reduction works, at La Fundicion, near Tifiahuarca, 9 miles from the mines, are connected therewith by rail. All buildings are of steel frames, covered with corrugated iron. The plant treats a small quantity of custom ores, and has a sampling mill with crushers, rolls and chain-bucket elevators. The works are terraced throughout, permitting the handling of material by gravity, and are built on the unit plan, so that their capacity may be doubled, or, if desired, quadrupled, at later date.

The furnace building has twelve 2,000-ton flat bottomed steel ore-bins, with lining of double thickness of 2" plank, being filled from railroad tracks above, and loading into charging cars run alongside. Charge cars are drawn by small locomotives, on a narrow-gauge track running on either side of each furnace, 2 cars constituting a charge. There are four 56x180" water-jacket blast-furnaces, with brick-lined hearths and crucibles, discharging into five 16' settlers. The furnaces, in October, 1908, were treating an aggregate of 600 tons of ore per day, but are of about 300 tons actual daily capacity each. Slag is granulated by running water. The smelter building has a steel stack, 220' high and 20' in diameter. There is one reverberatory furnace, and 5 additional reverberatories are to be in operation, early 1909. There are two 18' six-hearth McDougal calcining furnaces, and 8 are to be added early 1909. It is also planned to build a new dust-flue, dust-chamber and a 240' steel stack.

The converter department, in a separate building, has 4 stands, with twelve 84x180" shells, and 3 stands are to be added, early 1909. The converter, of the upright pattern, is tilted hydraulically, and blister copper is poured into moulds on a low car under the converter stand, cars being shifted hydraulically. The converter slags pour into ladles, and thence into iron moulds, slag being crushed in 2 slag mills and discharged into bucket elevators, going to a storage bin on the feed-floor, for remelting. The converter department has quartz mills for linings, and 2 large storage bins for material. Product of the converter is 99% blister copper, in cakes, shipped for refining to Baltimore.

The power plant includes a boiler-house with sixteen 250-h. p. Babcock & Wilcox boilers, an engine-house having a 600-h. p. Nordberg cross-compound

engine, direct-connected to a 440-kw. Westinghouse generator, two 475-h. p. Nordberg engines direct-connected to two 250-kw. generators, a 750-kw. Westinghouse alternator and dynamo, and 2 smaller dynamos furnishing electric power and light. There are 3 No. 11 Connersville blowers, driven by a Nordberg cross-compound engine, a large Nordberg air-compressor for converter blast, and an air-compressor for the pneumatic operation of furnace doors, etc. The power plant was practically duplicated, 1908, as a precaution against accidents.

Miscellaneous buildings at the works include an iron foundry with a 25-ton cupola and overhead electric traveling crane, patterns shops, 100x300' warehouse, machine shop, carpenter shop, smithy, laboratory, office building and dwellings for employees.

The altitude of the smelter is 14,300', and ores being refractory and labor inefficient, no little trouble was experienced in the earlier stages, but the difficulties encountered at the beginning have been overcome, gradually, and at the end of 1908 the works were giving fairly satisfactory service, with every prospect of still better work in 1909.

The company furnishes its own fuel, owning extensive beds of bituminous coal, of rather indifferent average quality, though with some coal of coking grade. The principal coal mines are located at Goyllarisquisca, Quishuarcancha and Vincusancha. A 21-mile branch line of the railway terminates at Goyllarisquisca, the Vincusancha coal mine being about midway, and it is proposed to install an aerial tram to connect with the Quishuarcancha, at present accessible only by wagons and pack animals. There are large reserves of coal of fair quality at Goyllarisquisca and Quishuarcancha, and production, at the end of 1908, was about 700 tons daily, of which 200 tons were used raw at the mines and on the railroad, 500 tons going to the coal washers near the smelter, the washed product being used for steam purposes and for coking. The coke plant, near the smelter, has seventy 75-ton beehive ovens, making a satisfactory coke for blast-furnace use, no coke being imported. The coal contains 50 to 60% fixed carbon, 20% volatile matter and about 13% ash, with considerable sulphur disseminated throughout. The company's brick plant has proven an important success, as imported brick of all kinds are very costly, and the local plant is turning out fire and silica brick of very fine quality, from clays found in the mines, and common building brick are made from a clay-pit near the Vincusancha mine. This plant will begin the manufacture of tile and tile pipe, in 1909.

A limestone quarry, 12 miles from the works, furnishes fluxing material, and the company also has a silica quarry, for material required in lining converter shells.

The Cerro de Pasco railway, owned by the company, operates under a government concession, the main line of 83 miles running from Cerro de Pasco to Oroya, where connection is made with the Central Railway of Perú, which runs 130 miles to Callao, the latter line being one of the most notable in the world, having cost \$43,000,000., and gaining nearly 3 miles vertical elevation, reaching the highest altitude of any railroad on the globe, after surmounting almost incredible obstacles, having an average grade of 2.5%, with no less than 57 tunnels, including the Galera tunnel of 1 kilometer length, which cuts through a ridge of the Andes. The Cerro de Pasco railway has a 21-mile branch to the coal fields, and, with all spurs, sidings and yards, has about 125 miles of track, of standard gauge. The main line has an average grade of 1.5%, with a maximum grade of 3%, and cost upwards of \$2,000,000. Equipment includes 13 locomotives, in addition to 6 light switching engines at the smelter, and 59 steel ore and coal gondolas, with a total of 247 forty-ton cars, rolling stock being of the best American manu-

facture. The railroad is on a paying basis. The Peruvian government was said, 1908, to have awarded, to Albert McCune, a contract for the construction of the Cerro de Pasco & Ucayali railroad, to open a district supposed to be immensely rich in minerals.

The company has built expensive and thoroughly comfortable hotels, club-houses and dwellings for its employes, and has furnished facilities for riding and hunting, and in consequence no longer has difficulty in securing and retaining competent mining and smelting men, many of whom have their families with them. Although the altitude is high, any person of normal good health need have no fear of ability to live comfortably in the rarefied air of Cerro de Pasco. Wages range \$2.50 to \$4 per day for white labor, and 60 to 75 cents per day for native labor, the latter being tractable, and, for some purposes, fairly efficient. The company employs a total force of about 6,000 men.

The Cerro de Pasco undoubtedly is the most expensive copper proposition ever developed, and the total investment is said to be, to date, nearly \$23,000,000. Production, 1906, was 3,389,787 lbs., and 1907 was 20,258,689 lbs. fine copper, while for 1908 the output was circa 30,000,000 lbs., and for 1909 should be nearly or quite 45,000,000 lbs. The management is experienced and capable, and its courage and financial resources have been demonstrated by the tremendous investment made. There were many discouragements met in the earlier stages, but in the main these have been overcome, one by one, and while there are some problems remaining, the progress already made warrants the expectation that all difficulties will be met and conquered. The property is one of vast possibilities, and the prediction of an ultimate annual production of 100,000,000 lbs. fine copper seems warranted, though some years will be required to reach this figure.

#### CERRO DE PASCO TUNNEL & MINING CO.

PERÚ.

Office: 45 Wall St., New York, N. Y. Mine office: Cerro de Pasco, Junín, Perú. Eleanor Rawls-Reader, president and general manager; Chas. A. Neville, vice-president; H. H. Leahy, secretary and treasurer; preceding officers, A. B. Rawls-Reader, Fred Tate and S. G. Harris, directors; Carroll D. Galvin, consulting engineer; Jos. E. Chastaine, assistant secretary. Organized Aug. 8, 1902, under laws of Maine, with capitalization \$2,000,000, shares \$2 par, half in 7% cumulative preferred and half in common stock. Annual meeting, third Monday in January. Management paid a 7% dividend, 1905, on preferred stock, money for which probably came from stock sales. Controlled the Copper Basin Mining & Smelting Co., of Nevada, which lost its lands and is worthless, through ownership of majority of stock. Peruvian lands are 9 groups, area circa 2,000 acres, about half in the Yanuli district and half in the Acari district, also the Rumaillana or Meigga tunnel, in the Cerro de Pasco district. Tunnel, begun 1877, is 3 meters wide and 2.75 meters high, of 2,800 meters projected length, of which only about 270 meters were completed in 1900. Tunnel, concessions carried rights to 20% of all mineral extracted by various owners of mines drained, and 40% of all mineral extracted by tunnel-owners. Company was promoted by Eleanor Rawls-Reader, who is largely exploited in the press, and at last accounts, Oct. 5, 1908, landlord was endeavoring to collect, by legal proceeding, \$195 for 3 months arrears of rent. Is not regarded favorably.

#### MINA CERRO DO GABALDO.

BRAZIL.

Mine office: Cacapava, Rio Grande do Sul, Brazil. Lands, 4 kilometers northeast of Cacapava, show ore outcropping at the summit of a steep hill, slightly developed by 6 very shallow shafts, bottomed in mica-schist impregnated with chalcocite.

**MINA CERRO MARTINO.****BRAZIL.**

Mine office: Cerro Martino, Rio Grande do Sul, Brazil. Property, located 140 kilometers from Rio Negro station, and 130 kilometers from Cachoeira, on the Urugayana railway, shows conditions somewhat similar to those at the Camaquam mine, but melaphyr is much more in evidence, with much less conglomerate, latter shading into coarse sandstone, with dip of about 40°, veins crossing these at approximately right angles. Copper occurs mainly as chalcocite, with gangue of pyrite and heavy spar, assaying 17 to 25% copper.

**CERRO MURIANO MINES, LTD.****SPAIN.**

Office: 9 Queen Street Place, London, E. C., Eng. Mine office: Manriques 9, Córdoba, Sevilla, Spain. Wm. Frecheville, chairman; John Taylor & Sons, managers; Richard Eshott Carr, agent; Henry F. Collins, superintendent; F. H. Williams, secretary; Jos. Tamblyn, mining captain. Organized May 7, 1903, under laws of Great Britain, and capitalization increased, 1906, to £225,000, shares £1 par. Debentures, £25,000, at 6%. Company holds a considerable share interest in the North Cerro Muriano Copper Mines, Ltd.

Lands, 314 hectares, in the districts of Córdoba and Obejo, held under perpetual lease from the State, also various leasehold tracts. Property shows sandy old mines, which were worked during the era of Roman domination, to a depth of at least 40%, notwithstanding their wetness. Property shows 6 large and several small fissure veins in micaeous schists, diorite and quartzite, carrying chalcopyrite and iron pyrites, with a gangue of calcite, quartz, clay and country rock. Veins have widths of 1' to 40', with following proven lengths: Calavera, 1,635'; Exektor, 635'; Lorenzo, 4,575'; Isabel, 5,550'; Cerro Muriano, 8,500'. Some ore taken from old Roman workings has assayed 28 to 34% copper.

Main shafts are the Santa Victoria, bottomed in the footwall at 726', and the San Rafael, 917' deep, and very wet, which intersected the vein at depth of 870'. The San Rafael shaft, 300 meters from the Santa Victoria, shows a vein of 5 to 13 meters width, with better portions worked out by the Romans, in the upper part of the mine. The San Rafael has a Hawthrone-Davey Cornish pump, with 54" high-pressure cylinder having a 96" stroke, and 94" low-pressure cylinder with a 16" stroke, calculated to operate to a depth of 1,580'. The San Guillermo shaft, 300 meters from the San Rafael, suspended sinking at 42' depth.

Surface equipment includes 3 hoists and a 10-drill Walker air-compressor. Mine is served by the Ferrocarril Andaluces. This is one of the largest and most interesting of the old Hispano-Roman mines, and was famous, before the Christian era, for the high quality of copper and brass produced from its ores, but was entirely idle for nearly 2,000 years, until reopened by the present owners. The mine employs circa 150 men, and shows reserves of about 25,000 tons of 4% ore, blocked out. A small smelter is being built.

**COMPANIA MINERA CERRO VERDE, S. A.****MEXICO.**

In the Mexican incorporation of the San Xavier Copper Co.

**CERULEAN COPPER MINING CO.****WYOMING.**

Office: Rawlins, Wyo. Mine office: Copperton, Carbon Co., Wyo. O. T. Gilbert, president and general manager; H. O. Granberg, vice-president; Ole Granberg, secretary; G. O. Gilbert, treasurer; preceding officers and Henry L. Larsen, directors. Organized July 21, 1906, under laws of Wyoming, with capitalization \$1,000,000, shares \$1 par; issued, \$631,000. Lands 6 claims, area 120 acres; patents applied for, in the Battle Lake district, showing contact veins between limestone and quartz, opened by seven 10' pits and shafts of 30', 48' and 65'. Idle.

**SUCESION CEEVERO.****CHILE.**

Mine offices: Los Marquis, La Ligua, Aconcagua, Chile, and Nipa, La Ligua, Aconcagua, Chile. Works office: Cabildo, La Ligua, Aconcagua, Chile. The Padres and Fraguas mines adjoin the Marquis mine of Otto Harnacker, and are similar in characteristics of ores. Greatest vertical depth is 130 meters, with extreme length of horizontal workings of about 200 meters. The Mina Maria, at Los Mercedes, 16 kilometers from Cabildo, has a vein in granite, ranging up to 15' in width, with strike of 50° West, and dip of 68°, carrying auriferous and cupriferous pyrite, with quartz gangue, ore averaging about 4% copper and 40 grams gold per ton. The Mina Montoya, opened 1855, has a 900' tunnel, opening a 15' vein in porphyry, carrying argentiferous sulphides with calcite gangue. The Nipa properties, 16 kilometers from Cabildo, includes the Castillo, Quisco and Cuevas mines, having an extreme depth of 850 meters, with extreme length of horizontal workings of 800 meters. The mines at Los Marquis produce 6% ore and the Nipa mines make a small production of selected ore averaging 25% copper, after discarding large quantities of ore of about 4% tenor, suitable for concentration later. Average of all ores treated is about 5% copper.

The smelter, at Cabildo, the terminal of the Calera & La Ligua railway, does a general custom business, about one-third of the ore smelted being produced by the mines of the firm. The old smelter had a number of small reverberatories, which have been replaced by 42" and 48" circular water-jacket blast-furnaces, making eis of about 45% copper tenor, 10% of which carries 250 grams of silver and 75 grams gold per metric ton. Fuel is mainly English and German coke, with some domestic coal and wood, 1 ton of imported coke being required for smelting 8 tons of ore, slags averaging 0.4% copper. Employs circa 100 miners and 50 smeltersmen, latter at average wages of 1.4 pesos daily. Production, 1903, was 928,458 lbs. fine copper.

**CHAFFEE GOLD & COPPER MINING CO. COLORADO & WYOMING.**

Mine offices: Black Hawk, Gilpin Co., Colo., and Tie Siding, Albany Co., Wyo. S. N. Cravens, president; G. W. Doverspike, vice-president; H. R. McClellan, secretary and treasurer. Organized September, 1901, with capitalization \$100,000, shares 10 cents par. Said to be out of debt, but without funds. Lands, 5 acres, known as the Telephone claim, 1½ miles from Black Hawk, opened by a 100' tunnel, said to show a 6' vein, also 80 acres of copper lands, undeveloped, near Tie Siding.

**CHAINMAN CONSOLIDATED COPPER CO.****NEVADA.**

Office: 25 Broad St., New York, N. Y. Mine office: Ely, White Pine Co., Nev. J. Berry, president and treasurer; L. A. Burleigh, clerk; W. N. McGill, general manager; Geo. E. Gunn, consulting engineer. Organized 1907, under laws of Maine, with capitalization \$5,000,000, taking over property of the Chainman Mining & Electric Co. Was promoted by W. B. Thompson. Lands, apparently 6 claims, area circa 120 acres, mainly patented. Mine was opened, 1869, for gold, but values turned into copper in lower workings. Old mine has a 300' shaft, with about 1 mile of workings, showing perhaps 200,000 tons of auriferous iron ore carrying some silver. There is an immense surface showing iron oxides, carrying \$1.50 to \$10 gold per ton, which should be underlaid by large bodies of copper ore. Iron ore will be valuable for fluxing, especially as it contains fair average gold values. It is planned to abandon the old Chainman shaft, and 2 new shafts, the Chamberlain, 200', and the Aultman, have been sunk. Has a 200-ton mill, with cyanide plant, but production of gold has been hampered by increasing copper values. Is a property of much promise.

**CHAINMAN MINING & ELECTRIC CO.**

NEVADA.

Dead. Succeeded, circa 1908, by Chainman Consolidated Copper Co. Formerly at Ely, White Pine Co., Nev.

**COMPANIA BENEFICIADORA DE MINERALES**

MEXICO.

**DE CHALCHIHUITES, S. A.**

Is the Mexican incorporation of the National Smelting Co. Theo. Montgomery, president; Adolfo Trauwitz, secretary; Paul W. Meyer, treasurer. Capitalization, 250,000 pesos, shares 50 pesos par.

**CHALCHIHUITES MINES CO.**

MEXICO.

Office: 288 Garside St., Newark, N. J. Mine office: Chalchihuites, Zacatecas, Mex. Edw. H. Jones, president; C. C. Hamer, secretary; B. W. Farris, general manager. Lands, 192 hectares, including the San Nicolás mine, carrying ores of gold, silver, copper and lead. Is opened by shaft and equipped with steam power.

**CHALLENGE MINE.**

MICHIGAN.

Owned by St. Mary's Mineral Land Co.

**CHAMBERS MINE.**

MONTANA.

Owned by Washoe Copper Co.

**CHAMPION COPPER CO.**

MICHIGAN.

Office: 82 Devonshire St., Boston, Mass. Mine office: Painesdale, Houghton Co., Mich. Mill office: Redbridge, Houghton Co., Mich. Wm. A. Paine, president; Chas. J. Paine, Jr., vice-president; preceding officers, Geo. P. Gardner, Chas. H. Paine, Nathaniel H. Stone, Hon. Richard Olney and Sam'l. L. Smith, directors; Frederic L. Stanwood, secretary and treasurer; F. W. Denton, general manager; John Jolly, underground superintendent; F. G. Coggins, mill superintendent; R. H. Leach, assistant mill superintendent; H. F. Mercer, chief engineer; M. J. Harrington, chief clerk; Richard Trevarrow, mining captain; W. E. Campbell, master mechanic; Mark Cunningham, superintendent motive power.

Organized December, 1899, under laws of Michigan, with capitalization \$2,500,000, shares \$10 par. Owns \$44,000 stock of the Michigan Smelting Co. Entire stock issue is owned, in equal parts, by Copper Range Consolidated Co. and St. Mary's Mineral Land Co. Dividends have been as follows: \$900,000 in 1903; \$200,000 in 1904; \$1,000,000 in 1905; \$1,200,000 in 1906; \$1,000,000 in 1907. Two dividends, of \$1 each, were declared Apr. 24, 1908. Net earnings 1905, were \$976,770.87 and 1907 were \$909,388.88, in addition to expenditure of \$446,373.81 for construction. Company ended 1907 with a surplus of \$504,345.11.

Lands, 1,240 acres, being the south half of Section 30; west half and north half of northeast quarter and southwest quarter of northeast quarter of Section 31, Town 54 North, Range 34 West; southeast quarter of Section 25 and east half of Section 36, Town 54 North, Range 35 West, practically all on the mineral belt. Neighbors of the Champion are the Copper Range and Trimountain on the north, lands of St. Mary's company and Hussey, Howe & Co. on the east; Hussey-Howe lands and the Globe tract on the south, and Copper Range lands on the west. The tract gives a distance of 9,047' on the strike of the lode, and at the present angle of dip, the deepest shaft could go down 18,950', before reaching the company's boundary line on the west.

Development was begun in 1899, under direction of Dr. L. L. Hubbard, and 3 parallel amygdaloids were uncovered by trenching, one of which, the Baltic bed, showed phenomenal copper values. The two amygdaloids paralleling the Baltic lode show copper in sufficient quantities to render their future exploration advisable. A fourth amygdaloid, about 15' wide, discovered 1901, east of the Baltic lode, carries heavy copper to a promising extent, and there also is a

Digitized by Google

fissure vein of arsenical ore, apparently algodonite, near C shaft. The width of this vein at surface is slight, and mineral contents variable, but on the second level the fissure is 2' wide and well mineralized.

The dip of the Baltic bed at the Champion is circa 70°, with about the same strike as at the Trimountain, rather than the exaggerated easterly trend noted at the Baltic mine. The bed runs 13' to 45' and averages 24' width, carrying more epidote than at the Trimountain and Baltic. The surface of the tract is very hilly, but the overburden is less than is found either to the northward or southward. The stretches of lean ground in the mine are few, and the lode carries heavy copper in profusion, mostly in barrel size, but running up to masses of 10 tons in weight.

The Champion mine is developed by 4 shafts, numbered from north to south, with room for 3 additional shafts.

A shaft is merely a site, there being no development.

B shaft, the northernmost, is 1,835' south of the Trimountain boundary, with collar 635' above mean water datum of Lake Superior, and, Jan. 1, 1908, was 1,300' deep.

C shaft, 1,050' south of B, is 1,616' above the lake and Jan. 1, 1908, was 1,300' deep.

D shaft, 1,300' south of C, is 631' above the lake, and Jan. 1, 1908, was 1,400' deep.

E shaft, 1,300' south of B and 3,900' north of the Globe boundary, was 1,475' deep on Jan. 1, 1908. The third level of E shaft had been driven 3,000' to the southward to the Globe mine, September, 1908.

F shaft, started 1,300' south of B, was abandoned on account of treacherous overburden, but the Baltic bed was located, 1907, by diamond drill, at a new site, circa 1,800' south of E, and 2,100' north of the Globe boundary.

G shaft is merely a site for a shaft, near the Globe mine, on which no work has been done.

All of the shafts are connected on numerous levels, and the mine has about 11 miles of lateral workings. The Baltic lode shows so little poor ground in the Champion that it is probable that eventually nearly every level will be opened from end to end of the mine, giving the longest average drifts of any Lake Superior property. The only really poor ground in the mine was shown in E shaft, between the 3d and 4th levels, below which the mineralization is regular and satisfactory. The mine shows some stopes of phenomenal width and richness. Dry-walling is used extensively, greatly reducing the cost of timbering.

The shafts are practically duplicates in all essential particulars, having 40x50' shaft-rockhouses, with 90-ton ore-bins, enlarged, 1908, by the Wisconsin Bridge & Iron Co. Equipment at each rockhouse includes a steam-hammer for heavy copper, and one 12x15" rock crusher, taking everything hoisted from the mine, direct from chutes. Initial equipment at the 4 shafts included second-motion Nordberg hoists, good for about 1,500' depth each, but all shafts have been equipped with new hoists, which are duplicates, these being first-motion Nordbergs with 24x60" duplex cylinders and double conical drums of 14' diameter, with capacity for two 3,000' cables each, hoisting 6-ton skips. The engine-houses are of redstone, or mine rock with redstone trimmings, the boiler-houses adjoining having Bradley and Burt boilers, with coal trestles connecting. Water for boilers is furnished from a 12,000,000-gallon dam, 30' from hardpan foundation to crest, with a cement core 5' wide at the bottom and 2' at the top, reinforced by rock.

Very extensive use is made of electric power on surface, and there are some underground electric pumps. The electric plant at F shaft has a 250-kw.

General Electric generator, direct-connected to an Allis-Chalmers cross-compound vertical engine.

The main compressor building, at F shaft, of steel, has a 100-drill Nordberg quadruple expansion two-stage air-compressor, with capacity to compress 9,120 cubic feet of free air per minute to a pressure of 70 lbs. per inch. The compressor operates at a steam pressure of 280 lbs. and has a regenerative feed-water system. Power is furnished by three 250-h. p. Geary water-tube boilers. At B shaft is a 40-drill Ingersoll-Sergeant cross-compound two-stage air-compressor, with vertical receiver intercooler. The electric plant, with a 100-kw. generator, is in the main compressor building.

Buildings at the mine include a 60x145' machine-shop, of sandstone, with slate roof, having a traveling crane and trolley rail for the entire length, with a 30-h. p. electric motor. Adjoining the machine-shop is a 50x128' smithy, of redstone, having a trolley rail, for handling forgings, running the entire length of the shop. The machine-shop and smithy have railroad tracks, connecting with the Copper Range railroad. The 32x60' carpenter-shop is of wood, with iron siding and roof.

Miscellaneous structures include a good office building, 2 changing houses, warehouses, stables, 3 large boarding-houses and about 250 substantial dwellings, located in the attractive townsite of Painesdale, which, in addition to the company's buildings, has a fine schoolhouse, hotels and various business houses; also the Sarah Sargeant Paine memorial library, a handsome redstone structure, costing \$30,000, erected by Wm. A. Paine as a memorial to his mother, which is much appreciated by the employees.

The water system, serving the mine and town jointly, has a 1,000,000-gallon electric pump, at Lake Perreault, 4½ miles distant, distributing water to the mains from a 200,000-gallon steel stand-pipe, on high ground, near the mine.

The company has an automatic telephone system, with about 40 instruments, connecting the principal buildings and a number of pump stations underground.

The stampmill, at Freda, on Lake Superior, 2 miles west of Redridge, is 215x354', of steel and concrete, built by the Wisconsin Bridge & Iron Co. The mill originally had 4 Nordberg stamps, each with a 15' concrete foundation, and an addition, built 1905, was used first for new crushing machinery, but 2 heads were added, 1908, in place of an experimental graded crushing plant using gyratory crushers instead of stamps, operated 2 years, which system was described in Vol. VII. The 4 heads in the original mill were cross-compounded June, 1903, but were changed back to simple heads in 1906. Theoretically the cross-compounding was an advantage, but practically the experiment was unsuccessful. If all four heads could be operated simultaneously and regularly, cross-compounding would effect a considerable saving in fuel cost, but in ordinary mill practice it is found preferable to have each stamping unit independent.

The wash for the heads has Hodge graduated adjustable-speed jigs, with plungers working simultaneously or alternately, in pairs, Woodbury jigs and Deister concentrating tables. Raggings are reground by Allis-Chalmers crushing rolls, having one roll in a fixed bearing and the other in a spring bearing. The preliminary discharge from the stamp-heads is treated on very large jigs, having 30x48" sieves, of punched steel, with  $\frac{1}{8}$ " openings, installed in connection with the head. Experiments with settling tanks having proven successful, an extensive series of settlers has been installed, each head having 6 tanks, each 40' long, 9' deep and of "V" shape, 12' wide at the top and 6" wide at the bottom, slimes being drawn from spigots at the bottom to the concentrators. The flow of the water through the settling tanks does not

exceed 6' per minute. Tailings losses were about 0.28% copper, but the new settlers are expected to bring the losses down to 0.24%, or even less.

The mill is heated by hot water from a Green fuel economizer, piped at 300° to 350° F. to a steel-clad chamber, whence heated air is drawn into ducts by a Sturtevant blower, and distributed through the mills, water being pumped back to the economizers and thence fed to the boilers.

The steel boiler-house has four 200-h. p. Stirling boilers, 5 Dutch Oven Scotch marine boilers, and 2 Hawley down-draft furnaces. Automatic stokers were tried, but discarded. Coal is brought to the boilers by tram, and reduced to uniform size by a grinder, before feeding to the grates, and ashes are washed into the lake through a launder, by jets of water. Exhaust steam passes through dry condensers, thence to a hot-well, from which water is fed to the boilers. Power for the mill is supplied by a 500-h. p. Nordberg cross-compound engine, having 14" and 32" cylinders, with 30" stroke, a 180-h. p. engine formerly used for the 4-head mill being held in reserve.

The 40x60' steel pumphouse, with truss roof and traveling crane, has a 20,000,000-gallon Nordberg triple-expansion pump. Water for the mill and boilers comes from the lake through a 1,020' tunnel, the shore end having a well with bottom 8' lower than the lake level, this being the longest tunnel ever driven under Lake Superior. The intake crib has an area of 45 square feet, and, with a second crib, the tunnel could furnish water for 8 to 10 stamps. Water cost is less than 1½ cents per ton of rock stamped. Screens have been installed in the tunnel, obviating the trouble formerly caused by sand and wood pulp in the water.

The mill plant includes a machine-shop, carpenter-shop, smithy, warehouse, office, laboratory and about 20 dwellings. There is a water system, with mains and hydrants and a fire pump, and the works have a private telephone system.

The mine is working about 80 power drills, and about 1,200 men are employed at the mine and mill.

Production of fine copper has been as follows: 10,564,147 lbs. in 1903; 12,212,954 lbs. in 1904; 15,707,426 lbs. in 1905; 16,954,986 lbs. in 1906; 16,489,436 lbs. in 1907. Mineral returns are 30 to 33 lbs. per ton, assaying about 73% fine copper, equivalent to circa 23 lbs. fine copper per ton. Rock stamped, 1907, was 708,685 tons, and yield of refined copper was 23.25 lbs. per ton, or 1.16%, placing the Champion second only to the Wolverine among the amygdaloid mines of Lake Superior in richness of its rock. Cost per ton of rock treated, including taxes, was \$1.78, and cost of finished copper, delivered, including taxes, was 9.05 cents per pound. The Champion is one of the largest and richest of Lake Superior mines, and has been admirably managed from the beginning. The mine has by no means reached its ultimate limit of output, and is capable, with the present mining and milling equipment, of producing nearly or quite 25,000,000 lbs. fine copper yearly.

#### CHAMPION COPPER MINING CO.

Mine office: Wallace, Idaho. Letter returned unclaimed from former mine office, Mullan, Shoshone Co., Idaho. Adam O'Donnell, president and manager. Lands, just east of the Park mine, on the southern slope of Stevens Peak, 4 miles south of Mullan, have 2 crosscut tunnels, longest 600'. Property is said to show a mineralized zone of 75' to 100' width, with a vein ranging up to 25', carrying chalcopyrite and occasional bornite, assaying up to 30% copper, with an average of about 5%, with quartz and calcite gangue. Idle and apparently moribund.

#### CHAMPION GOLD & COPPER MINING CO.

Office: California Blk., Tacoma, Wash. Location of lands, if any, unknown. Apparently moribund.

**CHAMPION GROUP MINING CO.****CALIFORNIA.**

Mine office: Yreka, Siskiyou Co., Cal. Property is the Herzog ranch, just outside the city limits, held under bond and lease, from September, 1907, which is being explored for copper.

**CHAMPION MINING CO.****IDAHO.**

Office: care of Edward R. Hall, president, Marquette Bldg., Chicago, Ills. C. T. Mixer, vice-president and manager; R. T. Badger, secretary and treasurer. Organized 1905, with capitalization \$100,000, shares 10 cents par, to develop claims in the Alder Creek district of Custer county, Idaho. Presumably idle.

**CHAMPLAIN MINING CO.****IDAHO.**

Dead. Formerly at Doniphon, Blaine Co., Idaho.

**CHAMPION MINING & MILLING CO.**

Dead. Was organized under laws of Colorado, with capitalization \$2,000,000, shares \$1 par. In advertisements claimed to have 19 claims, but failed to give location of property or names of officers, and the promise of dividends for January, 1908, was prima facie evidence of rottenness. Was promoted from 608 Heist Bldg., Kansas City, Mo., and advertising seemed suspiciously like that formerly done by Theo. Stegner, a crooked mining promoter and jail-bird who formerly infested Kansas City.

**SOCIÉTÉ DES MINES ET USINES DE CHAÑARAL. CHILE.**

Office: 26 Rue de Chateaudun, Paris, France. Mine office: Las Animas, Chañaral, Atacama, Chile. Eugene Renevey, chairman; preceding officer, E. Bethmont, M. Gergen, A. Gutais, J. Dellater and G. Renevey, directors. Organized July 17, 1906, under laws of France, with capitalization 6,000,000 francs, shares 500 francs par.

Property, bought November, 1906, of Besa y Ca., includes the Manto Verde group, Fronton, Descubridora and Andacollo mines.

The Manto Verde mine, at Los Pozos, 25 kilometers from Las Animas, has shafts of 80 to 120 meters depth, and has been worked horizontally for a length of approximately 300 meters. The mine has 2 parallel ore bodies in porphyry and syenite, with strike of nearly north and south, and dip of 53°, with an oxidized zone of 10 to 20 meters depth, succeeded by sulphide ores, in decomposed porphyry, with quartzose gangue, of 8 to 16 meters width, carrying 7 to 8% copper, the production of the mine averaging better than 7% in tenor. Ores are somewhat refractory, but the property is one of much merit.

The Mina Fronton, at Las Animas, is 550 meters deep, showing 2 parallel veins, in syenite, separated by 8 meters of porphyritic rock, quartz gangue and much limestone. Ore is pyritic, averaging 7 to 8% copper. In 1903, under former ownership, the Fronton and adjoining properties employed 120 men, producing circa 6,000 metric tons of 8% ore.

The Descubridora mine, which is the deepest in the department of Chañaral, is an old property, abandoned at depth of 650 meters.

There is a small concentrator, with steam power, at the Fronton mine.

Works include 2 smelters, at Chañaral, known as the old and new, the old smelter, of small capacity, having 2 old 50-ton water-jacket blast furnaces, in poor condition, and 6 reverberatory furnaces, each 18' in length, with a trapiche. In 1903 the old smelter treated 6,021 metric tons of ore averaging 8.53% copper, producing ejes of 50.76% average copper tenor.

The new smelter has 4 reverberatory furnaces and a 100-ton water-jacket blast-furnace, with hot blast, 2 Connersville blowers, three 52-h. p. engines and an electric light plant. Slags from new smelter average 0.65% copper. The new smelter requires remodeling, which doubtless will be done by the present owners. Fuel is Australian coal, costing 21 pesos per ton. Water is scarce and must be reused. Railroads run into the new smelter over a wooden trestle. A comparison of reverberatories and blast-furnaces for 1903 showed 12,041 tons

of ore smelted in reverberatories at an average cost of 14.21 pesos per metric ton, and 16,165 tons or ore smelted in blast-furnaces, at an average cost of 10.01 pesos per metric ton. Ore averages 5.5% copper, but losses in smelting, through fumes, dust and slag, aggregate 1.2% copper, giving a net extraction of only 4.48% copper by the old works.

Production, 1903, under former management, was 644,573 lbs. fine copper, but for first fourteen months, under present management, November, 1906 to December, 1907, inclusive, was circa 1,300 metric tons fine copper, and for first half 1908, company produced 102 to 120 metric tons fine copper monthly. Property is considered valuable and management good.

#### **MINA LA CHAPARRITA.**

**SPAIN.**

Owned by Sociedad Nuestra Señora de la Salud.

#### **CHARLEMONT COPPER CO.**

**MASSACHUSETTS.**

Dead. Formerly at Charlemont, Franklin Co., Mass.

#### **CHARLESLEY'S NATIVE STAR MINE.**

**AUSTRALIA.**

Office: Herberton, Queensland, Australia. Mine office: Orient Camp, Queensland, Australia. E. C. Wright, secretary; T. Birmingham, mine manager. Employed 13 men, on development work, in 1907.

#### **CHARTER OAK COPPER MINES, LTD.**

**BRITISH COLUMBIA.**

Office: 16 Victoria St., London, S. W., Eng. Sir H. Seton-Karr, chairman; T. Toten Wilcox, secretary. Organized June 22, 1898, under laws of Great Britain, with capitalization £40,000, shares £1 par; issued, £28,957. Lands are 2 claims in British Columbia, and company sold 89 acres, in Carbon county, Wyoming, 1908, to Copper Bar Mining Co. Idle for many years.

#### **CHASE CREEK COPPER CO.**

**ARIZONA.**

Mine office: Clifton, Graham Co., Ariz. Clarence K. McCormick, president; H. G. Smith, treasurer; S. S. Campbell, manager; I. N. Stevens, superintendent. Capitalization \$5,000,000. Lands, 52 claims, area 1,040 acres, circa 8 miles west of Clifton, having a 1,750' tunnel, 6x8', on lands adjoining the Longfellow mine, cutting the Longfellow ore body, of concentrating grade, at a distance of 493', having a back of about 900', showing low grade sulphide copper ore. Tunnel practically reaches the Coronado railroad, permitting advantageous shipments. Property considered promising.

#### **CHATHAM COPPER CO.**

**NEW MEXICO.**

Dead. Formerly at Silver City, Grant Co., N. M. Described Vol. VI.

#### **CHATTERTON MINING CO.**

**COLORADO & WYOMING.**

Office 1101 Fisher Bldg., Chicago, Ills. Mine office: Pearl, Larimer Co., Colo. Was controlled, through stock ownership, by the National Mining & Milling Co., which moved from same office and left no forwarding address. Lands, 7 claims, area 125 acres, known as the Kurtz-Chatterton mine, in the Upper Platte district, opened by shafts of 30', 35' and 38', and a 1,750' cross-cut tunnel, said to show 7 veins of low grade sulphide ore traversing granite. Widest vein, 7', is said to have given average assay of about 5% copper, with a trace of gold, ore being well adapted to concentration. Has a 5-stamp mill and a 50-ton concentrator. Idle for several years. Is not regarded favorably.

#### **CHATTERTON MINING CO.**

**MEXICO.**

Mine office: Tapalpa, Sayula, Jalisco, Mex. Samuel C. Brown, general manager. Mine, known as the San Antonio and extensions, said to have been bought for \$100,000, carries auriferous copper ore with values mainly in gold, and has been a small producer in the past. Has a 10-stamp mill and concentrator.

#### **CHAUTAUQUA MINING CO.**

**CALIFORNIA.**

Dead. Formerly at Manvel, San Bernardino Co., Cal.

#### **CHELAN CONSOLIDATED COPPER CO.**

**WASHINGTON.**

Office: 180 Broadway, N. Y. Mine office: Chelan, Chelan Co., Wash. Prof.

**Thos. B. Stillman**, vice-president; **Thos. J. Higgins**, secretary and treasurer; preceding officers, **M. L. Blackburn** and **H. L. Fox**, directors; **M. J. Corcoran**, assistant secretary and treasurer. Organized under laws of Washington, with capitalization \$12,000,000, shares \$12 par.

Lands, 125 claims, area circa 2,500 acres, including 58 claims taken over from the North Star Mining Co., on Red Mountain, and 14 claims, area 280 acres, at Index, Snohomish Co., Wash. Property was advertised by company as 101 producing mines, which was untrue, and must have been known to be untrue when the statement was made. Nearest railroad point is Leavenworth, 48 miles southeast of Red Mountain, with a fair wagon road connecting.

The Index property, lying between the Ethel and Bunker Hill-Sullivan mines, has a 6' vein, opened by tunnels of 600' and 700', with about 2,000' of workings, showing bornite and chalcopyrite, claimed to carry average values of 10% copper, which is an overestimate, with small silver and lead values.

Company advertised, 1906, that there was no question that it would soon be producing and shipping no less than 1,000 tons of ore daily, and would pay 60 to 80% dividends annually, which statements must have been prompted by ignorance, or intent to deceive. Officers are said to be men of good standing, and the property is considered of some promise, but the company is regarded with suspicion, because of the ample evidence that some of its officers were utterly untruthful in the promotion.

#### CHELAN COPPER CO.

#### WASHINGTON.

Mine office: Chelan, Chelan Co., Wash. Said to own the Texas Jack copper claims, in Upper Horseshoe basin, Washington. Vein is claimed to be 30' between walls, in places, with a paystreak of about 20", carrying copper and silver values. Idle and apparently moribund.

#### CHELAN TRANSPORTATION & SMELTING CO.

#### WASHINGTON.

Dead. Formerly at Chelan, Chelan Co., Wash. Described Vol. VI.

#### CHEMAINUS COPPER MINES, LTD.

#### BRITISH COLUMBIA.

Offices: 8 Broad Street Ave., London, E. C., Eng., and Vancouver, B. C. Mine office: Ladysmith, Vancouver Island, B. C. Samuel Erb, president; Chas. Erb, manager; preceding officers, C. J. Chapman, Robt. Larchin and Foster Collins, directors; A. Hebdon, London secretary; Robt. McCracken, Vancouver secretary; Henry Cecil, superintendent. Organized under laws of Great Britain, with capitalization £200,000, shares £1 par. Lands, 241 acres, 2 miles from Esquimalt & Nanaimo railway, known as the Victoria group, in the Bright district, well timbered and having a 200' waterfall available for development of power. Mine, opened by tunnel, has about 3,000' of workings, and has been tested by shallow pits and trenches, showing 3 fissure veins carrying 2 to 5% copper, with a narrow paystreak of chalcocite and bornite ranging up to 35% in copper tenor, high grade ores being both auriferous and argentiferous.

#### CHEMUNG COPPER CO.

#### NEW MEXICO.

Office: Wolvin Bldg., Duluth, Minn. Mine office: Tyrone, Grant Co., N. M. I. L. Merrill, managing director; preceding officer, John C. Oliver, Capt. Jas. Hostason, T. J. Crump, C. D. Frazer, Chester A. Congdon and Geo. E. Tenet, directors. Organized May, 1907, under laws of Minnesota, with capitalization \$3,000,000, shares \$10 par, as successor of Tyrone Development Co. Levied a \$1 assessment Sept. 1, 1908.

Lands, 3 groups, near the Burro Mountain, circa 12 miles southwest of Silver City, including the Burro Chief group, area 237 acres, with a millsite in Boston Gulch, near the mine; the Mutual group, 16 claims, area 247 acres, and the Huston group, 24 claims, area 469 acres, giving total holdings of 55 claims, area 953 acres. Mine is opened by 6 shafts, all in ore, 3 being upwards of 300' deep each, No. 2 being 500' in depth, mine having circa 8 miles of workings, developing approximately 1,000,000 tons of ore, of 2.5 to 3% average

copper tenor, with a small amount of high grade ore of 6 to 20% copper tenor.

Equipment includes a powerful pump, boilers, engines and air-compressors, and a 1,000-ton concentrator is planned, with the expectation of putting about 7 tons into one. Company employs circa 100 men, and management is excellent. Property is of much promise, and apparently should make a big low grade mine.

**CHENIUS FALLS COPPER MINING CO.** WASHINGTON.

Mine office: Fairfax, Pierce Co., Wash. Organized July, 1902, with capitalization \$1,000,000. Lands, 2 claims, on the Chenius river, circa 7 miles from Fairfax. Idle for some years.

**CHEROKEE COPPER MINING CO.** WYOMING.

Dead. Formerly at Encampment, Carbon Co., Wyo.

**CHERRY CREEK MINES CO.** ARIZONA.

Mine office: Cherry, Yavapai Co., Ariz. H. A. Ingalls, superintendent. Main shaft, 115', shows a vein with a 3' paystreak giving assays of about 12.5% copper, 4 oz. silver and \$9.60 gold per ton.

**CHESTATEE MINE.** GEORGIA.

Mine office: Villa Rica, Carroll Co., Ga. Property, 6 miles from Villa Rica, has a bedded vein of cupriferous pyrite of 22' to 30' width, with pay streaks on either wall, outcrops being traceable circa 2,000'. Ore is said to average 3%, but probably averages about 1.5% in copper tenor only. Idle some years.

**CHESTERFIELD COPPER CO.** ARIZONA.

Office: 1001 Chestnut St., Philadelphia, Pa. Mine office: Tucson, Pima Co., Arizona. C. W. Savery, president; W. C. Lloyd, secretary and treasurer; Col. Thos. Hughes, vice-president and general manager; Thos. Hughes, Jr., superintendent; preceding officers and L. W. Thompson, directors. Organized April, 1907, under laws of Arizona, with capitalization \$3,500,000, shares \$1 par.

Lands, 22 claims, area 440 acres, including the Tiger and Crown King groups, in the Pima district, 25 miles from the Twin Buttes railroad. Property has an 18' vein of massive argentiferous galena, with a 2-compartment 80' shaft and 10 pits showing copper sulphides.

**CHETICAMP COPPER CO., LTD.** NOVA SCOTIA.

Office: 37 Sackville St., Halifax, N. S. Mine office: Cheticamp, Inverness Co., N. S. Edward Staris, president; John W. Regan, secretary and treasurer; Milton V. Grandin, superintendent; W. H. Strachan, auditor. Organized May, 1904, under laws of Nova Scotia, with capitalization \$3,000,000, shares \$1 par, as a merger of the Eastern National Copper Co., Ltd. and three other corporations.

Lands, 950 acres, also a 200-acre mill and smelter site, 1,000 acres timber land, and 200 acres water frontage, with a government license for exploring and locating mines on 50 square miles. Lands are freehold and paid for.

Property shows a mineralized zone, in micaceous schist, of circa 350' width, traceable 1½ miles, carrying 4 ore bodies, of which 3 are developed by a 200' shaft and by tunnels of 25', 35', and 115', claimed by company to show 250,000 tons of exclusively sulphide ore, averaging 2.5 to 3.5% copper, 18% lead, 30 oz. silver and \$2 to \$30 gold per ton. Nearest railroad is 38 miles, but mine is 5 to 6 miles only from tidewater. Property considered promising, though estimates of tonnage and values are excessive.

**CHETKO COPPER CO.** OREGON.

Office: Ashland, Ore. Mine office: Kerby, Josephine Co., Ore. C. W. Evans, president and general manager; C. C. Hicks, vice-president and superintendent; A. E. Shepard, secretary and treasurer; J. M. Keith, mine superintendent. Organized, Aug. 10, 1905, under laws of Arizona, with capitalization \$1,000,000, shares, \$1 par; issued, \$730,516.

Lands, 36 claims, area 720 acres, fairly timbered, and 2 water rights, all in Curry county, Oregon. Property shows 8 ore bodies, with 2 under development, one reported by company as of 240' average width, traceable 1½ miles, carrying native copper in schist, also covellite, bornite and chalcopyrite, reported by company as of 9% average copper tenor, with \$4.75 gold per ton. Development is by shafts of 45°, 34° and 80°, and by 6 tunnels, of 30' to 230' length, with 969' of workings, estimated by company to show 600,000 tons of ore, with 115,000 tons blocked out for stoping, which figures seem high. Employs 6 to 20 men. Company plans continuous development by tunnel, installing an air-compressor and building a 22-mile electric line from the mines to Chetko Harbor, on the Pacific, which seems the only available outlet, as the lands are about 70 miles from Grants Pass, the nearest railroad point.

**CHEWELAH COPPER CO.****WASHINGTON.**

Office: Colville, Wash. Mine office: Chewelah, Stevens Co., Wash. F. A. Savage, president; F. H. McDermott, vice-president; L. E. Jessop, secretary; B. F. Hammond, treasurer; Benj. Bramley, manager. Organized 1907, under laws of Washington, with capitalization \$1,000,000, shares \$1 par.

**CHEWELAH COPPER KING MINING CO.****WASHINGTON.**

Office: 115 Wall St., Spokane, Wash. Mine office: Chewelah, Stevens Co., Wash. J. Grier Long, president; H. H. Hebart, vice-president; S. P. Domer, secretary and treasurer; preceding officers, J. W. McCabe and Walter G. Merryweather, directors; John M. Long, general manager; Geo. H. Miller, mine superintendent. Organized 1898, under laws of Washington, with capitalization \$100,000, shares 16 cents par; issued, \$797,000. Bonds, \$30,000 authorized, at 4%; issued, \$5,890.

Lands, 5 claims, area 100 acres, also an 8-acre millsite and 82 acres miscellaneous lands, showing 3 ore bodies, 2 of which have been developed by a 1,400' main tunnel with circa 2,000' of workings, showing a 30' to 40' vein carrying auriferous and argentiferous copper sulphides, of about 2.5 to 3% copper tenor and 6 to 12 oz. silver per ton, with small gold values. Transported ore, when working, to Chewelah, 4 miles, by 140-h. p. traction engine, hauling 5 to 10-ton loads, but plans a railroad spur and tram-line. Production, 1907, reported by company as 5,000 tons of ore, which probably carried about 250,000 lbs. fine copper. Suspended operations November, 1907, on account of financial depression. Some of claims are said to have been jumped, 1907. Management stands well and property is considered promising, but company lacks cash.

**CHEWELAH COPPER MINING & SMELTING CO.****WASHINGTON.**

Mine office: Chewelah, Stevens Co., Wash. W. H. Browlow, president and general manager. Lands, 7 claims, 2 fractional, known as the Alberta group, opened by 60' and 100' incline shafts, in sulphide ore averaging circa 2.5% copper, 2 oz. silver and \$5 gold per ton. Mine is wet. Has a 250-h. p. boiler and an air-compressor. Plans sinking shafts to 500' depth.

**CHIAPAS MINING CO., LTD.****MEXICO.**

Dead. Voluntarily liquidated, August, 1904. Formerly at Salto de Agua, Chiapas, Mex. Described Vol. V.

**CHIAPAS ZONE EXPLORATION CO., LTD.****MEXICO.**

Dead. Formerly at Pichuecalco, Chiapas, Mex.

**CHICAGO-ALGOMA NICKEL CO.****ONTARIO.**

Dead. Formerly at Sudbury, Algoma, Ont.

**CHICAGO-ALTA MINE.****MONTANA.**

Mine office: Corbin, Jefferson Co., Mont. Was developing by tunnel, early 1908.

**CHICAGO-BRITISH COLUMBIA MINING CO. BRITISH COLUMBIA.**

Dead. Formerly at Greenwood, Boundary district, B. C. Described Vol. VI.

**CHICAGO COPPER CO.****COLORADO.**

Mine office: Salida, Chaffee Co., Colo. Chas. Peck, manager, at last accounts. Lands, 7 claims, showing ore said to give good assays. Idle.

**CHICAGO COPPER MINING CO.****NEW MEXICO.**

Mine office: Estey, Socorro Co., N. M. E. G. Rafferty, president, treasurer and general manager. Ira Chase, vice-president; T. C. Fenton, secretary. Organized Jan. 31, 1906, under laws of New Mexico, with capitalization \$1,000,000, shares \$100 par. Lands, 22 unpatented claims, in the Osoero Mountains, 18 miles from nearest railroad, and sundry real estate in the town of Oseuro. Former owners shipped several carloads of ore said to have returned \$270 per ton.

**CHICAGO COPPER REFINING CO.****ILLINOIS.**

Office: 310-138 Jackson Blvd., Chicago, Ills. Works office: Blue Island, Cook Co., Ills. W. G. Coolidge, president; F. A. Simmons, secretary; C. E. Foster, superintendent; Winthrop Coolidge, metallurgical superintendent. Property is a refinery, with small smelter of 40 tons daily capacity, treating miscellaneous pig copper and by-products, making a specialty of copper mattes containing platinum, palladium and other rare metals. Has an electrolytic refinery with 100 tanks and two 60-kw. generators. Employs circa 100 men.

**CHICAGO DIXIE MINING CO.****NEVADA.**

Office: 81 Clark St., Chicago, Ills. Mine office: Letter returned unclaimed from former mine office, Fallon, Churchill Co., Nev. Frank E. Wire, president; H. B. Adams, first vice-president; H. L. Knott, second vice-president; Chas. Kreiss, secretary; Geo. V. Clementi, treasurer; R. W. Packard, superintendent. Organized Aug. 5, 1907, under laws of Nevada, with capitalization \$2,000,000, shares \$1 par. Was promoted by the Chicago Promotion & Brokerage Co. Lands, 440 acres, in the Silver Mountains, about 60 miles from Fallon, having a 50' shaft and short tunnel, showing ore assaying up to 3.83% copper, with fair gold and silver values. Idle.

**CHICAGO & KOOTENAY MINING CO.****BRITISH COLUMBIA.**

Dead. Formerly at Nelson, Kootenay district, B. C.

**CHICAGO-LA SAL GOLD & COPPER CO.****UTAH.**

Dead. Formerly at La Sal, Grand Co., Utah.

**CHICAGO-LA TOUCHE MINING & POWER CO.****ALASKA.**

Office: 1 Board of Trade, Chicago, Ills. Mine office: Latouche, Latouche Island, Alaska. Robert Prindle, president; Walter Fitch, vice-president and treasurer; Wm. E. O'Neil, secretary. Organized April, 1907, under laws of Maine, with capitalization \$1,500,000. Property is 520 acres, carrying good water-rights, held under option, developed by about 200' of tunnels. Employs about 20 men. Management considered good.

**CHICAGO-MEXICAN CONSOLIDATED MINING CO.****MEXICO.**

Dead. Formerly at Cusihuiriáchic, Iturbide, Chihuahua, Mex.

**CHICAGO & MILWAUKEE COPPER MINING CO.****IDAHO.**

Mine office: Mullan, Shoshone Co., Idaho.

**CHICAGO MINING & MILLING CO.****UTAH.**

Office: care of Fred T. McGurkin, secretary, Salt Lake City, Utah. Thos. Keeley, president. Organized 1904, with capitalization \$150,000, shares \$1 par. Lands include the Wild Bill group, in Beaver county, Utah. Idle.

**CHICAGO NICKEL CO.****ONTARIO.**

Mine office: Worthington, Algoma, Ont. Lands are sundry prospects in Drury township, showing nickel-copper ores. Idle and apparently moribund.

**CHICAGO & PATAGONIA COPPER & GOLD MINING CO. ARIZONA.**

Office: 97 Clark St., Chicago, Ills. Mine office: Nogales, Santa Cruz Co., Ariz. J. T. Brickwood, general manager. Organized January, 1904, with capitalization \$250,000. Lands, known as the Old Soldier group, on the western slope of the Patagonia Mountains, east of the Santa Cruz river, have several shafts, deepest circa 225'; with about 1,000' of workings.

**CHICAGO-UTAH COPPER MINING CO. UTAH.**

Mine office: Morgan, Morgan Co., Utah. Lands, 7 miles southeast of Morgan, in the northern Wasatch Mountains, slightly developed, are said to show, at depth of about 100', ore assaying 20% copper and 20 oz. silver per ton.

**CHICAGO-VENTURE MINING CO. WYOMING.**

Office and mine: Encampment, Carbon Co., Wyo. Robt. H. Young, president and general manager; S. A. McCoy, secretary and treasurer. Organized 1901, under laws of Wyoming, with capitalization \$1,000,000, shares \$1 par. Lands, 5 claims, patented, area 100 acres, showing 2 fissure veins in limestone, near a grano-diorite contact, of which one, averaging 15' width, is developed by shafts of 60' and 200', and tunnels of 50' and 60'. Idle since circa 1904, and apparently moribund.

**CHICKAGAMOO MINING CO. QUEBEC.**

Mine office: Roberval, Chicoutimi Co., Que. Peter McKenzie, general manager. Lands, apparently undeveloped, are in the Lake St. John region, about 165 miles north of Roberval, the nearest railroad point. Presumably idle.

**CHICKAMUN COPPER-GOLD MINING CO. WASHINGTON.**

Dead. Was merged in New Century Exploration & Investment Co. Formerly at Darrington, Snohomish Co., Wash.

**CHIHUAHUA COPPER CO. MEXICO.**

Office: 267 Central St., Lowell, Mass. Mine office: Moctezuma, Bravos, Chihuahua, Mex. C. M. Dickey, president; Joseph Jackson, vice-president; Clarence W. Hoyt, secretary and treasurer; Morris B. Parker, superintendent. Organized Nov. 9, 1905, under laws of Maine, with capitalization \$600,000, shares \$1 par. Annual meeting, second Tuesday in November.

Lands, 100 hectares, in the Sierra Mojena, 20 miles west of Moctezuma, showing numerous contact veins between limestone and porphyry, of which 4, undergoing development, range 2' to 40' in width, giving average assays of 8% copper, 3 oz. silver and \$1 gold per ton, from cuprite, malachite, chalcopyrite and occasional chrysocolla. Has several shallow shafts, deepest 75', and 9 short tunnels, longest 120', with 650' of workings, estimated to show 2,500 tons of ore. Has a 25-h. p. hoist, good for 500', small Gardner air-compressor, and necessary mine building. Property was a small producer in the past, but was tied up by litigation for some time, before secured by present owners. Company shipped sufficient ore, in the first quarter of 1906, to pay for the small machinery plant on hand, and all development work. Management and property are regarded favorably.

**CHIHUAHUA COPPER MINING CO. MEXICO.**

Office: Bearinger Bldg., Saginaw, Mich. Operating office: Apartado 299, Chihuahua, Mex. Mine office: Santa Barbara, Hidalgo, Chihuahua, Mex. B. W. McCausland, president; Ross D. McCausland, vice-president and general manager; Norman Rupp, secretary; E. G. Rust, treasurer; preceding officers, F. G. Palmerton, Geo. W. McCausland and F. R. Messinger, directors; Roy T. Chapman, superintendent; E. N. Funston, mill superintendent; Sidney S. Lang, engineer. Organized 1907, under laws of Arizona, with capitalization \$1,500,000, shares \$10 par; issued, \$98,000. Cash on hand, Aug. 15, 1908, was circa \$50,000, with liabilities of circa \$10,000. Annual meeting, third Tuesday in February.

Lands, 104 hectares, in the Chorreros, Santa Barbara and Carizalillo districts of Chihuahua. Property was said to include the Justicia y Anexas, in the Chorreros Mountains, bought of Madero Hermanos for 40,000 pesos, but it was reported, April, 1908, that bond on the Justicia y Anexas had been forfeited, after 2 payments. Properties show 8 ore bodies, of which 3, under development, are reported as 3' to 8' wide and traceable circa 4 miles, carrying chalcopyrite, bornite and nickeliferous pyrrhotite, averaging 5% copper, 5 oz. silver and 0.6% nickel. The Justicia mine has a 200' shaft, other shafts being the Sidney, 100'; Bronces, 400', and the Carizalillo shafts of 75' and 100', mine having circa 3,500' of workings, estimated to show 100,000 tons of ore, with 75,000 tons blocked out.

The Hathaway mine, 18 miles south of Santo Domingo and 12 miles south of Falomir station, on the Kansas City, Mexico & Orient Ry., has 2 small but persistent veins, carrying rich copper sulphide.

Los Bronces mine, at Santa Barbara, in the Chorreros Mountains, has no equipment.

Equipment includes a 25-h. p. steam plant, a 120-h. p. Otto suction gas producer, and two 60-h. p. Otto gas engines, having a fuel consumption of less than one pound per brake h. p.-hour. Equipment includes 25-h. p. and 35-h. p. hoists and an 8-drill air-compressor.

Buildings include a stone carpenter shop, stone smithy, power plant, store, stable, warehouse, office and 40 dwellings.

The concentrator, of about 30 tons daily capacity, built of stone and timber, has a No. 4 Blake crusher and 2 jigs, producing concentrates of about 20% copper tenor. It is planned to double the capacity.

The Hathaway mine has old smelter, of antiquated design and equipment, of no value for modern uses.

Company plans sinking 3 new shafts, deepening present shafts, driving a tunnel, building a power plant and building a new concentrator and possibly a small smelter. In August, 1908, was producing circa 16 tons daily of concentrates of 15% copper tenor, and expected to reach a daily output of about 40 tons daily by 1909. Property is considered good and management seems efficient.

#### **CHILICAT GOLD & COPPER CO.**

**ALASKA.**

Mine office: Haines, Alaska. Lands, 168 claims, on the Big Salmon river. Presumably idle.

#### **J. K. CHILD & CO., LTD.**

**BOLIVIA.**

Office: 33 Drury Bldg., Liverpool, Eng. Mine office: Coro Coro, La Paz, Bolivia. J. L. Barber, chairman; R. D. Barber, mine manager; Thos. S. Hancock, secretary. Organized Nov. 3, 1905, under laws of Great Britain, with capitalization £70,000, shares £1 par, fully issued, succeeding Juan K. Child y Compañía. Also is organized under laws of Bolivia, with capitalization 150,000 bolivars. Mine, known as the Vizcachani, is 270 meters deep, carrying native copper in conglomerate strata. Has a steam plant and modern machinery. The mineral carrying native copper is dressed to barilla de cobre of about 80% average copper tenor, production of barilla being 25 to 30 quintals daily, produced at an average cost of 12.43 bolivars per quintal. Production, 1907, was circa 700,000 lbs. fine copper. Employs 250 men.

#### **SOCIEDAD UNIÓN MINERA CHILENA.**

**CHILE.**

Mine office: Cobija, Tocopilla, Antofagasta, Chile. Lands, 5 hectares, including the Condessa and Unión mines. Presumably idle.

#### **SOCIEDAD CHILENA DE FUNDICIONES.**

**CHILE.**

Mine office: Tamaya, Ovalle, Coquimbo, Chile. Works offices: Guayacán, Coquimbo, Chiloé, and Tongoy, Ovalle, Coquimbo, Chile. The Tamaya mines,

opened circa 1860, are the principal ore producers. Company also has mines at Punitaqui and La Laja, in the province of Coquimbo. Has 2 smelters, the Fundicion Guayacan, which is one of the oldest copper reduction plants in Chile, having 20 very small calcining furnaces and 14 very small reverberatory furnaces, 4 of latter being used for casting ejes, 8 for bars and 2 for ingots, ejes averaging 50%, bars 97% and ingots 99.5% copper tenor, which may be considered excellent practice for so antiquated a plant, especially as slags average only 0.4% copper. Fuel, 1903, was 25,000 metric tons of Chilean coal, from Lebu, and 5,000 tons of Australian coke. Employs 350 men, at average wages of 1.2 pesos daily. Smelter production, 1903, was ejes carrying 9,695,090 kilograms fine copper.

The Fundicion Tongoy has 2 reverberatory smelting furnaces and 5 calcining furnaces, producing ejes averaging 57% and Chile bars averaging 97% copper, slags running about 0.5%, fuel being local coal and imported coke, ores treated averaging 15.4% copper tenor, with slag losses of 0.5%. Employs circa 50 men, at average wages of 1.2 pesos daily. In 1903 produced 1,177,000 kilograms fine copper, at estimated smelter cost of 16.3 pesos per metric ton.

Production, 1903, secured mainly from custom ores, was 23,968,809 lbs. fine copper.

#### **CHILI COPPER CO., LTD.**

**CHILE.**

Registered in Guernsey, March 4, 1905, with capitalization £400,000, shares £1 par. Office and location unknown. Regarded with suspicion.

#### **CHILI COPPER SULPHATE SYNDICATE, LTD.**

**CHILE.**

Office: 101 Leadenhall St., London, E. C., Eng. J. E. G. Hadath, secretary. Copper lands in Chile were sold to Copaqueire Copper Sulphate Co., Ltd.

#### **SOCIÉTÉ CHILIENNE.**

**BOLIVIA.**

Mine office: Coro Coro, La Paz, Bolivia. Operates mines of native copper opened in conglomerate strata.

#### **CHILLAGOE BLOCKS, N. L.**

**AUSTRALIA.**

Dead. Formerly at Herberton, Cardwell Co., Queensland, Australia.

#### **CHILLAGOE COMPANY, LTD.**

**AUSTRALIA.**

Office: 39 Queen St., Melbourne, Australia. British office: Palmerston House, London, E. C., Eng. Mine and works office: Chillagoe, Lynd Co., Queensland, Australia. J. S. Reid, chairman; Harvey Patterson, vice-chairman; C. L. Hewitt, secretary; Edwin Hatben, London secretary; E. A. Whitbery, consulting engineer; Peter Branden, mine manager; J. Horsburgh, smelter superintendent; Fred Back, railway superintendent; W. A. F. Davies and E. J. J. Rodda, mine superintendents.

Organized June 16, 1898, under laws of Victoria, as Chillagoe Proprietary, Ltd.; reorganized as Chillagoe Railway & Mines, Ltd.; reconstructed, 1902, as New Chillagoe Railway & Mines, Ltd., and reconstructed for third time, June 5, 1905, under laws of Queensland, under present title, with capitalization £350,000, shares 10s. par; 9s. paid in. Debentures, £500,000, at 5%, issued by New Chillagoe Railway & Mines, Ltd., registered February, 1902. Debentures were issued at 6%, but holders agreed to permanently reduce interest rate to 5%, except in years when shareholders have been paid dividends to exceed 1s. per share. Owns 75,000 shares, of 5s. par, in the Mungana (Chillagoe) Mining Co., Ltd., which was organized by the predecessor of the Chillagoe Co., Ltd., March, 1901. For fiscal year ending June 30, 1908, receipts were £270,276, with expenditures of £212,375. Quick assets were £240,275, and liabilities were £225,394.

Lands, 1,863 acres, mainly held under special act of the Queensland Parliament, also an 80-acre smelter site and miscellaneous lands giving total holdings of 2,935 acres, in the Walsh & Tinbaroo district. Mineral concessions include 9

groups, with 70 leases, expiring Jan. 1, 1948, held at annual rental of £1 per acre, with exemption from labor conditions, also 6 ordinary leases.

Principal mines are the Ruddygore, Zillmanton, Penzance and Queenslander or Morrison. The district shows Silurian limestone, sandstone and conglomerates, with various fissure veins and contact deposits, carrying auriferous copper ores giving average returns of 3.5% copper and 2 oz. silver per ton, with traces of gold, and lead ores ranging in tenor about 20% lead, 8% zinc and 2 oz. silver per long ton.

The Ruddygore, which is the principal mine, shows a large ore body, opened by shaft, but worked mainly open-cast. Production, 1907, was 4,139 long tons of ore, yielding 337,276 lbs. fine copper and 10,411 oz. silver, an average return of 3.63% copper and 2.5 oz. silver per ton. A new shaft is planned. Equipment includes a 6-drill air-compressor and an 8x12" hoist.

The Zillmanton mine has shafts of 360' and 250', shaving a 17' to 20' vein, and, in 1907, produced 1,855 tons of ore, averaging 4.75% copper and 1.6 oz. silver per long ton, with reserves of 18,000 tons. Mine was flooded, early 1908, but has been reopened.

The Penzance, or Red Cap, mine, has a 200' shaft, but is worked mainly open-cast, in 1908 producing 853 tons of ore, ranging 2 to 6% in copper tenor and circa 2.5 oz. silver per ton.

The Queenslander or Morrison mine has a 255' main shaft, with Cornish pump, carrying mainly low grade sulphide fluxing ore, and, in 1907, produced 2,232 long tons of ore, yielding 142,960 lbs. fine copper. Reserves are estimated at 18,500 long tons, averaging circa 3% copper and 3 oz. silver per ton. Owing to disappointing development, work was suspended on bottom levels March 15, 1908.

Miscellaneous mines include the Hensley, having a 200' shaft, which, in 1907, produced 76 tons of ore; the Dargalong mine, which shows auriferous copper and lead sulphides; the Otho, which has proven disappointing in development; the McIlwraith, having a 250' shaft, which is idle; the Victoria, having a 600' shaft, which is idle; the Harper, which has a 368' shaft and is idle; also the Hobson and Ti Tree mines, both idle. Fluxing properties include the Boomerang and Mount Lucy iron mines, and a limestone quarry at Mount Lucy.

Equipment includes steam power at the principal mines, with 6 hoists good for 500' each, and several air-compressors. Buildings include a 50x70' wood and iron machine-shop, and a 50x70' carpenter-shop and smithy, with 5 other mine structures, and 11 dwellings.

The smelter, at an average distance of 4 miles from the different mines, receiving ore by railroad, is of 700 tons rated daily capacity, treating also custom ores from the Mungana and other mines. The smelter has five 140-ton copper furnaces, and two 140-ton lead furnaces, the lead smelter using the Huntington-Heberlein process of reduction, with 8 kettles. Smelter includes a converter with 4 shells, taking 35% matte from the blast-furnaces, and turning out pimple metal averaging 79% copper and 100 oz. silver per ton. Fuel is wood, coal and coke, and water is taken from a 1,500-gallon dam across Chillagoe Creek, which has a minimum flow of 4,000 gallons hourly. The smelter has electric power.

The Mareeba to Chillagoe railway, owned by the company, has 102 miles of main line, and, July, 1908, had 84 miles of steel laid on the Etheridge extension, and planned reaching Einasleigh, 106 miles distant, in 6 weeks, and the terminus, 140 miles from Chillagoe, early 1909. The railway is proving profitable.

Company employs about 600 men. Production, for fiscal year ending June 30, 1908, was 53,112 long tons of ore, yielding 3,391,360 lbs. fine copper, 4,399 long tons lead, and 478,478 oz. silver, these figures including metals made from

custom ores of the Mungana. Production, 1907, from company's own ores, was circa 1,500,000 lbs. fine copper.

#### CHILLAGOE COPPER PROPRIETARY, LTD.

AUSTRALIA.

Dead. Dissolved Dec. 26, 1902. Formerly at Chillagoe, Lynd Co., Queensland, Australia.

#### CHILLAGOE RAILWAY & MINES, LTD.

AUSTRALIA.

Dead. Reconstructed June 5, 1905, as Chillagoes Company, Ltd. Very fully described Vol. VI.

#### CHINIPAS COPPER CO.

MEXICO.

Office: 1531 Railway Exchange, Chicago, Ills. H. M. McIntosh, manager; Fred W. Dow, superintendent. Organized Oct. 8, 1906, under laws of Maine. Lands, in the northwestern corner of the state of Chihuahua, Mexico, include El Vencedor mine, having a ledge or dyke of circa 300' width, with an ore chute traceable about one-third mile, showing considerable native copper, ore, after eliminating the native metal, giving average assays of about 7% copper.

#### CHIPPEWA COPPER MINING CO.

WISCONSIN.

Dead. Lands sold, October, 1902, for debt. Succeeded by Corona Copper Mining Co. Formerly at West Superior, Douglas Co., Wisc. Described Vol. II.

#### CHIRICAHUA DEVELOPMENT CO.

ARIZONA.

Dead. Succeeded Jan. 9, 1907, by San Simon Copper Co. Formerly at Paradise, Cochise Co., Ariz. Very fully described Vol. VI.

#### MINAS LA CHIRIPA Y ANEXAS.

MEXICO.

Mine office: Zimapán, Hidalgo, Mex. León Lamine y Ca., owners. Properties are La Chiripa, La Pretoria and El Moro mines, carrying argentiferous lead and copper ores. Employed circa 50 men at last accounts.

#### CHISNA CONSOLIDATED MINES CO.

ALASKA.

Office: 263 La Salle St., Chicago, Ills. Mine office: Landlock, Prince William Sound, Alaska. Geo. L. McKay, president; Ira A. Town, vice-president; Chas. Kreis, secretary and treasurer; Jos. Kreis, general manager; Dr. Edward T. Griffith, superintendent. Organized April, 1906, under laws of Washington, with capitalization \$5,000,000, shares \$1 par, as successor of Central Alaska Gold & Copper Co.

Lands are 28 placer claims, on the Chisna river, in interior Alaska, claimed to return \$1.75 per cubic yard gold, which is more than doubtful, and company is also said to have quartz claims on the Chitochina river, circa 220 miles north of Valdez.

Coast lands are 37 claims on Landlock Bay, near Valdez, including the Oxide, Peacock, Steinmetz and Kreis groups, latter east of the Reynolds-Alaska. The Steinmetz group, near Valdez, has a shaft only 70' from the bay, in a fissure vein claimed to be 150' wide and to carry an average of 7% copper, which is a palpable exaggeration, though assays up to 23% copper, with gold and silver values, have been secured. It is planned to drive a tunnel on the Kreis group, to cut veins outcropping at surface. Ore is loaded into vessels by gravity.

The predecessor of the Chisna Consolidated was guilty of advertising that was very flamboyant and remarkably uninstructive. The Steinmetz apparently is a property of some promise, but the present company advertised its stock as an investment in proven properties, which is not true, and is not regarded favorably. Production, 1907, was circa 300 tons of ore, of about 12% average copper tenor.

#### CHITINA EXPLORATION CO.

ALASKA.

Dead. Formerly at McCarthy's Creek, Copper River district, Alaska. Described Vol. V.

#### CHLORIDE GOLD MINING CO.

ARIZONA & CALIFORNIA.

Office: 10 Board of Trade, Pueblo, Colo. Mine office: Chloride, Mohave

ggle

Co., Ariz. L. Hoffman, president and manager; Dr. A. B. Seelye, vice-president; J. H. Hoffman, secretary; C. Hoffman, treasurer; preceding officers and J. E. Adams, directors. Capitalization \$1,000,000, shares \$1 par. Lands, 130 acres, known as the Samoa group, 4 miles east of Chloride, having auriferous silver-lead ores, said to carry average values of about \$40 per ton, opened by a 300' shaft. Lands include the Iron Gossan group, 11 claims, in the northeastern corner of San Bernardino county, California, near the Nevada line, showing a 20' to 150' iron gossan, traceable about 1 mile, of iron ore carrying copper carbonates of about 1.6% average tenor.

#### COMPAÑIA MINERA Y BENEFICIADORA

MEXICO.

#### DE METALES DE CHOIX, S. A.

Is the Mexican incorporation of the Choix Consolidated Mining Co.

#### CHOIX CONSOLIDATED MINING CO.

MEXICO.

Office: 43 Wall St., New York, N. Y. Operating office: 516-355 South Broadway, Los Angeles, Cal. Mine office: Choix, Fuerte, Sinaloa, Mex. R. A. Thomas, president; Thos. E. Metcalfe and W. W. Thomas, vice-presidents; J. R. Thomas, secretary; J. E. MacKechnie, general manager. Organized May, 1902, under laws of Arizona, with capitalization \$5,000,000, shares \$1 par, and protocolized under laws of Mexico.

Lands, 471 hectares, also several mill and smelter sites, on both sides of the Fuerte river, in the Choix district of Sinaloa and the Urique district of Chihuahua. Apparently part of lands were sold, 1907, to Los Platnos Development Co. The property originally included the Creston-Verde group, area 103 hectares, and the Colon-Espinocena group of 115 hectares. Ore bodies are claimed to measure 50' to 300' in width, occurring as contact deposits between porphyry, diorite and limestone, with gold ore in fissure veins in granite and quartzite. Property includes several antiguas.

Shipments, 1900-1902, of 1,062 tons of ore to the Aguascalientes smelter, gave returns of 19.5 to 28% copper, with gross values of \$127,915.44 and net values of \$47,940.61. Property considered promising. Apparently idle for several years.

#### CHOTA NAGPUR MINES.

INDIA.

Mine office: Chota Nagpur, Bengal, India. Were worked in very ancient days. Ore occurs as chalcopyrite, disseminated in schistose rocks. A local company did a little development work, 1903; since idle.

#### CHTASTIE MINE.

BULGARIA.

Sold, June 24, 1907, to Widin Copper Syndicate, Ltd.

#### SOCIEDAD BENEFICIADORA DE CHUQUICAMATA.

CHILE.

Office: Santiago de Chile. Mine office: Tarapacá, Tarapacá, Chile. Organized Apr. 30, 1902, under laws of Chile, with capitalization 225,000 pesos, shares 1,500 pesos par.

#### SOCIEDAD EXPLOTADORA DE CHUQUICAMATA.

CHILE.

Office: Valparaiso, Chile. Mine office: Calama, Antofagasta, Chile. Organized Aug. 7, 1900, under laws of Chile; with capitalization £40,000, and reorganized, Jan. 18, 1904, with capitalization £100,000, shares £2 par.

#### SOCIEDAD MINERA CHURECUA.

PERÚ.

Mine office: Morococha, Junín, Perú. Organized 1904. Lands, in the San Francisco and Santa Cruz Mountains, near Morococha, are being developed by a tunnel known as the Roland East, with a force of 50 men. Production, 1903, was 228,683 lbs. fine copper.

#### COMPAÑIA MINERA DE LA CIENEGUITA, S. A.

MEXICO.

Is the Mexican incorporation of the Cieneguita Copper Co.

**CIENEGUITA COPPER CO.****MEXICO.**

Office: 1303-25 Broad St., New York, N. Y. Mine office: Minas de Cieneguita, Sahuaripa, Sonora, Mex. Geo. Beebe, president; J. H. Wilhelm, vice-president; C. W. Wilhelm, secretary and treasurer; Chas. W. Howbert, general manager; Frank Fitz, superintendent; preceding officers, August Gaspé; Hon. C. Campbell and Dr. Eugene Boyce, directors; B. F. Tipton, mine superintendent; W. F. Oden, smelter superintendent.

Organized May 18, 1901, under laws of Arizona, with capitalization \$10,000,000, shares \$10 par, and reorganized, 1905, under laws of Nevada, with same capitalization, reconstruction being effected to eliminate a certain stock interest, known as the Christy, which stock in the old company was rendered worthless by the reorganization. Suits in the courts resulted in upholding the company. Holds property through the Compañía Minera de la Cieneguita, S. A., which has direct title to lands.

Lands, 937 hectares, circa 40 miles southeast of Sahuaripa, also about 30,000 acres of grazing lands, fairly watered and timbered. Property is in 4 groups. The Chipiona group carries about 1,800' of the strike of a vein system; the Cargona group is near the Chipiona; the Ostimuri group, circa 2 miles southeast of the Chipiona, was worked extensively in early days, and the Tayapa group, lying west of the Osimuri, has several antiguas, carrying silver-lead and copper ores. Country rocks are recent acid eruptives, of rhyolitic nature, rhyolite tuffs and rhyolite breccias, with diabase dykes, probably diorite. Development includes shafts of 125' and 138', but is mainly by 18 tunnels, of 35' to 1,200' length, with circa 3 miles of workings. In 1907 new openings of 3,919' were made. Veins are of practically vertical dip, and 13 ore bodies have been located, with 5 under development, these being reported as 3' to 50' in width, and one, traceable 3 miles, opened to extreme depth of 800' by tunnel. Ores are sulphides, first claimed to carry average values of 5% copper, 70 oz. silver and \$3 gold per ton, which figures were grossly exaggerated, and stated later to run 4% copper and 61 oz. silver, but average assays December, 1907, gave 2.5% copper and 45 oz. silver. Company, in 1906, claimed 2,000,000 tons of ore in sight, with 300,000 tons blocked out for stoping, which was absolutely untrue, as the company yet lacks any considerable amount of ore blocked out for stoping.

Equipment at the mine includes a 100-h. p. steam plant, with 6-drill air-compressor, 30x60' stone machine-shop, assay office, store, miscellaneous mine buildings and 120 dwellings for employees.

The smelter, at Chipiona, 1,500' from the portal of the main tunnel, and receiving ore therefrom by tram-line, has Blake crushers and rolls, a 75-ton calcining furnace and 2 small wood-burning reverberatory furnaces, of about 50 tons daily capacity each. Fuel is inferior wood, costing \$3 per cord. Smelter was blown in Sept. 24, 1906, but apparently has proven a misfit, and Mr. Howbert recommends the installation of a 150-ton pyritic smelter, and company is said to plan a mill also.

Transportation is by a 65-h. p. 2-motor freight automobile.

At the annual meeting, Feb. 3, 1908, the financial statement showed \$748,000 had been advanced to the Mexican operating company, for development and equipment. Despite much talk regarding the richness of these mines, the large production imminent, and the tremendous profits to be earned, the actual output for 1907 was only 42 tons of 40 to 50% copper matte, of which 12 tons were shipped. The property, while not devoid of promise, is poorly located as to transportation facilities, and the company's estimates of ore reserves, production and profits are, utterly unwarranted. Company is not regarded favorably.

**MINA CIGARRERO.**

Office and mine: Bacs, Jiménez, Chihuahua, Mex. I. Rodriguez, general manager. Ores are mainly high-grade silver-lead carbonates, averaging circa 26 grams gold per ton, with gold values increasing and silver values decreasing at depth.

**CIMA COPPER CO.**

Office: Searchlight, Nev. Mine office: Cima, San Bernardino Co., Cal. Was exploring for copper, 1907, with a diamond drill.

**CIMARRON MOUNTAIN MINING CO.****CALIFORNIA.****NEW MEXICO.**

Office: 13 Dodge Blk., Lansing, Mich. Mine office: Cimarron, Colfax Co., N. M. Hon. Justus S. Stearns, president; C. C. Hopkins, vice-president; F. S. Porter, secretary and treasurer. Organized Oct. 24, 1904, under laws of New Mexico, as successor of Consolidated Verde Mining & Milling Co., with capitalization \$2,000,000, shares \$1 par; issued, \$1,800,000.

Lands, 65 acres, patented, in the Cimarron district of the Maxwell land grant, 35 miles from Springer, the nearest railroad station, with good wagon road connecting. Property shows gossans of decomposed limonite and honeycomb quartz carrying gold values and copper stains. Has circa 1,500' of workings, mainly tunnels. Practically no work has been done by present company.

**CINCINNATI CONSOLIDATED MINING CO.****UTAH.**

Office: care of A. Hanauer, Jr., Salt Lake City, Utah. Lands are in Beaver county, Utah. Refuses a statement; idle some years and apparently moribund.

**CINCO DE MAYO MINING & SMELTING CO.****MEXICO.**

Office: San Antonio, Tex. Letter returned unclaimed from former mine office, Descubridora, Mapimi, Durango, Mex. Alfred Van der Stucken, president; E. Harms, vice-president and general manager; G. C. Carothers, secretary; Douglas Muir, general manager. Lands include the Mimbe and Parandara mines, both copper properties, latter showing a 4' vein of 8% ore, developed by shafts, No. 1 being 75 meters and No. 3 being 30 meters in depth. Was shipping ore to Torreón smelter, until 1907 copper slump, employing circa 50 men.

**CIRCUMSTANCE GOLD & COPPER MINING CO.****ARIZONA.**

Mine office: Huron, Yavapai Co., Ariz. Idle and apparently moribund.

**CITY ROCKS MINING CO.****UTAH.**

Office: Sheldon Bldg., Houghton, Mich. Mine office: Alta, Salt Lake Co., Utah. Wm. S. Cleaves, president; John Edwards, vice-president; Jas. P. Edwards, secretary and treasurer; W. S. Zehring, assistant secretary; Robt. L. Edwards, general manager. Organized 1906, under laws of Utah, with capitalization \$1,000,000, shares \$1 par. Has an issue of convertible bonds. Lands, paid for 1907, area circa 250 acres, are about one-half mile from the Columbus Consolidated and near the Continental-Alta, showing a main fissure of about 12' average width, with 2 other promising ore bodies undeveloped. Mine is opened by 2 tunnels, the Topeka, or upper tunnel, being circa 1,800' and the lower or City Rocks tunnel, circa 2,700', all but first 300' of latter being on the vein, face of tunnel having a back of 900' showing a 20' vein. Also has a 1,500' tunnel, and plans a fourth tunnel, to be started 700' vertically below No. 3; and to run 6,000'. Ores are argentiferous lead and copper sulphides, and highly argentiferous lead carbonates. Shipped ore, 1907, running 12.5% copper, 16 oz. silver and \$1 gold per ton, also carbonate ores averaging 30% lead and 10 oz. silver per ton. Has gasoline power and a short aerial tram, connecting with the 5-mile aerial tram of the Continental-Alta. Extensive ore dumps, remaining from old workings, were leased, 1907, to John C. Stillwell, for culling. Property considered promising.

**CLAUDE COPPER CO.****IDAHO.**

Mine office: Montpelier, Bear Lake Co., Idaho. G. C. Gray, president and treasurer; A. D. Young, secretary. Organized Sept. 16, 1902, under laws of Idaho, with capitalization \$200,000, shares 50c. par. Lands, 3 claims, area 60 acres, with fissures in sandstone, and contact deposits between limestone and porphyry, giving ores assaying 4.6% copper, 10 oz. silver and about \$1 gold, from a 12" vein carrying cuprite, melaconite, dioptase and chrysocolla, opened by tunnels of 100' and 200'. Idle.

**CLARA CONSOLIDATED GOLD & COPPER MINING CO.** **ARIZONA.**

Office: 536 Byrne Bldg., Los Angeles, Cal. Mine office: Planet, Yuma Co., Ariz. Geo. Mitchell, president; T. J. Carrigan, vice-president and general manager. Organized circa August, 1908, with capitalization \$3,000,000, as a merger of the Clara Gold & Copper Mining Co., Signal Copper Co., Crown Princess Mining Co., Crown Queen Mining Co. and Morrow Copper Co.

Lands, 132 claims, having about 6,000' of workings. The Clara mine, circa 10 miles from Planet, has a vein of 30' to 100' width, opened by shaft and tunnel, with circa 2,000' of workings, showing malachite and chrysocolla, with copper sulphides at depth, all carrying fair silver values and exceptional gold values.

The Signal group includes the Copper Prince mine, which has a 150' shaft showing a large ore body.

**CLARA COPPER CO.****UTAH.**

Dead. Formerly at Thompsons, Grand Co., Utah.

**CLARA GOLD & COPPER MINING CO.****ARIZONA.**

Dead. Merged, circa August, 1908, in Clara Consolidated Gold & Copper Mining Co. Formerly at Planet, Yuma Co., Ariz. Described Vol. VI.

**CLARA MINING & SMELTING CO.****MONTANA.**

Dead. Formerly at Butte, Silver Bow Co., Mont. Described Vol. VI.

**CLARA ST. DORA COPPER MINING CO.****AUSTRALIA.**

Dead. Succeeded, 1897, by New Clara St. Dora Copper Mining Co., N. L. Formerly at Hergott Springs, South Australia. Described Vol. IV.

**CLARK CONSOLIDATED MINING CO.****ARIZONA.**

Dead. Formerly at Douglas, Cochise Co., Ariz. Described Vol. VI.

**CLARK COPPER CO.****CALIFORNIA.**

Office: Los Angeles, Cal. Mine office: Greenwater, Inyo Co., Cal. F. M. Lyon, vice-president; H. L. Percy, secretary and treasurer; Jas. P. Harvey, superintendent; preceding officers and Patrick Clark, directors; J. Ross Clark, general manager. Organized 1906. Lands, 6 claims, near the Furnace Creek Copper Co., showing carbonate ores assaying 8 to 18% copper. Idle.

**CLARK DEVELOPMENT CO.****ARIZONA.**

Office: care of H. S. Clark, secretary and manager, Los Angeles, Cal. Mine office: Chloride, Mohave Co., Ariz. Capitalization \$2,000,000. Lands include the Chester mine, sometimes known as the Distaff, having 2 shafts, deepest circa 200', with about 1,000' of workings.

**CLARK MINE.****MICHIGAN.**

Office: care of Dr. Léon Estivant, owner, 47 Ave. de l'Alma, Paris, France. Mine office: Copper Falls, Keweenaw Co., Mich. R. R. Godell, agent. Lands, 2,433 acres, including mines formerly known as the Clark, Bell and Montreal, lying south of Copper Harbor, between Lake Fannie Hooé on the north and Breakfast Lake on the south, including Lake Manganese. Mine, opened 1858, for copper, had a 16-stamp gravity mill, built 1874, run by water power from Lake Manganese, mill now being dismantled. Property also carries a promising 2" vein of pyrolusite, average of assays, 1900, by Duparc, of Geneva, giving 56.73% manganese and 1.36% copper. Has shipped circa 1,200 tons of high

grade manganese ore. Was tested, 1905, by diamond drills. Idle. Fully described Vol. II.

**CLAERK-MUNGER CO.**

**ARIZONA.**

Office and mine. Phoenix, Maricopa Co., Ariz. Mine, in the Mazatzal district, circa 55 miles from Phoenix, has a 60' shaft and 20-ton smelter. A small shipment, 1909, to El Paso smelter, returned 22% copper, 6 oz. silver and \$2.80 gold per ton.

**KÖNIGLICHE HÜTTENAMT CLAUSTHAL.**

**GERMANY.**

Works office: Clausthal, Hanover, Germany. Herr Bergrat Boltze, manager. Property is a silver-copper smelter, operated under state auspices.

**CLAYTON MINING & SMELTING CO.**

**IDAHO.**

Mine office: Clayton, Custer Co., Idaho. Lands, 18 claims, showing argeniferous copper and lead ores. Has water power and a smelter rated at 50 tons. Idle.

**CLEAR CREEK MINING & REDUCTION CO.**

**COLORADO.**

Dead. Formerly at Russell Gulch. Clear Creek Co., Colo. Described Vol. VI.

**CLEAR GRIT MINE.**

**MONTANA.**

Owned by Washoe Copper Co.

**CLEARWATER GOLD & COPPER MINING CO.**

**IDAHO.**

Office: Wallace, Idaho. Mine office: Clearwater, Idaho Co., Idaho. Organized 1907, under laws of Idaho, with capitalization \$2,500,000, shares \$5 par. Lands, 5 lode claims, 1 fractional, and 3 placer claims, on the north fork of the Clearwater river, circa 20 miles south of Wallace. Has 2 tunnels, longest circa 100', showing ore assaying 15 to 23% copper and 3 to 20 oz. silver per ton.

**CLEOPATRA COPPER CO.**

**ARIZONA.**

Office and mine: Jerome, Yavapai Co., Ariz. Hon. Geo. W. Hull, president, treasurer and general manager; H. E. Wilcox, secretary. Organized 1902, under laws of Arizona, with capitalization \$4,000,000, shares \$1 par, and planned, September, 1907, increasing capitalization to \$10,000,000.

Lands, 13 claims, 11 patented, area circa 200 acres, showing fissure and gash veins carrying ores assaying 1 to 65% copper and 1 to 500 oz. silver per ton, with fair gold values. Has 6 shafts, of 25' to 150' depth, and 9 tunnels, the Dillon tunnel, of circa 3,200' length, planned to connect with the 1888 shaft, showing a 3' vein of argentiferous and auriferous copper sulphide, of good average tenor. The Dillon tunnel passes through the Cleopatra into lands of the Hull Copper Co., and latter has permission to use the tunnel through the Cleopatra tract. Company estimates 2,000,000 tons of ore in sight, which is a preposterous figure. Some good ore has been taken from cross-cuts driven from the Dillon tunnel, but apparently no commercial ore bodies have been developed thereby.

Equipment includes a steam plant, hoists, air-compressor and necessary mine buildings. A 100-ton smelter, built 1906, was not blown in, simply from lack of ore, notwithstanding the immense tonnage claimed in sight. Company is developing with a small force, and plans blowing in the smelter, eventually.

**CLEOPATRA GROUP.**

**CALIFORNIA & OREGON.**

Office: care of F. H. Osgood, Seattle, Wash. Mine office: Galice, Josephine Co., Ore. F. H. Osgood and Col. J. S. Crawford, owners. Lands, 45 claims and a 40-acre millsite, in Del Norte county, California, and Josephine county, Oregon. Slight development shows auriferous and argentiferous copper ore, and native copper in masses up to several hundredweights. District is isolated and difficult of access. Idle for several years.

**CLEVELAND-ARIZONA MINING CO.**

**ARIZONA.**

Dead. Lands sold, 1907, to El Tiro Copper Co. Formerly at Red Rock, Pinal Co., Ariz. Described Vol. VI.

**CLEVELAND-MONTANA MINING & DEVELOPMENT CO. MONTANA.**

Office and mine: Butte, Silver Bow Co., Mont. D. A. McKenzie, general manager; preceding officer, Frank S. Mitchell, Frank Hartzell, D. D. Bogart and D. Dorais, directors. Organized Feb. 15, 1905, under laws of Montana, with capitalization \$1,000,000, shares \$1 par. Lands, in Leslie Gulch, southeast of Butte, have a tunnel, said to be 1,000' long. Is not regarded favorably. Presumably idle.

**CLEVELAND-NEVADA MINING CO. NEVADA.**

Letter returned unclaimed from former mine office, Black Horse, White Pine Co., Nev. Organized 1907, with capitalization \$5,000,000. Is said to be an auxiliary of the Amalgamated Nevada Mines & Power Co.

**CLIFF MINE. MICHIGAN.**

Owned by Tamarack Mining Co.

**CLIFTON-ARIZONA COPPER CO., LTD. ARIZONA.**

Mine office: Clifton, Graham Co., Ariz. Organized 1907, under laws of Arizona, with capitalization \$750,000.

**CLIFTON-ARIZONA COPPER CO., LTD. ARIZONA.**

Dead. Succeeded, June 6, 1901, by Clifton Consolidated Copper Mines of Arizona, Ltd., also dead. Formerly at Clifton, Graham Co., Ariz.

**CLIFTON CONSOLIDATED COPPER MINES OF ARIZONA, LTD. ARIZONA.**

Dead. Absorbed, 1903, by New England & Clifton Copper Mines of Arizona. Formerly at Clifton, Graham Co., Ariz.

**CLIFTON COPPER CO. NEW MEXICO.**

Office: Deming, N. M. Mine office: Santa Rita, Grant Co., N. M. J. L. Burnside, president; F. F. Rogers, secretary; M. M. Z. Elliott, superintendent. Organized 1900, with capitalization \$500,000, shares \$5 par. Lands, in the Central district of Grant county, were in litigation until 1906. Mine has 5 shafts, deepest 235', showing a vein of 40' to 50' claimed length and one-half mile length, carrying oxide, carbonate and sulphide ores, with occasional native copper, ore being of concentrating grade, with occasional high-grade pay streaks. Mine shows considerable ore ready for stoping. Has steam hoists and a 65-ton concentrator with 2 Huntington mills, 2 Wilfley tables and 2 Standard concentrators. Idle several years.

**CLIFTON COPPER BELT MINING CO. UTAH.**

Office: 24-65 West Second South St., Salt Lake City, Utah. Mine office: Callao, Juab Co., Utah. Clyde H. Wilson, president; Frank L. Wilson, secretary, treasurer and general manager. Capitalization \$25,000, shares 5c par. Lands, in the Deep Creek district, show ores assaying up to 35.5% copper, 9 oz silver and \$1.20 gold per ton. Also has ores carrying lead, nickel, tin and bismuth, values apparently being mainly in auriferous bismuth.

**CLIFTON COPPER MINES, LTD. ARIZONA.**

Office: 52 Wall St., New York, N. Y. Mine office: Clifton, Graham Co., Ariz. Organized July 29, 1903, with capitalization \$1,000,000, shares \$5 par, as a reconstruction of the Arizona Copper Syndicate, which forfeited its West Virginia charter, 1902, on account of unpaid corporation tax. Is controlled, through ownership of 70% of stock, by Standard Consolidated Copper Co. Lands, 8 claims, area 160 acres, lying east of the Standard mines. Production, 1905, was 37,517 lbs. fine copper.

**CLIFTON COPPER MINING CO. ARIZONA.**

Dead. A stock-jobbing scheme, promoted 1898, by Julius Leszynsky. Formerly at Clifton, Graham Co., Ariz.

**CLIFTON GOLD & COPPER CO. ARIZONA.**

Office and mine: Clifton, Graham Co., Ariz. A. S. Rosecrans, manager; LaMar Cobb, consulting engineer. Organized circa August, 1907. Lands

include the Oregon group, having a shaft showing ore of 5 to 8% copper tenor.

#### CLIMAX GROUP MINING CO.

WASHINGTON.

Office: 1203 Maxwell Ave., Spokane, Wash. Mine office: Baring, King Co., Wash. J. J. Browne, president; J. W. Douglas, vice-president; Frank P. Smith, general manager. Organized under laws of Washington, with capitalization \$1,500,000, shares \$1 par. Lands, 9 claims, area 180 acres, also a 20-acre millsite, in the Index district. Country rocks are granite and diorite, showing several contact veins, of which two are developed by a 37' shaft, two short tunnels and a 345' tunnel not yet in ore. Ores are bornite and chalcopyrite, giving assays of 3 to 34% copper, 20 to 70 oz. silver, and from a trace to \$6 gold per ton. Property idle for some years, except for assessment work.

#### CLIMAX MINING CO.

COLORADO.

Mine office: Granite, Chaffee Co., Colo. B. H. Pelton, president. Property is the Spondulix mine, opened by a shaft showing auriferous and argentiferous copper ore. Presumably idle.

#### CLIMAX MINING CO.

COLORADO.

Dead. Formerly at Ouray, Ouray Co., Colo.

#### CLIPPER MINING CO.

WASHINGTON.

Dead. Formerly at North Bend, King Co., Wash. Very fully described Vol. VII.

#### CLONCURRY CELESTIAL COPPER & OPTIONS CO.

AUSTRALIA.

Office and mine: Cloncurry, Queensland, Australia. Organized circa January, 1908, with capitalization £5,000, shares £10 par.

#### CLONCURRY COPPER & GOLD EXPLORATION CO., LTD.

AUSTRALIA.

Offices: 39 Lombard St., London, E. C., Eng., and Brisbane, Queensland, Australia. Mine office: Cloncurry, Queensland, Australia. F. H. Hopkins, mine manager; Alex Doig, London secretary. Organized Jan. 22, 1906, under laws of Queensland, with capitalization £5,000, shares £5 par. Lands, 560' acres, near the Corella river.

#### CLONCURRY COPPER & SMELTING CO., LTD.

AUSTRALIA.

Dead. Succeeded Oct. 29, 1895, by New Cloncurry Copper & Smelting Co., Ltd. Formerly at Cloncurry, Beaconsfield Co., Queensland, Australia.

#### CLONCURRY EXPLORATION SYNDICATE, LTD.

AUSTRALIA.

Office: 31 Lombard St., London, E. C., Eng. Mine office: Cloncurry, Queensland, Australia. Organized Jan. 22, 1907, under laws of Great Britain, with capitalization £7,000, shares £1 par.

#### CLONCURRY RAILWAY & DEVELOPMENT SYNDICATE.

AUSTRALIA.

Office: 541 Salisbury House, London, E. C., Eng. Mine office: Cloncurry, Queensland, Australia. Lord Ernest W. Hamilton, chairman; F. A. Labouchere, secretary. Organized June 14, 1906, under laws of Great Britain, with capitalization £50,000, shares £1 par, fully issued.

#### COMPANIA CLORURADORA DE COBRE.

CHILE.

Mine office: Melhagua, Santiago, Chile. Property shows large ore bodies of low grade, mainly blanket veins carrying 4 to 6% copper. Works, at Noviciado, include a plant for leaching, but apparently the company has not made a success of its venture.

#### CLERIN COPPER DEVELOPMENT SYNDICATE, LTD.

IRELAND.

Office: 356 Winchester House, London, E. C., Eng. Mine office: Allihies, County Cork, Ireland. R. J. Norton Dawson, chairman; A. E. Middleton, secretary. Organized Aug. 26, 1904, under laws of Great Britain, with capitalization £10,000, shares £1 par; issued, £7,892. Property is an option to lease, at £20 yearly, plus 5% royalty, a tract of about 900 acres, lying southwest of lands of the Berehaven Copper Mines, Ltd. Idle.

**CLUSTER MINING CO.**

UTAH.

Mine office: Bingham Canyon, Salt Lake Co., Utah. Lands, lying between the Bingham Consolidated and United States mines, were planned to be developed by a 1,000' tunnel. Is in litigation with Ernest Bamberger over title to apex of vein. Has produced circa 1,000 tons of medium grade ore. Idle.

**COAHUILA MINING & SMELTING CO., LTD.**

MEXICO.

Office: Apartado 72, Monterey, N. L., Mex. Mine office: Jimuleo, Viesca, Coahuila, Mex. G. F. Meehan, president; Frank J. Llewellyn, vice-president; H. B. Bennett, secretary; Walter E. Parker, general manager; F. B. Draper, superintendent. Company is operated as a close corporation, but apparently has paid dividends. There is complaint from minority shareholders that they cannot obtain information.

Property includes the Santa Maria, Sultana and other mines, carrying auriferous and argentiferous copper and lead ores, opened by a 700' main shaft and a 1,000' main tunnel, equipped with steam and electric power. Company was said, August, 1907, to have bonded the Filipinas copper group, area 25 hectares, adjoining Las Vigas Mining Co. at San Sóstenes, Coyame, Iturbide, Chihuahua, Mex.

A 250-ton smelter, with steam and electric equipment, blown in early 1903, is connected with the mines by rail, but the smelter has not been operated regularly. At last accounts the company was manufacturing guayule rubber, and apparently had turned its old smelter into a rubber factory. Latest reported production, 1903, was 178,865 lbs. fine copper.

**COAST LINE COPPER CO.**

MEXICO.

Office: Caboeca, Altar, Sonora, Mex. John T. Cave, president; Judson A. Elliott, secretary; John Henderson, consulting engineer; John Cave, general manager. Organized, 1902, as successor of the Porvenir de Sonora company. Lands include a gold property at El Oro, 14 miles from Pozo, in the Ures district, and an idle copper property, formerly a profitable silver producer, in the Altar district. Gold mine has a 100-ton mill and cyanide plant. Employed circa 25 men at last accounts.

**COAST RANGE COPPER CO.**

OREGON.

Office and mine: care of T. R. Sheridan, Roseburg, Douglass Co., Ore. Organized Jan. 16, 1903, under laws of Oregon, with capitalization \$25,000, shares \$50 par. Presumably idle.

**COBAR CHESNEY COPPER & GOLD MINING CO.**

AUSTRALIA.

Dead. Lands sold to Great Cobar, Ltd. Formerly at Cobar, Robinson Co., N. S. W., Australia. Fully described Vol. VI.

**COBAR COPPER CO., LTD.**

AUSTRALIA.

Office: 308 Winchester House, Old Broad St., London, E. C., Eng. Mine office: Cobar, Robinson Co., N. S. W., Australia. A. E. Barton, chairman; A. E. McMahon, secretary. Organized Feb. 9, 1907, under laws of Great Britain, with capitalization £70,000, shares £1 par.

**COBAR CORPORATION, LTD.**

AUSTRALIA.

Dead. In 1907 experimented with an electrical ore finder, this work resulting in liquidation. Formerly at Cobar, Robinson Co., N. S. W., Australia.

**COBAR FREEHOLD COPPER MINING CO., N. L.**

AUSTRALIA.

Mine office: Cobar, Robinson Co., N. S. W., Australia. Organized 1907, under laws of New South Wales, with capitalization £15,500, shares 10s. par. Lands, sundry claims about one-half mile from the Great Cobar, slightly developed by a shallow shaft showing malachite and azurite.

**COBAR GOLD MINES, LTD.**

AUSTRALIA.

Office: 10 Austin Friars, London, E. C., Eng. Mine office: Cobar, Robinson Co., N. S. W., Australia. A. E. Stephenson, chairman; Thos. Buckland,

managing director; J. Bondeson, mine manager; Wm. Bailey, secretary. Organized May 3, 1898, under laws of Great Britain, as a reconstruction of company by same name that was formed March 17, 1896, with capitalization £200,000, shares £1 par; issued, £176,407. Property is leases of 123 acres of gold mining lands, 50 acres of water rights and a 50-acre millsite. Mine shows a large body of low grade auriferous copper ore. Equipment includes a 100-stamp mill, cyanide plant and slimes plant, and it is planned to erect a new plant for the treatment of sulphide ores. Accounts for 2 years, to September 30, 1906, showed receipts, from production, of £57,630, with £7,547 net profits, with £45,775 carried forward to credit of profit and loss.

**COBAB JEWEECO MINING CO., N. L.**

AUSTRALIA.

Office: Wrightsville, N. S. W., Australia. Mine office: Canbelego, Canbelego Co., N. S. W., Australia. Organized early in 1907, under laws of New South Wales, with capitalization £3,000, shares £10 par. Is a prospect only.

**COBAB LUKNOW COPPER MINING CO., N. L.**

AUSTRALIA.

Office and mine: Cobar, Robinson Co., N. S. W., Australia. Organized early 1907, under laws of New South Wales, with capitalization £3,000, shares £10 par. Is a prospect only.

**COBRE DE GRANDE MINING CO.**

MEXICO.

Dead. Formerly at Sahuaripa, Sonora, Mex. Described Vol. VI.

**COBRE GRANDE COPPER CO.**

MEXICO.

Mine office: La Cananea, Arizpe, Sonora, Mex. Was organized to develop the Cobre Grande mine, under a bond given by Col. Wm. C. Greene, which provided for quarterly payments of \$37,500, with the proviso that failure of payments should forfeit claims. No payments were made under this agreement, and property, reverting to Col. Greene, later became part of Cananea Consolidated Copper Co., S. A. A controlling interest in the Cobre Grande company was bought, for a nominal sum, by Col. Greene, and placed in the treasury of either the Cananea Consolidated or Greene Consolidated. Sundry shareholders of the Cobre Grande have brought suit against the Greene Consolidated Copper Co. and Cananea Consolidated Copper Co., S. A., but apparently the litigation is directed at Col. Greene personally, through these corporations. Lands once held by the Cobre Grande were forfeited to the Mexican government, and afterwards denounced by the Cananea Consolidated, which took direct title from the government. It is obvious that the Cobre Grande Copper Co. has no recourse against either the Cananea Consolidated, Greene Consolidated or Greene-Cananea, the only chance of recovery being a verdict for damages against Col. Greene personally, and on the evidence such a verdict would appear impossible.

**COBRELOMA CONSOLIDATED COPPER CO.**

ARIZONA.

Letter returned unclaimed from former office, 212 Henne Bldg., Los Angeles, Calif. Mine office: Middlemarch, Cochise Co., Ariz. Richard Gird, president; M. M. O'Gorman, vice-president; Wm. J. Gird, secretary and treasurer; preceding officers, Robert C. Davis and Edw. C. Kelley, directors. Organized under laws of California, with capitalization \$1,000,000, shares \$50 par. Lands, 43 claims, in 9 groups, which have had more or less desultory development in the past, 9 miles west of Pearce. Surface indications are promising, but development, to a limited depth, has shown no large ore bodies. Property is opened by the 165' Ella shaft, showing 4% ore; the 105' Emma shaft and the 120' Emma tunnel, the 344' Iron Age tunnel, crosscutting a 12' vein, and the 386' Carpeta tunnel, planned to cut rich ore outcropping on the surface of Richmond Hill, and a 90' tunnel on the Cobreloma claim, planned to penetrate Copper Glance Hill, which shows sulphide ore in a 70' shaft. There also are several other shallow shafts. Ore occurs in a mineral zone carrying 6 veins, substantially parallel, limestone and porphyry being the country rocks,

with a garnet capping that is 200' wide in places. Property has steam power and a telephone system. In 1906 company planned a consolidation with the Middlemarch Copper Co.

**CORRE MINING CO.****ARIZONA.**

Mine office: Silver Bell, Pima Co., Ariz. Lands, 15 claims, known as the Copper Prince group, circa one mile south of the Copper Giant, slightly developed by a two-compartment shaft. Presumably idle.

**MINAS DE COBRES DE CARRIZALILLO.****CHILE.**

Mine office: Chafiaral, Atacama, Chile. Property includes several old and deep mines, with one shaft 2,122' deep, but idle, because of heavy inflow of water, mine lacking adequate pumping equipment.

**COMPAÑIA MINERA LA COBERIZA.****MEXICO.**

Office: Monterey, N. L., Mex. Mine office: Santa Barbara, Hidalgo, Chihuahua, Mex. Donald R. Morgan, president and general manager; W. B. Van Voorhees, secretary; Edw. J. Cosman, superintendent. Capitalization, 500,000 pesos. Lands in the Chorreros Mountains, include the Brooks group, having 2 shafts. A concentrator is planned. Company also owns the Minillas mines, which have produced some auriferous silver-lead ore.

**COMPAÑIA MINERA LA COBERIZA.****MEXICO.**

Mine office: San Dimas, Durango, Mex. Idle and apparently moribund.

**COMPAÑIA MINERA LA COBERIZA y ANEXAS.****MEXICO.**

Mine office: Alamos, Sonora, Mex. Manuel Salazar y Perron, manager. Has argentiferous and auriferous copper ores, developed by shafts and tunnels.

**MINA COBERIZAS.****BOLIVIA.**

Office and mine: Lipes, Potosí, Bolivia. Is a considerable producer of native copper, making more or less silver as a by-product, both metals being found native, and in association. Is the largest Bolivian producer of native copper outside of the Coro Coro district.

**SOCIEDAD MINERA COCHAY-COCHA.****PERÚ.**

Mine office: Morococha, Junín, Perú. Organized 1894, under laws of Perú. Is controlled, through ownership of practically entire stock issue, by Cerro de Pasco Mining Co. Lands, 4 pertenencias, including the San Miguel, Victoria and several smaller mines. Main ore body is a fissure vein in diorite with northeast and southwest strike, traceable 1 mile, property also having other ore bodies of less importance, some of which are workable. The San Miguel mine has a 550-meter tunnel, giving a back of about 90 meters, with portal 2' above the level of Lake Morococha. Principal ores are enargite, tetrahedrite and chalcopyrite, with about 20,000 metric tons of high grade ore, averaging circa 17% copper and 7 oz. silver per ton, in sight. Has a pumping station, about 200 meters from mouth of tunnel. The San Miguel mine, opened 1894, produced to end of 1907, circa 40,000 metric tons of ore of 15% average copper tenor. Production, 1904, was 4,416 metric tons of ore yielding 1,947,102 lbs. fine copper, and, 1905, was 5,497 tons of ore averaging 11% copper and 2,166 grams silver per metric ton, secured at a cost of \$10.50 per ton, yielding 1,450,554 lbs. fine copper. Employs circa 300 men.

**COCHISE CONSOLIDATED COPPER CO.****ARIZONA.**

Office: 1404 Arrott Bldg., Pittsburg, Pa. Mine office: Paradise, Cochise Co., Ariz. Henry F. Alexander, president and general manager; W. C. Hagan, vice-president. Capitalization \$1,500,000, shares \$1 par.

Lands, 17 claims, circa 6 miles northeast of Paradise, including an unpopulated townsite called Pittsburg. Mine has the 150' Ainsworth shaft, sunk at 60°, and the Treasure shaft showing a 4' vein of medium grade chalcopyrite, claimed to give average assay values of circa \$75 per ton in copper, silver and gold, which is a serious overestimate. The 2-compartment 180'

Duplex shaft shows mixed sulphides carrying good values in copper, silver and gold, with heavy percentages of zinc. There also is a short tunnel.

Equipment includes a 150-h. p. Webber gasoline engine and a small electric light plant. The 50-ton mill is 62x100', having a crusher, 3 sets of rolls, 3 elevators, 2 jigs and 2 settling tanks. Water is supplied from 2 wells, and pumped into five 6,000-gallon tanks.

The company was in financial difficulties for some years, which culminated, 1907, in sale of property, by sheriff, for \$23,350, to Madison F. Larkin, et al., of Scranton, Pa., shareholders having 6 months in which to redeem the property. Apparently this sale was set aside by Judge Doane Oct. 31, 1907, and property was resold, by sheriff, June 27, 1908, to Gibson Abstract Co., as trustee, on 4 judgments, leaving Larkin the principal creditor. Company apparently is hopelessly involved, with remote prospects of saving its property.

#### **COCHISE COPPER CO.**

**ARIZONA.**

Mine office: Johnson, Cochise Co., Ariz. K. L. Hart, manager; Geo. M. Brown, superintendent. Lands carry the extension of the vein of the Peabody mine lying to the eastward. Has a shallow 2-compartment shaft, with circa 500' of workings.

#### **COCHISE COPPER MINING CO.**

**ARIZONA.**

Dead. Reorganized, August, 1905, as Cochise Development Co., Formerly at Bisbee, Cochise Co., Ariz.

#### **COCHISE DEVELOPMENT CO.**

**ARIZONA.**

Office and mine: Bisbee, Cochise Co., Ariz. Lemuel C. Shattuck, president; G. L. Jones, vice-president and general manager; Harry Duby, secretary; Joseph M. Muheim, treasurer; R. J. Ledwick, mine superintendent. Organized Aug. 1, 1905, under laws of Arizona, with capitalization \$1,000,000, shares \$10 par, succeeding the Cochise Copper Mining Co. Annual meeting, second Tuesday in January. Lands, 16 claims, area 176 acres, abutting on the Holbrook mine of the Copper Queen Consolidated, lying north of the Dividend fault and Dubacher gulch. Has a 600' 3-compartment shaft, with a drift on the 300' level showing small bunches of sulphide ore. Machinery includes a 10x30" first-motion double-drum hoist, good for 1,200', a 6-drill Sullivan straight-line air-compressor and a 100-h. p. Atlas boiler. Has an engine-house, boiler-house, 20x40' carpenter shop, 20x30' smithy and a coal trestle. Property considered promising. Idle.

#### **COCHISE EXPLORATION & DEVELOPMENT CO.**

**MEXICO.**

Office: Bisbee, Ariz. Mine office: Fronteras, Arizpe, Sonora, Mexico. Lands, at the southern end of the Ajo Mountains, about 25 miles west of Fronteras, show ores assaying well in copper, lead, silver and gold. Presumably idle.

#### **COCHISE MINING & MILLING CO.**

**ARIZONA.**

Dead. Formerly had copper claims in Cochise and Pinal counties, Arizona.

#### **COCHISE PROSPECTING, MINING & DEVELOPMENT CO.**

**MEXICO.**

Dead. Succeeded, Jan. 25, 1906, by Brooks Consolidated Copper Co. Formerly at Fronteras, Arizpe, Sonora, Mex.

#### **COCONINO COPPER CO.**

**ARIZONA.**

Dead. Formerly at Ryan, Coconino Co., Ariz. Property sold to Buckskin Mountain Copper Co. Very fully described Vol. III.

#### **COCOPAH COPPER CO.**

**CALIFORNIA.**

Office: 1014 Central Bldg., Los Angeles, Cal. Mine office: Needles, San Bernardino Co., Cal. Dr. S. D. Godshall, vice-president and manager; Dan Murphy, president; G. Holterhoff, Jr., secretary and treasurer. Lands are the Copper World group, formerly operated by the Ivanpah Consolidated Smelting Co., said to have produced circa \$500,000 worth of ore under former ownership.

**COEUR D'ALENE EAGLE MINING CO.****IDAHO.**

Office: care of C. E. Mitchell, secretary, Spokane, Wash. Mine office: Lane, Kootenai Co., Idaho. B. N. Danskin, president; R. H. Dunn, vice-president. Organized circa 1906, under laws of Washington, with capitalization \$1,500,000, shares \$1 par. Lands, 4 claims, area 80 acres, on Eagle Hill, 2 miles from Lane, having a 60' shaft and 115' tunnel showing auriferous and argentiferous lead and copper ores. Has a 5-drill air-compressor and 4 buildings. Resumed work January, 1908, after 4 months idleness.

**COEUR D'ALENE PACIFIC MINES.****IDAHO.**

Office: care of Dr. Jas. Sutherland, Spokane, Wash. Letter returned unclaimed from former mine office, Mullan, Shoshone Co., Idaho. J. A. Reinhart, vice-president; M. N. Stratton, secretary and treasurer; preceding officers, E. A. Patrick and E. Jessup, directors. Lands, 2 claims, near the Silver Cable mine, circa 9 miles east of Mullan, showing fair surface indications of lead and copper ore, with a short tunnel.

**ELBERT C. COFFMAN.****MEXICO.**

Mine office: Teocaltiche, Jalisco, Mex. Property is the San Felipe mine, carrying auriferous and argentiferous copper ores.

**COLDWATER COPPER MINING CO.****COLORADO.**

Office: 232 West Cedar St., Kalamazoo, Mich. Mine office: Encampment, Carbon Co., Wyo. Z. L. Baldwin, president; E. S. Drury, vice-president; Edwin Gillis, secretary and treasurer; Burr Lobdell, general manager. Organized May 18, 1900, under laws of Wyoming, with capitalization \$1,000,000, shares \$1 par. Lands, 5 claims, area circa 50 acres, also 20 acres miscellaneous lands, in the Pearl district of Larimer county, Colorado. Property, known as the Wolverine mine, has 3 fissure veins in granite and diorite, of which 1, of 20' estimated width, shows oxidized ores and native copper, with sulphides at a little depth, estimated to carry an average of 10% copper and 8 oz. silver per ton, opened by shafts of 80' and 170', bottom of principal shaft showing massive chalocite and a little disseminated chalcocite, of high average grade. Has steam power. Property is leased, for a 3 to 5 year term, to the Wolverine Leasing & Mining Co., composed of Coldwater shareholders. Idle.

**COLEBROOK PROSPECTING ASSOCIATION.****TASMANIA.**

Mine and works office: Rosebery, Montagu Co., Tasmania. Senator Clemons, chairman; Cecil Rae, smelter superintendent. Lands circa one mile from Rosebery, show chalcocite in a schistose gangue, said to be self-fluxing and adapted to cheap smelting. Mine is worked opencast, with 3 opencuts, and has a 1,000' gravity tram.

Smelter building is 50x60', with a 200-ton blast-furnace, which was in blast only 120 hours, after an expenditure of £7,000. Ore was estimated, by alleged careful sampling, to carry 3% copper, but smelting returns were under 1% copper. Smelted 800 long tons of ore to obtain 6½ tons of copper. Mr. Rae says the mine is worthless, and is accused, by directors, of making misleading reports. Idle since May, 1908. Company in debt, and bankruptcy apparently inevitable.

**COMPANIA MINERA DE COLLAHUASI.****CHILE.**

Office: Iquique, Chile. Mine office: Collahuasi, Tarapacá, Chile. Bartolomé Novoa, general manager. Lands, 28 claims, area 140 hectares, lying near the peak of the Cerro de Collahuasi, at an elevation of 4,480 meters above sea-level. Lands include various mines, deepest workings being 426', carrying fissure veins in porphyry having an oxidized zone of about 100 meters depth, which shows argentiferous copper ore averaging nearly 20% in tenor, succeeded by chalcocite. At beginning of 1907 ore in sight was 85,791 short tons, estimated to average 27.2% copper; on the floors and dumps were 25,866

tons, estimated to average 13.6% copper, a total of 111,657 short tons, with a general average tenor of 24% copper.

Principal property is the Pergolesi mine, having 8 levels opened on the Pergolesi and Delirio veins, showing ore of high average tenor.

The Don Eduardo mine has a 36' ore body, claimed to average 30% copper on the third level, which seems almost impossible, but the statement is fully vouched for by authorities of excellent standing. On the second level north the Don Eduardo has various veins of 3' to 4' thickness, giving average assays of 66% copper, presumably from massive chalcocite.

The San Nicolás mine has 2 levels opened, showing ores averaging 20% copper, with rich bunches up to 50% in tenor, in a vein of 18" to 8' width.

The Anita mine shows ore up to 50% copper tenor in rich chutes, with long stretches of barren ground intervening.

The Tiuque mine shows various small stringers of ore and has a vertical shaft which will cut the Tiuque vein at a depth of circa 45 meters.

The Esperanza mine has the Empalme shaft of 3x5 meters section, and plans sinking a new shaft 250 meters to the south.

The Sud-America mine has a 42' main shaft, showing a little ore.

Transportation formerly was by llamas to Cariote, nearest railroad station on the Ferrocarril Onera i Antofagasta, but the Ollagüe i Collahuasi railway was nearing completion at last accounts.

To end of 1903 the property produced circa 5,000 tons of ore averaging 32% copper, 600 grams silver and 2.3 grams gold per metric ton. Production, last half of 1906, was 4,218 short tons of ore, ranging 20 to 30% in copper tenor, of which 1,637 short tons were shipped, balance being held at mine. Production, 1907, estimated at 1,750,000 lbs. fine copper. Is a property of exceptional promise.

#### **COLLAHUASI SYNDICATE, LTD.**

Dead. Was organized Feb. 28, 1904, and reorganized Apr. 4, 1905, as Compañía Minera Poderosa de Collahuasi. Formerly at Collahuasi, Tarapacá, Chile.

#### **COLOMBIA GOLD & COPPER CO.**

#### **CHILE.**

Office: 71 Broadway, New York, N. Y. Thos. E. Moffat, president. Capitalization \$125,000, shares \$10 par. Lands are sundry undeveloped government concessions in the Republic of Colombia. Apparently company never made any effort to develop ore, and is regarded as a mere bit of stock-jobbery.

#### **COLONIAL COPPER CO.**

#### **COLUMBIA.**

Office: 716 Law Bldg., Baltimore, Md. Mine office: Cape D'Or, Cumberland Co., N. S. David H. Carroll, president; W. J. Sneeringer, vice-president; Frederick B. Beacham, secretary; Fletcher B. Speed, treasurer. Organized Jan. 19, 1899, under laws of West Virginia, with capitalization \$5,000,000, shares \$1 par; issued circa \$3,700,000. Bonds, \$300,000 authorized, at 6%; issued, \$140,000. Annual meeting, first Tuesday after first Monday in February.

Lands, circa 2,000 acres, well timbered, and circa 500 acres miscellaneous lands, showing 6 ore bodies, reported as fissure veins in Triassic trap, and contacts between trap and conglomerate, with nearly vertical dip, 3 deposits being more or less developed, one, of 25' reported average width, said to be traceable circa 6,500', having a 500' incline shaft and 2 vertical shafts, showing native copper, formerly reported as of 2.5% average tenor, but now reported by company as averaging 1% copper only.

There are 3 large and 6 small hoists, 3 small Rand air-compressors and about 20 small mine buildings. There is a 300 h. p. equipment at the mine, with 150 h. p. at the mill.

A 400-ton concentrator, circa 100x300' in size, has Blake crushers, rolls and 15 jigs, and is connected with the mine, 1½ miles distant, by a 36" narrow-

gange railway. Nearest railway is 30 miles, but property is located on the Bay of Fundy, with good shipping facilities by water.

Company also owns the New Annan mine, carrying sulphide ore in lenses, and the Chandos mine, in Peterboro county, Ontario, latter showing a 4' vein, said to assay 5% copper, both idle for some years.

Operations were suspended December, 1907, but company plans resumption. Production of mine has been about 40 tons fine copper, secured in the course of development.

#### **COLONIAL COPPER CORPORATION, LTD.**

#### **AUSTRALIA.**

Office: 615 Salisbury House, London, E. C., Eng. Mine office: Lithgow, Robinson Co., N.S.W., Australia. Geo. Hardie, chairman; C. P. Oswald, secretary, J. Wills, mine manager. Organized March 29, 1899, under laws of Great Britain, with capitalization £125,000, shares £1 par; issued, £102,507. Lands, 243 acres, freehold, including the Cow Flat mine, 20 miles from Lithgow. Idle some years.

#### **COLONIAL MINING CO.**

#### **ARIZONA.**

Mine office: Ehrenburg, Yuma Co., Ariz. Louis S. Judd, manager. Has argentiferous and cupriferous cinnabar, assaying up to 7% copper, 30% mercury and 150 oz. silver per ton. Has gasoline power and a 30-ton Scott furnace.

#### **MINA COLORADO.**

#### **MEXICO.**

Office: care of Independence Grove, owner, Guadalajara, Mexico. Lands, 10 hectares, on the Rio Palmarejo, circa 12 miles west of Ameca, Jalisco, Mexico, showing a vein of about 6' width, carrying auriferous and argentiferous copper and iron sulphides, opened by a 700' tunnel. Idle.

#### **MINA COLORADO.**

#### **MEXICO.**

Office and mine: care of Don Carlos Yanes, owner, San Javier, Alamos, Sonora, Mex. Idle.

#### **COLORADO-BOHEMIA MINING & MILLING CO.**

#### **COLORADO & OREGON.**

Office: 15 William St., New York, N. Y. Albert Hawkins, president; S. B. Henzer, secretary and treasurer. Organized under laws of Colorado, with capitalization \$1,250,000, shares \$1 par. Property claimed is sundry gold and copper claims, located in various districts of Oregon and Colorado. No traces of lands, and no traces of operations.

#### **COLORADO & CONNECTICUT GOLD MINING CO.**

#### **COLORADO.**

Office: 35 Wall St., New York. Wm. Garlick, president; Col. John A. Thompson, vice-president; A. S. Garlick, secretary. Organized 1902, under laws of South Dakota, with capitalization \$40,000, shares \$5 par, non-assessable. Lands, 3 claims, area 21 acres, known as the Dolly Varden mine, in the Galena district of Hinsdale county, Colorado, showing three 2' fissure veins, giving assays of 9 to 19% copper, with good silver values, from chalcopyrite, tetrahedrite and occasional argentite, opened by a 50' shaft and an 800' tunnel. Company's prospectus quotes Edwin J. Hulbert as predicting (in 1879) that this property will equal the Calumet & Hecla as a dividend-payer. The report by Mr. Hulbert is a most remarkable document, but not especially calculated to inspire confidence in the property by reason of the ridiculous comparisons made. Idle.

**COLORADO COPPER MINING CO.****COLORADO.**

Office: Salida, Colo. Mine office: Copperfield, Frémont Co., Colo. Organized under laws of New Mexico, with capitalization \$5,000,000. Was promoted by W. C. Calhoun, of Denver, one of the most notorious mining swindlers now out of jail. Apparently is a mere bit of stock-jobbery.

**COLORADO COPPER SYNDICATE, LTD.****COLORADO.**

Dead. Voluntarily wound up, April, 1901.

**COLORADO-ELY COPPER CO.****NEVADA.**

Mine office: Ely, White Pine Co., Nev. Capitalization \$1,000,000, shares \$5 par.

**COLORADO GOLD-COPPER MINING & TUNNEL CO.****COLORADO.**

Dead. Organized 1901, and was succeeded by Ouray Consolidated Mining Co. Formerly at Ouray, Ouray Co., Colo.

**COLORADO MINE.****MONTANA.**

Owned by Trenton Mining & Development Co.

**COLORADO MINING & DEVELOPMENT CO.****MONTANA.**

Dead. Title changed, 1904, to Wickes-Corbin Copper Mining Co. Formerly at Corbin, Jefferson Co., Mont.

**COLORADO MINING & SMELTING CO.****COLORADO.**

Letter returned unclaimed from former office and mine; Cañon City, Frémont Co., Colo. H. C. Tabor, general manager. Lands were in the western part of Frémont county, Colorado.

**COLORADO MINING & SMELTING CO.****MONTANA.**

Dead. Succeeded, 1905, by Trenton Mining & Development Co. Formerly at Butte, Silver Bow Co., Mont.

**COLORADO RIVER & ELY COPPER CO.****CALIFORNIA.**

Mine office: Klinefelder, San Bernardino Co., Cal. Organized 1906, under laws of Arizona, with capitalization \$1,000,000. Lands are the Desert Light and Big Foot groups, 4 miles from Klinefelder.

**COLORADO RIVER GOLD & COPPER CO.****CALIFORNIA.**

Office: 511 Bradbury Bldg., Los Angeles, Cal. Mine office: Parker, Yuma Co., Ariz. Geo. E. Bounton, president; J. L. Curtis, vice-president; E. S. Gannon, secretary and treasurer; T. M. Brennan, general manager; preceding officers, C. F. Gray, J. P. Elms and E. W. Peck, directors. Organized July 1, 1901, under laws of Arizona, with capitalization \$1,500,000, shares \$1 par; issued, \$1,230,000. Annual meeting, first Monday in January.

Lands, 10 claims, area 200 acres, and a 5-acre smelter site, in the Monumental district, 10 miles from the Arizona & California Railway, showing 12 ore bodies, occurring as fissures in altered granite, quartz-porphry and limestone, one vein of 12" to 30' width, traceable circa 6,000', being opened by 7 pits, shafts of 120' and 140', and 4 tunnels, of 15' to 310' length, with 1,400' of workings, estimated to show 20,000 tons of ore, with 12,000 tons blocked out for stoping. Ore is oxidized for shallow depth, succeeded by chalcopyrite said to give average assays of 8% copper, 1 oz. silver and \$1.5 gold per ton. Has river transportation to the camp. Company plans deepening shaft to the sulphide ore zone.

**COLUMBIA RIVER MINING & DEVELOPMENT CO.****CALIFORNIA.**

Letter returned unclaimed from former office, San Bernardino Co., Cal. Lands are 4 miles from Mono, the junction of the Bill Williams Fork river, a promising outcrop giving fair assays in gold.

**COLORADO & SONORA MINING CO.**

Mine office: La Cananea, Sonora, Mex. Superintendent. Presumably idle.

**COLORADO SPRINGS COPPER MINING & TUNNEL CO. COLORADO.**

Dead. Lands sold, January, 1906, to Michigan-Colorado Mining & Milling Co. Formerly at Florissant, El Paso Co., Colo.

**COLOSSAL GOLD & COPPER CO.****UTAH.**

Letter returned unclaimed from former office, care of Wallace W. Wait, Salt Lake City, Utah. Organized August, 1902, under laws of Utah, with capitalization \$600,000. Lands included the C. M. C. group, in Beaver county, Utah. Idle and apparently moribund.

**COLUMBIA BUTTE MINING & MILLING CO.****MONTANA.**

Office: Butte, Silver Bow Co., Mont. Mine office: Whitehall, Jefferson Co., Mont. J. L. Howard, general manager. Organized 1908, under laws of Montana, with capitalization \$100,000, shares 50 cents par. Lands, 8 claims, freehold, circa 6 miles northeast of Whitehall, having a crosscut tunnel and a 140' shaft showing a little gold ore.

**COLUMBIA COPPER CO.****ARIZONA.**

Dead. Lands sold, under judgment for \$4,000. Formerly at Globe, Gila Co., Ariz.

**COLUMBIA COPPER CO.****MEXICO.**

Dead. Property was sold, 1906, to Greene Gold-Silver Co. Formerly in state of Chihuahua, Mexico.

**COLUMBIA COPPER CO.****NEW MEXICO.**

Office: Guaranty Trust Bldg., El Paso, Tex. Mine office: Santa Rita, Grant Co., N. M. Colonel Lewis, president and general manager; Martin Fishback, vice-president; Samuel W. Biggs, secretary and assistant manager; Eugene E. Neff, treasurer; preceding officers, Jas. A. Carroll, Winchester Cooley and Geo. J. Wolfinger, directors; F. O. Wills, mine superintendent. Organized 1906, under laws of New Mexico, with capitalization \$1,000,000, shares \$1 par. Annual meeting, second Monday in July. Rio Grande Bank & Trust Co., El Paso, registrar.

Lands, 35 claims, area 700 acres, in 4 groups. The Gallinas group, 10 claims, 5 patented, 7 miles from Gallinas, in the Gallinas Mountains, has a 200' shaft, with 700' of workings, showing argentiferous copper and lead ores.

The Clearwater group, 4 claims, 2 patented, near Santa Rita, held under a two-year bond and lease, includes the Clearwater mine, having a new 2-compartment shaft, with hoist good for 1,000', with circa 1,000' of workings, showing considerable ore of 4 to 6% copper tenor.

The Columbia group, 9 claims, in Good Fortune Cañon, San Andres Mountains, circa 10 miles north of Three Rivers, has a 300' tunnel and a 52' shaft, showing oxidized ores giving average assays of 6.45% copper and 1 oz. silver per ton, and several carloads of ore have been shipped.

The Iron Mask group, 10 claims, in the White Mountains, near the Mescalero Indian reservation, shows a limonite gossan, apparently of commercial grade for iron ore, carrying traces of copper and silver.

Company employs 15 men, in development work, and shipped, 1907, a little ore from the Santa Rita properties. Officers are men of good standing.

**COLUMBIA COPPER MINING CO.****ARIZONA.**

Dead. Formerly at Clifton, Graham Co., Ariz.

**COLUMBIA COPPER MINING CO.****ARIZONA.**

Dead. Merged circa 1903, in Consolidated King Development & Columbia Copper Mining Co. Formerly at Jerome, Yavapai Co., Ariz.

**COLUMBIA COPPER MINING CO.****BRITISH COLUMBIA.**

Dead. Formerly at Princeton, Boundary district, B. C. Described Vol. VI.

Dead. Lands sold, 1903, to Ohio Copper Co. Formerly at Bingham Canyon, Salt Lake Co., Utah. Fully described Vol. III.

**COLUMBIA COPPER MINING CO.****WASHINGTON.**

Office: 1014 Spafford Ave., Spokane, Wash. Mine office: Conconully, Okanogan Co., Wash. E. P. Wheeler, president; W. D. Scott, vice-president; preceding officers, R. L. Campbell and G. W. Dickinson, directors. Organized March, 1904, under laws of Washington, with capitalization \$1,000,000, shares \$1 par; issued, \$615,000. Lands, 100 acres, well timbered, showing 2 ore bodies, largest of 9' estimated average width, also a low grade dyke of about 300' width, former giving ores, mainly bornite, assaying 5 to 6% copper, with traces of silver and \$3 to \$18 gold per ton. Has shafts of 30' and 40' and tunnels of 110' and 200'. About \$15,000 has been expended on the property.

**COLUMBIA COPPER MINING CO.****WYOMING.**

Mine office: Holmes, Albany Co., Wyo.. At last accounts was in litigation with the Duchess Mining, Milling & Smelting Co.

**COLUMBIA GOLD & COPPER CO.**

Office: 27 Central St., Boston, Mass. Location of lands, if any, unknown.

**COLUMBIA GOLD & COPPER MINING & SMELTING CO.**

Mine office: Rosalia, Whitman Co., Wash. Idle and apparently moribund.

**COLUMBIA MINE.****NEVADA.**

Mine office: Goodsprings, Lincoln Co., Nev. Lands, 6 claims, formerly owned by Columbia Mining Co., said to show a 30' vein averaging 15% copper, which is an overestimate all around, the carbonate and oxide ores carrying about 10% copper and up to \$10 gold per ton. The Extension vein, 3' wide, is opened to a depth of 230'. Mine has about 1,800' of workings. Property is considered promising.

**COLUMBIA MINING CO.****CALIFORNIA.**

Dead. Formerly at Needles, San Bernardino Co., Cal. Described Vol. VI.

**COLUMBIA MINING CO.****NEVADA.**

Dead. Formerly at Goodsprings, Lincoln Co., Nev.

**COLUMBIAN COPPER CO.****ONTARIO.**

Office: care of Hunt & Sutherland, Chamber of Commerce Bldg, Detroit, Mich. Property supposedly is in the Georgian Bay district of Algoma, Ontario.

**COLUMBIA RIVER GOLD MINING CO.****WASHINGTON.**

Mine office: Kettle Falls, Stevens Co., Wash. Col. J. M. Fish, president and general manager. Lands, 9 claims, on Gold Hill, opened by a tunnel and a 350' shaft, with about 2,000' of workings. Shaft shows a vein 5' wide at surface, 12' wide at 200' depth and 48' wide on the 350' level, at latter depth carrying a paystreak of 3' width. Company is said to have expended about \$65,000 on the mine. Has a 50-h. p. gasoline engine and a 3-drill air-compressor. Small sample shipments, 1905, gave returns of 22% copper, 3 oz. silver and \$4.60 gold per ton.

**COLUMBUS-BUTTE MINING CO.****MONTANA.**

Dead. Lost option, 1906, on Jennie Dell mine and adjoining claims. Formerly at Butte, Silver Bow Co., Mont. Fully described Vol. VI.

**COLUMBUS CONSOLIDATED MINING CO.****UTAH.**

Office: 37 Commercial Blk., Salt Lake City, Utah. Mine office: Alta, Salt Lake Co., Utah. Anthony O. Jacobson, president; Dr. W. R. Harlow, vice-president; S. A. Whitney, secretary and treasurer; preceding officers, Lewis A. Jeffs and Chas. A. Walker, directors. Organized 1902, under laws of Utah, and capitalization increased, 1904, to \$1,500,000, shares \$5 par. Begun quarterly dividends January, 1907, with a 15 cent disbursement, followed by 20 cent dividends in April and July, 1907, after which dividends were passed, total dividend disbursements, 1907, being \$212,623.50. Company ended 1907 with a debit balance of \$9,841, having been caught badly by the 1907 slump in the metal market.

Lands, 17 claims, area 275 acres, on both sides of Little Cottonwood Cañon, mainly on Old Flagstaff Hill, showing 9 fissure veins and contact deposits, 6 said to average 12' width. Principal ore body, known as the Braine fissure, of circa 12' average width, has been reached by 2 tunnels, 1,250' apart, practically on the same level, mine being opened by 4 shallow shafts and 4 tunnels, latest, a drainage tunnel, started 1907, circa 4,000' down the cañon, being planned to unwater the Columbus Consolidated and adjoining properties. Mine has about 3 miles of workings, new openings, 1907, being 3,427'. No. 5 shaft, in 1907, showed, on the 110' level, a large body of sulphide ore ranging 5 to 15% in copper tenor. Principal ore bodies are fissures and contacts in limestone and quartzite, with highly mineralized sections of 30' to 100' width and several hundred feet length, carrying concentrating and smelting ores, latter ranging up to 8% copper, 18% lead, 15% zinc, 60 oz. silver and \$4.50 gold per ton. Ores are carbonates at and near surface, succeeded by sulphides. Some trouble was had, 1908, with water from underground vugs. It is planned deepening the main shaft to 1,500'. The Holland and Columbus tunnels are connected on the Braine fissure, and the Holland tunnel has electric traction. Production is divided into 3 classes, first being copper ore, second silver-lead ores and third concentrates.

A Pelton water-wheel works under a head of 494', taking water through a 20" and 22" steel pipeline, of 4,500' length, developing 660-h. p., which is transformed into electricity by two 300-kw. dynamos, and carried to the mine by a 4½-mile transmission line. Foundations are in for a second wheel of the same size. At the mine there are four 25-h. p. hoists, good for 600' each, 10-drill Nordberg and 5-drill Ingersoll-Sergeant air-compressors, machine-shop and a sawmill.

The concentrator, of 150 tons daily capacity, was built from material secured out of two old 100-ton mills. Equipment includes a Gates gyratory crusher, 2 sets of Rogers rolls, six 3-compartment jigs and 7 Wilfley tables. Mill puts about 4 er-5 tons into 1, and concentrates are shipped, 16 miles, to Murray, for smelting.

The mine being located in a very rugged district, transportation facilities are poor, but have been much improved by a new wagon-road leading from the loading station to the railroad.

Production, 1907, was 6,865 wet tons, or 6,689 dry tons, of first-class ore, yielding \$259,359, or \$38.77 per ton, in addition to 10,569 dry tons of milling ore that gave average returns of \$11.88 per ton. Production was suspended, late 1907, and resumed circa April, 1908. The Columbus Consolidated is a valuable property, though dividend disbursements were too free, and the company was caught badly by the 1907 stamp in the metal market.

#### COLUMBUS EXTENSION MINING CO.

UTAH.

Office: care of Anthony O. Jacobson, president and general manager, Salt Lake City, Utah. Mine office: Alta, Salt Lake Co., Utah. Lands, circa 300 acres, near the Columbus Consolidated, having an old 140' tunnel. Is developing by a new tunnel, began May 20, 1906, planned to be driven 6,500' jointly by Columbus Consolidated and Columbus Extension.

#### COLUMBUS-WEDGE MINING CO.

UTAH.

Dead. Was succeeded, circa 1908, by Superior & Montana Mining Co. Formerly at Alta, Salt Lake Co., Utah.

#### COLUSA-LEONARD EXTENSION COPPER CO.

MONTANA.

Office and mine: Butte, Silver Bow Co., Mont. Dr. O. E. Whitford, president; Meyer Gensberger, vice-president; J. A. Talbot, treasurer; Arthur Smith, secretary. Organized Oct. 1, 1906, under laws of Arizona, with capitalization \$5,000,000, shares \$5 par. Trust Company of America, New York, registrar and transfer agent. Lands, 5 fractional patented claims, area 47 acres, form-

ing practically a parallelogram, some distance east of the Colusa and Leonard mines of the Boston & Montana and about 2,000' east of the Minnie Healy mine of the Butte Coalition, being near the Pittsburg & Montana. Has an 800' 3-compartment shaft, planned to be sunk to 1,500', on the Little MacQueen claim, lying about the center of the group. Shaft has cut several small stringers of ore assaying up to 9% copper, but none of commercial size, and has a 7' vein of 2% ore carrying a 14" paystreak said to range 8 to 10% in copper tenor, with small gold and silver values and some lead and zinc. Judging from neighboring properties on the east, ore will be found at considerable depth, if at all. Shaft was sunk on record time. Equipment includes a good air-compressor and temporary hoist, and the company was said to have ordered a 5-ton Nordberg first motion hoist, good for 2,000'. Mine is said to have a 400-gallon electric pump. Was promoted by same people who put out the Emma Mining & Development Co., which was a failure; the Reins Copper Co., which is in doubt, and the Butte & London Mining & Development Co., which also is in doubt. An attempt to place shares in London was not successful. Idle at last accounts.

#### **COLUSA-PARROT MINING & SMELTING CO.**

**MONTANA.**

Office and works: Butte, Silver Bow Co., Mont. Hon. Wm. A. Clark, president; Arthur H. Wethey, vice-president and general manager; W. M. Bickford, secretary; Fred Pratt, mill superintendent; David Mathews, smelter superintendent. Organized Nov. 26, 1897, under laws of Washington, with capitalization \$500,000, shares \$50 par. Has paid dividends, to the end of 1906, of \$2,080,000, and surplus, Jan. 1, 1907, was \$1,391,656.

Property is a concentrating and smelting plant, known as the Butte Reduction Works, on the flat south of Butte, overhauled and largely rebuilt, 1905-1906, at a cost of circa \$300,000, and partially destroyed by fire February, 1906, after which again thoroughly rebuilt.

The 1,000-ton concentrator puts 4 tons into one. Equipment includes a 15x24" Blake crusher, five 9x15" crushers, ten 6' Chilean mills, nine 16x30" Cornish rolls, 62 two-compartment and 3-compartment Hartz jigs and 76 Wildley tables. Concentrates carry 15 to 20% silica.

The smelter has 5 Wethey and 2 McDougall calciners. Crude ore fines are mixed with concentrates, and the roasted product carries 5 to 7% sulphur only. High-grade ore requiring no concentration is desulphurized by kiln-roasting, going thence to the blast-furnaces. There are two 150-ton blast-furnaces and three 80-ton 20x60' reverberatory furnaces. Waste gases from the reverberatories are utilized for power purposes. The main dust-chamber, 60' to 80' wide, 30' high and 360' long, has brick walls and sheet steel roof. The smelter has the largest concrete stack ever built, this being 352' 7" high, with a uniform diameter of 18' from top to bottom. Material required for this stack included 60 tons of steel, 1,500 barrels of Portland cement and 1,400 tons of sand. The foundation, 100' square and 3' deep, weighing 12,800 tons, is made of molten slag, in solid blocks, interlaced with 70 tons of scrap iron and steel, leading from the base into the bottom of the stack. Above the foundation of slag is a solid block of concrete, 42' 6" square, 5' high at the sides and 8' 6" high in the center, with four layers of 1 $\frac{1}{4}$ x1 $\frac{1}{4}$ " "T" iron, also 500 bars of the same size "T" steel, radiating in a circle from the chimney opening. The stack was built at the rate of about 30' per week.

The converter building, 100x225', of steel, has 2 stands, with room for a third, and six 84x126" shells, electrically rotated. These works treat the ores of the Original Consolidated Mining Co., and are modern and efficient, with a capable management.

#### **COMANCHE CONSOLIDATED COPPER CO.**

**NEW MEXICO.**

Office: 1201 Alaska Bldg., Seattle, Wash. Mine office: Fairview, Sierra Co.,

N. M. J. J. Haggerty, president; P. D. Johnson, vice-president; Marcus Murray, treasurer; Maurice D. Leehey, secretary; preceding officers, J. B. Taylor, Mangus McIntosh and J. C. Arkard, directors; Harry B. Johnson, general manager. Organized 1906. Lands, 14 claims, 10 miles from Fairview. Presumably idle.

**COMANCHE MINE.****MONTANA.**

Owned by Boston & Montana Consolidated Copper & Silver Mining Co.

**COMANCHE MINING & SMELTING CO.****NEW MEXICO.**

Office: 46 Loan & Trust Bldg., Milwaukee, Wis. Mine and works office: Silver City, Grant Co., N. M. S. S. Curry, president; Geo. J. Lonstorf, vice-president; Hugh F. Ellard, secretary; Carl Landsee, treasurer; Hon. E. A. Wayne, trustee. Organized 1902, under laws of Arizona, with capitalization \$5,000,000, shares \$1 par.

Lands, 38 claims, area 760 acres, with sundry ranch and orchard lands, including the Burro Mountain and Pinos Altos groups, in the Burro Mountains, circa 13 miles from Silver City. Mines are the Hearst, Pacific, Kept Woman, Gillette and Oquawka, also the Iron Mountain mine of hematite, used for fusing ore.

The Burro Mountain group shows 3 lenses, carrying oxide, carbonate and silicate ores, said to give average assays of 5 to 8% copper, with only nominal gold and silver values, with indications of sulphides at a little greater depth.

The Pinos Altos mines were considerable producers for some years, under the ownership and management of the late Senator Hearst. The group shows 4 fissure veins, opened by 4 shafts of 400' to 700' depth. The Gillette is the main working shaft. Ores are cuprite, malachite, azurite and chrysocolla in the upper workings, with sulphide ores below that give returns up to 3% copper, 15 oz. silver and \$7 gold per ton, with occasional zinc up to 20% in tenor. The Pinos Altos group has large bodies of low-grade ore developed.

The mines and works are connected by a 13-mile narrow-gauge railway, from Pinos Altos to Silver City, built 1905-1906.

The reduction plant, replacing the old works, burned 1903, includes a concentrator 1,500' west of the smelter, having magnetic separators for the extraction of zinc.

The smelter has 250-ton and 300-ton blast-furnaces, with converter turning out blister copper of 98% tenor, including 150 oz. silver and 10 oz. gold per ton, silver and gold being secured mainly from custom ores. Slag losses were 0.39% copper. The reduction works includes a briquetting plant, machine-shop, iron foundry, smithy, electric light plant, office building and a number of dwellings for employees.

The company came to grief, late 1907, when an attempt was made to levy a 10-cent voluntary assessment, which was not paid—such assessments never are. A receiver was appointed, December, 1908, the company's debts amounting to \$402,096. Property has been idle since late in 1907, but, in October, 1908, plans were under way for a merger of the Comanche with the Copper Gulf Mining Co., under title of Savanna Copper Co.

**COMPANIA MINERA DE COMBARBALÁ.****CHILE.**

Office: Valparaiso, Chile. Mine offices: Combarbalá, Coquimbo, Chile, and Illapel, Coquimbo, Chile. Organized Oct. 31, 1906, under laws of Chile, with capitalization 400,000 pesos, shares 25 pesos par.

**COMET GOLD & COPPER MINING CO., LTD.****IDAHO.**

Office: Wallace, Idaho. Mine office: Mulan, Shoshone Co., Idaho. Archibald McClellan, president; J. L. Whalen, secretary. Lands, 4 claims, adjoining the Springfield, on the western slope of Steeves Peak, opened by tunnel, with about 1,000' of workings.

**COMMERCE GOLD & SILVER MINING CO.**

ARIZONA.

Dead. Formerly at Duncan, Graham Co., Ariz.

**COMMERCIAL CORPORATION, LTD.**

SPAIN.

Office: 4 Union Court, London, E. C., Eng. Spanish general office: Pelayo 2, Barcelona, Spain. Mine office: Huercal-Overa, Almeria, Spain. Jas. Taylor, chairman; Henry R. Gardiner, secretary. Organized May 10, 1897, under laws of Great Britain, with capitalization £500,000, in £494,000 ordinary and £6,000 deferred shares of £1 par; issued, £302,000 ordinary and £4,100 deferred. Property is sundry lands carrying copper, nickel and cobalt ores, in process of development at last accounts.

**COMMERCIAL MINING CO.**

ARIZONA.

Office: Prescott, Ariz. Mine office: Maxton, Yavapai Co., Ariz. Lands, in the Copper Basin, are extensively developed, and considerable production was secured by leasers, 1907, output being 694,126 lbs, fine copper.

**COMMODORE COPPER MINING CO.**

WYOMING.

Dead. Formerly at Encampment, Carbon Co., Wyo.

**COMMODORE MINES, LTD.**

BRITISH COLUMBIA.

Letter returned unclaimed from former office, Vancouver, B. C. Mine office: Van Anda, Texada Island, B. C. Bruce Kirk, chairman; H. W. Pegram, secretary; W. Thos. Newman, manager. Organized June 20, 1902, under laws of British Columbia, with capitalization \$750,000, shares \$10 par.

Lands, near the Marble Bay mine, show 3 veins that can be worked from the same set of openings, there being a 2-compartment 200' main shaft, with about 2,000' of workings. Development is on the main or contact vein, between limestone and eruptive rocks, showing argentiferous and auriferous chalcopyrite, associated with sphalerite and galena, of good average tenor. Equipment includes a 16-h. p. Jenckes hoist, Cameron sinking pump, duplex Morris station pump and several mine buildings. Employed 12 men, latter half of 1907. Property considered promising.

**COMMONAGE COPPER SYNDICATE, LTD.**

TRANSVAAL.

Office: 8 Bain's Bldgs, Johannesburg, Transvaal. Mine office: Upington, Transvaal. H. Southcott, secretary; Chas. O. Bain, David Poole, E. Parsley, E. J. Pullinger and W. J. Holmes, directors. Organized July, 1908, under laws of Transvaal, with capitalization £3,000, shares £1 par. Lands, circa 2,000 acres, in 2 equal tracts, with privilege of 99-year lease on the basis of 1% of gross value of output, also 2 options of 7,750 morgen each on the Bethesda group, having 7 miles of frontage on the Orange river, showing a vein of 12" to 24" width, traceable circa 1,000', giving samples of ore assaying 15% copper and 14 dwts. silver per long ton.

**COMMONWEALTH MINES CO.**

UTAH.

Office: care of Newton A. Dunyon, Salt Lake City, Utah. Mine office: Milford, Beaver Co., Utah. Wm. M. Bradley, vice-president; W. T. Aiken, secretary and treasurer; preceding officers, C. H. Strevell and Jas. H. Paterson, directors. Organized November, 1906, under laws of Wyoming, with capitalization \$600,000, shares \$1 par. Lands, 7 claims, in the Star district, adjoining the Hub property on the east, and near the Burning Moscow mine, supposed to carry the extension of ore bodies of the Cactus mine. Considerable lead ore was produced from surface workings, in the past, and the Nellie claim shows copper sulphides at bottom of workings. Property shows a broad contact zone between granite and porphyry, intersected by 6 cross-fissures showing ores assaying well in copper, lead and silver. The Beaver claim shows ores giving average assays of 13.2% copper and 17.2 oz. silver per ton, with more or less lead. Property considered promising.

**COMMONWEALTH MINING CO.**

MEXICO.

Office: Boston, Mass. Mine office: Ocotlán, Ocotlán, Jalisco, Mex. Lands,

23 acres, known as the Humboldt mine, having a 42' crosscut shaft on a 12' vein giving assays up to 6% copper, 62% lead, 500 grams silver and 6 grams gold per metric ton.

**COMPTON COPPER CO.**

Dead. Property was the House mine, circa 30 miles south of Casa Grande, having a 65' shaft, with gasoline power. Formerly at Casa Grande, Pinal Co., Ariz.

**COMORA MINING CO.**

**IDAHO.**

Mine office: Kelton, Box Elder Co., Utah. E. Rammelmeyer, superintendent. Lands, in Cassia county, Idaho, show argentiferous and auriferous lead and copper sulphides, mainly former, galena assaying up to 79% lead, 119 oz. silver and \$1.20 gold per ton. Has a 250' shaft with about 600' of drifts, on a 6' vein carrying a 12" paystreak of massive galena. Wagon freight to Kelton is \$7 per ton.

**COMSTOCK COPPER MINING CO.**

**IDAHO.**

Office: care of John H. Nordquist, Wallace, Idaho. Mine office: Burke, Shoshone Co., Idaho. Organized under laws of Idaho, with capitalization \$1,500,000, shares \$1 par. Lands are on Baldy Mountain, east of Burke.

**COMSTOCK COPPER MINING SYNDICATE.**

**AUSTRALIA.**

Mine office: Gloucester, N. S. W., Australia. W. J. Gillam, secretary. Capitalization £30,000. Has received a government grant in aid of prospecting. Lands, circa 30 miles from Gloucester, show a 6' vein, opened by a 55' shaft and a 100' tunnel, exposing high grade carbonates, with sulphide ore at shallow depths, giving assays up to 23.61% copper, 21 oz. silver and 3.7 dwts. gold per long ton. Is supposed to be building a small smelter.

**COMSTOCK MINE.**

**WYOMING.**

Office and mine: Hecla, Laramie Co., Wyo. Martha Ferguson, owner. A. H. Lindsey & Co., lessees, at last accounts. Has a 150' shaft and a 300' tunnel, showing small bunches of chalcopyrite.

**COMSTOCK MINING CO.**

**WYOMING.**

Dead. Formerly at Encampment, Carbon Co., Wyo. Fully described Vol. VI.

**COMPÀNIA MINERA CONCEPCIÓN DEL ORO.**

**MEXICO.**

Mine office: Concepción del Oro, Mazapil, Zacatecas, Mexico. Santiago Chamberlain, president; J. L. Kowalski, secretary and general manager; Santiago Chamberlain, Jr., superintendent; Juan Sanchez, mining captain. Organized 1902, with capitalization \$30,000, shares \$30 par. Lands, 32 pertenencias, area circa 80 acres, in the Mazapil district. A 4' vein carries oxide ores assaying 30% copper, with gold and silver values. Shaft, 33 metres. Ore is shipped 336 miles to smelters at San Luis Potosí. Has gasoline power.

**GEWERKSCHAFT CONCORDIA.**

**GERMANY.**

Mine office: Herdorf, Rheinprovinz, Germany. Was a very small producer of copper ore at last accounts.

**COMPÀNIA MINERA CONCORDIA DE COLLAHUASI.**

**CHILE.**

Office: Iquique, Chile. Mine office: Collahuasi, Tarapacá, Chile. Organized March 17, 1906, under laws of Chile, with capitalization 120,000 pesos, shares 100 pesos par. Property is the Concordia mine, undergoing development.

**CONCRETE GOLD MINING CO.**

**COLORADO.**

Office: 324 Cooper Bldg., Denver, Colo. Mine office: Central City, Gilpin Co., Colo. Sam'l. V. Newell, superintendent, at last accounts. Ores carry gold, silver, lead and copper. Has steam power. Presumably idle.

**COMPÀNIA MINERA CÓNDOR DE COLLAHUASI.**

**CHILE.**

Office: Iquique, Chile. Mine office: Collahuasi, Tarapacá, Chile. Organized July 4, 1906, under laws of Chile, with capitalization £50,000, shares £5 par.

**COMPAÑIA MINERA DE CONDORIACO.****CHILE.**

Mine office: La Serena, Coquimbo, Chile. Has steam power and employed about 75 men at last accounts. Presumably idle.

**CONFEDERATE MINING CO.****ARIZONA.**

Office: care of Col. Lee Crandall, president, Washington, D. C. Maj. D. W. Crabb, secretary and treasurer; Carl Crandall, manager. Organized Sept. 6, 1901, under laws of Arizona, with capitalization \$1,000,000, shares \$1 par. Property is the Candelaria group, on Reno Mountain, Maricopa county, Arizona, opened by shafts of 30', 60' and 64', said to show a 12' vein of sulphide ore, carrying a 4' paystreak, giving assays of 20% copper. Idle for several years.

**CONGLOMERATE MINING CO.****UTAH.**

Office: care of G. Lavagnino, Denver, Colo. Mine office: Bingham Canyon, Salt Lake Co., Utah. A. P. Hanson, consulting engineer. Idle.

**CONGO MINE.****WYOMING.**

Mine office: Dillon, Carbon Co., Wyo. C. L. Flammé, manager. Lands, north of Dillon, opened mainly by tunnel to depth of 250', show a ledge up to 40' in width, carrying a paystreak of about 4' of concentrating ore. Is said also to have struck a 25' body of copper ore of good grade. Is said to contemplate building a small concentrator or matting furnace.

**CONGOR GOLD & COPPER MINING CO.****UTAH.**

Office: 506 Auerbach Bldg., Salt Lake City, Utah. Mine office: Bingham Canyon, Salt Lake Co., Utah. Glen R. Bothwell, president and general manager; R. C. McConaughy, vice-president; Frank E. Loose, secretary; preceding officers, E. F. Jenkins and C. G. Hall, directors. Capitalization increased, 1907, from \$200,000 to \$1,000,000, shares \$1 par. Lands, 10 claims, area circa 150 acres, adjoining the Dalton & Lark mine, with about 400' of workings, showing copper sulphides.

**CONGRESO COPPER (MEXICO), LTD.****MEXICO.**

Office: 134 Salisbury House, London Wall, London, E. C., Eng. G. H. Phillips, chairman; Dr. T. R. Marshall, resident managing director; G. H. Bullock, secretary; Fredk. Swinney, superintendent. Organized June 23, 1906, under laws of Great Britain, with capitalization, £20,500, in 20,000 ordinary shares, £1 par, and 10,000 deferred shares of 1s. par. Lands, circa 150 acres, adjoining the Congreso mine. Employed 40 men at last accounts.

**CONGRESS GOLD & COPPER CO.****COLORADO.**

Office and mine: Silverton, San Juan Co., Colo. J. B. Ross, president and general manager; Jacob Ross, vice-president; Frank L. Ross, secretary and treasurer; preceding officers and Isaac D. Smead, directors; M. E. Rumery, mine superintendent. Organized Apr. 16, 1908, under laws of Colorado, with capitalization \$500,000, shares \$10 par. Bonds, \$100,000 authorized, at 6%; none issued. Lands, 3 claims, area 30 acres, in the Red Mountain district, carrying 5 ore bodies, opened by a 350' shaft, with 1,500' of workings, showing ore reported to assay 15 to 20% copper, 5% lead, 5.1% zinc, 8 to 20 oz. silver, and 0.5 to 1.5 oz. gold per ton. Property was worked 1883-1902, and is said to have produced circa \$400,000 in ore. Has a 50-h. p. steam plant. Company plans deepening main shaft 100' and opening the 5 ore bodies on one level.

**CONGRESS GOLD & COPPER MINING CO.****WASHINGTON.**

Letter returned unclaimed from former office, Spokane, Wash. Mine office: Keller, Ferry Co., Wash. Joseph Roslow, president; J. Goodrich, secretary. Lands, circa, 80 acres, opened by shafts and tunnels, on 2 veins giving good assay values in gold, silver and copper, with a little nickel. Idle and apparently moribund.

**CONQUEST CONSOLIDATED MINING CO.****WASHINGTON.**

Office: 253 Broadway, New York, N. Y. Mine office: Newport, Stevens Co., Wash. Wm. Coverley, president; Robt. Caddock, vice-president; W. C. Ingalls, secretary; A. W. Lindsay, treasurer. Organized under laws of Washington, with capitalization \$5,000,000, shares \$1 par, as a merger of Conquest Copper & Gold Mining Co. and American Eagle Gold Mining Co. Annual meeting, second Tuesday in November.

Lands, 15 claims, area 300 acres, in the Newport district of Washington and Idaho, showing 7 ore bodies, of which one, under development, 1' to 6' wide and traceable circa 2,000', is opened by a 186' shaft and by tunnels of 200', 700' and 500', with circa 3,000' of workings, showing slightly auriferous and argentiferous copper sulphides of concentrating grade, with considerable ore blocked out and on the dump. Has steam power, with hoist good for 1,000', and several mine buildings. Idle since April, 1907, from lack of cash. Property considered promising.

**CONQUEST GOLD & COPPER MINING & MILLING CO. WASHINGTON.**

Dead. Reorganized, circa 1902, as Conquest Consolidated Mining Co. Formerly at Newport, Stevens Co., Wash.

**CONRAD CONSOLIDATED MINE.****AUSTRALIA.**

Dead. Succeeded, 1906, by Conrad Stannite Mines, Ltd. Formerly at Howell, Hardinge Co., N.S.W., Australia.

**CONRAD STANNITE MINES, LTD.****AUSTRALIA.**

Office: 13 Austin Friars, London, E. C., Eng. Mine office: Howell, Hardinge Co., N.S.W., Australia. Sir W. L. Young, chairman; R. Randall Stevens, secretary. Organized Feb. 14, 1906, under laws of Great Britain, with capitalization £500,000, shares £1 par; issued £375,000. Lands, 10 leases, area 294 acres, including the Conrad and King Conrad mines, in the parish of Mayo. The geology is unusual, country rock being granite carrying a fissure vein at 20° to 30° width, without faults, so far as developed. Ore is an intimate mixture of copper, lead and tin sulphides, principal values being in tin. The ores include slightly argentiferous galena, chalcopyrite, stannite and pyrite, with small quantities of sphalerite, stannite being a rather rare member of the pyrite family, carrying circa 27.5% tin, 29.5%, copper, 13.1% iron and 29.9% sulphur. Mine, opened to depth of 400', has estimated ore reserves of about 200,000 tons. Ore stands well, requiring little timbering.

Ore is hand-sorted at surface before sent to 2 mills using the Wetherill magnetic process. Two classes of concentrates are made, the first being silver-lead, which is easily separated by jiggling, the second concentrate consisting of a mixture of copper and tin with a small amount of galena and zinc.

The smelter has a 30-ton water-jacket blast-furnace, 10-ton reverberatory furnace and 3-ton slag furnace for treatment of tin slags. In the blast-furnace the tin and copper separate, product being a white metal carrying mainly copper, with small percentages of tin and lead, bulk of the tin being thrown off in the slags, which are remelted in the tin furnace. Employs circa 200 men.

**COMPANIA MINERA LA CONSECUENCIA DE SANTA ROSA. CHILE.**

Office: Iquique, Chile. Mine office: Santa Rosa, Tarapacá, Chile. Organized Aug. 3, 1904, under laws of Chile, with capitalization, 64,000 pesos, shares 100 pesos par.

**CONSERVATIVE MINING CO.****WASHINGTON.**

Office: Snohomish, Wash. Letter returned unclaimed from former mine office, Silverton, Snohomish Co., Wash. Frank M. Evans, president; Hugh Kennedy, secretary and manager. Organized under laws of Washington, with capitalization \$200,000, shares 20 cents par. Lands, 10 claims, known as the St. Louis group, 3 miles from Silverton, said by company to show a 15' vein—

which is called by others a vein of 18" to 36" width—carrying argentiferous and auriferous chalcopyrite, assaying up to 20% copper. Idle and apparently moribund.

#### **CONSOLIDATED AFRICAN COPPER TRUST, LTD.**

**RHODESIA.**

Office: 8 Old Jewry, London, E. C., Eng. Mine office, Bulawayo, Rhodesia. Dr. Hans Sauer, chairman; preceding officer, J. H. Walker, H. D. Boyle, E. R. Tymms and J. Seear, directors; P. S. Inskip, J. D. McDonald and Geo. Mitchell, local committee; Consolidated Gold Fields of South Africa, Ltd., consulting engineers and secretaries; Cyril E. Brackenbury, general manager.

Organized Feb. 17, 1902, under laws of Great Britain, with capitalization £600,000, shares £1 par, in £50,000 cumulative 7% preference shares and £550,000 ordinary shares; issued, £534,000. The preference shares carry the right, until August, 1910, to purchase one share of Edmundian Copper Mining Co., Ltd., at par. Preference shares are convertible, at option of holder, into ordinary shares at par. On August 7, 1907, company floated the Edmundian Copper Mining Co., Ltd., controlling the latter through ownership of £85,000 in stock, of the capitalization of £135,000, apparently holding all of the present issued stock of the Edmundian.

Lands are 1,587 claims, including 135 in the Lomagunda district, 900 in the Victoria district, 30 in the Kafue district, 20 in the Umtali district, 70 in the Tuli district of Mashonaland, 60 in Bechuanaland, including coal lands. The Mozambique claims, 202½ in number, in Portuguese East Africa, were sold to the Edmundian Copper Mining Co., Ltd.

The Alaska mine, 90 miles northwest of Salisbury, shows the second largest ancient workings in Rhodesia, having ore bodies estimated at 150' width and 1,700' length, which estimate seems high. Numerous drill-cores from depths of 200' to 800' show copper ore, and the company estimates that 150,000 tons of cupriferous schists, of 3% tenor, are exposed above the water-level. Company has expended £13,011 on the Alaska mine, which has been idle some years.

The Umkondo mine, in the Victoria district, 10 miles west of the Subeni river, and circa 115 miles east of Victoria, by wagon road, shows ancient workings inferior only to those of the Alaska, extending over 300' in width, and circa 1,500' in length, with some open pits of 60' depth, and small shafts with ore stoped out to the water-level. The Umkondo has been tested extensively by diamond drill, cores giving average assays of circa 9% copper. Several shafts have been sunk, showing 2 veins, with a shallow oxidized zone, company estimating reserves at 81,000 long tons of ore at 8.5% average copper tenor. To June 30, 1907, the company had expended £30,060 on development at the Umkondo.

The properties of this company are extensive, and both the Alaska and Umkondo mines are of promise, and management is considered good.

#### **CONSOLIDATED ARIZONA GOLD & COPPER CO.**

**ARIZONA.**

Office: Phoenix, Ariz. Mine office: Troy, Pinal Co., Ariz. Property is the Lucky Boy mine, carrying gold and copper ores.

#### **CONSOLIDATED ARIZONA SMELTING CO.**

**ARIZONA.**

Office: 1212-71 Broadway, New York, N. Y. John L. Elliott, president; L. Vogelstein, vice-president; Wm. Schall, Jr., treasurer; preceding officers, G. Haven, Jr., Chas. J. Peabody, Chas. D. Chapman and Henry A. James, directors; J. K. Rice, receiver. Organized 1906, under laws of New Jersey, with capitalization \$17,500,000, shares \$10 par; issued \$16,000,000. Property is practically the entire stock issues of the Arizona Smelting Co. and the De Soto Mining Co., which are separately described, and it is said that practically the entire stock issue of the Consolidated Arizona Smelting Co. is controlled by the Consolidated Arizona Smelting & Securities Corporation.

Upon Thos. W. Lawson becoming financially interested in this company, it promptly went bankrupt, in 1907. Assets are figured by court appraisers at \$1,165,417. Efforts, for nearly a year, to reorganize, have been unsuccessful, and the company's prospects are not bright.

**CONSOLIDATED BIG LEAD & CALUMET MINING CO.** **ARIZONA.**

Mine office: Kelvin, Pinal Co., Ariz. Lands include the Calumet mine, said to have been bought for \$40,000 cash, which shipped 147 carloads of ore up to August, 1907. Presumably idle.

**CONSOLIDATED CENTRAL BUTTE COPPER MINING CO.** **MONTANA.**

Letter returned unclaimed from former mine office, Butte, Silver Bow Co., Mont. Augustus T. Morgan, D. J. Charles, William V. Lalor, Robt. M. Cobban, Elmer D. Hershey, R. H. Wearing and R. E. Jones, directors. Organized Oct. 27, 1906, under laws of Montana, with capitalization \$1,200,000, shares \$1 par. Lands are sundry claims near the South Butte, also claims east and west of the Ophir mine of the Butte Central & Boston. Lands are said to show several veins of 1' to 4' width. Idle.

**CONSOLIDATED COPPER CO.** **BRITISH COLUMBIA.**

Dead. Formerly at Ainsworth, Kootenay district, B. C.

**CONSOLIDATED COPPER CO.** **NEVADA & UTAH.**

Dead. Was organized May, 1907, under laws of Delaware, with capitalization \$50,000,000, shares \$5 par, and name changed, April, 1908, to Coppermines Co. Formerly at Ely, White Pine Co., Nev.

**CONSOLIDATED COPPER CO.** **OREGON.**

Office: Anderson, Ind. Mine office: Homestead, Baker Co., Ore. Organized Sept. 25, 1905, under laws of Oregon, with capitalization \$2,500,000, shares \$10 par, by Wm. Robertson, Wm. Garretson and A. E. Johnson, to develop copper claims on the Snake river, near Homestead. Idle.

**CONSOLIDATED COPPER CO., LTD.** **CORSICA & MEXICO.**

Letter returned unclaimed from former office; Dashwood House, London, E. C., Eng. Mine office: Charcas, Moctezuma, San Luis Potosi, Mex. F. Hawdon, chairman; S. J. Crouch, secretary; Thos. P. Rowe, manager. Organized June 10, 1899, under laws of Great Britain, as a reconstruction of the New Consolidated Mining Co., Ltd., with capitalization £100,000, shares 10s. par. Lands include La Bufa de Charcas and sundry adjoining claims, carrying copper, silver and lead ores, in Mexico, also the Lancene copper mine at Bastia, Corsica, which has been idle for some years.

**CONSOLIDATED COPPER CO. OF LOWER CALIFORNIA.** **MEXICO.**

Office: 301 Bradbury Bldg., Los Angeles, Cal. Letter returned unclaimed from former mine office, San Quintin, Norte, Baja California, Mex. W. E. Simpson, president; Wm. C. Mullock, vice-president; E. T. Wright, secretary; J. M. Stead, treasurer; preceding officers, C. A. Ford, W. I. Hollingsworth, Geo. P. Brown, Walter H. Wren and I. L. Pike, directors. Organized 1905, with capitalization \$1,000,000. Lands, 48 hectares, also a 50-acre millsite, lying 4 to 50 miles from tidewater, several miles inland from Punta Canoas, below San Quintin. Lands are said to show 18 veins, of 10' to 50' width, all carrying carbonate and oxide ores with quartz gangue averaging better than 6% copper, which is manifestly improbable. Mines were claimed by old owners to show upwards of 250,000 tons of ore averaging 10% copper, 18 oz. silver, and 15 to 16 oz. gold, which is a self-evident fabrication. Property includes the Julio Caesar and Santa Maria mines, latter said to have a 120' vein opened by shaft, and has wagon roads from principal mines to San Quintin. Mill, rated at 100 tons capacity, has 5 Newnham crushers. Property also has a 100-ton leaching plant.

**CONSOLIDATED COPPER CO. OF PARRY SOUND.** **ONTARIO.**

Office: 705 Palladio Bldg., Duluth, Minn. Mine office: Parry Sound,

Parry Sound district, Ont. Robt. Forbes, president; Robt. Millard, vice-president; J. G. Harris, secretary and treasurer; preceding officers, A. C. Le Bicheux, Frank Cox, M. A. Ryan, Dr. J. D. Budd, F. L. Young and C. J. Jackes, directors; John Moffatt, general superintendent. Organized February, 1902, under laws of Ontario, with capitalization \$5,000,000, shares \$1 par; issued, circa \$3,100,000. Has no bonds or liabilities.

Lands, circa 1,500 acres, practically all patented, carrying considerable standing timber, in Foley, McDougall, Haggerman and Conger townships. Property formerly was held by Hattie Belle Gold, Copper & Nickel Co., which claimed 4,000,000 tons of ore in sight, of \$10 to \$15 average value per ton, which was untrue. Ores occur as contact veins, between slate and quartzite, and as fahlbands, ore being mainly chalcopyrite, with occasional bornite and chalcocite, mainly low in grade but with occasional seams of high grade ore. There are 18 different ore bodies, shown by test-pits and stripping, of which 2 are somewhat developed. The fahlbands are said to show a width of more than 1,000', carrying 7 bands of fairly good ore, of 200' estimated aggregate width, between which is low grade ore, part of which may be amenable to concentration. Ores assay 1.5 to 12% copper, circa 3 oz. silver, and from a few cents up to \$8 gold per ton. Property has a 180' vertical shaft, and about 25 pits of 10' to 80' depth.

The Spider Lake mine has a shafthouse, and steam hoist good for 500', with necessary mine buildings, and a considerable ore body has been exposed by trenching.

The Leflex mine has shafts of 90' and 40', showing nothing of particular promise. Surface on the Leflex shows an iron gossan, carrying up to 2% copper and \$2 to \$3 gold per ton. A 600-lb. test shipment, from the 65' level, returned circa 30% copper, and various samples have shown from 0.5% to 3% nickel, and from nothing to \$20 gold per ton. Property considered promising.

#### CONSOLIDATED COPPER CO. OF VIRGINIA.

Office: 924-5 Beekman St., New York, N. Y. Franklin Bien, president; Edw. T. Coyne, vice-president; Jos. B. Bissell, treasurer; Nathan E. Clark, secretary. Organized October, 1902, under laws of South Dakota, with capitalization \$100,000,000. Presumably an abortive attempt at some sort of a consolidation of existing companies.

#### CONSOLIDATED COPPER CREEK MINING CO.

#### ARIZONA.

Office: 707 Shukert Bldg., Kansas City, Mo. Mine office: Mayer, Yavapai Co., Ariz. E. J. White, secretary, treasurer and manager; F. E. Dobbins and L. W. Dumm, fiscal agents; G. W. Lightburn, superintendent. Organized 1906, under laws of Arizona, with capitalization \$1,000,000, shares \$1 par. Controls the Consolidated Copper Co. of Colorado, which holds the Delmonico gold mine at Cripple Creek. Arizona lands, 15 claims, known as the Sunset group, adjoining the Rosalie Copper Co., carrying slightly argentiferous copper ores, with a 100' 2-compartment shaft. Equipment includes a 125-h. p. boiler, 8x10" hoist and 8-drill air-compressor. Advertising, largely in the cheap mail order monthlies, is of the brazenly fakish sort, calculated to catch the dollars of the ignorant. Advertised, 1907, that it was altogether likely to become as famous as Amalgamated, but this impression is not shared generally. Is regarded with suspicion.

#### CONSOLIDATED COPPER DEVELOPMENT CO.

#### NATAL.

Office: Mutual Bldg., Harrison St., Johannesburg, Transvaal. Mine office: Vryheid, Transvaal. Works office: New Clare, Transvaal. Organized circa September, 1907, under laws of Transvaal, with capitalization £15,400. Lands, near the Umhlatusi river, in the Babanango division of the N'kandha district of Zululand, Natal, near the Zululand-Transvaal border, show an extensive belt of schists, carrying disseminated copper ores below commercial grade, with

commercial ores occurring in contact deposits between granite-porphry and schist, ore being mainly bornite, with some chalcopyrite, with quartz gangue, the bornite carrying 3 to 27 dwts. gold per long ton.

**CONSOLIDATED COPPER-GOLD MINES CO.**

**CALIFORNIA.**

Office: care of Arthur Philbrick, president, Reno, Nev. Mine office: Quincy, Plumas Co., Cal. John S. E. Houck, secretary and treasurer. Lands, 32 claims, in Genesee Valley and on Copper Hill, in the Ward Creek district, said to show 8 practically parallel veins of 1' to 30' width. Has a 30' shaft, said to be bottomed in a 24" paystreak of massive chalcocite, and is said to have other openings showing auriferous and argentiferous copper ore of about 10% average tenor. Planned driving a 2,300' crosscut tunnel to cut veins at depth of 1,500' and installing a 500-h. p. water plant. Idle and apparently moribund.

**CONSOLIDATED COPPER MINING CO.**

**IDAHO.**

Dead. Succeeded, circa 1904, by Ladd Metals Co. Formerly at Mineral, Washington Co., Idaho.

**CONSOLIDATED COPPER MINING & MILLING CO.**

**MONTANA.**

Office: care of F. D. Willard, secretary, Mullan, Idaho. Mine office: Saltese, Missoula Co., Mont. Company plans developing the Black Traveler vein by a 500' tunnel.

**CONSOLIDATED FLAGSTAFF MINES CO.**

**UTAH.**

Dead. Was succeeded, April, 1908, by Flagstaff Copper Mines Co. Formerly at Alta, Salt Lake Co., Utah.

**CONSOLIDATED GOLD & COPPER CO.**

**ARIZONA.**

Dead. Was promoted by Douglas, Lacey & Co., notorious swindlers, of 66 Broadway, New York. For methods of these scoundrels see description of Amalgamated Gold & Copper Co. Formerly at Clifton, Graham Co., Ariz.

**CONSOLIDATED GOLD & COPPER CO.**

**MEXICO.**

Dead. Formerly at La Cananea, Arizpe, Sonora, Mex. Described Vol. VI.

**CONSOLIDATED GOLD, COPPER & COAL CO. COLORADO & WYOMING.**

Office: Encampment, Wyo. Mine office: Pearl, Larimer Co., Colo. J. E. Hedding, president; J. W. Hedding, secretary. Lands include 2 copper claims, area 40 acres, near Pearl, Larimer Co., Colo.; 6 gold claims, known as El Rey gold mine, area 98 acres, and 3,595 acres of coal lands, circa 15 miles from Walden, Larimer Co., Colo. Latter tract is said to show a 65' vein of coal, which could be developed by stripping. Coal lands are remote from transportation, but probably will be of value eventually. Idle for several years.

**CONSOLIDATED GOLD & COPPER MINING CO.**

**UTAH.**

Office: 25 Broad St., New York. Letter returned unclaimed from former mine office, La Sal, Grand Co., Utah. A. Graham Donnelly, president; N. D. Biddison, secretary; Gid R. Propper, superintendent. Capitalization \$20,000,000. Claims also to have lands in Utah, Montana, Colorado and Oregon, with a total of 56 claims. Is grossly overcapitalized, idle, and management, at last accounts, proposed reorganizing—presumably in order to sell more stock to people who like that sort of thing and are willing to pay real money for it.

**CONSOLIDATED GOLD & COPPER MINING & MILLING CO.** **WYOMING**

Dead. Formerly at Encampment, Carbon Co., Wyo. Described Vol. VI.

**CONSOLIDATED GOLD MINES CO.**

**WASHINGTON.**

Letter returned unclaimed from former mine office, Berlin, King Co., Wash. W. H. Sherrod, superintendent. Lands, 2 claims, known as the Una group, formerly the John Stevens mine, opened 1892, on Miller river, 5 miles from Berlin. Mine has about 1,800 tons of ore, blocked out for stoping, giving assays of 8% copper, 3 oz. silver and \$4 gold ton.

**CONSOLIDATED GREENE COPPER CO.**

**ARIZONA.**

Mine office: Kirtland, Yavapai Co., Ariz. Lands, near the Zonia Copper

Mining Co., circa 9 miles southeast of Kirtland, show ores giving average assays of 6 to 10% copper and 2 to 6 oz. silver per ton.

**CONSOLIDATED GREEN MOUNTAIN**

**BRITISH COLUMBIA**

**ST. LOUIS MINES, LTD.**

Office: care of Chas. D. Clark, treasurer, Peoria, Ills. Letter returned unclaimed from former mine office, Rossland, Trail district, B. C. W. L. Lowry, president. Capitalization \$3,000,000, shares \$1 par. Has a 400' shaft. Idle for some years and apparently moribund.

**CONSOLIDATED GREENWATER COPPER MINING CO. CALIFORNIA.**

Office: 1306 Keystone Bank Bldg., Pittsburgh, Pa. Mine office: Greenwater, Inyo Co., Cal. John A. Kirby, president; J. G. Butler, Jr., vice-president; Walter C. Lamb, secretary; Eugene Howell, treasurer; preceding officers, Hon. Francis Newlands, W. H. Blackburn and Arthur Kunze, directors. Organized 1906, under laws of South Dakota, with capitalization \$1,500,000, shares \$1 par. Lands, 23 claims, area circa 450 acres, in 3 groups, showing 4 practically parallel copper veins, widest 25'. Idle.

**CONSOLIDATED JEFFERSON GOLD & COPPER MINING CO. UTAH.**

Office: 221 Atlas Block, Salt Lake City, Utah. Mine office: Brighton, Salt Lake Co., Utah. A. W. Neiman, president; H. F. Wallstein, vice-president; Frank Rumel, secretary and treasurer; preceding officers, Julius Coop, C. I. Nicholson, Nicholas Schmittroth, A. Y. Reed and Jacob Coop, directors; F. W. Shule, superintendent. Organized June, 1902, under laws of Nevada, with capitalization \$1,000,000, shares \$1 par.

Lands, 49 claims, 7 fractional, and 40 acres placer grounds for a building site, in the Big Cottonwood district, having a 1,400' tunnel, with about a quarter-mile of workings, showing sulphide ores, said to average circa 5% copper, with small silver values and high gold values. Equipment includes a good machinery plant and necessary mine buildings.

**CONSOLIDATED KANSAS CITY SMELTING & REFINING CO. TEXAS.**

Works office: El Paso, El Paso Co., Tex. Is controlled, through stock ownership, by American Smelting & Refining Co., and is a branch of same.

**CONSOLIDATED KING DEVELOPMENT & COLUMBIA ARIZONA.**

**COPPER MINING CO.**

Office and mine: Jerome, Yavapai Co., Ariz. Geo. W. Hull, president; H. E. Wilcox, secretary. Organized under laws of Arizona, with capitalization \$6,000,000, shares \$1 par. Lands, 34 claims, area 400 acres, in the Verde district, adjoining the United Verde on the south and east, showing several ore bodies carrying oxide, carbonate and sulphide ores, giving fair assay values in copper, gold and silver. Development is by a 400' shaft and several tunnels, longest 1,750'. It is claimed that about \$250,000 has been expended on the property. Idle for several years.

**CONSOLIDATED LA SAL MINING & SMELTING CO. COLORADO.**

Dead. Formerly at Cashin, Montrose Co., Colo. Fully described Vol. VI.

**CONSOLIDATED MERCURE GOLD MINES CO. UTAH.**

Office: P. O. Box C, Salt Lake City, Utah. Mine office: Mercur, Tooele Co., Utah. John Dern, president; Wm. M. Thompson, secretary; Geo. H. Dern, treasurer and general manager. Is a gold mine, but has tailings carrying thousands of tons of copper, which eventually may be recovered partially.

**CONSOLIDATED MINES & DEVELOPMENT CO. ARIZONA.**

Mine office: Globe, Gila Co., Ariz. Organized 1905, with capitalization \$500,000, shares \$1 par. Lands, 8 claims, at the head of Arkansas Gulch, 7 miles west of Globe, from which diamond drill cores have shown 6% ore, apparently from stringers in the ledge. A 45' shaft is claimed to be bottomed in solid sulphide ore. Idle.

**CONSOLIDATED MINING & SMELTING CO.****NEW MEXICO.**

Mine office: Cerillos, Santa Fe Co., N. M. R. B. Thomas, manager; J. L. Wells, superintendent. Ores carry gold, silver, lead, zinc and copper, latter in small quantities, as a by-product. Property includes the Tom Paine, Albany and other mines, extensively developed and well equipped with gasoline and electric power. Has a 120-ton lead smelter.

**CONSOLIDATED MINING & SMELTING CO.****UTAH.**

Dead. Formerly at Brigham, Box Elder Co., Utah.

**CONSOLIDATED MINING & SMELTING CO.****BRITISH COLUMBIA.****OF CANADA, LTD.**

Office: 49 Wellington St., Toronto, Ont. Mine office: Rossland, Trail district, B. C. Works office: Trail, Trail district, B. C. W. D. Matthews, president; Geo. Summer, vice-president; W. H. Aldridge, managing director; preceding officers, E. B. Osler, Chas. R. Hosmer, H. S. Osler, W. L. Matthews, J. C. Hodgson and F. P. Buck, directors; R. H. Stewart, mine manager; Jules La-barthe, smelter manager; John N. Turnbull, engineer.

Organized 1905, as Canadian Consolidated Mines, Ltd., and name changed, Jan. 1, 1906, to present title, with capitalization \$5,500,000, shares \$1 par; issued, \$5,355,200. First quarterly dividend of 2.5% was paid April, 1906, and dividends, 1907, were \$500,005. Annual meeting, fourth Tuesday in September.

Company is mainly a securities holding corporation, controlling, through stock ownership, the Centre Star Consolidated Mining Co., War Eagle Consolidated Mining & Development Co., Ltd., St. Eugene Consolidated Mining Co., Ltd., and the Rossland Power Co., companies in question being described separately under their respective titles. Also holds, under lease, the Snowshoe mine, at Phoenix, B. C., and owns the Richmond-Eureka mines at Sandon, B. C., Phoenix-Amalgamated, Crown Point and Iron Mask mines, at Rossland, and owns and operates the Canadian Smelting Works at Trail.

The reduction works include both copper and lead departments, and in addition to treating ores from the mines of the company, it does an extensive custom business, mainly on Rossland ores. In connection with the smelter is an acid plant making sulphuric acid as a by-product.

The sampling plant, built 1906, includes a 100-ton Gates crusher, 3 Vezin automatic samplers and a Jones riffle sampler.

The copper smelter, of 1,650 tons daily capacity, has one 42x264" Bruckner furnace and five 42x240" Bruckner furnaces, taking a 32-oz. cold blast, with 24 Huntington-Heberlein pots. Ore and fluxes are handled in hopper-cars, drawn by three 10-h. p. electric locomotives. First fusion product is a matte of only 7 to 12% copper tenor, which is granulated and roasted in 2 O'Hara calciners, the 10 hand-roasters formerly used having been discarded. Calcined matte is briquetted, and remelted to a matte of circa 50% average copper tenor. The roast department includes 6 Bruckner roasters. The second fusion matte is shipped to the Tacoma works, for conversion.

The lead smelter, of 350 tons daily capacity, has two 60x244" furnaces, and 6 Huntington-Heberlein calcining furnaces of 26' diameter. The lead plant includes an electrolytic lead refinery, handling silver-lead-zinc bates, which is the first ever built, and these works have turned out commercial lead assaying 99.907 fine, which means that 1 ton of lead carried only 1 oz. of impurities—a marvelously successful result. In connection with the lead refinery is an antimony plant, built 1907, which is designed to fill a promising field.

Power at the works is electric throughout, brought 30 miles, from Bonnington Falls, on the Kootenai river, a line current of 32,000 volts being stepped down to 550 volts at the smelter, where 1,000-h. p. is used by 16 motor units. Fuel at the smelter is coke.

The company employs a total force of circa 1,400 men, at the various subsidiary mines and works, about 350 being at the smelter.

Operations, 1907, were hampered by two coal miners' strikes, severe weather and a serious fall in the market price of both copper and lead, notwithstanding which a very creditable record was made. For the fiscal year ending June 30, 1907, production was 3,433,310 lbs. copper, 20,380,083 lbs. lead, 1,100,271 oz. silver and 69,186 oz. gold. Receipts for fiscal year 1907, were \$4,062,129 from smelter products, and \$812,263 from ores sold. For fiscal year ending June 30, 1908, the works treated 305,956 tons of ore, producing 4,004,468 lbs. fine copper, 32,157,139 lbs. lead, 2,224,888 oz. silver and 121,380 oz. gold. The company controls valuable mines, and has a thoroughly modern and well equipped smelter that gives exceptionally successful results, with a strong and experienced management.

**CONSOLIDATED MOUNT LYELL COPPER MINES, LTD.** TASMANIA.

Dead. Formerly at Gormanston, Montagu Co., Tasmania.

**CONSOLIDATED NICKEL, TIN & COPPER MINES, LTD.** SPAIN.

Office: 6 Court Row, Guernsey, Eng. Ernest H. Williamson, chairman; J. Simon, secretary. Organized March 21, 1903, under laws of Guernsey, with capitalization £60,000; issued £53,480, partly full paid, partly part paid. Was organized to adopt an agreement with the Lerida Copper Mines, Ltd. Apparently moribund.

**CONSOLIDATED STANLEY MINING & MILLING CO.** COLORADO.

Dead. Succeeded by Stanley Mines Co. Formerly at Idaho Springs, Clear Creek Co., Colo.

**CONSOLIDATED UNITED VERDE JUNIOR MINING CORPORATION.** ARIZONA & COLORADO.

Office. Old Orchard, Me. Letter returned unclaimed from former mine office, Jerome, Yavapai Co., Ariz. Daniel L. Dean, president; F. A. Sidelinger, secretary and treasurer. Capitalization \$2,000,000, shares \$1 par. Lands are the Lucile group in the Wisconsin district of Gilpin Co., Colo. Arizona lands were lost. In debt and apparently moribund.

**CONSOLIDATED VERDE MINING & MILLING CO.** NEW MEXICO.

Dead. Organized Aug. 23, 1899, and reorganized Oct. 24, 1904, as Cimarron Mountain Mining Co. Formerly at Cimarron, Colfax Co., N. M.

**CONSTANTINE COPPER MINING CO.** WYOMING.

Dead. Formerly at Encampment, Carbon Co., Wyo. Described Vol. VII.

**CONSOLIDATED WHITE BEAR MINING CO., LTD.** BRITISH COLUMBIA.

Mine office: Rossland, Trail district, B. C. J. J. Warren, superintendent. Ore is auriferous and argentiferous chalcopyrite, carrying values mainly in silver and gold, friable and sliming badly in concentration. Equipment includes a 150-h. p. Jenckes electric hoist and a 30-drill Rand compound air-compressor, driven by a 300-h. p. electric motor. Has a mill with 30 gravity stamps, having double-discharge mortars, 6 Wilfley tables and a 4-unit Elmore oil concentrator. Production, 1907, was 310 tons of concentrates and 2,641 tons of ore, carrying circa 100,000 lbs. fine copper. Formerly employed about 25 men. Closed down October, 1907.

**CONSTELLATION CONSOLIDATED COPPER MINES.** CALIFORNIA.

Mine office: Campo Seco, Calaveras Co., Cal. Idle.

**CONSTELLATION GOLD MINES CO.** OREGON.

Dead. Formerly at Sumpter, Baker Co., Ore.

**CONSTITUTION CONSOLIDATED COPPER MINES.** NEW MEXICO.

Office: care of Beedy, McLellan & Co., 57 Broadway, New York, N. Y. Mine office: Lucero, Mora Co., N. M. Jas. R. Pitcher, president; R. Pitcher Woodward, vice-president and secretary; F. M. Andrus, treasurer; preceding officers, Hon. Frémont Cole and A. H. Hall, directors; S. W. Tyler, consulting

engineer. Organized Apr. 24, 1906, under laws of Maine, with capitalization \$3,000,000, shares \$1 par. Lands, 400 acres, showing 3 parallel beds of slate or arenaceous shale, having an approximately north and south strike, with 3 minor ledges, main beds being 3' to 8' in thickness, carrying impregnations of malachite, chalcocite and bornite, occasionally weighing pounds, but occurring more commonly in masses of a few grains up to several ounces in weight. Veins extend nearly vertically, interbedded with limestone and arenaceous sandstone, the cupriferous shales containing both calcium carbonate and organic matter in appreciable quantities, probably accounting for precipitation of the copper ores. Apparently igneous rocks are lacking on the property, though these should exist if impregnations are to prove sufficiently rich to constitute ore of commercial grade. Ore is said to assay 3 to 20% copper, with net claimed average of at least 5% copper and \$1 to \$2 gold per ton, this estimate probably being too high. Development is by numerous pits and trenches, and by shafts of 230' and 325'. Management is composed of men of excellent business and professional standing, but lacking mining experience. New Mexico has thousands of square miles of Permian red beds, carrying small percentages of copper, mainly of unworkable tenor. Future of the company is merely a question of the average copper contents of the shale beds, plus capital and management.

**CONTACT COPPER CO.****MONTANA.**

Letter returned from former mine office, Helena, Lewis & Clark Co., Mont. N. H. Graeniling, superintendent. Organized 1906, with capitalization \$40,000. Lands, in Colorado Gulch, circa 4 miles west of Helena, show a vein of 6' to 8' width, carrying slightly auriferous ore, giving average assays of 4 to 6% copper, from a 60' shaft, showing ore from surface, which it is planned to sink to depth of 500'. Has gasoline power. Made, 1907, several small ore shipments.

**CONTENTION MINING CO.****COLORADO.**

Mine office: Silverton, San Juan Co., Colo. Ores carry gold, silver and copper values. Has steam and water power. Presumably idle.

**CONTINENTAL CONSOLIDATED MINING CO.****SOUTH DAKOTA.**

Office: care of Ben Blanchard, manager, Mayer, Ariz. Mine office: Salome, Yuma Co., Ariz.

**CONTINENTAL COPPER CO.****MEXICO.**

Dead. Succeeded by Continental Copper Mining & Smelting Co. Formerly at Hill City, Pennington Co., S. D.

**CONTINENTAL COPPER CO.****WYOMING.**

Dead. Formerly at Battle, Carbon Co., Wyo.

**CONTINENTAL COPPER & GOLD MINING CO.****ARIZONA.**

Office: care of J. F. Halsted, secretary, County Recorder's office, Los Angeles, Cal. Mine office: Planet, Yuma Co., Ariz. Lands, 15 claims, on Bill Williams Fork river, in the northern part of Yuma county, on which a little development work has been done.

**CONTINENTAL COPPER MINING CO.****WYOMING.**

Mine office: Battle, Carbon Co., Wyo. J. T. Brown, superintendent. Property, in the Cow Creek district, is said to show a large outcrop of quartz impregnated with copper sulphides. A crosscut tunnel, planned to cut the vein at depth, was started.

**CONTINENTAL COPPER MINING & SMELTING CO.****SOUTH DAKOTA.**

Office: Lima, Ohio. Mine office: Hill City, Pennington Co., S. D. A. C. Baxter, president and general manager; J. W. Horton, vice-president; W. J.

Booth, secretary; H. M. Moore, treasurer; preceding officers, Thos. Sweeney, C. J. Buell, A. K. Gardner and C. H. Kinter, directors; A. C. Overpeck, superintendent. Organized March, 1907, under laws of South Dakota, with capitalization \$3,000,000, shares \$1 par, as successor of Continental Copper Co. Bonds, \$600,000 authorized, at 5%; issued, circa \$150,000, in denominations of \$100, \$200 and \$500, "convertible into stock after company has been placed on a paying basis." Is a holding company, its only property consisting of two-thirds of the stock issue of the Dakota-Calumet Co., and property is described under title of latter.

**CONTINENTAL COPPER SYNDICATE, LTD.**

AUSTRIA.

Dead. Liquidated Apr. 20, 1906. Fleated the Mitterberg Copper Co., Ltd. Formerly at Innsbruck, Tyrol, Austria. Described Vol. VI.

**CONTINENTAL GOLD MINING CO.**

OREGON.

Mine office: Nugget, Douglas Co., Ore. W. B. Stewart, president and general manager, at last accounts. Ore is an auriferous iron-copper sulphide, with values principally in gold. Was said, 1906, to be building a 50-ton concentrator.

**CONTINENTAL MINES & SMELTING CORPORATION.**

UTAH.

Office: 505-52 Broadway, New York, N. Y. Operating office: 409 Dooly Bldg., Salt Lake City, Utah. Mine office: Alta, Salt Lake Co., Utah. Wm. J. Robinson, president; Henry M. Crowther, vice-president and managing director; G. C. Van Alstyne, secretary and treasurer; Richard S. Smith, superintendent; Harry Lee, mine superintendent. Organized July, 1903, under laws of New York, with capitalization \$1,500,000, shares \$10 par. Is controlled, through stock ownership, by Unity Mines Co. Empire State Trust Co., New York, registrar.

Lands, 30 claims, partly patented, area 460 acres, and a 20-acre millsite. Property shows circa 20 contact deposits, between limestone and porphyry, of 1' to 40' width, giving assays of 2 to 35% copper, 10 to 48% lead, circa 7.5% zinc, 15 to 120 oz. silver and 60 cents to \$5 gold per ton, from oxidized copper ores, galena and sphalerite. Lands formerly were held by the Lavinia, Grizzly Consolidated, Darlington and Regular mining companies, said to have produced upwards of \$1,000,000 worth of ore. Mines were first opened circa 1864.

Mines have 5 shafts, deepest 200', and 9 tunnels, of 300' to 2,000' length, with total workings of circa 18,000', estimated by company to show 742,000 tons of ore, with 242,000 tons blocked out for stoping, which estimate is considered excessive.

Transportation is by a 5-mile Riblet aerial tram, greatly reducing the former freight cost of \$1.75 per ton on outgoing ore, and \$5 per ton on incoming fuel and supplies.

A 100-ton mill, built 1905, puts about 4 into 1, turning out concentrates said to carry circa 40% lead and 16 oz. silver per ton. Water from Little Cottonwood Creek actuates a direct-connected Pelton wheel.

Company paid, to end of 1905, eleven 2% dividends on issued treasury stock, amounting to \$24,000, which apparently came from stock sales, and not from earnings, hence is regarded unfavorably.

**CONTINENTAL MINING CO.**

IDAHO.

Office: Wallace, Idaho. Mine office: Mullan, Shoshone Co., Idaho. Organized May, 1908, under laws of Idaho, with capitalization \$1,250,000, shares \$1 par, by John P. Gray, Jas. T. McCarthy, M. J. Flohr, A. H. Comer and Therres Towles. Lands are one claim.

**CONTINENTAL MINING CO.**

MEXICO.

Office: care of City Brewery, San Antonio, Tex. Mine office: Mineral de Pánuco, Monclova, Coahuila, Mex. Otto Koehler, president; Otto Wahrmund,

vice-president and general manager; Arthur L. Tuttle, general superintendent; A. H. Buck, mine superintendent; S. D. Bridge, auditor and sales agent. Organized April, 1905, as successor of Continental Copper Co. Ownership and management are practically the same as that of Jimuleo Mining Co.

Property is extensive mines at Pánuco and Romero Rubio, including La Reforma group at latter point. Principal property is the Mina Pánuco, an antigua, opened circa A. D. 1700, and worked at intervals since. Mine, bought of the Pánuco Copper Co., Ltd., which was a badly mismanaged corporation, is circa 600' deep, having a fissure vein in syenite, carrying mainly slightly argentiferous chalcopyrite, estimated by former owners as of 6% average copper tenor, but actually averaging about 4%.

Company owns a 71-kilometer railroad, from Monclova to Pánuco, with 3 locomotives, costing circa \$300,000, and has invested about \$1,000,000, all told. Largest production under former ownership, 1902, was 665 long tons fine copper. Production was begun circa July, 1907, by present owners, at rate of about 200 tons daily, shipped to Velardeña smelter, shipments being deflected, October, 1907, on closing down of Velardeña smelter, to the Aguascalientes smelter, when production was cut to about 3,000 tons monthly. Mine considered valuable and management good.

#### COOKE & MONTANA MINING CO.

#### MONTANA.

Office: Owlesy Blk., Butte, Mont. Mine office: Cooke, Park Co., Mont. W. M. Kearns, president; Thos. Hicks, vice-president and manager; J. C. Fetig, secretary; Dr. Chas. M. Eddy, treasurer. Capitalization \$250,000, shares \$10 par. Lands, 4 claims, on Henderson Mountain, in the New World district, developed by a tunnel of circa 600' length having a back of about 300', showing ore assaying 13.6% copper, 34 oz. silver and \$14 gold per ton. Has a power plant, smithy and cabins, and a second tunnel is planned. Property considered promising, though handicapped by lack of adequate transportation facilities.

#### COONEY HILL GOLD & COPPER MINING & MILLING CO. WYOMING.

Dead. Lands passed, 1907, to Emerald Mining Co. Formerly at Wheatland, Laramie Co., Wyo.

#### CO-OPERATIVE COPPER & GOLD MINING CO.

#### OREGON.

Office: Rockford, Ills. Mine office: North Powder, Union Co., Ore. Mine, opened 1905, has a 180' shaft, with indications of copper at bottom. Has gasoline power and electric light.

#### CO-OPERATIVE MINING CO.

#### COOSHEEN MINERALS, LTD.

#### IRELAND.

Office: 5 Great Winchester St., London, E. C., Eng. Mine office: Schull, County Cork, Ireland. Sir Thos. Selby Tancred, Bart., chairman; Thos. Williams, Jr., secretary. Organized May 10, 1906, under laws of Great Britain, with capitalization £25,000, shares 5s. par; issued, £20,000, fully paid. Property is a 60-year lease, from March, 1906, at yearly rental of £30 and 30% royalty of net profits, of the Coosheen mine, area 329 acres. Property, formerly a copper producer, was reported upon favorably by J. Andrew Wauchope. Sir Thos. Selby Tancred, baronet, the chairman, is a guinea-pig, with a long

record of connection with various stock companies that have proven the reverse of successful.

#### COPAQUIRE COPPER SULPHATE CO., LTD.

CHILE.

Office: Bassishaw House, Basinghall St., London, E. C., Eng. Operating office: Casilla 266, Iquique, Chile. Mine office: Huatacondo, Copaque, Tarapacá, Chile. H. P. Desham, chairman; H. Crewdson Howard, secretary; Richard Stanton, general manager; J. E. Gillmore, clerk. Organized May 19, 1900, under laws of Great Britain, and capitalization increased from £300,000 to £494,000, shares £1 par; issued, £309,082. Debentures, £20,000, first mortgage, at 6%, convertible at option of holders into shares at par, and £3,580 second-mortgage debentures, at 6%, similarly convertible. Has issued no financial statement since July 31, 1903.

Lands, 25 claims, area probably 25 hectares, in 2 groups. The Huiquintipa group of 13 claims at Huatacondo, carries dioprose and chrysocolla, these silicates of copper occurring as the cementing material in a conglomerate bed up to 85' thick. Company estimates 6,000,000 long tons of 3.25% ore exposed.

The Copaque group, which was the original property, has granite for country rock, showing an abundance of oxidized copper minerals, mainly copper sulphates and sub-sulphates averaging 2.5 to 3% in copper tenor. The management of the company always has stated that the deposits were natural bluestone, with some impurities mechanically mixed therewith, but, as a matter of fact, the ore deposits consist of a mixture of three different salts, very difficult of separation. Company's "experts" have estimated that the Copaque deposits show upwards of 100,000,000 long tons of ore, worth £20,000,000. Development is by a 150' shaft and about 1,000' of open-cuts and trenches.

Equipment includes a 45-h. p. steam plant; warehouse, office and laboratory, of stone, to withstand numerous and severe earthquake shocks. The lixiviation plant, covering about 1 acre, is rated at 500 tons daily capacity, with a dehydrator for drying crystals of bluestone. Mine and leachery are connected by a 4,000' tramline. Nearest railway is 70 miles distant, transport between being on the backs of mules, over rough mountain roads. Soft coal costs £8 15s. per ton, delivered, and this price being prohibitive, yareta is burned, mainly, for fuel. This is a gigantic club-moss, having a lob of resin, a single cluster occasionally weighing more than a ton.

The company ended 1905 about £30,000 in debt, but a proposed reorganization was voted down by shareholders. Reconstruction or bankruptcy seems inevitable. The property is not devoid of promise, but requires ample funds and technical ability in its management, if success is to be secured.

#### COPETE CONSOLIDATED COPPER CO.

MEXICO.

Office: 1104-27 William St., New York, N. Y. Mine office: Pesquera, Ures, Sonora, Mex. Col. Britton Davis, vice-president and managing director; Myra B. Martin, secretary and treasurer; preceding officers, Hollister Logan and Prof. Geo. A. Treadwell, directors. Organized 1906, under laws of West Virginia, with capitalization \$1,000,000, shares \$1 par.

Company was organized to finance the Copete Mining Co., under contract, and was to have one-half the net earnings therefrom, being practically an underwriting corporation for the Copete Mining Co. Company holds entire stock issue of Melczer Mining Co., which corporation holds direct title to the mines of the Copete Mining Co., this stock having been turned over by the Copete Mining Co., the former owner. The Copete Consolidated Copper Co. failed to comply with the consideration named in the transfer, which apparently was fraudulent, and suit has been instituted to set the matter right. Officers of the company are said to be creditors to the extent of \$20,000, this being an old dodge of the Logan-Martin gang. Further particulars regarding the company will be found in description of the Copete Mining Co.

**COPETE & MELOCZER MINING CO.****MEXICO.**

Dead. Succeeded (its only success), circa 1900, by Copete Mining Co. Formerly at Pesqueira, Ures, Sonora, Mex.

**COPETE MINING CO.****MEXICO.**

Office: 1104-27 William St., New York, N. Y. Mine office: Pesqueira, Ures, Sonora, Mex. Myra B Martin, secretary; Chas. S. Spraker, general manager. Organized 1900, under laws of West Virginia, with capitalization \$5,000,000, shares \$5 par. Company apparently has invested about \$1,000,000, but it is impossible to state how much of this has been diverted from legitimate channels of expenditure.

The Copete Mining Co. formerly owned the entire stock issue of the Melczer Mining Co., which holds direct title to the Copete lands, but this stock was turned over, Apr. 10, 1906, to the Copete Consolidated Mining Co., which promised sufficient money to put the property on a dividend basis, but failed to furnish same. Suit has been instituted in connection with this transfer, which apparently was fraudulent, Hugh M. Creighton, Lock Box 1398, New York, being in charge of the investigation for a shareholders committee. Under the transfer arrangement the Copete Mining Co. was to pay back to the Copete Consolidated money loaned, with interest at 6%, and any proceeds, through sale of stock of the Melezer Mining Co., was to be divided equally between the Copete Mining Co. and the Copete Consolidated Copper Co. The agreement between the two companies was signed by Myra B. Martin, a notorious petticoat garter, as secretary for Copete Consolidated Copper Co., and by the late "General" Walter S. Logan, an equally notorious garter of the other sex, now dead, for the Copete Mining Co. Apparently the Copete Mining Co. has been stripped of everything by the action of its officers, its only assets having been the stock of the Melczer Mining Co. The property is described under title of Melezer Mining Co.

The Copete Mining Co. is a deliberate swindle, which has taken large sums from deluded shareholders, and its promoters, except Logan, who is dead, should be punished for their frauds.

**COPIAPÓ MINING CO., LTD.****CHILE.**

Office: 138 Leadenhall St., London, E. C., Eng. Mine office: Copiapó, Atacama, Chile. Nicol Brown, chairman; preceding officer, Albert Straube, H. Loeffler, J. A. D. Hancke and Henry von Berg, directors; W. Hoeltzer, general manager; W. S. Bartlett, secretary. Organized June 21, 1836, under laws of Great Britain, and capitalization increased March, 1899, to £250,000, and later to £800,000; shares £2 par; issued, £225,000. Debentures, £50,000 authorized, February, 1907, in denominations of £100, convertible into shares at par. Last dividend, 1903, was £s. 6d.

Lands include groups of mines in the valley of the Rio Copiapó, and at Púquios, also a half interest in the Republicana mine and a large hacienda near Copiapó. The company owns 1,200 meters of the strike of 6 veins, having development for circa 500 meters horizontally, with average development of approximately 400 meters depth. The Copiapó was one of the first British mining companies to operate in Chile.

The Dulcinea mine, at Púquios, on which work is now centered, was opened 1854, and has been, for some years, the largest copper producer of Chile. The mine is very deep, the Fletcher or main shaft being 960 meters deep on the incline, or 870 meters vertically, being the deepest in South America. The Weir shaft was 1,800' deep in 1906. Greatest extent of longitudinal workings is 1,642'. The Dulcinea has 2 parallel veins traceable 8 to 10 kilometers, with strike of N. 30° E. and dip of 65°, separated by 8 to 10 meters of decomposed talcose porphyry. Veins average about 5' in width, with occasional enlargements.

ments up to 20' and even 25', and one vein, in the bottom workings, is said to be circa 8' wide and to average 11% copper. The oxidized zone, of about 220 meters depth, carries ores averaging circa 3.8 oz. silver with fair gold values, and occasional cerussite and wulfenite. The sulphide zone carries mainly chalcopyrite and cupriferous pyrite, with very small gold and silver values, having a gangue of quartz and occasional calcite. The mine makes very little water, but lower workings are very hot, and there was a serious mine fire, 1905, from spontaneous combustion. Ore reserves, to the 450-fathom level, are mainly depleted, and of rather indifferent grade, with a better showing below the 480-fathom level, the south drift on this floor showing a 3' vein of 15% ore, average tenor of ore extracted, 1905, having been 14.8% copper.

The Descubridora mine, in the Checo district, opened 1825, was the company's original property, but produced, 1905, only 658 long tons of ore, as compared with 10,160 metric tons in 1903, and is now idle.

The Ojancos group, at Ojancos, Atacama, includes the Carmen Alto, San Francisco and Antonio mines. As a whole, this group has proven disappointing, and is now idle, though the Carmen Alto and San Francisco produced 30,476 metric tons of ore of good average grade in 1903. The Carmen Alto has a 400' main shaft. The San Francisco has a 350' main shaft, and ore produced, 1905, averaged 16% in copper tenor. The Antonio is as yet in the development stage. The Republicana was showing poorly, when closed down, and has been idle some years.

There is a 5,808-meter aerial tram from La Dulcinea to Llanos de Varas, whence ore is taken by cart to the works.

The concentrator, at Puquios, has 4 crushers, 2 Wilfley tables and other washing machinery, but has not given satisfactory work, losses in tailings being unduly large. There are extensive old dumps of low grade ore, estimated at 60,000 metric tons averaging 4.61% copper, and this ore is being treated at the new mill.

The works include an extensive lixiviation plant, near the mill, where oxidized ores of low average tenor are treated.

In 1903 the Dulcinea mine produced 14,850 metric tons of ore, averaging 15.54% copper, which was about 7% of the total production of Chile, and was the largest output made by any mine in the Republic. Production of the company was 3,131,520 lbs. fine copper in 1904, but, owing to damage from fire, was only 2,515,520 lbs. in 1905, and is estimated at 3,500,000 lbs. for 1907.

#### COPPER AGE & EDISON MINING CO.

#### MONTANA.

Mine office: Saltese, Missoula Co., Mont. C. J. Heidenrich, president and general manager. Organized 1906, under laws of Washington, with capitalization \$250,000. Lands, 12 claims, 4 miles south of Saltese, lying just east of the Monitor and Richmond mines and carrying extension of the ledge of latter. Mine, opened December, 1906, has a 700' tunnel cutting a 6' vein of chalcopyrite giving assays up to 29.1% copper, with fair gold values.

#### COPPER AGE MINING & SMELTING CO.

#### WYOMING.

Dead. Formerly at Rambler, Carbon Co., Wyo. Described Vol. VII.

#### COPPER APEX MINING CO.

#### UTAH.

Office: Salt Lake City, Utah. L. B. Wright, president; D. G. Scott, vice-president; A. A. Pike, secretary; Sherman Fargo, treasurer. Organized, 1906, to develop a group of claims in the Scott Hill district, between the Big Cottonwood and Uintah districts, in Summit county, Utah. Development is by a shallow shaft, showing argentiferous copper ore of good grade.

#### COPPER BAR MINING CO.

#### NEW MEXICO.

Dead. Formerly at Organ, Donna Ana Co., N. M. Fully described Vol. VI.

**COPPER BAR MINING CO.****WYOMING.**

Office 206 Burr Blk., Lincoln, Neb. Mine office: Saratoga, Carbon Co., Wyo. W. J. Crane, president; H. M. Stratton, vice-president; Geo. E. Hibner, secretary and general manager; Fred Williams, treasurer; preceding officers, H. Schoettger, Fred Echenkamp and Ernst Hoppe, directors; J. B. Hassett, mine manager.

Lands include the original holdings, now idle, on Cow Creek, near Budefeha, and the Charter Oak group of 14 claims, 5 patented, bought 1908, on California Creek, circa 16 miles southwest of Saratoga.

The Charter Oak mine, having a 488' main shaft, has circa 2,200' of workings. Development under former owners was misdirected, the shaft having been sunk at right angles to the vein. The Charter Oak has a shallow zone of oxidation, succeeded by sulphides in a schistose gangue, latter claimed to average 12% copper, several ounces silver and \$6 gold per ton, with upward of 300,000 tons of ore blocked out, but these figures, made by the former owners, are greatly exaggerated. Has steam power and shipped a little ore, 1907. Property considered promising.

**COPPER BASIN GOLD & COPPER MINING CO.****ARIZONA.**

Dead. Formerly at Prescott, Yavapai Co., Ariz. Described Vol. V.

**COPPER BASIN MINING CO.****ARIZONA.**

Mine office: Mayer, Yavapai Co., Ariz. Organized 1907, under laws of Arizona, with capitalization \$1,250,000, by J. H. Brodrick, William Little and W. A. Hurst. Lands, 17 claims, adjoining the Commercial Mining Co., having a 140' shaft, showing aniferous and argentiferous copper ore.

**COPPER BASIN MINING CO.****ARIZONA.**

Mine office: Yuma, Yuma Co., Ariz. Presumably idle.

**COPPER BASIN MINING CO.****COLORADO.**

Office: care of B. B. Harlan, president, Chicago, Ills. Mine office: Placerville, San Miguel Co., Colo. Milton Evans, superintendent, at last accounts. Lands, 15 claims, opened by shaft. A carload of ore shipped to smelter, returned 14% copper and \$2.50 gold per ton. Idle for several years.

**COPPER BASIN MINING & SMELTING CO.****NEVADA.**

Office: 45 Wells St., New York, N. Y. Eleanor Rawls-Reader, president and treasurer; Carroll D. Galvin, managing director; J. Mitchell Galvin, fiscal agent; Earle H. Matthys, superintendent. Chas. F. DeArmond, manager. Organized 1907, under laws of Maine, with capitalization \$6,000,000, shares \$1 par. Is controlled, through stock ownership, by Cerro de Pasco Tunnel & Mining Co. Lands were 20 claims, on Bald Mountain, in the southern end of the Ruby range, White Pine county, Nevada. Company claimed that these mines resembled both the Butte mines and the United Verde, which seems rather remarkable. Did a little development work, by shaft and 4 tunnels, and planned—in advertisements—a smelter, promising \$600,000 net earnings yearly, when smelter was built, but fell behind with pay-roll and lost lands. Moribund.

**COPPER BELLE MINING CO.****ARIZONA.**

Office: 43 Wooster St., New York, N. Y. Mine office: Gleeson, Cochise Co., Ariz. Peter Quinn, president; Elie J. Moneuse, vice-president; preceding officers, Henry G. Mayer, Frank H. Hereford and Geo. E. Crawford, directors. Organized 1904, with capitalization \$1,000,000, as a reconstruction of a company of the same name, which became bankrupt, circa 1903, under suspicious circumstances.

The mine was developed by John Gleeson, with fairly satisfactory results, but the eastern management foolishly superseded Gleeson, and begun a policy of lavish expenditures that ruined the first company, and a continuation of which ruined the present company. Gleeson retired, taking a mortgage on the property for his interest, and considerable sums in cash were borrowed of

Martin Costello. Property was leased, 1906, to the Shannon Copper Co., under a \$1,500,000 bond. Judgment was rendered, June, 1907, for \$272,299.04, in favor of Paine, Webber & Co., of Boston, for money advanced, secured by note. Minority shareholders intervened, alleging fraud in that the note lacked consideration, and a 30-day stay was granted. Property was sold, July, 1908, to satisfy a mortgage held by Martin Costello, and was bid in, by Nathan L. Amster, president of the Shannon Copper Co., presumably for that corporation. Company is hopelessly bankrupt, having reaped as it sowed.

#### COPPER BELLE MINE.

#### ARIZONA.

Mine office: Gleeson, Cochise Co., Ariz. Nathan L. Amster, general manager; Geo. K. Reed, superintendent. Mine, formerly owned by Copper Belle Mining Co., was bought, at sheriff's sale, July 25, 1908, for circa \$90,000, by Nathan L. Amster, presumably representing the Shannon Copper Co., which took the mine, September, 1906, under a \$1,500,000 bond and lease.

Lands, 8 claims, in the Turquoise district, having a 2-compartment 200' shaft, showing ore claimed by former owners to average 7% copper, which is an overestimate, with fair gold and silver values.

The smelter, of 50 tons daily capacity, is a mistake, and of no value whatever. This formerly produced a 30% matte.

Mine employs circa 35 men, and, first half of 1908, shipped circa 2 carloads of ore daily. Production, 1907, was 64,982 lbs. fine copper, 20,843 oz. silver and 807 oz. gold. Property considered promising, and now in strong hands.

#### COPPER BELL MINING CO.

#### UTAH.

Mine office: Brigham, Box Elder Co., Utah. F. M. Bishop, president; J. W. Duffield, vice-president; Alonzo Young, treasurer; Wm. Crabbe, secretary. Organized 1907, under laws of Utah, with capitalization \$50,000, shares 10 cents par. Presumably idle.

#### COPPER BELLE MINING CO.

#### WASHINGTON.

Dead. Lands sold, 1901, to Bunker Hill-Sullivan Mining Co. Formerly at Index, Snohomish Co., Wash.

#### COPPER BELL MILL & MINING CO.

#### MONTANA.

Dead. Lands sold by sheriff Jan. 10, 1905, afterward going to Calumet & Montana Mining Co. Formerly at Clinton, Missoula Co., Mont., and Red Rock, Beaverhead Co., Mont.

#### COPPER BELL MINING & MILLING CO.

#### UTAH.

Office: care of John P. Anderson, president, Springville, Utah. Mine office: Ibapah, Tooele Co., Utah. Robert Hutchinson, vice-president; T. R. Kelly, secretary and treasurer; preceding officers, Jas. Oakley and C. D. Palfreyman, directors. Organized 1906, with capitalization \$50,000, shares, 25c par. Lands, in the Dugway district, are opened by a 112' shaft showing lead and copper ores said to assay up to \$100 per ton in value.

#### COPPER BELT MINES CO.

#### WYOMING.

Office: 407-135 Adams St., Chicago, Ills. Mine office: Lusk, Converse Co., Wyo. Edwin Hall, president; E. S. Averill, vice-president; Arthur A. Taylor, secretary and treasurer; preceding officers, B. L. Paine and Peter Nickell, directors. Organized June 25, 1906, under laws of Wyoming, with capitalization \$2,000,000, shares \$1 par; issued, \$1,400,456. Property is held subject to an unpaid balance of \$50,000, due the Copper Belt Mining & Milling Co., on Oct. 25, 1910, without interest. Company owns a controlling interest in the Lucky Strike Mining & Smelting Co.

Lands, 35 claims, area circa 600 acres, of which about 100 acres are timbered, with running water on the property, in the Rawhide Buttes district, 12 miles south of Lusk, the nearest railroad point. Property shows 4 parallel veins, 2 traceable nearly a mile, developed by a 620' main shaft and a 520' tunnel intersecting on the 400' level, with circa 1,400' of workings at this

point, there also being 250' tunnel and several shallow shafts with circa 2,400' of workings, all told, showing ore assaying 3 to 60% copper, with small silver values, and \$1.40 to \$12 gold per ton, company estimating its ore to average circa 7% copper, mainly from carbonates to depth of nearly 600', followed by sulphides in limonite.

Equipment includes a 54-h. p. Fairbanks & Morse gasoline engine, a 1,500' hoist and a 5-drill Franklin air-compressor, with machine-shop, smithy, engine-house and several other small mine buildings.

The advertising done by this company, at the time of its flotation, was grossly exaggerated and highly censurable. These advertisements claimed that the Homestake gold mine, in the adjoining state of South Dakota, is apparently on the same ledge, which is one of the most remarkable geological discoveries of the century. Advertisements also stated that history does not record a single instance of a copper mine pinching out, which would be important, if true. Company's advertisements claim that the mine has enough ore to keep it going for centuries, which undoubtedly is correct, if progress is no more rapid in the future than formerly. Company figures, in advertisements, that on a product of 500 tons daily, a \$100 investment should yield \$1,500 yearly. It might be added that on an output of 500,000 tons daily the annual dividend from a \$100 investment should be \$1,500,000. When estimating possible profits it always is well to take the highest possible figures, as these are just as easy to make, and are more pleasing to the "investors" who buy lithographed stock certificates, on the basis of such estimates.

#### COPPER BELT MINING CO.

#### UTAH.

Dead. Formerly at Marysville, Piute Co., Utah. Fully described Vol. VII.  
**COPPER BELT MINING & MILLING CO.** WYOMING.

Office: Grain Exchange, Omaha, Neb. Mine office: Lusk, Converse Co., Wyo. Edw. M. Weston, president; Wm. B. Parsons, vice-president; A. H. Merchant, secretary and treasurer; Edwin Hall, manager. Property was sold to Copper Belt Mines Co., and apparently only asset is a balance on purchase price of \$50,000, due Oct. 25, 1910, from the Copper Belt Mines Co.

#### COPPER BLUSH MINING CO.

#### COLORADO.

Mine office: Jamestown, Boulder Co., Colo. S. C. Bashor, president. Lands, on Longfellow Hill, show milling ores said to carry stringers of high-grade copper telluride.

#### COPPER BOND COPPER CO.

#### NEVADA.

Mine office: Ely, White Pine Co., Nev. Organized 1907, under laws of Arizona, with capitalization \$1,500,000. Lands, west of the Veteran mine, are said to have been prospected with a 6" churn drill, which is said to have struck ore assaying 18% copper and \$2 to \$20 gold per ton.

#### COPPER BOTTOM MINING & REDUCTION CO.

Letter returned from former office, Pueblo, Colo. Organized 1906, under laws of Colorado, with capitalization \$2,000,000, by Thos. M. Bowen, R. F. Lytle, O. H. P. Baxter, M. P. Bowen and Henry C. Royce. Location of lands, if any, unknown.

#### COPPER BOY CONSOLIDATED MINING & MILLING CO., WASHINGTON.

Mine office: Valley, Stevens Co., Wash. Lands, 20 claims, showing ore assaying up to 4.5% copper and \$5 to \$20 gold per ton, with gross average values of about \$10 per ton. Is said to plan a 50-ton mill.

#### COPPER BULLION MINING CO.

#### ARIZONA.

Dead. Formerly at Pearce, Cochise Co., Ariz. Fully described Vol. VI.

#### COPPER BULLION MINING CO.

#### UTAH.

Office: care of J. N. Christensen, president, Provo, Utah. Robt. Anderson, secretary; P. P. Hindmarsh, treasurer. Organized 1907, with capitalization

\$1,000,000, shares 5 cents par.. Lands, 13 claims, in the Santaquin district of Utah.

#### COPPER BULL MINING CO.

COLORADO.

Offices: 211 North 7th St., St. Louis, Mo., and Lock Box 507, Pueblo, Colo. Mine office: Walsenburg, Huerfano Co., Colo. Chas. R. Mason, president; Isaac M. Mason, secretary and treasurer; Chas. O. Unfug, general manager; H. S. McIntyre, superintendent. Organized 1901, under laws of Arizona, with capitalization \$3,000,000, shares \$1 par. Lands, 32 claims, patented, area 320 acres, on Copper Bull Mountain, showing five 7' fissure veins, carrying oxide ores, with claimed values of 10% copper, .2 oz. silver and \$80 gold per ton, which is much too high. Has shafts of 202' and 238', and tunnels of circa 300' and 700'. Has 4 mine buildings and has been said to be erecting an 80-ton smelter. Advertising was deceptive and company is not regarded favorably. Idle and presumably moribund.

#### COPPER BUTTE MILLING CO.

IDAHO.

Office: Ninde Bldg., Ft. Wayne, Ind. Mine office: Weiser, Washington Co., Idaho. O. P. Eversole, secretary; J. Harvey Allen, superintendent. Was offering, February, 1908, an issue of \$600,000 ten-year 6% bonds, with 100% stock bonus, subject to redemption at 106, after 3 years. Lands, apparently 1 claim only, with millsite and water right, including the Peacock mine, formerly held by Peacock Copper Co., held under 10-year lease, circa 3 miles from the Snake river and about 50 miles northwest of Weiser, the nearest railroad point, connected therewith by a fair wagon road. Mine, discovered 1869, with about 1,500' of openings, is said to have about 100,000 tons of ore of all grades in sight, and shipped, by wagon, under former ownership, a little ore of 40 to 70% copper content. It is claimed to have shipped about 15,000 tons of high-grade ore, and to have, on the dumps, upwards of 100,000 tons of ore averaging 6% copper, with small gold and silver values. Ten shipments, 1903, to Bingham smelter, returned 13.3 to 18.3% copper, from 3 to 5 oz. silver and from nothing to \$1.33 gold per ton, and 11 shipments to Oregon Smelting & Refining Co. gave returns of 20.5 to 40.2% copper, 1.15 to 8.7 silver and \$1.20 to \$3.40 gold per ton. A 50-mile narrow-gauge railroad, from Council to the Peacock mine, has been planned by other interests. Company's prospectus states that this property includes the purchase of a 200-ton smelter near the Weiser river, on a tract of circa 550 acres, with townsite and available water power. The Peacock is a high-grade mine of much promise, but is handicapped by lack of adequate transportation facilities.

#### COPPER BUTTE MINES.

ARIZONA.

Office: 523 Lyceum Bldg., Duluth, Minn. Mine office: Phoenix, Maricopa Co., Ariz. Capt. Harry Roberts, president and general manager; Geo. H. Abeel, vice-president; Benj. C. Shelden, secretary; Henry W. Knoche, treasurer. Organized July 21, 1900, under laws of Arizona, as the Arizona Copper Mountain Mining Co., name being changed, June, 1904, to present title, with capitalization \$6,000,000, shares \$10 par.

Lands, 34 claims, unpatented, and a 5-acre millsite, on the Gila river, in the Walnut Grove district of Pinal county, Arizona, with a good wagon road 1½ miles from mine to the Phoenix & Eastern railway. Property shows granite and limestone, intruded by an immense cupriferous breccia, of 1,300' to 3,000' width, traceable circa 7,000', carrying oxidized ores for some little depth, with sulphides shown in lowest workings. Average of 39 assays was 7.39% copper and circa \$2 gold per ton, but actual extraction would be very much lower.

Property was worked, 1879-1881, for silver. Present development is by about twenty 15' pits, 6 shafts of 30' to 60' depth, and shafts of 175' and 465', also by 6 tunnels, longest 275' and 300', with circa 2,000' of workings, estimated by management to show 5,000,000 tons of ore.

Equipment includes a 60-h. p. steam plant, with 2 hoists, a 20x30' machine-shop and 2 bunk-houses.

Production, for year ending July, 1907, was circa 650 tons of ore, of 7.5% average copper tenor, equal to about 100,000 lbs. fine copper. Suspended work October, 1907, on account of the low price of copper. Property considered promising and management good.

**COPPER BUTTE MINING CO.**

**SOUTH DAKOTA.**

Mine office: Custer, Custer Co., South Dakota. Idle.

**COPPER BUTTE MINING CO.**

**WASHINGTON.**

Mine office: Orient, Ferry Co., Wash. J. D. Gumpfer, president; H. J. Miller, secretary; Willis Townsend, general manager. Organized December, 1905, under laws of Washington, with capitalization \$1,000,000, shares \$1 par. Lands, 4 claims, patented, in the Pierre Lake district south of Orient, opened by 4 pits and shafts of 10' to 75' depth, with about 700' of workings, showing a little low-grade ore, with some ore giving good assays.

**COPPER BUTTES CONSOLIDATED MINING &**

**CALIFORNIA.**

**SMELTING CO.**

Dead. Formerly at Bagdad, San Bernardino Co., Cal. Fully described Vol. VII.

**COPPER CAÑON MINING CO.**

**NEW MEXICO.**

Mine office: Abiquiu, Rio Arriba Co., N. M. J. E. Irvine, superintendent. Lands, 100 acres, undeveloped. Idle several years.

**COPPER CANYON MINE.**

**BRITISH COLUMBIA.**

Mine office: Mt. Sicker, Vancouver Island, B. C. Lands, sundry claims near the foot of Mt. Sicker, in the Nanaimo district, opened by 2 tunnels, cutting a 4' vein of good ore. Idle several years.

**COPPER CANYON MINING CO.**

**ARIZONA.**

Mine office: Mayer, Yavapai Co., Arizona. S. T. Allen, president; L. T. Carr, vice-president; E. A. Girvin, secretary; C. A. Westenberg, treasurer; preceding officers, J. F. Littlefield, C. H. Haight and Wilbur Treadwell, directors. Organized under laws of Arizona, circa 1905, with capitalization \$15,000,000, shares \$1 par. Lands, 5 claims and a millsite, in the Black Canyon district, formerly held by the Black Canyon Copper Co., Ltd., which went out of business without paying its debts. Claims considered promising, but capitalization is excessive, and company is not regarded with favor. Idle and apparently moribund.

**COPPER CAVE MINING CO.**

**WYOMING.**

Mine office: Saratoga, Carbon Co., Wyo. J. F. Crawford, manager. Idle several years and apparently moribund.

**COPPER CENTER MINING CO.**

**IDAHO.**

Office: Wallace, Idaho. Mine office: Mullan, Shoshone Co., Idaho.

**COPPER CENTURY MINE.**

**ARIZONA.**

Mine office: Washington, Santa Cruz Co., Ariz. Geo. A. Lonsberry, superintendent. Ores are argentiferous copper, lead and zinc sulphides. Has gasoline power. Idle.

**COPPER CHIEF MINING CO.**

**ARIZONA.**

Mine office: Jerome, Yavapai Co., Ariz. Arthur Hendy, superintendent. Lands, near the Equator, circa 5 miles south of Jerome, show a large body of auriferous and argentiferous copper ore, and mine is claimed to have upwards of \$3,000,000 worth of ore blocked out, which is a serious overestimate. Ore is pyritic and difficult of reduction. Property is developing slowly, but is considered of some promise.

**COPPER CHIEF MINING CO.**

**MONTANA.**

Mine office: Borax, Salteese Co., Mont. J. H. Nordquist, president; Otto Freeman, secretary and treasurer. Lands, 11 claims, in the St. Joe district,

supposed to carry the extension of the Bullion vein, which company plans to open by a crosscut tunnel, at circa 700' depth.

**COPPER CHIEF MINING CO.**

**NEW MEXICO.**

Dead. Succeeded, 1903, by Sater Copper Co. Formerly at Clayton, Union Co., N. M. Described Vol. III.

**COPPER CHIEF MINING CO.**

**WASHINGTON.**

Office: Everett, Wash. Mine office: Index, Snohomish Co., Wash. Lands, 4 claims, between Galena and Mineral City, in the Silver Creek camp, having a 600' tunnel showing an 8' vein with a 2' paystreak. Idle.

**COPPER CHIEF MINING CO., LTD.**

**MONTANA.**

Office: 604 The Rookery, Spokane, Wash. Letter returned unclaimed from former mine office, Dillon, Beaverhead Co., Mont. H. A. Fosselman, president; J. S. Graves, vice-president; F. M. Longshore, secretary and general manager; F. M. Dudley, treasurer. Organized June, 1901, under laws of Washington, with capitalization \$375,000, shares 25 cents par. Lands, 7 claims, area 130 acres, in the Silver Star district of Madison county, Montana. Country rocks are graphite and limestone, showing 5 contact veins, with some work on each, mine having 9 pits and shafts of 10' to 112' depth. Main vein, estimated by company to average 10' width, shows carbonates at surface, with chalcoelite and chalcopyrite at a little depth, giving average assays of 10% copper, 2 to 5 oz. silver and \$1.60 to \$31 gold per ton. Has a 40-h. p. hoist, good for 1,000', and necessary mine buildings. Idle.

**COPPER CITY MINE.**

**ALASKA.**

Office: Coppermount, Prince of Wales Island, Alaska. Lands, sundry claims on the beach, at Cordova Bay, 6 miles south of Coppermount. Has fair mine buildings, and shipped some good ore to the Crofton smelter, circa 1905. Presumably idle.

**COPPER CLIFF MINES OF MONTANA, LTD.**

**MONTANA.**

Office: 8 Broad Street Avenue, London, E. C., Eng. Mine office: Elliston, Powell Co., Mont. S. E. Illingsworth, chairman; R. S. Illingsworth, mine manager; A. Hebden, secretary. Organized Sept. 11, 1903, under laws of Great Britain, with capitalization £200,000, shares £1 par, in £65,000 "A" preference shares and £135,000 common shares, preference shares taking all profits up to par value of stock, after which preferred becomes common stock. Issued, £30,282. Lands, 140 acres, bought of the Copper Cliff Mining Co., having an 186' shaft and tunnels of 300', 500' and 800', showing contact veins of fair width, carrying oxide, carbonate and sulphide ores, which are claimed to give average assay values of 10% copper and \$10 gold per ton. Claims ore reserves of 72,140 long tons.

**COPPER CLIFF MINING CO.**

**ARIZONA.**

Dead. Lands sold, 1902, to Catalina Copper Mining Co., also dead. Formerly at Tucson, Pima Co., Ariz.

**COPPER CLIFF MINING CO.**

**BRITISH COLUMBIA.**

Office: Seattle, Wash. Mine officé: Heriot Bay, Nanaimo district, B. C. Wm. Simison, president and general manager; C. W. Carter, secretary. Organized 1906, presumably under laws of Washington, and registered under laws of British Columbia as an extra-provincial company, with capitalization \$10,000, shares \$1 par. Property, on Heriot Bay, Valdes Island, has a strong ledge, with a paystreak of about 10' of chalcopyrite, of smelting grade, with considerable development. Shipped 120 tons of ore, 1906, to the Tyee smelter.

**COPPER CLIFF MINING CO.**

**MONTANA.**

Dead. Succeeded, Sept. 11, 1903, by Copper Cliff Mines of Montana, Ltd. Formerly at Elliston, Powell Co., Mont.

**SOUTH DAKOTA.**

Dead. Formerly at Rochford, Pennington Co., S. D. Described Vol. VI.

**COPPER CLIFF SYNDICATE, LTD.**

Office: 14 Queen Victoria St., London, E. C., Eng. Organized Oct. 17, 1906, under laws of Great Britain, with capitalization £5,000, in 4,900 ordinary shares of £1 par, and 2,000 deferred shares of 1s. par, to acquire copper mines in the United States. Location of lands, if any, unknown.

**COPPER COBRE MINING CO.**

ARIZONA.

Dead. Succeeded by Bradshaw Mountain Copper Mining & Smelting Co., also dead. Formerly at Middelton, Yavapai Co., Ariz.

**COPPER COMPANY OF ARIZONA.**

ARIZONA.

Dead. Was organized circa 1907, under laws of Arizona, with capitalization \$1,000,000, shares \$5 par, as reconstruction of the Arizona Amalgamated Copper Company, and was reorganized, circa 1907, as the Coppermines Company of Arizona. Formerly at Clifton, Graham Co., Ariz.

**COPPER COMPANY OF BRITISH COLUMBIA, LTD. BRITISH COLUMBIA.**

Office: 11 Grocers' Hall Ct., London, E. C., Eng. Formerly in the Kootenay district of British Columbia. Moribund.

**COPPER CONCENTRATING CO.**

MICHIGAN.

Dead. Succeeded August, 1907, by Mason Manufacturing Co., entire stock of which is owned by Houghton Concentrating Co. Formerly at Houghton, Houghton Co., Mich. Very fully described Vol. VII.

**COPPER CORPORATION OF CHILI, LTD.**

CHILE.

Dead. Voluntarily liquidated, December, 1906. Lands sold to Las Animas Copper Mining & Smelting Co., Ltd. Formerly at Las Animas, Chafaral, Atacama, Chile. Described Vol. III.

**COPPER CREEK CONSOLIDATED COPPER CO.**

ARIZONA.

Dead. Lands were sundry claims between the Brooklyn and Rosalie, circa 25 miles east of Mayer, in the Black Hills range. Formerly at Big Bug, Yavapai Co., Ariz.

**COPPER CREEK CONSOLS, LTD.**

BRITISH COLUMBIA.

Dead. Formerly at Ashcroft, Yale district, B. C.

**COPPER CREEK DEVELOPMENT CO.**

ARIZONA.

Mine office: Hillside, Yavapai Co., Ariz. Lands, 35 miles northeast of Hillside, opened by tunnel, are said to show ore of good average tenor, with copper values increasing at depth.

**COPPER CREEK MINING CO.**

ARIZONA.

Office: 407 Metropolitan Bldg., Minneapolis, Minn. Operating office, Tucson, Ariz. Mine office: Copper Creek, Graham Co., Ariz. Frank J. Sibley, president and general manager; Chas. H. Robinson, vice-president; John E. Wright, secretary; R. Roy Sibley, treasurer and superintendent; preceding officers, M. W. Atwood and D. C. Reynolds, directors; W. H. Salisbury, mine foreman; C. N. Carter, mill superintendent; C. S. Gelser, engineer; F. Fay Sibley, master mechanic. Organized June 18, 1903, under laws of Arizona, with capitalization \$2,000,000, shares \$1 par; issued, \$1,725,000. On Aug. 1, 1908, cash on hand was \$9,500, with \$30,500 cash due the company. Paid, July, 1904, to July, 1905, inclusive, 5 quarterly dividends of 1½% on preferred stock, amounting to \$1,735.69, but preferred stock apparently since retired, very wisely, as no mining company has any business to pay dividends except from earnings.

Lands, 80 claims, area 1,500 acres, also 300 acres in mill and smelter sites, 14 miles east of Mammoth, in the Bunker Hill district of the Galurio Mountains. Country rock is diorite, with immense porphyritic intrusions, showing a large number of ore bodies, occurring as fissure veins in rhyolite and as contact deposits between rhyolite and porphyritic rocks, 3 ore bodies being under development. Property is in 3 groups, the upper group, of circa 800 acres, near the apex of the Galurio Mountains, showing rhyolite and basalt, with fissure

veins carrying cuprite, melaconite, malachite, chalcocite and chrysocolla. The Middle Basin group, area circa 500 acres, shows 3 strong hematite gossans, carrying copper, along a granite-porphry and limestone contact. The lower camp, 2 miles from Middle Basin, shows mainly diorite, ore being principally chalcopyrite, with small quantities of chalcocite and cuprite. The Sioux Chief group shows an outcrop traceable one-half mile, vein carrying chalcocite said to have given mill returns on test of 40% copper and 50 oz. silver per ton. Property includes a water-right, 16 miles from the mines, estimated to be capable of developing 500 h. p. at low stage of water.

The mines have shafts as follows: Sioux Chief, 220'; Iroquois, 232'; American Eagle, 300'. There are tunnels as follows: the Pettit, 718'; Ute Chief, 300', and on the American Eagle group, the Upper, Middle, Lower and No. 1 tunnels, with combined length of 800'. The mines have circa 7,000' of workings, with 55 different openings, estimated to put 500,000 tons of ore in sight, with 150,000 tons blocked out for stoping.

Equipment includes a 240-h. p. steam plant, 200-h. p. electric plant and a 60-h. p. gasoline plant, with 1 gasoline and 3 electric hoists, largest of latter, of 82 h. p., good for 1,000' depth, having a hoisting capacity of 5,000 lbs. at 600' per minute. Machinery includes a 3-drill Rand air-compressor.

There are about 50 buildings including an engine-house, boiler-house, smithy, machine-shop, warehouse, a 52x60' stone store, and dwellings for employees.

A 200-ton concentrator, of wood, with galvanized iron roof, has one 9x15" Blake crusher, three 16x36" rolls, 3 Wilfley tables, 10 Card tables, Callow screens and a 6-compartment 4' Richards pulsator classifier.

Nearest railway is the Phoenix & Eastern, at Winkelman, 30 miles distant, but survey was made, 1908, for a railroad to the mine, planned to be built shortly. An aerial tram is being built across the Gila river, latter making trouble at times of high water, and the company plans a 2-mile electric surface line from the mine to the smelter site.

Forces average 90 men, and work is being pushed systematically. Company plans deepening the American Eagle 2-compartment shaft to 700' and doing extensive drifting and crosscutting, also adding to the central electric power plant, and building a smelter of at least 150 tons daily capacity, or doubling size of mill to 300 tons, though probably the smelter will be built in preference.

Production, 1905, was 49,000 lbs. fine copper, but no production was secured 1906 or 1907, though a little ore was shipped, on test, to Denver, in 1908. Company estimates 1909 production as probably 5,000,000 lbs. fine copper, from ore averaging 4 to 5.5% in tenor. Estimated costs are \$2 per ton for mining, 50 cents for concentrating and \$3.90 for smelting. Property has been developing for several years, and large ore bodies have been opened. Mine considered valuable and management good.

#### COPPER CREEK MINING CO.

CALIFORNIA.

Dead. Formerly at Kaweah, Tulare Co., Cal.

#### COPPER CREST MINING CO.

CALIFORNIA.

Letter returned unclaimed from former office, Los Angeles, Cal. Mine office: Redding, Shasta Co., Cal. Organized 1905, to operate the Milton mine, and to develop the Copper Crest group. Idle.

#### COPPER CROWN OF ARIZONA MINING CO.

ARIZONA.

Dead. Lost lands Jan. 1, 1905, through failure to do annual assessment work. Formerly at Pearce, Cochise Co., Ariz. Described Vol. V.

#### COPPER CROWN MINING CO.

IDAHO.

Letter returned unclaimed from former mine office, Mullan, Shoshone Co., Idaho. F. Albert Massing, president. Organized Dec. 11, 1907, under laws of

Arizona, with capitalization \$125,000, shares 10 cents par, as a reconstruction of the Iron Crown Mining & Milling Co. Lands, east of Mullan, have an 800' tunnel with a 600' back, said to show a vein of high grade ore, with 2 small veins carrying medium grade copper ore.

**COPPER CROWN MINING CO. OF MICHIGAN.****MICHIGAN.**

Office: 1013 Easton Ave., St. Louis, Mo. Mine office: Matchwood, Ontonagon Co., Mich. Dr. M. J. Hopkins, president; J. E. Allen, vice-president and treasurer; W. B. Hopkins, secretary; Baxter L. Brown, general manager; preceding officers, F. O. Cutler and F. L. Huntoon, directors; Enoch Henderson, superintendent. Organized July 18, 1902, under laws of Michigan, with capitalization \$2,500,000, shares \$25 par. Annual meeting, second Tuesday in July.

Lands, 3,740 acres, 6 to 8 miles west of the Victoria and 8 miles north of Matchwood, the nearest railroad point, including a number of old mines on which more or less work was done, 1850-1860, principal properties being the Hamilton, Norwich and Lafayette. First work of present company was on the Hamilton, where a 602' tunnel was driven and a 270' shaft sunk on the Meads vein, the tunnel of 602' securing a back of only circa 300', and a shaft was sunk mistakenly on a drift boulder in sandstone. Later work has been on the Norwich, which, next to the Victoria, is the most extensively developed and promising mine west of the Ontonagon river. The Norwich tunnel is 950' long, with circa 1,000' of drifts that give an encouraging copper showing. The Norwich mine, worked 1850-1865, produced 496 tons 1,360 lbs. fine copper, securing masses of native metal up to 10 tons in weight. The lode is bunchy, but shows considerable promising stamp-rock. The Meads lode was located by a series of prehistoric pits along the outcrop, the 270' shaft thereon showing a strong bed, up to 25' in width, with a 720' drift to the westward on the fourth level.

Equipment includes a power-house, pumphouse, toolhouse, smithy, barn and 9 dwellings, with 250-h. p. and 120-h. p. engines, 40-kw. dynamo, 250-h. p. boiler and 6-drill and 5-drill air-compressors.

The company began life as a wildcat, doing some remarkably misleading advertising, and the early mining work was very badly planned. Later the company gave satisfactory evidences of genuine reform, and for several years past its work has been along legitimate lines, especially since Mr. Henderson took charge of the property, when the mining practice was vastly improved, and sinking was done that should have been begun years earlier. Operations were suspended, January, 1908, through lack of funds, and 28 labor liens, aggregating nearly \$4,000, were filed. Property is considered promising, but the company has no particular prospects of success unless thoroughly reorganized and given adequate working capital, as copper mining operations in the Lake Superior district are the most expensive in the world, with the possible exception of gold mining on the Witwatersrand of South Africa.

**COPPER CROWN OF NOVA SCOTIA MINING CO.** NOVA SCOTIA.

Dead. Formerly at Pictou, Pictou Co., N. S. Described Vol. VI.

**COPPER OZAR MINING CO.****ARIZONA.**

Mine office: Mayer, Yavapai Co., Ariz. Loyal A. Osborne, manager; E. W. McClave, superintendent. Has gasoline power.

**COPPER EAGLE MINING CO.****OREGON.**

Mine office: Merlin, Josephine Co., Ore. R. J. Ginn, president; N. P. Hansen, secretary; J. C. Mattison, superintendent. Lands, in the Galice district, show a 10' quartz vein giving assays of 10 to 30% copper, opened by a tunnel of circa 300'.

**COPPER EAGLE MINING & SMELTING CO.****MONTANA.**

Office and mine: Butte, Silver Bow Co., Mont. A. W. Burnett, president; Patrick Mullins, vice-president; A. Dome, secretary and treasurer. Organized

1907, with capitalization \$500,000, shares 50 cents par, as a reconstruction of the Eagle Mining & Smelting Co. Property is the Eagle claim, north of Walkerville, and about a quarter mile north of the Alice mine, having a 265' shaft, with about 300' of drifting on the 200' and 250' levels, ore carrying mainly silver, with small copper values, commercial copper ore being expected at depth of circa 600'. Shipped, 1907, a little ore ranging up to 90 oz. silver and \$6.50 gold per ton. Has a steam hoist and smithy. Resumed work, August, 1908.

#### COPPER ESTATES OF WESTERN AUSTRALIA, LTD.

AUSTRALIA.

Office: 66 Finsbury Pavement, London, E. C., Eng. Mine office: Northampton, Western Australia. Jas. Barrie, chairman; John McLaren, secretary. Organized March 4, 1903, under laws of Great Britain, as reconstruction of company of some title, which, in turn, succeeded the Derby Syndicate, Ltd., with capitalization £15,000, shares 5s. par. Lands, 1,050 acres, freehold. Idle since circa 1904.

#### COPPER EXPLORERS, LTD.

AUSTRALIA.

Office: Winchester House, London, E. C., Eng. Mine office: Cobar, Robinson Co., N. S. W., Australia. A. E. Barton, chairman; E. Jacobs, secretary. Organized Jan. 1, 1900, with capitalization £40,000, shares £1 par, to acquire the North Cobar mine, in New South Wales. Idle for several years.

#### COPPER FACE MINING & POWER CO.

IDAHO.

Office: care W. H. Hoeffenger, Spokane, Wash. Letter returned unclaimed from former mine office, Mullan, Shoshone Co., Idaho. Organized 1907, with capitalization \$1,500,000. Lands, 14 claims, between Saltese and Mullan, showing 3 veins. Has a short tunnel, planned to cut the main vein at a distance of circa 1,700'.

#### COPPER FALLS MINING CO.

MICHIGAN.

Dead. Absorbed, 1898, by Arnold Mining Co. Formerly at Copper Falls, Keweenaw Co., Mich. Fully described Vol. I.

#### COPPERFIELD MINE.

ARIZONA.

Mine office: Salome, Yuma Co., Ariz. Lands, 103 claims, in the Greenstone camp.

#### COPPERFIELD MINES.

VERMONT.

Office: 820 Pennsylvania Ave., Pittsburg, Pa. Mine office: Vershire, Orange Co., Vt. Geo. Westinghouse, owner. Property includes the old Ely and Copperfield mines, having a strong ore body carrying low-grade disseminated chalcopyrite. Has a 3,700' main shaft, sunk at 23°, equal to circa 1,500' vertical depth, and a 1,000' tunnel, leading from the 300' level to mill. Reduction plant includes a combined mill and smelter, connected with the mine by a gravity tram. Smelter has 2 water-jacket blast-furnaces, one reverberatory furnace and one converter stand. Property was worked on a considerable scale, previous to circa 1860, and was reopened, 1900, by present owner, who spent large sums thereon, but met with disappointment. Best ore has been stoped, ore growing markedly leaner with depth. Mine has perhaps 20,000 tons of low-grade ore in sight. Idle since circa 1903.

#### COPPERFIELD MINING CO.

COLORADO.

Office: Colorado Springs, Colo. Mine office: Copperfield, Frémont Co., Colo. Lands, 9 miles from Cotopaxi, in the western part of Frémont county, adjoin the Copper Prince and the Colorado Mining & Smelting Co. Company said to plan sinking a 750' shaft. Presumably idle.

#### COPPERFIELD MINING CO.

UTAH.

Dead. Formerly at Bingham Canyon, Salt Lake Co., Utah.

#### COPPER FIELDS OF NAMAQUALAND, LTD.

CAPE COLONY.

Office: Dashwood House, London, E. C., Eng. J. Eustace, chairman; N. A. Eustace, secretary. Organized Sept. 3, 1897, under laws of Great Britain,

with capitalization £100,000, shares £1 par; issued, £88,432. Lands, 354 acres, in Little Namaqualand, Cape Colony, South Africa, known as the Buffalo River mine. Idle.

**COPPER FLAT MINING CO.**

NEVADA.

Dead. Expired circa 1904. Formerly at Ely, White Pine Co., Nev.

**COPPER FLOAT MINING & MILLING CO.**

WYOMING.

Office: care of P. N. Hodgins, Denver, Colo. Mine office: Tie Siding, Albany Co., Wyo. Organized, September, 1906, under laws of Wyoming, with capitalization \$1,000,000. Lands are on Sherman Hill.

**COPPER GIANT GOLD & COPPER MINING CO.**

WYOMING.

Dead. Lands sold, 1908, by sheriff, to satisfy a judgment for \$1,642.71. Formerly at Encampment, Carbon Co., Wyo.

**COPPER GIANT MINING CO.**

ARIZONA.

Office: care of O. Z. Kane, general manager, Tucson, Ariz. Mine office: Silver Bell, Pima Co., Ariz. Lands, 50 claims, in several different groups, lying south of the Imperial mine and to the eastward of the Silver Hill Mountains, opened by about 500' of shafts and tunnels, with a 100' shaft on the Copper Giant claim. Property shows a contact vein, with bold outcrops, between limestone and quartzite. Ore is chalcopyrite, with occasional chalcocite, and ores from the Copper Giant shaft are claimed to average 15% copper, 20 to 40 oz. silver and \$4 to \$7 gold per ton, which estimate is excessive. Is said to be under option to the Calumet & Arizona Mining Co.

**COPPER GIANT MINING CO.**

UTAH.

Mine office: Promontory, Box Elder Co., Utah. W. E. Headings, president; L. D. Seager, vice-president; G. A. Livingston, secretary; J. H. Kidd, treasurer; preceding officers, S. S. Buckwalter and Ernest D. Sadler, directors. Organized circa January, 1907.

**COPPER GIANT MINING CO.**

WASHINGTON.

Dead. Formerly had an office in Spokane, Wash.

**COPPER GLANCE CONSOLIDATED MINING CO.**

UTAH.

Dead. Reorganized January, 1907, as Bingham Copper Glance Mining Co. Formerly at Bingham Canyon, Salt Lake Co., Utah.

**COPPER GLANCE MINING CO.**

ARIZONA.

Office and mine: Bisbee, Cochise Co., Ariz. S. W. Clawson, president and treasurer; A. S. Barker, secretary; C. L. Beckwith, general manager. Organized March, 1901, under laws of Arizona, with capitalization \$2,500,000, shares \$1 par. Lands, 24 patented claims, area 480 acres, in the Warren district, about 7 miles southeast of Bisbee. Has shafts of 50', 100', 140' and 560', and tunnels of 75' and 150'. Idle since circa 1904. Very fully described Vol. IV.

**COPPER GLANCE MINING CO.**

NEW MEXICO.

Dead. Formerly at Taos, Taos Co., N. M.

**COPPER GLANCE MINING & MILLING CO.**

COLORADO &amp; WYOMING.

Dead. Lost Colorado lands through inability to pay for them, and lost Wyoming lands through failure to do annual assessment work. Formerly at Cashin, Montrose Co., Colo., and Encampment, Carbon Co., Wyo. Fully described Vol. VI.

**COPPER GLOBE MINING CO.**

UTAH.

Dead. Lost lands November, 1902. Formerly in Emery county, Utah.

**COPPER-GOLD MINING CO.**

WASHINGTON.

Dead. Formerly at Bossburg, Stevens Co., Wash.

**COPPER-GOLD MINING & MILLING CO.**

WYOMING.

Dead. Formerly at Hecla, Laramie Co., Wyo.

**COPPER GORGE DEVELOPING CO.**

NEW MEXICO.

Office: 82 Wisconsin St., Milwaukee, Wis. Mine office: Santa Rita, Grant Co., N. M. Lands, 12 claims. Company was asserted, in the press, to have put

in a big machinery plant and concentrator, and to plan shipping concentrates to the Comanche smelter, at Silver City, but these statements apparently were merely the vain imaginings of one C. T. McElroy, of Milwaukee, a proficient promoter of more than dubious "mining" schemes.

**COPPER GULCH MINING & REDUCTION CO.**

**COLORADO.**

Mine office: Ouray, Ouray Co., Colo. Lands, 67 claims, in Gray Copper Gulch, on both Red and Brown mountains, area circa 600 acres. Has 3 tunnels, showing chalcopyrite assaying up to 14% copper and 41 oz. silver per ton.

**COPPER GULF DEVELOPMENT CO.**

**NEW MEXICO.**

Dead. Reorganized, circa February, 1908, as Copper Gulf Mining Co. Formerly at Tyrone, Grant Co., N. M.

**COPPER GULF MINING CO.**

**NEW MEXICO.**

Office: 616 Lonsdale Bldg., Duluth, Minn. Mine office: Tyrone, Grant Co., N. M. David L. Fairchild, president; H. B. Hovland, vice-president; Lucian Merritt, treasurer; preceding officers, W. A. Barnes, Jr., and E. A. Wayne, directors; C. S. Morris, general manager. Organized circa February, 1908, with capitalization \$500,000, shares \$10 par.

Lands, circa 1,500 acres, including the original Copper Gulf group of about 120 acres, and the Virginia group of circa 40 acres, to which were added, 1907, the Alessandro group of 30 claims, the Bentley group, and 6 claims of the Leopold-Tyrone Copper Co. The Alessandro lands, said to be held under \$20,000 bond, apparently have been bought outright.

The Copper Gulf has a 300' main shaft, developing considerable ore of 4 to 5% copper tenor.

The Virginia mine, opened to depth of 300', is an old property, showing considerable good ore; and was said, late 1907, to have circa 100,000 tons of ore developed on the 200' level. The Virginia shipped, to the Calumet & Arizona smelter, during the summer of 1907, circa 3 carloads of ore weekly, said to average \$23.25 per ton in value.

The Alessandro mine is said to have 9 ore bodies, near porphyritic intrusions, reported, by old company, to give average assays of 8% copper and 5 to 40 oz. silver, from carbonate and sulphide ores, which figures probably are much too high. The mine has 5 shafts, deepest 225', with total workings of 1,300'.

The works, taken over with the Alessandro, include a 50-ton concentrator and leaching plant, now idle.

In September, 1908, it was planned to merge the Copper Gulf with the Comanche Mining & Smelting Co., under title of Savanna Copper Co. Property considered promising and management good.

**COPPER HEAD MINING & MILLING CO.**

**IDAHO.**

Office and mine: Wallace, Shoshone Co., Idaho.

**COPPER HILL MINE.**

**ARIZONA.**

Owned by Arizona Commercial Copper Co.

**COPPER HILL MINE.**

**CALIFORNIA.**

Office and mine: care of W. F. Detert, owner, Jackson, Amador Co., Cal. Lands, circa 1,000 acres, patented, on the Consumnes river, showing a quartz porphyry dyke of 500' to 600' width, carrying chalcopyrite, associated with pyrrhotite and surmounted by a heavy gossan. Mine was opened 1861, and suspended circa 1881, after securing a considerable production, as evidenced by extensive mine openings, with deepest shafts 200' and 400', and extensive slag dumps. Idle since circa 1881.

**COPPER HILL MINES CO.**

**NEW MEXICO.**

Office: St. Joseph, Mo. Mine office: Orogrande, Otero Co., N. M. Dr. Jacob Geiger, president; R. M. Ladwig, vice-president; M. H. Dirks, secretary, treasurer and general manager; Geo. Stagner, superintendent. Organized 1907.

Lands include the High Five group, and the Red Hill group of 4 claims, latter said to have a fair surface showing of auriferous and argentiferous copper ore, opened by a 140' shaft.

**COPPER HILL MINING CO.****ALABAMA.**

Dead. Formerly at Stone Hill, Cleburne Co., Ala. The property, known also as the Woods mine and Stone Hill mine, was opened in 1870 and closed in 1879, after securing a production valued at about \$1,300,000, mainly from high-grade surface ores, the mine being closed when these were exhausted. The vein, of about 24' average width, had paystreaks on the walls carrying 3 to 7% copper ore. Idle since 1879.

**COPPER HILL MINING CO.****IDAHO.**

Mine office: Mullan, Shoshone Co., Idaho. Organized circa August, 1907, to develop sundry claims in the vicinity of Mullan.

**COPPER HILL MINING CO.****NEW JERSEY.**

Mine office: Copper Hill, Hunterdon Co., N. J. Idle for many years.

**COPPER HILL MINING CO.****NEW MEXICO.**

Dead. Lands sold, November, 1903, to A. B. Renchan, for \$7,600. Formerly at Rinconada, Rio Arriba Co., N. M. Described Vol. II.

**COPPER HILL MINING CO.****UTAH.**

Dead. Succeeded, circa 1907, by Bingham-Butte Copper Mining Co. Formerly at Bingham Canyon, Salt Lake Co., Utah.

**COPPER HILL MINING & MILLING CO.****IDAHO.**

Dead. Formerly at Mullan, Shoshone Co., Idaho.

**COPPER HILL MINING & MILLING CO.****WASHINGTON.**

Office: 504 Empire Bldg., Spokane, Wash. Letter returned unclaimed from former mine office, Newport, Stevens Co., Wash. F. J. Heller, president; G. O. Nettleton, secretary. Organized 1899, with capitalization \$75,000, shares 5c par. Lands, 4 claims, area 80 acres, opened by a 230' shaft and a 260' tunnel, showing an 18' vein carrying chalcopyrite, disseminated in pyrrhotite. Idle for several years and apparently moribund.

**COPPER HILL MINING & SMELTING CO.****ARIZONA.**

Dead. Formerly at Jerome, Yavapai Co., Ariz. Described Vol. VI.

**COPPER INDEPENDENT CONSOLIDATED MINING CO.****WASHINGTON.**

Dead. Bondholders foreclosed, circa 1907. Paid dividends from stock sales. Formerly at Silverton, Snohomish Co., Wash. Fully described Vol. VI.

**COPPER JACK MINING CO.****UTAH.**

Office and mine: Eureka, Juab Co., Utah. J. C. Jensen, president; J. T. Williams, vice-president; Geo. A. Udall, secretary; D. D. Hanks, treasurer; C. C. Griggs, general manager. Organized July 31, 1905, under laws of Utah, with capitalization \$75,000, shares 10 cents par. Lands, 24 claims, area 480 acres, 4 miles west of Eureka, in the Erickson district of Tooele county, Utah, opened by a 22' shaft, showing a 30" fissure vein in granite with a paystreak carrying oxidized and sulphide copper ores, assaying 13% copper, associated with pyrite in a quartz gangue. Idle.

**COPPER JIM MINING & MILLING CO.****COLORADO.**

Office: 417 Quincy Bldg., Denver, Colo. Mine office: Central City, Gilpin Co., Colo. A. G. Rummel, president; Fred C. Wagner, vice-president; John Stewart, treasurer; J. G. Bramlett, secretary; J. A. McCracken, mine superintendent; preceding officers are directors. Organized June 15, 1906, under laws of Arizona, with capitalization \$1,500,000, shares \$1 par. Lands, 6 claims, on Gray Copper Mountain, in the Wisconsin district, showing a 4' vein with 22" paystreak of sulphide ore giving good assays in copper, with fair gold and silver values, opened by a few shallow pits and shafts and a 70' tunnel.

**COPPER KEY MINING CO.****WASHINGTON.**

Office: Spokane, Wash. Mine office: Republic, Ferry Co., Wash. J. L. Digitized by Google

Prickett, president; G. D. Russell, vice-president; E. L. Tate, secretary, treasurer and manager; preceding officers, T. E. McBroom, E. L. Dyer and H. L. Jones, directors. Organized under laws of Washington. Lands, 7 claims, 1 fractional, on Belcher Mountain, adjoining the Oversight group on the north, having a 145' shaft and 3 tunnels, longest 571', showing low-grade auriferous chalcopyrite, of 1 to 3% copper tenor, associated with pyrite, marcasite, hematite and magnetite. Has a 7-drill air-compressor. Property, though low in grade, is considered promising.

**COPPER KING OF ARIZONA.****ARIZONA.**

Dead. Lands sold under foreclosure, Aug. 28, 1905, to former shareholders, and reorganized under title of Arizona Copper Syndicate of Providence. Formerly at Pearce, Cochise Co., Ariz. Fully described Vol. V.

**COPPER KING OF ARIZONA MINING CO.****ARIZONA.**

Dead. Reorganized, 1903, under title Copper King of Arizona, also dead. Formerly at Bisbee, Cochise Co., Ariz. Fully described Vol. IV.

**COPPER KING GOLD & COPPER MINING CO.****NEVADA.**

Mine office: Mizpah, Elko Co., Nev. Made a few shipments of auriferous and argentiferous copper ore, claimed to average about \$100 per ton in value, during latter half of 1907.

**COPPER KING, LTD.****CALIFORNIA.**

Mine office: Letcher, Fresno Co., Cal. Geo. W. Ade, receiver; C. E. Leavitt, superintendent. Company, organized under laws of Great Britain, was said to have been liquidated, 1903, but the estate remains in process of adjustment, and considerable dividends have been paid to creditors, from operations under the receiver. Was expected, 1908, that receiver would be discharged shortly, and company take possession.

Lands, 90 acres, circa 20 miles from Fresno, having a 250' working shaft with 6 levels opened, having about one-half mile of drifts. Property has a schistose vein, of circa 100' width, carrying a 2' to 20' paystreak, with oxidized ores above and sulphides below, of about 7% average copper tenor.

The reduction plant included a concentrator and smelter, at Martinez, known as the Bay Point smelter, which was sold in 1907. Ore produced later was sent to the Tacoma smelter.

The old management squandered, about £250,000, ending with a net indebtedness of £100,000, but, under the able management of Mr. Ade, this debt was liquidated, and company put in good shape financially. Employed circa 50 men before suspending operations, October, 1907.

**COPPER KING MINE.****ARIZONA.**

Office and mine: care of Peter Johnson, owner, Bisbee, Cochise Co., Ariz. This is the property first held by the Copper King of Arizona, abandoned circa 1902, and relocated, 1903, by present owner. Has a 625' shaft, in porphyry, which has cut a number of small stringers of copper ore. Property, which lies between the Denn-Arizona and Cochise Development tracts, was generally regarded as worthless, until circa 1904, when developments on the Junction lands of the Superior & Pittsburg indicated the possibility of considerable ore bodies underlying the conglomerate over the porphyry and limestone contact. Material on dump, taken from shaft, is altered and slightly mineralized porphyry, carrying considerable iron pyrites. Idle since circa 1902.

**COPPER KING MINE.****BRITISH COLUMBIA.**

Letter returned unclaimed from former mine office, Nelson, Kootenay district, B. C. Lands, 6 claims, near the Queen Victoria property, at Beasley, 7 miles west of Nelson, showing several exposures of sulphide ore. Has a gravel overburden, carrying considerable float ore. Idle since circa 1902.

**COPPER KING MINE.****BRITISH COLUMBIA.**

Mine office: Kamloops, Yale district, B. C. Lands, sundry claims, 16 miles

west of Kamloops, showing ore giving assays of 5 to 20% copper, 1 to 6 oz. silver and \$10 to \$20 gold per ton. Shipped 500 tons to the Crofton smelter, May, 1904. Idle since circa 1905.

#### COPPER KING MINE.

Office: care of Wm. Purdue, Spokane, Wash. Mine office: Hutton, Siskiyou Co., Cal. Has a vein of about 75' width opened by a 659' tunnel giving a back of about 350', showing auriferous copper ores, ores and nature of their occurrence strongly resembling the Blue Ledge property, in the same district. Is claimed, in press, to have \$25,000,000 worth of ore in sight, which, of course, is a gross exaggeration.

#### COPPER KING MINE.

Mine office: Twin Lakes, Lake Co., Colo. Jas. Harrison, manager. Lands, 11 claims, on Middle Mountain, circa 13 miles from Twin Lakes, showing, in micaeous granite and porphyry dykes, a 20' fissure vein, with a 12" hanging-wall paystreak carrying medium grade auriferous and argentiferous copper ore, slightly developed by tunnel.

#### COPPER KING MINE.

Mine office: Landore, Washington Co., Idaho. Is said to have a 15' vein showing a 3' paystreak of bornite. Idle.

#### COPPER KING MINE.

Mine office: Parrot, Madison Co., Mont. Lands, 1 claim, 2 miles southeast of Parrot, showing ores assaying up to 12.5% copper, 0.85 oz. silver and \$2.80 gold per ton. Idle for several years.

#### COPPER KING MINE.

Mine office: Comer, Grant Co., Ore. Property, slightly prospected, is located in a little-known district. Idle.

#### COPPER KING MINE.

Mine office: Benguet, Luzon, Philippines. Hanson & Meade, owners. Lands, on the Bued river, show refractory ores carrying fair copper and gold values. A small stamp mill was planned, at last accounts, to treat ores for their gold values.

#### COPPER KING MINE.

Owned by Burnie Copper Mines.

#### COPPER KING MINE.

Mine office: Whitehorse, Yukon, Canada. Lands include the Copper King, Rabbit Foot, Anaconda, Spring Creek and miscellaneous claims, in the Wheaton district, near Whitehorse. Is said to be owned by Pittsburg capital. Mine has several shallow shafts and open-cuts, and a crosscut tunnel, in limestone, cutting ore 150' from the portal. Property shows high-grade ore, in small quantities, at numerous points. Has a hoist and air-compressor. To end of 1907, had shipped, to British Columbia smelters, circa 400 tons of ore, averaging about 15% copper and \$1 to \$2 combined gold and silver values per ton. Shipped no ore, 1907, but stocked several thousand tons. Employs circa 30 men. Property considered promising, but requires further development.

#### COPPER KING MINING CO.

Mine office: Tucson, Pima Co., Ariz. Lands are in the Tucson Mountains. Idle several years and apparently moribund.

#### COPPER KING MINING CO.

Dead. Formerly at Boulder, Boulder Co., Colo.

#### COPPER KING MINING CO.

Dead. Succeeded, circa, 1904, by Pearl Copper Mining & Smelting Co. Formerly at Pearl, Larimer Co., Colo.

#### COPPER KING MINING CO.

Office and mine: Shoup, Lemhi Co., Idaho. Earl Gilbreath, manager. Is a limited partnership, not an incorporation. Lands, 11 claims, area 220 acres,

#### CALIFORNIA.

#### COLORADO.

#### IDaho.

#### MONTANA.

#### OREGON.

#### PHILIPPINES.

**COPPER KING MINING CO.**

Dead. Formerly at Rawlins, Carbon Co., Wyo.

**WYOMING.**

**COPPER KING MINING & MILLING CO., LTD.**

**IDAHO.**

Office: Kellogg, Idaho. Mine office: Iron Springs, Idaho Co., Idaho. P. P. Webber, president; Peter Mason, vice-president; Chas. W. Simmons, secretary; Ed. Hearing, treasurer; Chas. McKinnis, general manager; Jos. Rogers, superintendent. Organized March 2, 1902, under laws of Idaho, with capitalization \$1,250,000, shares \$1 par. Lands, 7 claims, area 140 acres, also a 10-acre mill-site, 2 water rights and 80 acres timber lands, with total landed holdings of 230 acres, on the west fork of the Rapid river, in the Seven Devils district. Has 2 fissure veins, in phonolite, of which one, of 8' width, is opened by 7 pits and shafts, deepest 50', and by tunnels of 55', 200' and 300', showing argentiferous and auriferous bornite, and medium grade chalcopyrite, giving assays up to 45% copper, 445 oz. silver and \$45 gold per ton.

**COPPER KING MINING & MILLING CO.**

**WASHINGTON.**

Office and mine: Vancouver, Clark Co., Wash. Organized January, 1904, with capitalization \$1,000,000, shares \$1 par. Idle.

**COPPER KING MINING & MILLING CO.**

**WASHINGTON.**

Dead. Formerly had an office at Spokane, Wash.

**COPPER KING MINING, MILLING &**

**MONTANA.**

**DEVELOPMENT CO.**

Mine office: Cooke, Park Co., Mont. J. Nelson, president; R. M. Manderville, vice-president; B. R. Holland, secretary and treasurer. Organized December, 1905, under laws of Montana, with capitalization \$150,000, shares 15 cents par. Lands, 4 claims, in process of patenting, in the Goose Lake basin, developed by a 50' trench of 18' depth, showing ore of low to medium grade.

**COPPER KING MINING & SMELTING CO.**

**IDAHO.**

Office and mine: Mullan, Shoshone Co., Idaho. E. B. Crawford, president; Hon. H. W. Ingalls, secretary and general manager; Wm. Commerilb, treasurer; Jos. Carson, superintendent. Organized Aug. 28, 1905, under laws of Idaho, with capitalization \$1,500,000, shares \$1 par. Is raising money for a new tunnel, by 1-cent assessments at 6-month intervals.

Lands, 13 claims, 2 fractional, in the Hunter and Leland districts, near the Snowstorm mine, showing a 5' to 6' contact vein, between quartzite and limestone, with a paystreak of 6" to 2' carrying massive galena assaying circa 5% copper, 28% lead and 18 oz. silver per ton, and a vein of 10' to 40' width, between quartzite and limestone, carrying a 4' paystreak of argentiferous copper ore, with some native silver. Has about 3,000' of workings, mainly tunnels on the Copper Queen vein, on the Burke side of the range, and, July, 1908,

started a new tunnel on the west fork of Deadman Gulch, planned to be driven 3,600', at depth of 927' below the old tunnel, to be completed circa January, 1910.

Equipment includes a 30x60' engine-house, 30x60' boarding-house, and a 4-drill air-compressor. Property considered promising.

**COPPER KING MINING SYNDICATE.****WASHINGTON.**

Office: Tacoma, Wash. R. E. McFarlane, president; C. L. Judd, vice-president; E. Areith, secretary and treasurer; D. E. Guiley, superintendent. Capitalization, \$10,000,000. Lands, 64 claims in Pierce county, Washington, including the old Eastlick mine, opened by a 130' crosscut tunnel, with a small amount of drifting, which produced some good ore years ago. District is said to be rich but not easily accessible. Idle and apparently moribund.

**COPPER KINGS MINING CO.****UTAH.**

Dead. Succeeded by Consolidated Mining & Smelting Co., also dead. Formerly at Brigham, Box Elder Co., Utah.

**COPPER KNOB MINE.****NORTH CAROLINA.**

Office: Salisbury, N. C. Mine office: Hopkins, Ashe Co., N. C. Richard Eames, Jr., owner. Lands, 160 acres, freehold, also 90 acres miscellaneous lands, showing a 3' fissure vein in hornblendic slate, carrying carbonate and sulphide ores, mainly bornite, estimated to average 6 to 8% copper, 15 oz. silver and \$12 gold per ton. Property was opened circa 1880. Has steam power, with hoist and 2-drill air-compressor, and a 5-stamp mill. Management plans further development by an adit cutting Copper Knob Mountain.

**COPPER KNOB MINING CO.****NORTH CAROLINA.**

Dead. Succeeded, circa 1902, by Blue Ridge Copper Mining Co. Formerly at Hopkins, Ashe Co., N. C.

**COPPER LEDGE MINING CO.****UTAH.**

Office: care of James Courtney, secretary and treasurer, Salt Lake City, Utah. E. F. Marshall, president. Organized 1907, with capitalization \$125,000, shares 25 cents par. Lands, 9 claims, in the Henry district of Sevier county, Utah.

**COPPER MILLS SYNDICATE, LTD.****AUSTRALIA.**

Dead. Organized 1906 to operate in New South Wales. Formerly had an office at 6 Gresham St., London, E. C., Eng.

**COPPERMINES CO.****NEVADA.**

Office: 66 Broadway, New York, N. Y. Mine office: Ely, White Pine Co., Nev. Wm. B. Thompson, president; Jas. Phillips, Jr., vice-president; Frank W. Holmes, treasurer; T. M. Harriman, secretary; preceding officers, W. Hinkle Smith, Louis Marshall and F. L. Hermann, directors.

Organized May, 1907, under laws of Delaware, with capitalization \$50,000,000, as Consolidated Copper Co., and name changed, 1907, to present title, and capitalization increased, April, 1908, to \$60,000,000, shares \$5 par. Was planned as a holding company, to control, through stock ownership, the properties in the Ely and Bingham camps known as the Guggenheim mines, these being the Nevada Consolidated Copper Co. and Cumberland-Ely Copper Co. at Ely, and the Utah Copper Co. at Bingham. Company was said, August, 1908, to have no floating or current indebtedness, but it is not known whether or not the various properties named are controlled through ownership of stock.

The lands of the Ely Mines Co., 33 claims, area 500 acres, were taken over Aug. 8, 1907, and circa 25 men are employed on development work at that property.

**COPPERMINES CO. OF ARIZONA, LTD.****ARIZONA.**

Office: 27 William St., New York, N. Y. English office: 13 Queen Victoria St., London, E. C., Eng. Mine office: Clifton, Graham Co., Ariz. Thos. B. Taylor, president; Wm. C. Shires, vice-president; Luther Martin, second vice-

president; Fred E. Rittman, secretary and treasurer; Maj. Henry Catlin and Alex. Veitch, consulting engineers.

Organized Aug. 5, 1907, under laws of Arizona, with capitalization \$10,000,000, shares \$5 par, in \$5,000,000 cumulative 7% preferred stock and \$5,000,000 common shares, under title of Copper Co. of Arizona, as a reconstruction of the Arizona Amalgamated Copper Co., which was organized under laws of Maine, circa 1906, and name changed, circa 1908, to present title. Annual meeting, first Monday in April.

Company was planned to merge the Stevens, Bonanza, Celtic, Monte Carlo, Keystone-Merritt, Corona, Becker, O'Donnell and Crystalina mining companies, in the Clifton district of Graham county, Arizona, for which properties \$4,000,000 of stock was to be exchanged. Apparently this was to be common stock, as company states that \$5,000,000 preferred stock is at the disposal of the treasury. In December, 1907, predecessor of present company secured extensions of the bonds on properties under option.

Lands are reported by the company as 168 claims. The Copper Co. of Arizona claimed to have upwards of 4,000 acres, with a total of about 4 miles of workings, and upwards of 1,000 acres of available mill and smelter sites, and claimed ore reserves exceeding 200,000,000 tons, which was a gross and utterly indefensible exaggeration. Company is not regarded favorably.

#### COPPER MINES OF MOUNT LYELL WEST, LTD.

AUSTRALIA.

Dead. Succeeded, Oct. 2, 1907, by West Mount Lyell, Ltd. Formerly at Gormanston, Montagu Co., Tasmania. Described Vol. VI.

#### COPPER MINES & SMELTERS CORPORATION

CALIFORNIA.

OF AMERICA.

Office: 417 Montgomery St., San Francisco, Cal. Letter returned unclaimed from former mine office, Vontrigger, San Bernardino Co., Cal. E. H. Kramer, president; C. H. Dunsmoor, vice-president; T. Wilkinson Tetley, secretary and treasurer; preceding officers, W. E. Ewing, E. H. Geary, Louis Hogan and E. W. Sichel, directors. Organized July 16, 1907, under laws of Arizona, with capitalization \$5,000,000, shares \$5 par. Annual meeting, first Monday in January.

Is said to have absorbed, circa September, 1907, the Green Dragon Copper Co. and the Deesie Boyer Copper & Gold Mines, Ltd. Lands, 12 claims, one fractional, area 220 acres, in the Signal district, opened by shafts of 30' and 90' on the Humming Bird claim, 2 miles from Vontrigger. C. Marcercau Garrison is reported by company to have estimated 9,000,000 tons of ore in sight, but either Mr. Garrison is subject to strange optical illusions, or has been grossly slandered. Company is not regarded favorably.

#### COPPER MINING & DEVELOPING CO.

CALIFORNIA.

Office: care of J. B. Campbell, president, Fresno, Cal. Mine office: Kaweah, Tulare Co., Cal. Lands, 50 claims, area circa 1,000 acres, on Kearsarge Peak, 35 miles east of Kaweah, slightly developed, showing carbonate and sulphide ores, assaying 2 to 25% copper. Idle several years and moribund.

#### COPPER MINING & SMELTING CO. OF ONTARIO, LTD.

ONTARIO.

Office: 6 Broad Street Place, London, E. C., Eng. Mine office: Bruce Mines, Algoma, Ont. T. Hayes Sheen, president and general manager; C. E. Osborn, secretary; H. J. Carnegie-Williams, superintendent. Organized Aug. 16, 1905, under laws of Ontario, with capitalization \$1,000,000, shares \$5 par. Property is the old Bruce mines, area 12,800 acres, freehold, on Georgian Bay. Mine, worked 1846-1876, producing copper to value of circa \$3,500,000, has several tunnels and 10 shafts of 75' to 450' depth, with about 3 miles of workings. Mine has several parallel veins, with strike of 15° West of North and dip of 85° to 90°, there being 6 known veins, of which 2, of 4' to 10' width, traversing diabase, are developed, carrying mainly chalcopyrite with occasional bornite and chalcocite, with quartz gangue, estimated to average 5% copper.

Principal workings are shafts Nos. 2, 3 and 4, latter 453' deep, upper levels of mine being stopeed out. Waste burrows of mine contain about 125,000 tons, estimated to carry 1.5% copper.

Equipment includes a 400-h. p. steam plant, with 4 hoists of 25 to 150-h. p. each, latter with double drums of 36" face and 60" diameter. Has a 16-drill Rand air-compressor, 35-kw. dynamo and 14 mine buildings, including a 25x60' machine shop.

Mine and mill, 1½ miles apart, are connected by the tracks of the Bruce Mines & Algoma Railway. The 200-ton concentrator, of wood and iron, 75x192', has an Austin crusher, 5 sets of rolls, 12 Hartz jigs, 18 Frue vanners, 2 double-deck slime tables and 18 sizers. Miscellaneous improvements include 3 docks, a coal wharf, merchandise wharf, electric light plant and telephone system. Total production of mine, under old management, was 40,461 long tons of concentrates of about 20% average copper tenor, equivalent to circa 8,000 long tons fine copper.

**COPPER MOUNTAIN CONSOLIDATED MINING CO.** CALIFORNIA.

Letter returned unclaimed from former mine office, Copley, Shasta Co., Cal. Fred Grotfend, superintendent. Property is the Sugar Loaf mine. Has electric power. Idle.

**COPPER MOUNTAIN COPPER CO.** ALASKA.

Mine office: Nome, Alaska. Property is sundry claims near the head of the Nome river, on which development work was in progress, late 1907.

**COPPER MOUNTAIN DEVELOPMENT CO.** CALIFORNIA.

Dead. Succeeded by Copper Mining & Developing Co. Formerly at Kaweah, Tulare Co., Cal.

**COPPER MOUNTAIN MINING CO.** CALIFORNIA.

Letter returned unclaimed from former office, 310 Laughlin Bldg., Los Angeles, Cal. Mine office: Victor, San Bernardino Co., Cal. W. A. Cooper, president; J. S. Longley, secretary; J. A. Morlan, manager. Lands, 10 claims, including the Amazon mine, showing a 200' gossan outcrop, opened circa 1873, reopened 1901. Main shaft, 200', shows sulphide ores assaying 8 to 10% copper. Is claimed to have about 10,000 tons of ore on the dump, which is doubtful. Idle and apparently moribund.

**COPPER MOUNTAIN MINING CO.** COLORADO.

Office: Ward, Boulder Co., Colo. Geo. W. Barnhardt, superintendent. Lands, about 1 mile north of Ward, have a 50' tunnel, showing a 6' vein, assaying well in gold and silver.

**COPPER MOUNTAIN MINING CO.** NEVADA.

Dead. Formerly at Tecoma, Elko Co., Nev.

**COPPER MOUNTAIN MINING CO.** UTAH.

Office: care of B. T. Lloyd, superintendent, 323 D. F. Walker Bldg., Salt Lake City, Utah. Mine office: Milford, Beaver Co., Utah. Lands, 6 claims, owned formerly by Copper Mountain Mining & Milling Co., having open-cuts and shallow shafts of 5' to 60', and a main shaft, of peculiar construction, about 250' in depth, showing an iron ore vein of 4' to 14' width, giving assays of 18 to 28% copper. Shaft is vertical for about 100', thence drops 100' at an angle of 75°, thereafter has 50' sunk at an angle of 70°, which is excellently bad engineering. Has gasoline power. Presumably idle.

**COPPER MOUNTAIN MINING CO.** WYOMING.

Dead. Formerly at Big Horn, Sheridan Co., Wyo., and Rudefaha, Carbon Co., Wyo. Described Vol. VI.

**COPPER MOUNTAIN MINING & DEVELOPMENT CO.** IDAHO.

Office and mine: Mullan, Shoshone Co., Idaho. James I. Dickinson, president. Organized 1906, under laws of Idaho, with capitalization \$1,500,000,

shares \$1 par. Lands, 8 claims, 1 fractional, on Copper Mountain, just east of Mullan, having a 500' tunnel, showing bornite.

**COPPER MOUNTAIN MINING WASHINGTON & BRITISH COLUMBIA.  
& DEVELOPMENT CO.**

Office: 5406 Union Ave., South Tacoma, Wash. Mine offices: Ryan, Stevens Co., Wash., and Quatsino, Atlin district, B. C. B. S. Cowles, president; Jos. Hutchinson, secretary; B. D. Holcomb, general manager; A. T. Macaulay, superintendent. Capitalization \$200,000, shares 10 cents par. The Washington group has 4 claims, area 90 acres, with 3 ore bodies, one lens 75' wide being opened by a 300' shaft and a 115' tunnel. The June group, at Quatsino Sound, includes 5 claims, area 258 acres, showing an ore body said to be 100' wide, with measured length of 3,000', giving assays of 6 to 8% copper, 3 oz. silver and \$2 gold per ton, from chalcopyrite. A large amount of ore is shown on surface, and the deposit has been worked open-cast. British Columbian group considered promising. Both groups idle for several years.

**COPPER MOUNTAIN MINING & MILLING CO. IDAHO.**

Office and mine: Mullan, Shoshone Co., Idaho. J. A. Grenier, president; W. Wyman, secretary. Lands, 8 claims, on Copper Mountain, east of the Snow Storm, developed by tunnel.

**COPPER MOUNTAIN & MILLING CO. UTAH.**

Dead. Was bankrupted, 1904, by bad management. Formerly at Milford, Beaver Co., Utah. Fully described Vol. IV.

**COPPER MOUNTAIN MINING & SMELTING CO. MONTANA.**

Office: Phoenix Bldg., Butte, Mont. Mine office: Corbin, Jefferson Co., Mont. J. H. McCabe, manager; J. S. Cohen, secretary. Organized 1907, with capitalization \$1,000,000. Lands, circa 50 claims area about 1,000 acres, including 5 claims on Valparaiso Hill, also claimed by Butte & Corbin Consolidated Mining Co., and title vested in latter by judgment of court June 7, 1908. Has a shallow shaft, showing numerous stringers of ore assaying circa 6% copper, with small silver values, and is said to have a 15' vein with 15" pay-streak. Idle.

**COPPEROPOLIS COPPER CO. OREGON.**

Letter returned unclaimed from former office, 503 McKay Bldg., Portland, Ore. Mine office: Prairie City, Grant Co., Ore. J. L. Hartman, president; H. W. Prettyman, vice-president; W. W. Gibbs, treasurer and general manager; N. A. Butcher, secretary. Organized 1900, under laws of Oregon, with capitalization \$120,000, shares 10 cents par.

Lands, 10 claims, 2 patented, area 200 acres, and a 2-acre millsite, in the Quartzburg district, showing 2 ore bodies between diorite and porphyry, of which one, of 50' to 60' estimated average width, is opened by a 1,500' tunnel, showing chalcopyrite giving average assays of 3% copper, 1.5 oz. silver and \$1.50 gold per ton. Has steam and gasoline power, a 2-drill air-compressor and 8 mine buildings.

A 50-ton mill, 50x60', of wood, equipped with crusher, rolls and jigs, puts about 10 into 1, concentration not being very close, with heavy losses in tailings, concentrates ranging in tenor from 19 to 24% copper, 3 to 22 oz. silver and \$2.16 to \$6.40 gold per ton. Property considered promising, but mill was built before the mine was opened adequately. Idle from lack of funds, and apparently moribund.

**COPPEROPOLIS MINING CO. NEVADA.**

Office: Nixon Blk., Goldfield, Nev. J. W. McLisle, president; H. Tidwell, vice-president; H. C. Hamlin, secretary; J. P. Marshall, treasurer. Lands, supposedly in Esmeralda County, Nevada, are said to have a 30' vein, between limestone and schist, with schistose gangue, carrying good gold and silver values.

**COPPEROPOLIS MINING & LEASING CO.****WASHINGTON.**

Office: 3 Marion Blk., Indianapolis, Ind. Mine office: Keller, Ferry Co., Wash. H. Hibschman, president; Geo. P. Garwood, secretary and manager; preceding officers, F. E. Stone, G. D. McClain and M. Hibschman, directors. Organized circa 1907, under laws of Washington, with capitalization \$3,000,000, shares \$10 par. Lands, 6 claims, 3 fractional, area circa 90 acres, 5 miles west of Keller, opened by a 60' tunnel, showing low grade chalcopyrite.

**COPPEROSITY MINE.****ARIZONA.**

Mine office: Vekol, Pinal Co., Ariz. Wm. Forbach, superintendent. Has a power plant, installed 1907.

**COPPER PLATE & ARIZONA MINING CO.****ARIZONA.**

Letter returned unclaimed from former office, Duluth, Minn. Mine office: Metcalf, Graham Co., Ariz. Ambrose Burke, superintendent, at last accounts. Organized 1904, with capitalization \$5,000,000. Lands are the Copper Plate group, on Chase Creek, said to show a 5' vein of milling ore in the breast of a 200' tunnel. Idle.

**COPPER PLATE MINING CO., LTD.****IDAHO.**

Dead. Formerly at Mullan, Shoshone Co., Idaho.

**COPPER PRINCE CONSOLIDATED MINING CO.****UTAH.**

Office: Salt Lake City, Utah. Letter returned unclaimed from former mine office, Alta, Salt Lake Co., Utah. Anthony O. Jacobson, president; Clarence K. McCornick, vice-president; Chas. H. Post, secretary. Organized 1904, with capitalization \$500,000, shares \$1 par. Lands, 3 groups, near the Continental-Alta and Columbus Consolidated, from which \$900,000 worth of ore is said to have been shipped in the past. Apparently moribund.

**COPPER PRINCE MINING CO.****CALIFORNIA.**

Office: care of J. C. Ruddock, secretary, Ukiah, Cal. Mine office: Middle-town, Lake Co., Cal. E. Lobree, president, at last accounts. Lands, 3 claims, opened by tunnel and trenches. A vein of 6' to 8' width, in limestone, has given assays of 5% copper, 1 oz. silver and \$3 gold per ton. Idle for some years, and apparently moribund.

**COPPER PRINCE MINING CO.****CALIFORNIA.**

Letter returned unclaimed from former office, Daggett, Cal. Mine office: Crackerjack, San Bernardino Co., Cal. Frank Durham, Jr., president; Chas. Melini, vice-president; L. W. Flournoy, treasurer; Col. D. K. B. Sellers, secretary; preceding officers, Theron Flower and Washington Hall, directors. Organized May, 1907. Presumably idle.

**COPPER PRINCE MINING & SMELTING CO.****COLORADO.**

Mine office: Copperfield, Frémont Co., Colo. Mine, in the Red Gulch district, shipped ore, 1907, running 31% copper.

**COPPER QUEEN CONSOLIDATED MINING CO.****ARIZONA.**

Office: 99 John St., New York, N. Y. Mine office: Bisbee, Cochise Co., Ariz. Works office: Douglas, Cochise Co., Ariz. Prof. Jas. Douglas, president; A. C. James, vice-president; Geo. Notman, secretary and treasurer; Walter Douglas, general manager; Arthur Woodman, assistant general manager; Gerald Sherman, mine superintendent; Geo. B. Lee, smelter superintendent; J. B. Moulton, assistant smelter superintendent; G. H. Dowell, ore purchaser; W. F. Crane, auditor; W. H. Brophy, store manager; J. S. Taylor, Jas. Finley and Thos. Devine, mine foremen.

Organized August, 1885, under laws of New York, with capitalization \$2,000,000, shares \$10 par. Was said to have paid \$5 per share quarterly dividends in 1906. Is operated as a close corporation, and is said to have only about 15 shareholders.

About 4,000 men are employed, of whom approximately 2,500 are at the mines and 1,500 at the smelter.

Lands are upwards of 1,000 acres, including various mines hereinafter described in detail. The mine is opened ahead for about 8 years, present ore reserves being among the richest and most extensive ever developed in any property. In December, 1907, new openings aggregated 5,600'. Ore bodies are so soft that it is difficult to secure the mine openings, especially as the entire hill above the mine is creeping, and serious crushes can be avoided only by heavy timbering and the exercise of great care. Many of the stopes are bulk-headed throughout, and the mine is timbered with square sets of 10x10" and 12x12" timber, mainly Washington fir, an average of 30' of timber, board measure, being required for each ton of ore won. All ore is hand-sorted underground, after breaking, and culs used for filling in worked-out stopes, this material standing remarkably well. Notwithstanding numerous disadvantages of operation and menaces to life, the Copper Queen is one of the safest of mines for underground workmen, an evidence of able and experienced management.

The mine has electric pumps, there being three 300-gallon pumps at the Czar shaft, two of 100 gallons each at the Holbrook, two 50-gallon pumps at the Silver Spray, and two 100-gallon pumps at the Lowell. Lead-lined pump columns are used, to obviate excessive corrosion from acid mine-waters. The mine, as a whole, is not especially wet, the district being drained largely by the Superior & Pittsburg.

The entire system of mine operation was changed, radically, in 1908. Formerly each of the principal shafts was operated as a separate mine, but the 5 old shafts are now used only for men, waste, timber and supplies, all ore extraction being through the Sacramento shaft. The haulage system has circa 6 miles of tracks, on the 400', 600', 800', 1,000' and 1,200' levels. In order to complete this traction system it was necessary to open many new drifts and crosscuts, which have been located in solid ground, wherever possible, as the electric tram-lines are the arteries of the mine. The haulage system has Goodman locomotives and side-dumping ore cars. Chutes have been installed throughout the mine, for loading the motor-cars, which discharge into large storage bins, from which the skips are loaded.

The mine was opened, 1880, on a solid outcrop of oxidized copper, iron and manganese, opposite the Copper Queen hotel in Bisbee. The original ore body, since removed, leaving a large artificial cave, gave average returns of 23% copper, smelted in a 30" water-jacket furnace, with English coke, brought via San Francisco, but was exhausted in three or four years, and the mine experienced many vicissitudes, until additional and far larger ore bodies were developed, by following seams and stringers of ore wherever occurring, these almost invariably leading to further large and rich ore deposits. The formation of the Copper Queen, and other mines of the district, consists essentially of two dolomitic limestone beds, of Carboniferous age, the upper white and the lower blue, dipping to the southward and flanking a granite-porphry core, with intrusive porphyritic dikes. Until 1902 the principal ore bodies were found at the base of the upper limestone bed, which is much broken and interrupted by feldspathic, igneous, intrusive rocks, that evidently have a considerable bearing upon the ore deposits, which occur in pockets, lenses, chimneys, bunches, chutes, veins, stringers and seams, the larger bodies being connected, in most cases, by small veins, or mere knifeblade seams. The limestone and its included ore bodies have a general pitch to the southeast, somewhat sharper than the pitch of Tombstone Cañon, necessitating deeper shafts as distance is made toward the southeast. Extensive bodies of high-grade ore have been found, since 1902, in the underlying limestone strata, and developments prove these underlying ore bodies to be persistent to great depth.

All of the Copper Queen's deep shafts are bottomed in disseminated sul-

phide ores of high grade, consequently the depth of the ore bodies, while already proven great, is conjectural. The mines show numerous beautiful caves, lined with calcite, some of these being of considerable size, and frequently found in close association with good ore bodies. Rich oxidized ores are found on the lowest level, with chalcocite and bornite occurring above azurite, malachite, cuprite and even considerable bodies of native copper. The larger masses of native metal, ranging up to several hundredweights, and even tons, have been found mainly, not in the upper levels, as might have been expected, but at considerable depth. There is much talc and hematite, with frequent occurrences of manganese, in connection with the ore bodies. Only oxidized ores were worked, until 1893, when converters were added to the smelting plant, since which time the furnaces are charged with a mixture of oxide, carbonate and sulphide ores, perhaps one-third of the charges being sulphide ores, the ores smelted giving average returns of better than 7%. The system of assaying used by the mine gives no figures regarding ores richer than 15%, and the frequent occurrence of the figures "15+," on the assay books of every shaft, testifies to the wonderful richness of the ore bodies.

The Czar shaft, the oldest of the present workings, is 400' deep, with an electric hoist. The old shops and smelter were located on a narrow bench of ground, made by grading the steep hillside above the Czar. The old smelter has been dismantled, but some of the shops remain.

The Holbrook mine lost its old shaft, by fire and caving, this being replaced, 1907, by a new 4-compartment shaft, 540' deep, located circa 1,100' southeast of the Czar. Surface equipment includes a steel gallows-frame and a 750-h. p. hoist actuated by compressed air. The Holbrook is the principal mine of the Copper Queen, having large and numerous bodies of exceptionally high grade ore.

The Hayes shaft, between the Holbrook and Silver Spray, is out of commission, having been replaced by the latter some years ago.

The Silver Spray shaft, commonly known as the Spray, circa 1,400' southeast of the Holbrook and near the Irish Mag shaft of the Calumet & Arizona, is 954' deep, with 3 compartments, retimbered, 1907, having become badly drawn. This shaft shows rich ores from the fourth level to the bottom, the upper workings carrying mainly chalcocite, which changes to bornite on the fifth level, with oxidized ores and a continuance of sulphides on the sixth and seventh levels, ores being mainly sulphide on the eighth level. The ore bodies are very extensive and persistent, but most erratic in nature, with frequent porphyry dykes. A considerable body of native copper was cut on the 700' and again on the 800' level, thus setting at defiance some deeply cherished geological theories regarding ore deposition. A 20x60" Nordberg Corliss hoist, actuated by compressed air, operates 3-deck cages.

The Lowell shaft, southeast of the Irish Mag, is 1,447' deep, showing no important ore bodies above the 900' level, but having high grade sulphide ores on the lower workings, the 1,000' level showing high grade oxidized ores below sulphides. This shaft makes circa 175,000 gallons of water daily, which is forked to surface by a Prescott station pump on the 1,000' level. A 20x60" Nordberg hoist, operated by compressed air, raises 3-deck cages, and the shaft has a steel headgear.

The 3-compartment 1,100' Gardner shaft, 1,450' southeast of the Silver Spray, has large bodies of high grade sulphide ore. Surface equipment includes a 100' steel gallows-frame and a 750-h. p. Nordberg 20x60" hoist, actuated by steam.

The 700' Cuprite shaft, circa 1,400' west of the Silver Spray, is connected underground with the Czar. No large ore bodies have been located by this

shaft, though it should find the extension of the ore bodies of the Shattuck-Arizona.

The Uncle Sam has an old shaft, and a new shaft, sunk 1907-1908, to circa 500' depth, connected with the Czar and Holbrook mines.

The White Tail Deer shaft, lying some distance south of the main workings, is reached by road through a detour of several miles, and was opened, circa 1893, to 100' depth on the incline, and some high grade ore was shipped, 1904, by lessees, running 12 to 15% copper. The mine shows a large body of low grade ore.

The 4-compartment 1,200' Sacramento shaft is planned to handle the entire output of the mine, having a hoisting capacity of 4,000 tons daily, with ore-loading bins on the various levels served by the electric haulage system, the Sacramento being connected with all the other workings of the mine. The shaft was sunk in rock for practically the entire distance, insuring as great a degree of immunity from drawing as is possible in this district. The Sacramento hoist is a powerful Nordberg tandem compound engine, with 7' drums having a 5' face, the hoist being operated by steam, with 6 auxiliary engines actuated by oil, under 150 lbs. pressure. Hoisting is by 3-ton skips, and the arrangements for uninterrupted hoisting, to the capacity of the shaft, are unusually complete.

The Sacramento shaft has perhaps the most elaborate and best devised system for mixing and loading ores to be found at any copper mine. On reaching surface, in the shafthouse, ore is dumped automatically upon a Stephens-Adamson belt conveyor, which carries the ore about 150' down the hill to the loading tracks. The loading shed is 42x800', of steel frame, with 4 railroad tracks running beneath, cars being loaded from 2 conveying belts running lengthwise between the 4 tracks, ore being scraped off the belts by dumping carriages moving continually back and forth, the motion mixing the ore thoroughly. Every tenth skipload is weighed automatically, and loaded into a special car for sampling and checking purposes.

A precipitation plant, built 1906, at the Czar shaft, on the site of the old smelter, has a series of vats and launders, taking mine water, from the Holbrook and Czar shafts, which is heavily charged with copper sulphate in solution. The two monstrous slag-dumps near the Czar shaft, remaining from the old smelting plant, are being broken up and shipped to Douglas for remelting.

Formerly each shaft had its own independent power plant, but these were replaced, 1908, by a central power plant that effects large savings. The main power plant, between the Sacramento and Gardner shafts, has an engine-house and boiler-house, both of steel frame. Equipment includes four 400-h. p. Stirling boilers, 3 Curtis 500-kw. turbo-generators, 3 Ingersoll-Rand air-compressors, with aggregate piston capacity of 9,300 cubic feet of free air per minute, and various smaller machinery. Fuel is Texas and California petroleum, with large tanks for oil storage.

The mine machine-shop, 66x150', of steel frame, located on Sacramento Hill, near the power plant, includes a smithy and boiler-shop. Mine buildings include a considerable number of minor shops, warehouses, changing-houses and offices. All of the shafts and the principal mine buildings are reached by spurs of the El Paso & Southwestern railway, the railroad line at the mines having been rebuilt, 1907, with better grades.

The smelter, known as the Douglas reduction works, is at Douglas, Arizona, 28 miles from the mine and 1 mile from the Mexican border. This plant was designed as a central smelter for the mines of Phelps, Dodge & Co. in Arizona and Mexico, these including the Copper Queen at Bisbee, the Detroit at Morenci, the Old Dominion at Globe, the Moctezuma at Nacoziari, and the Sierra de

Cobre at La Cananea. These properties produce a great diversity of copper ores, including those of practically every grade and character found in the American southwest and in northern Mexico, and it is possible, by means of this central reduction plant, to take advantage of the varied nature of the ores, in mixing furnace charges. This plant also does a considerable custom business, on copper, gold and silver ores.

The works occupy a site of 320 acres, and are served by a very complete Y-track railroad system, of standard gauge, that reaches every building and department of the plant, there being about 15 miles of railroad track, including main line and sidings. Construction of the plant was begun May, 1901, and the first stack was blown in March, 1904, since which time there has been almost continuous enlargement, and the works, costing circa \$4,000,000, are second in size only to the mammoth Washoe smelter, having a daily smelting capacity of about 4,000 tons.

Water for the works is secured from artesian wells of about 300' average depth, water rising nearly to the surface, with one well, of circa 1,000' depth, flowing 200 gallons per minute. A large reservoir and cooling tower have been built, in connection with the water supply.

The ore bedding system at the works consists of 5 pits, the fifth having been built 1908, each 40x800' in size, and 11' deep, having an aggregate storage capacity of circa 90,000 tons. Ore, received from the mine in side-dumping steel cars, is discharged into the pits, which are lined with white tufa. The pits are filled with the different grades of ore required to constitute a normal furnace mixture, and mixed by a mechanical plow, while ore is removed therefrom, as required at the furnaces, by steam-shovels running on permanent tracks laid upon the floors of the pits.

Adjoining the furnace building is a steel trestle, 48' high and 1,343' long, divided into sections, with storage bins for coke, fluxes and silica.

The sampling mill, 65x235' in size, of steel and brick, has 3 crushers, 6 rolls and 2 Vezin automatic samplers.

The steel blast-furnace building, twice enlarged, is 160x775' in size, including also the converter department and relining plant, and is equipped with three 60-ton 5-motor Morgan traveling cranes, of 60' span, running the entire length of the building. There are ten 400-ton blast-furnaces, each 44x240", with forty 4" tuyeres, and a height of 16' from the tuyeres to the charging floor. The 10 furnaces are set 15' apart, in a single line, with one settler between each pair, settlers being 10' wide and 20' long, lower half lined with chrome brick and upper half with ordinary fire-brick. Slags skim through 2 spouts into 18-ton slag-cars, hauled by electric locomotives, the slag being used for grading by the El Paso & Southwestern railway. Ore is charged on either side, alternately, charging being done from trains of 20 cars, each car carrying 2,500-lb. charges, hauled by 13-ton electric locomotives.

The dust chamber is of steel frame, with brick walls, roofed with reinforced concrete supported by steel trusses, and has a bottom of tiled hoppers.

There is one large reverberatory furnace in the slag-yard south of No. 6 blast-furnace. This has been run experimentally, taking charges of flue dust and fines mixed with converter slags. The experiment has not proven entirely successful. The original plans called for 4 additional reverberatories, giving one for each pair of blast-furnaces.

Molten matte is taken from the blast-furnaces to the conveyors by two 60-ton Morgan electric traveling cranes, each having two 15-ton auxiliary hoists. The converter department has 8 stands, operated hydraulically, with 36 shells of the well-known Copper Queen barrel type, 96x126" in size. Copper is poured in a Walker casting machine. The lining department has 3 grinding-pans, with pneumatic machinery for tamping.

The steel stack of the furnace building, 30' in diameter at the base and 25' at the top, was 200' high, but a 60' extension was added, 1906, by the Wisconsin Bridge & Iron Co. The new section, weighing 40 tons, built upon a scaffolding at the top of the old stack, upon the windward side, was rolled into position and riveted on within a few hours after completion, without the suspension of smelting.

The power-house, of steel and brick, repeatedly enlarged, is now 120x379' in size, and has about 20 engines of various sizes and types, aggregating more than 6,000 h. p., for different uses. The equipment includes 4 Nordberg cross-compound blowing engines, each direct-connected to a 400-kw. 250-volt direct current generator; Nos. 9 and 10 Connerville blowers, set staggering; a cross-compound 2-stage condensing air-compressor, with piston capacity of 2,000 cubic feet of free air per minute, at 100 lbs. pressure, for running pneumatic tamping machines, operating charging doors of the blast-furnaces and pumping water; 3 triplex motor-driven pumps, delivering water into compression tanks at 350 lbs. pressure per square inch, with automatic regulation; four 400-kw. 250-volt direct current generators, supplying power for cranes, slag locomotives and electric light, and a number of minor engines and dynamos.

The 85x205' steel boiler-house has six 500-h. p. and four 1,000-h. p. Stirling water-tube boilers, with a Green fuel economizer and a Foster superheater with capacity of 90,000 lbs. of steam per hour. The stack of the boiler-house is of brick, 13' in diameter at the base, and 177' high. Boilers are arranged to burn either coal or petroleum, but latter is used exclusively, consumption of California and Texas petroleum, at the mine and works, amounting to about 500,000 gallons monthly. Oil for fuel is cheaper in first cost, easier and cleaner to handle, and effects a great saving in the wages of 3 daily shifts of stokers formerly required at every boiler plant.

The machine-shop, 80x204', of steel and brick, is fitted with a very complete line of shop tools, capable of handling the heaviest work.

The boiler-shop, 85x120', of steel and brick, is exceptionally well equipped, and can repair locomotive boilers.

The smithy, 90x120', of steel frame, is equipped as thoroughly as the other shops, and is capable of handling forgings of considerable size.

The foundry, 80x90' in size, of steel frame, has both iron and brass cupolas, turning out iron castings up to many tons in weight. The shops at the Douglas works can do, not only any ordinary or extraordinary repair work, but, at a pinch, are capable of manufacturing heavy machinery.

Miscellaneous shops at the smelter include a combination sawmill and planing mill, 95x120' in size, well equipped with wood-working tools.

Miscellaneous buildings at the Douglas works include an office and warehouse, various minor shops and a considerable number of neat dwellings for employees.

A limestone quarry, at Lee station, 7 miles east of Douglas, has a large crusher and storage bins, the requirements of the smelter being 400 to 500 tons of limestone daily, for flux.

The El Paso & Southwestern railway, owned by Phelps, Dodge & Co., which serves the Copper Queen mines and works, has some 300 miles of main line, and, though designed solely as an outlet for the Phelps-Dodge mines, has developed a previously inaccessible district, rich in natural resources. One result of the construction of this line has been the building of the new town of Douglas, named in deserved honor of the president of the Copper Queen, which is a bustling young metropolis of some 15,000 population, already a strong competitor of El Paso as a custom smelting point, taking ores from Arizona, New Mexico, Sonora and Chihuahua.

A sawmill is operated, in the Chiricahua Mountains, through the bulk of

the timber and lumber requirements of the mine and works are met by the importation of timber from the Pacific coast.

The company maintains, at Bisbee, an enormous department store, that carries a stock larger than can be found in most cities of twice the size. This store has extensive branches, at Lowell, Douglas and Naco. There is, however, no compulsion of employees, who are at perfect liberty to buy goods of any of the numerous and flourishing independent mercantile establishments of Bisbee and Douglas.

The Copper Queen has a large and well equipped hospital at Bisbee. The company also owns, at Bisbee, a fine 4-story hotel, and maintains libraries and reading-rooms for employees at both Bisbee and Douglas. At Bisbee there is a handsome 3-story gymnasium, having baths, bowling alleys and a large auditorium, in which scientific and popular lectures are given frequently.

Relations of the Copper Queen with its employees have been notably cordial for many years, though some trouble was had, 1906-1907, through a strike called by the Western Federation of Labor. Efforts were made, at different times, to unionize the Bisbee camp, but, early in 1906, a referendum vote of the mine-workers was taken on this point, no bosses or other salaried employees being allowed to vote. The polling was conducted on the Australian system, with complete poll-lists, inspectors and guards, and was absolutely fair, resulting in a vote of more than 5 to 1 against forming a union of the Western Federation of Miners, notwithstanding which the Federation promptly organized, in violation of the spirit of the vote, and immediately thereafter called a strike. This was maintained for some months, backed by all the power of a strong labor union, but, though causing more or less trouble, resulted in a disastrous defeat for the Federation, and Bisbee is now an open camp. The mine workers have not suffered, however, as wages have been maintained at the high level set by the Copper Queen many years ago, and the 8-hour system continued. The attitude of the miners employed by the Copper Queen is that, inasmuch as they are obtaining all the benefits demanded by the miners' union, without any of the strikes and other troubles usually attendant upon the existence of the union, they are satisfied to leave matters as they have been for 20 years past.

Production was 64,570,847 lbs. fine copper in 1905; 71,711,813 lbs. fine copper, 332,311 oz. silver and 7,573 oz. gold in 1906, and 66,916,972 lbs. fine copper, 338,723 oz. silver and 4,197 oz. gold in 1907. The ultimate productive capacity of the Copper Queen cannot be rated at less than 100,000,000 lbs. yearly. The mine is one of the best in existence, and both mine and works have grown wonderfully within the past few years, the mining and reduction plants now being among the best in existence. The management is exceptionally farsighted and capable, and deserves the highest commendation for the friendly and helpful spirit shown in dealings with employees, and for the neighborliness that has impelled the Copper Queen to lend a helping hand to the newer mines at Bisbee.

**COPPER QUEEN CONSOLIDATED MINING CO.**

WYOMING.

Dead. Formerly at Dillon, Carbon Co., Wyo.

**COPPER QUEEN CONSOLIDATED MINING & MILLING CO.**

Office: 500 Auerbach Bldg., Salt Lake City, Utah. Moribund.

**COPPER QUEEN GOLD MINING CO.**

ARIZONA.

Office: Mayer, Yavapai Co., Ariz. J. S. Johnson, superintendent. Lands, across the Agua Fria river from the Binghamton mine, show argentiferous and auriferous copper ores. Was developing with a small force at last accounts.

**COPPER QUEEN GROUP MINING CO.**

COLORADO.

Office: 723 Oddfellows Bldg., St. Louis, Mo. J. G. Bolmer, president;

Digitized by Google

C. A. Weber, vice-president; M. M. Clemons, secretary and treasurer. Organized 1901, under laws of Colorado. Lands, 6 claims, patented, in the Elk Mountain district of Gunnison county, Colo., having about 600' of workings, said to have produced several thousand dollars' worth of ore under previous ownership. A tunnel to undercut this and adjoining properties, being driven by the Usona Mining Co., at last accounts, was planned to intersect the Copper Queen vein about one-half mile below surface. Idle since 1903, but selling stock at last accounts.

**COPPER QUEEN, LTD.****BRITISH COLUMBIA.**

Dead. Dissolved, August, 1904. Formerly at Nelson, Kootenay district, B. C.

**COPPER QUEEN MINE.****BRITISH COLUMBIA.**

Office: care of Edw. B. Cox, manager, Seattle, Wash. Mine office: Van Anda, Texada Island, B. C. Harry Wild, superintendent. Lands, crown-granted, near the Cornell and Marble Bay mines, carry bornite and chalcopyrite ranging in tenor up to 8% copper, 2.5 oz. silver and \$1 gold per ton. Has a 500' main shaft, with a 180' winze. Presumably idle.

**COPPER QUEEN MINE.****COLORADO.**

Office and mine: care of Miss Nettie Hornbeck, owner, Silverton, San Juan Co., Colo. Lands, 8 claims, area 160 acres, on Sultan Mountain, opened by a 70' contact tunnel showing ore assaying 15% copper and \$25 gold per ton, with small silver values.

**COPPER QUEEN MINE.****NEW MEXICO.**

Mine office: Jarilla, Otero Co., N. M. Wm. Wade, manager, at last accounts. Lands, in the northern part of the Jarilla Mountains, show a 14' vein of sulphide ore assaying circa 8% copper, with small gold and silver values. Presumably idle.

**COPPER QUEEN MINING CO.****IDAHO.**

Office and mine: Mullan, Shoshone Co., Idaho. E. B. Crawford, president and general manager; Tennes Nelson, vice-president; C. B. Boyden, secretary; Dr. E. D. Keys, treasurer. Organized 1906, with capitalization \$1,000,000. Lands, 7 claims, known as the Stevens Peak group, at the head of Willow Creek, having a 400' tunnel cutting a vein, supposed to be the Reindeer, of 40' estimated width, carrying a 12" paystreak of massive chalcopyrite, assaying 20 to 30% copper, with fair silver values, balance of vein being spathic iron ore impregnated with low-grade chalcopyrite of concentrating tenor. Has an 86' tunnel and plans running, jointly with the Reindeer, a tunnel of circa 2,800', giving a back of circa 775' on the Reindeer and circa 1,200' on the Copper Queen.

**COPPER QUEEN MINING CO.****WASHINGTON.**

Mine office: Chewelah, Stevens Co., Wash. Lands, 6 claims, held under a \$33,500 bond and lease.

**COPPER QUEEN MINING CO.**

Dead. Formerly had an office at 542 Rookery Bldg., Spokane, Wash.

**COPPER QUEEN MINING CO., LTD.****ONTARIO.**

Dead. Succeeded, 1905, by Calumet & Algoma Mining Co. Formerly at Bruce Mines, Algoma, Ont.

**COPPER QUEEN MINING & SMELTING CO.****IDAHO.**

Office: 409 Providence Bldg., Duluth, Minn. Mine office: Grant, Beaverhead Co., Mont. T. E. G. Lynch, president; B. F. White, vice-president; A. J. McLennan, secretary and treasurer; Geo. H. Crosby, general manager; Emerson Hill, superintendent; preceding officers, Dr. C. W. McFadden and J. C. McFadden, directors. Organized June 12, 1905, under laws of Arizona, with capitalization \$500,000, shares \$1 par. Absorbed, circa 1908, the Queen & Crescent Mining Co., giving one share for eight.

Lands 23 claims, on Agency creek, in Lemhi Pass, in the Eureka district

of Lemhi county, Idaho, 38 miles from the Oregon Short Line railway. Property includes the Queen & Crescent group of 17 claims, and the Copper Queen group of 6 claims, latter carrying 8 fissure veins, in schistose quartzite, of which 3, under development, range from 15" to 15' in average width, showing mainly bornite, with occasional chalcocite and chalcopyrite, said to give average assays of 15% copper, 5 to 10 oz. silver and \$15 gold per ton. Development is by shafts of 100' and 140', and by 7 tunnels, longest 425', with circa 2,000' of workings.

Equipment includes a steam plant with 3 boilers, 2 hoists and a 3-drill and air-compressor. There are 10 buildings, including a log mill having 10 gravity stamps, 2 concentrators and Wilfley tables. In January, 1908, shipped 2 carloads of ore assaying circa 45% copper, 8 oz. silver and \$20 gold per ton. Is developing with force of 16 men. Property considered promising and management good.

#### COPPER RANCH GOLD MINING & MILLING CO. COLORADO.

Office: 1711 Tremont St., Denver, Colo. W. E. Alexander, president; T. E. Fisher, vice-president; Thos. Fielding, secretary. Organized under laws of Colorado, with capitalization \$1,000,000, shares \$1 par. Lands, 170 acres, patented, in the Grand Island district of Boulder county, Colorado, opened by a 218' shaft, with circa 350' of drifts. In May, 1903, advertised that there was no risk in buying this stock, as dividends would be paid in a few months. Was still selling stock, 1906, advertising its property as a tungsten mine, with no dividends paid, and no prospects of dividends. Is not regarded favorably.

#### COPPER RANCH MINING CO. UTAH.

Office: 323 D. F. Walker Bldg., Salt Lake City, Utah. Letter returned unclaimed from former mine office, Milford, Beaver Co., Utah. Moses Thatcher, president; C. L. Rood, vice-president; Benj. T. Lloyd, secretary and treasurer. Organized under laws of Utah with capitalization \$500,000, shares 50 cents par.

Lands, 17 claims, area circa 340 acres, between the Old Hickory and O. K. mines of the Majestic company, carrying circa 2 miles of the strike of a vein of about 100' width, opened at intervals for a mile, showing ores assaying up to 43% copper, 10 oz. silver and \$8 gold per ton. Management estimates that entire vein will average 4 to 7% copper, with fair gold and silver values, which is a serious overestimate. Ore carries 5 to 25% iron, rendering it desirable for fluxing purposes. The mine has but slight development, with a shaft, poorly planned, 32' deep on the incline and 43' farther vertically, mainly in ore. Said to have been bonded, early 1907, for 18 months, to E. H. Wilson, R. N. Hertzig and John W. Compton, for \$75,000. Property considered promising, but out of cash and idle several years.

#### COPPER RANGE CO. MICHIGAN.

Office: 82 Devonshire St., Boston, Mass. Mine office: Painesdale, Houghton Co., Mich. Wm. A. Paine, president; Chas. H. Paine, vice-president; Frederic Stanwood, secretary and treasurer; preceding officers and Chas. A. Snow, directors; F. W. Denton, general manager.

Organized 1899, under laws of Michigan, with capitalization \$2,500,000, shares \$25 par. Is controlled, through ownership of 99,674 shares out of the total issue of 100,000, by the Copper Range Consolidated Co. Owns 50,000 shares of Champion Copper Co., being one-half the total issue, and 26,051 shares of Copper Range Railroad Co. Income, 1907, was \$502,913.97, of which \$500,000 came from dividends on stock of Champion Copper Co., \$2,749.97 from interest and \$114 from rentals. Disbursements, 1907, were \$545,532.75, including \$150,000 paid in dividends. Ended 1907 with \$69,146.55 cash on hand, and liabilities of only \$427.06. Dividend record is as follows: \$300,000 in 1905, \$600,000 in 1906, \$150,000 in 1907.

Lands, 9,360 acres, in a compact tract south of the Baltic mine, in Town

54 North, Range 34 West, and Town 54 North, Range 35 West, upwards of 5,000 acres being on the mineral belt. Company also holds an option on 2,000 acres of mineral land owned by St. Mary's Canal Mineral Land Co., in the immediate neighborhood of its own holdings. Miscellaneous lands include 441 acres, with nearly 4 miles frontage on Lake Superior, near the mouth of the Graveraet river, 3 miles southwest of the Champion mill, at Freda, sufficient to give sites to three or four new stamp mills. The mineral tract was explored, 1907, by 1,535' of diamond drilling, without results.

#### COPPER RANGE CONSOLIDATED CO.

MICHIGAN.

Office: 82 Devonshire St., Boston, Mass. Mine office: Painesdale, Houghton Co., Mich. Wm. A. Paine, president; Chas. H. Paine, vice-president; Frederic Stanwood, secretary and treasurer; preceding officers, J. Henry Brooks, Kenneth K. McLaren, R. Townsend McKeever, Frank McM. Stanton, F. W. Denton and Samuel L. Smith, directors; John M. Wagner, purchasing agent; C. E. Cleaves, mechanical engineer.

Organized November, 1901, under laws of New Jersey; capitalization increased, 1903, to \$38,500,000, and increased, 1907, to \$40,000,000, shares \$100 par; issued, \$38,418,500. Has about 6,000 shareholders. American Trust Co., Boston, transfer agent; Old Colony Trust Co., Boston, registrar. Dividends have been as follows: \$1,536,086 in 1905, \$2,300,064 in 1906, \$2,304,810 in 1907, \$1,536,740 in 1908.

The Copper Range Consolidated Co. is a securities holding corporation, its assets consisting principally of stock in subsidiary companies, these including the Copper Range Co., Copper Range Railroad Co., Baltic Mining Co. and Trimountain Co., all practically owned outright; a one-half interest in the Champion Copper Co., and control of the Globe mine, now under development, all separately described, under their respective titles.

Share assets of the Copper Range Consolidated Co. are as follows: 99,699 shares Copper Range Co.; 99,659 shares Baltic Mining Co.; 99,185 shares Trimountain Mining Co.; 13,986 shares Copper Range Railroad Co., and \$615,000 bonds of Copper Range Railroad Co. In addition, the company holds, unissued, 791 shares of its own stock, in reserve, for exchange for outstanding shares of the Baltic Mining Co. and Copper Range Co.

Company's assets, Jan. 1, 1908, included bills receivable of Champion Copper Co., \$579,808.99; bills receivable of Baltic Mining Co., \$535,070.23; bills receivable of Copper Range Railroad Co., \$35,082.97. Total assets, Jan. 1, 1908, were \$41,106,790.73, with a balance of \$344,154.24 to credit of profit and loss.

Receipts for 1907 were \$4,384,315, and disbursements were \$4,128,502.82, company beginning the year with a cash balance of \$194,526.83, and ending with a cash balance of \$450,339.01. Principal items of 1907 receipts were \$996,590 dividends from Baltic Mining Co.; \$448,645.50 dividends from Copper Range Co.; \$114,906.57 from the Michigan Smelting Co., from advances previously made; \$600,000 from United Metals Selling Co., advances on copper unsold; \$1,150,000 bills payable, representing loans made, and \$514,885.42 from A. C. Burrage, as balance in full under the Trimountain majority stockholders' agreement of Aug. 25, 1903, this completing payment of the full amount of \$854,954.80, as per settlement effected 1907. Disbursements, 1907, included dividends of \$2,304,810; \$117,030.06 for miscellaneous expenditures, mainly legal expenses in the Burrage litigation, and various advances to the subsidiary companies, necessitated by the complete collapse of the metal market during the latter part of 1907, these advances being \$363,045.72 to the Baltic Mining Co., \$513,808.99 to the Champion Copper Co., \$546,583.49 to the Trimountain Mining Co., and \$42,251.57 to the Copper Range Railroad Co. Expenditures also included \$41,716.40 for electric construction, and \$191,580.92 on the Globe

option and exploration, total expenditures on the latter, to end of 1907, having been \$392,307.20.

While the Copper Range Consolidated Co. is merely a securities holding corporation, the option on the Globe mine is held direct, but probably will be transferred later, if the property is taken over. The Globe mine is described separately.

The company is said to plan a central electric power plant, for the operation of the mines and mills of its subsidiary companies, which plant probably will be located near the Michigan smelter, at Houghton.

Through its subsidiary corporations the Copper Range Consolidated Co. has become the second largest copper producer of the Lake Superior district, and one of the dozen largest producers of the world. Copper Range production includes total outputs of the Baltic and Trimountain mines, and one-half of the output of the Champion mine, other half going to the St. Mary's Mineral Land Co., a joint owner, with the Copper Range, in the shares of the Champion Copper Co. The production, 1907, of the Baltic, Trimountain and Champion mines was 41,385,015 lbs., leaving a net production, for the Copper Range Consolidated Co., of 33,140,297 lbs. fine copper, comparing with 32,382,983 lbs. in 1906, and 32,714,859 lbs. in 1905. Production, 1908, was practically unchanged. The mines and mills are in condition to increase production materially, in the near future. Average cost of copper produced, 1907, by the subsidiary companies, was about 9 cents per pound.

It is probable that the Baltic, Trimountain and Champion mines carry more copper, and eventually will produce more copper, than the Calumet & Hecla mine proper, and it should be produced at nearly as great a profit per pound. The management of the Copper Range Consolidated Co. is one of the most progressive and efficient in the industry, and its mines are among the very best in the Lake Superior district.

#### COPPER RANGE & ARIZONA MINING CO.

#### ARIZONA.

Office: 44 Pine St., New York, N. Y. Mine office: Tucson, Pima Co., Ariz. Francis M. Hartman, president; Frank G. Wright, secretary; Geo. Saville, treasurer; Joe W. Coffin, consulting engineer. Organized under laws of Arizona, with capitalization \$1,000,000, shares \$2 par. Lands, 15 claims, 5 patented, area 300 acres, also 100 acres of millsites and water rights, 40 miles from a railroad, opened to depth of 300', with about 3,000' of workings, showing auriferous and argentiferous chalcopyrite and galena.

#### COPPER RANGE MINING CO.

#### MEXICO.

Office: Chicago, Ills. Mine office: Autlán, Jalisco, Mex. Is said to have ordered a 50-ton smelting-furnace.

#### COPPER RANGE RAILROAD CO.

#### MICHIGAN.

Office: 82 Devonshire St., Boston, Mass. Operating office: Houghton, Houghton Co., Mich. Wm. A. Paine, president; R. Townsend McKeever, vice-president, manager, assistant secretary and assistant treasurer; Frederic Stanwood, secretary and treasurer; preceding officers, John H. Rice, F. W. Denton, Frank McM. Stanton, Rufus R. Goodell and Samuel L. Smith, directors; C. T. Fales, general superintendent.

Organized 1899, under laws of Michigan, with capitalization \$5,000,000, shares \$100 par; issued, \$4,033,700. Bonds, outstanding, \$2,025,000, at 5%. Is authorized to issue bonds to the extent of \$20,000 per mile of completed main line, and \$15,000 per mile of completed branch lines and sidetracks.

Balance sheet, Dec. 31, 1907, gave cost of road as \$5,678,676.83, and cost of equipment as \$735,249.55. Earnings, 1907, were \$860,434.84, comparing with \$659,252.86 in 1905. Operating expenses, 1907, were \$602,245.21, with \$146,680.12 taxes and interest, leaving a surplus of \$111,298.51, with total credit balance of income account, for all years, of \$504,899.42.

The railroad has upwards of 100 miles of trackage, the main line, of 60 miles, running from Calumet to Mass., connecting with the Keweenaw Central at Calumet, Duluth, South Shore & Atlantic, Hancock & Calumet and Mineral Range railways at Hancock and Houghton, and the Chicago, Milwaukee & St. Paul railway at Mass. The company's principal business is the transportation of copper rock and supplies for the subsidiary corporations of the Copper Range Consolidated Co., for which purpose the line was built, but, incidentally, a large general business has been built up, and what was a wilderness at the end of the Nineteenth Century has been developed and populated. The road is in fine physical condition, with well ballasted tracks laid with heavy steel rails, substantial bridges and good rolling stock.

The company owns a half interest in a railroad bridge crossing Portage Lake, between Houghton and Hancock. An extensive water frontage on Portage Lake, in the western part of Houghton, is improved by a two-story stone and brick general office building, shops, roundhouse, warehouses and wharves for merchandise and coal. The coal-wharf is equipped with modern unloading machinery, and has deep water alongside, capable of accommodating the largest freighters plying the great lakes.

**COPPER RIDGE MINING & DEVELOPMENT CO. NEW MEXICO.**

Mine office: Magdalena, Socorro Co., N. M. Capitalization, \$500,000. Lands are said to show chalcopyrite and sphalerite.

**COPPER RIDGE MINING & MILLING CO. COLORADO.**

Mine office: Steamboat Springs, Routt Co., Colo. W. H. Dunfield, president; Clinton E. Bivens, vice-president; W. C. Shaw, secretary and treasurer; Burt Goldsworthy, general manager; preceding officers, Ben Goldsworthy, S. R. Mayberry and G. W. Bratton, directors. Organized 1907, under laws of Colorado, with capitalization \$300,000, shares \$1 par. Lands, 2 claims, known as the Democrat and Republican, 5 miles north of Steamboat Springs, carrying a fissure vein opened by a shaft of circa 100', showing ore assaying up to 18% copper, 2.5 oz. silver and \$10 gold per ton.

**COPPER RIVER COPPER CO. ALASKA.**
